Dispute mediators' *reframing* as an argumentation competence

ABSTRACT: Our contribution focuses on the phenomenon of *reframing* in dispute mediation, as a technique by which mediators help parties frame convergence, which is correlated to conflict resolution. We claim that reframing is an *argumentative* competence that is to be understood as part of a mediator's *strategic maneuvering* (van Eemeren, 2010). We provide an argumentative analysis of instances of reframing involving "shifts in levels of abstraction" (Putnam, 2004), taken from transcripts of mediation sessions.

KEYWORDS: argumentative competence, conflict resolution, frames, mediation, reframing, shifts in levels of abstraction, strategic maneuvering

1. INTRODUCTION

This paper intends to investigate the argumentative nature of *reframing*, which is understood as a key communication competence of dispute mediators, enabling them to help parties in the resolution of their conflict. Our research complements previous studies on argumentation in the context of dispute mediation, focusing on a specific discursive technique that, to our knowledge, has not received attention so far.

The concept of *reframing* has been defined in a variety of ways, both in the literature on conflict resolution and in other fields. This lack of a single coherent definition is consequent to a lack of a single definition of the related concepts of *frames* and *framing*, which have received different and not always compatible characterizations in different disciplines (see Dewulf, 2009 for an overview).

For our research purposes, we adopt the follow definition reported by the *Dictionary of Conflict Resolution*: "[a] technique of relabeling or redefining a particular concept or reality so as to give it a slightly different and more constructive perspective" (Saposnek, 1983, p. 42). The same dictionary also adds that when the term is used referring to the practice of mediation, it may specifically indicate "a mediation technique that the mediator uses to recast conflictual issues in neutral terms" (Van Slyck, Newland, and Stern, 1992, p. 196). In the literature on conflict resolution, the fundamental role of reframing has been clearly recognized: it is inserted among mediators' key "communicative competence[s]" (Donohue, Allen & Burrell, 1988; Moore, 2014) allowing the parties to "achieve a common basis for the parties' discussion" (Ury, 1993, p. 78; Putnam & Holmer, 1992, p. 129). It has also been established that there is a correlation between *frame convergence* – which can be obtained through reframing – and conflict resolution (Drake & Donhoue, 1996).

However, there is still no complete understanding on how *reframing* really works at the discursive level. With this paper, we would like to further exploring its functioning. We

will start from the hypothesis that reframing, at least in some cases, includes an argumentative dimension (Greco, 2016), because it requires parties to make an inference in order to accept the new *frame* suggested by the mediator. Reframing is sometimes accompanied by implicit or explicit argumentation (ibid.). By giving an argumentative interpretation of reframing, we hope to contribute to explain how it work at a discursive level and why it might be effective for conflict resolution.

2. REFRAMING IN DISPUTE MEDIATION

2.1 Putnam's working definition of reframing as a communication competence

Arguably, the most complete approach to framing and reframing as communicative processes in conflict resolution to date has been presented in the works by Linda Putnam and her colleagues (see Putnam, 2004; Putnam & Holmer, 1992). Putnam gives a definition of reframing as a communicative process in negotiation and dispute resolution, including mediation; she also proposes some categories of reframing that we will assume as a basis for our identification of this phenomenon in the empirical corpus of data. Notably, Putnam's approach, which is centred on communication, does not talk about an argumentative dimension of reframing; yet, in her view, reframing involves a process of *shift in levels of abstraction* that, in our interpretation, might be related to argumentation. To our knowledge, there have been no other specific approaches to reframing as an argumentative process in conflict resolution. Therefore, in order to start an analysis of reframing, it is worth starting from Putnam's communicative interpretation that allows us to identify cases of reframing in our empirical corpus.

In some of her works, Putnam has discussed reframing in connection to the phenomenon of *transformation* in conflict resolution:[1]

> Transformation refers to moment in the conflict process in which parties reach new understandings of their situation, ones that redefine the nature of the conflict, the relationship among the parties or the problems they face. New understandings are marked by different meanings or interpretations of events. The parties involved have a fundamentally different view of what is happening than they did when they entered the negotiation. (Putnam, 2004, p. 276)

Those "new understandings" correspond to that "more constructive perspective" mentioned by Saposnek in his definition of reframing (Saposnek, 1983, p. 42). In our view, reframing only partially overlaps with the phenomenon of *transformation* as defined by Putnam (2004). In fact, *transformations* in conflict are often beneficial but they not need to be so (Putnam 2004): a new understanding of a conflictual situation may as well be detrimental to conflict resolution, whereas with *reframing* we only label changes that have a positive value in relation to the objectives of mediation. Moreover, Putnam stresses the fact that *transformations* radically alter the view parties have of a conflict: in contrast, *reframing* can simply change the way parties view a small, specific sub-issue in their conflict. This should by no means diminish the importance of *reframing*: in fact, starting to agree on a specific

---

[1] The fact that her work is not specifically on mediation is not relevant for our purpose, as we are interested in understanding how reframing works, and it is a phenomenon that can be encountered also in other activity types.

point may steer the conversation in a positive direction, and, besides, *reframing* regarding different sub-issues constituting a dispute can eventually lead to resolution.

This said, a correlation between the concept of transformation and *reframing* is suggested by Putnam herself, by arguing that the latter can "parallel transformation" (Putnam, 2004, p. 290) "when [it] is aligned with "revaluation" or altering the bargainers' frames of references" (Putnam and Holmer, 1992). According to Putnam, *transformations* are enacted by *shifts in levels of abstraction* (Putnam, 2004), namely changes in "the way words are categorized or exist in relationship to other concepts" (Putnam, 2004, p. 278). For example, in a mediation case in our corpus, the mediator shifts the discussion from a problem concerning a single child, *Rudolph*, to the broader category of problems occurring to children in general, by using the term *a young boy*.

She also describes the relationship between shifts in levels of abstraction and *reframing* at first she views *reframing* as "a process similar to shifting levels of abstraction" (Putnam, 2004, p. 290); then she acknowledges that "shifts in levels of abstraction could be viewed as a type of reframing, one that is conductive to altering the very nature of the conflict" (Putnam, 2004, p. 291). Again, in our view reframing does not necessarily have to alter completely the nature of the conflict: it may just work on a single sub-issue within a broader conflict.

Reviewing the conflict literature, Putnam explains that at least five types of shifts can be found (Putnam, 2004, p. 278): shift from specific to general level, from concrete to abstract, from part to whole, from individual to system and from literal to symbolic. She states that "shifts in levels of abstraction could be viewed as a type of reframing, one that promotes discovery and learning that is conductive to altering the very nature of the conflict" (Putnam, 2004, p. 291). As Putnam notes, shifts can also work together (i.e. a transformation or *reframing* may involve both a shift from specific to general *and* from literal to symbolic) and they can go in both directions (Putnam, 2004, p. 278). In our analysis, we will start from this categorization to identify types of reframing and then analyse them in argumentative terms (see section 2.3).

2.2 Argumentative tools

We adopt the extended model of a critical discussion (pragma-dialectical approach, van Eemeren and Grootendorst, 1984; 2004; van Eemeren, 2010) as a theoretical framework. The choice of pragma-dialectics as an analytical model is suited for our purpose, because we wish to understand the role and function of reframing within the process of mediation as a resolution of the parties' initial difference of opinion.

The model of critical discussion proposes four stages that are present (although not necessarily in chronological order) in an ideal argumentative discussion: the *confrontation stage*, the *opening stage*, the *argumentation stage* and the *concluding stage.* The *confrontation stage* refers to the moments in which "the parties establish that they have a difference of opinion" (van Eemeren et al., 2002, p. 25); in the *opening stage* they "decide to try to resolve the difference of opinion" (van Eemeren et al., 2002, p. 25); in the *argumentation stage* "the protagonist defends his or her standpoint against the sometimes persistent criticism of the antagonist by putting forward arguments" (van Eemeren et al., 2002, p. 25); in the *concluding stage* they "assess the extent to which difference of opinion has been resolved and in whose favor" (van Eemeren et al., 2002, p. 25). We will view transcripts of mediation sessions as critical discussions to see in which stages *reframing* occurs.

We understand *reframing* as part of a mediator's *strategic maneuvering* (van Eemeren, 2010), which refers to "the continual efforts made in all moves that are carried out in

argumentative discourse to keep the balance between reasonableness and effectiveness" (van Eemeren, 2010, p.40) in all stages of a critical discussion. Strategic maneuvering involves three interrelated aspects: selection from the available *topical potential*, *adaptation to audience demand* and *presentational devices* (van Eemeren 2010: 93-94)*.* How these aspects are realized depends on the stage of a critical discussion in which strategic maneuvering is present and on the institutional context. In section 4, we will discuss how strategic maneuvering is achieved through reframing in the data we analysed.

3. DATA COLLECTION AND ANALYSIS

Our corpus is composed of ten transcripts of best-practice (mostly role-played) mediation sessions (approximate nr. of words = 86'000) in English, mediated by US and UK mediators that are available as video recordings[2].

Since mediation is a confidential process, it would be almost impossible to have access to real data; therefore, several authors have relied on role-play sessions (mediated by professional mediators) to approach this kind of communication practice.

The role-plays that we have selected are either used in the training of professional mediators or proposed as best-practice cases to showcase what mediation is to potentially interesting parties; therefore, the findings deriving from our analysis may be considered as typical examples of dispute mediation. The corpus is composed of interpersonal conflict cases in various domains, in which the relationship between the parties may or may not continue after the mediation process. Moreover, we tried to include as many different fields of application of mediation as possible, in order to guarantee the generalizability of our findings.

The video recordings of these cases have been transcribed according to standards of Conversation Analysis adapted to the needs of argumentation, in conformity with the standard described in Greco Morasso (2011).

For our analysis in this paper, we have proceeded as follows. At first, we identified cases of reframing in terms of shifts of levels of abstraction within the communication process, starting from Putnam's definition (section 2.1). Then we categorized these shifts according to the categories proposed by Putnam (section 2.1). When we found a shift in level of abstraction that did not fit into these categories, we created a new category, as we will detail below. Finally, we have interpreted the shifts that we found in argumentative terms, based on the extended pragma-dialectical theory, which we have discussed in section 2.2.

4. FINDINGS AND DISCUSSION

Our analysis will consist of two parts. We will first give an overview of the types of shifts that we observed and then detail the analysis of two representative examples.

4.1 General overview of our findings

Generally speaking, we found examples of some of the categories of reframing illustrated by Putnam in our corpus of empirical data. Notably, we found 5 cases of shifts from specific to general, 3 cases of shift from literal to symbolic, 3 cases of shift from individual to system and one case of shift from whole to part. We did not have any example of shift from concrete to abstract.

---

[2] Six cases are taken from the corpus analyzed in Greco Morasso (2011). The other four cases have been collected and transcribed by C. Jermini-Martinez Soria. This is a sub-corpus within the Refra.Me project.

Looking at our data, we also found two other types of shift that did not fit Putnam's categories. We will call them, respectively, from negative to positive and from individual to species. We use the label *from negative to positive* to indicate *reframing* in which mediators take a meta-perspective on the ongoing dialogue between the parties and redefine it in positive terms. We found a case of this shift in our corpus.

In the second category (from individual to species), we include all *reframing* in which there is a shift from the single *individual* to the *species* it belongs to, using Aristotelian concepts. In this type of shift, the mediator may state something that characterizes a group of people in general instead of a single individual (i.e. a party in the mediation). For example, through mediators' *reframing*, *a* discussion about whether and when a specific child is (or is not) to be told that he is adopted, turns into a discussion concerning child-development in general, or a quarrel about the nature of a specific job is transformed into an exchange about the link between job descriptions and actual assigned tasks in general. We found seven instances of this type of reframing in our corpus; this is the most frequent category that we have identified.

Having done this preliminary communication analysis of types of shift and reframing, we then moved on to an argumentative analysis according to the extended pragma-dialectical theory. At a first level, we found that reframing might concern either the confrontation stage or the argumentation stage of a critical discussion.

That reframing might affect the confrontation stage is not surprising: van Eemeren (2010, p. 126) has already observed that framing processes normally concern issues, and the definition of issues primarily concerns the confrontation stage (Schär, 2018). As we will show below, sometimes the *reframing* of the confrontation stage concerns the main discussion in which the parties are involved to find a solution to their conflict; in other cases, mediators use reframing to open up a meta-argumentative discussion. As it has been argued in Greco Morasso (2011), a typical session of mediation is a macro-text of argumentative discussions, with mediators opening discussions at a meta-level to help parties manage their issues. *Reframing* might include a shift from the core discussion to one of these meta-discussions.

We also found that reframing sometimes involves the argumentation stage, when the mediator's reframing tends to condensate a largely implicit standpoint and argument(s).

At the level of strategic maneuvering, as van Eemeren (2010) has noted, framing involves all three aspects – and so does reframing. In some cases, we found that one aspect is more prominent: for example, in the case in which reframing is a shift from literal to symbolic, presentational devices (for example, the use of a metaphor) are notable. When reframing involves the argumentation stage, we always have the choice of a particular inference (based on a *locus*, according to Rigotti and Greco Morasso, 2010), which means that the choice at the topical potential is particularly prominent. In all cases, anyway, we recurrently found an important role played by the adaptation to audience demand. For mediators, adapting to audience demand is crucial, because of their ideally neutral role in the resolution of the dispute and, as a consequence, in the parties' discussion. Because it is the parties who will need to make a decision on the conflict, the mediator's reframing must be approved by them. Audience demand – expressed, for example, with a reformulation of what the parties have said– also signals that the mediator is listening to the parties. Listening is, again, related to the mediator's neutral function – what he or she says must reflect the parties' concerns as ultimately they will need to make a decision.

4.2 Examples of argumentative analyses

We will now analyse in detail two examples from our corpus, which illustrate how reframing might involve either the confrontation stage or the argumentation stage of a discussion (or both). While concentrating on an argumentative analysis, we show how this might be crossed with the typology of reframing tentatively sketched by Putnam and integrated by us.

Example 1 is taken from a mediation session[3] between an NGO's director and a major benefactor, who are working together on a development project in Ethiopia. They are having issues coordinating and handling the project because they have different ideas concerning the project priorities (what should be done first in order to help the local population in an efficient way). The NGO's director feels that the benefactor wants to impose his point of view, in spite of not having experience on the field. At turn 302, after having listened to the parties' point of views and personal histories, the mediator intervenes by stating (turn 302):

> (1) Just in a lot of ways the two of you are quite similar with your your drive and you're ability to get things going and to be in charge and (.) *sometimes people who like to be in charge aren't as comfortable when they're working with somebody else who wants to be in charge* (.) you can't both be in charge of all aspects of this project it looks to me like if you try to be you're not gonna work to altogether does that make sense↑ (our emphasis)

In this excerpt, the mediator suggests a plausible reason why the parties are not able to cooperate in an efficient and positive way. This may be important for conflict resolution, because each party blames the other for the malfunctioning of their collaboration. The mediator tries to make them understand that the problems they are having are not caused by the other person; but they are due to the fact that *people* (in general) *who like to be in charge aren't as comfortable when they're working with somebody else who wants to be in charge.* And both parties can be counted among these people.

In this example, considering shifts in level of abstraction, we encounter a shift *from individual to species.* The parties do not need to feel guilty for "not being comfortable" in the present situation, because this is typical of the category "people who like to be in charge". This shift removes the blame from the individuals, and it serves an important function of mediation, which consists in reassuring the parties that it is normal to find themselves in that situation[4].

We now turn to an argumentative analysis of this example. With his intervention at turn 302, the mediator gives an argument to support an implicit standpoint, thus intervening mainly at the argumentation stage of the parties' discussion. The mediator's argument refutes a standpoint that the parties have expressed before, i.e. that their problems are due to the other person[5]. We might analytically reconstruct this move as follows:

---

[4] Putnam notes that "the shift in the level in which to enact the conflict […] mitigates the rightness or wrongness debate" (Putnam, 2004, p. 282).

[5] This emerges from a careful reading of the whole transcription. Cf. for example turn 74 (Jember): "Well I think the difficulties lie in ehm him not having enough confidence in our abilities […]" and turn 124 (Alec): "[…] I mentioned several times to Jember that (.) eh the (.) fact that we have not built a single home yet *well that may not eh be particularly troubling to her but is very troubling to me*" (our emphasis).

(1 The fact that you are not working well together is not the other person's fault.)
1.1 Because people who like to be in charge aren't as comfortable when they are working with somebody else who wants to be in charge.

It is interesting to analyze this argument from a viewpoint of strategic maneuvering, which involves all three aspects. First, at the level of audience demand, we reconstruct an implicit standpoint ("The fact that you're not working well together is not the other person's fault") that serves the purpose of removing blame from the parties. As said, removing blame is important in the context of dispute mediation (Welton et al., 1998), it permits to shift the issue from an attribution of fault to the solution of the conflict. We interpret this as a move at the level of audience demand, because, by doing this, the mediator is trying to appeal to the deepest parties' interests and concerns, leaving their positions aside (according to the famous principle "focus on interests, not positions" [Fisher, Ury and Patton, 1991]).

The mediator realizes this adaptation to audience demand through a choice at the level of topical potential: instead of referring to the one conflict he is dealing with, the mediator generalizes to other conflicts in similar situations, moving from the individual to the species. Here the mediator – in selecting an issue among the topical potential – chooses the *locus from ontological implications*, one of the definitional loci according to Rigotti and Greco (forth): it is a defining trait of the category "people who like to be in charge" that makes them feel uncomfortable and inevitably causes the conflict between them. This maneuvering with the topical potential is accompanied by the choice of words such as "people" and "sometimes", as well as the use of the plural – these being presentational devices that anchor the reframing at a linguistic level.

Example 2 is taken from a mediation session between a primary school teacher and the mother of one of his pupils; this mediation session has been discussed originally in Greco Morasso (2011) but from a different viewpoint. The parties entered mediation following the school principal's suggestion, after Lisa (the mother) complained to him about Claire (the teacher). Lisa is convinced that Claire treats his son in an extremely unfair way by unjustly punishing him and giving him more work to do than to the other kids, whereas Claire blames the parents for not having educated properly their son, since he disturbs the other kids in class and never puts efforts in his work. While the two parties are arguing about homework, at turn 46 the mediator intervenes (turn 46):

(2) Mmh (.) so here's another thing *(.) we are getting some clarity* and I have a SENSE that what we're going to do this afternoon (.) is get more and MORE CLARITY (.) ah:: so that (.) you can each *do what's (.) best for (.) Kevin* 'cause I think it's clear (.) that you both want what' s the best for him (.) in the context of what's: needed for all of the other kids in the class as: [as well (our emphasis)

In this turn two cases of *reframing* occur: the former involves what we call a shift *from negative to positive* and latter a shift *from specific to general.* By drawing the parties' attention to the fact that the discussion they are having is in fact a way of "getting some clarity", the mediator redefines what for them is a dead-end quarrel in positive terms. For the parties, the discussion is perceived as useless because each one of them is not able to convince the other party that they are right and the other is wrong, and with this *reframing* the mediator shows them that the conversation – if viewed as an opportunity to get more clarity – can bring positive results. We observe here a case of shift from positive to negative as a reframing that happens at a meta-discursive level: the mediator here is reinterpreting the usefulness of the whole discussion between the parties, and ascribing a positive effect to it. In terms of an argumentative analysis, this reframing concerns the *confrontation stage*, because the parties

are asked to accept a new meta-discussion concerning the usefulness of their discussion. They, thus, are brought to engage in a sort of meta-argumentation. In this sense, this reframing opens up a new confrontation stage for a meta-discussion, including a sort of meta-reflection on how the main discussion is going. As it has been argued by Greco Morasso (2011), meta-argumentation is typical of mediators' interventions in the parties' discussion.

The mediator then links this need for clarity to a common goal of the parties, which is the child's wellbeing, thus shifting from specific to general (i.e. to a common, shared goal). This second *reframing* might be reconstructed as follow:

1 We need to get more clarity
1.1 Because so you can each do what's best for Kevin
1.1.1 Because this is what you both want

The second reframing is similar to example 1 discussed above, in the sense that the mediator is proposing to the parties an implicit argument that they will have to approve; it therefore involves the argumentation stage. What is more notable in this example from a viewpoint of strategic maneuvering is that the mediator makes a premise left implicit by the parties explicit (i.e. the fact that both parties want the child's wellbeing). In the previous discussion, both parties declared to be interested in the child's wellbeing but none of them recognized that the other party had the same interest. Arguably, by means of this choice at the level of topical potential, the mediator adapts to the more profound expectations of the audience's demand. At the level of presentational devices, the mediator presents argument 1.1.1 as if it were emerging clearly from the previous discussion: "'cause I think it's clear" (turn 46). In this sense, he is taking the risk to state that the parties have a shared interest without going against his neutral role.

5. CONCLUSION

This paper presented a first analysis within a broader research project that explores the argumentative nature of *reframing* in dispute mediation. We focused on cases of reframing that have to do with shifts in levels of abstraction within the parties' discussion and analysed them in terms of strategic maneuvering to understand their role within mediators' interventions in the parties' discussion. In line with van Eemeren (2010), we observed that (re)framing involves all aspects of strategic maneuvering. In addition, we showed that reframing might concern either the confrontation stage or in the argumentation stage of the parties'   discussion.

The occurrence of reframing in the argumentation stage is a first notable result of this investigation. In fact, it shows that reframing does not only modify the propositions at issue (as suggested in van Eemeren 2010 in relation to framing processes), but it can also condensate a partly implicit argument that is offered to the parties to reinterpret their situation and make a step forward towards the resolution of their conflict.

At the level of mediators' strategic maneuvering, perhaps the most notable aspect that we found so far concerns the mediator's interpretation of the *audience demand*, which clearly emerged in the two examples discussed above. When reframing concerns the argumentation stage, the mediator proposes an argument that is supposed to help the parties in making their profound interests emerge – e.g. removing blame, resolving the conflict, doing the best for a child that they love. These interests are something that has not been clearly said by the parties, but that the mediator reconstructs on the basis of the preceding discussion. In other words, adaptation to audience demand for mediators does not mean to pay lip service to the parties'

expressed interests and positions; but to dig deeper into their (more often than not unexpressed) interest. This interpretation of the audience demand might be typical of a mediator's role and contribute to explain why *reframing* contributes to conflict resolution: by touching upon profound interests, mediators may steer the discussion on what is really interesting for the involved parties and find a solution that is more likely to meet their agreement.

These findings are the result of a pilot study conducted on a preliminary set of data. We are currently extending the empirical basis on which our research is based and collecting other instances of reframing, which will enable us to examine whether there are different categories of reframing and what kind of argumentative interpretation they can be given. On the long run, the aim of our project is to provide an argumentative analysis of reframing in dispute mediation, in order to explain how this works and how it contributes to the resolution of the parties' discussion (Jermini – Martinez Soria, in preparation).

ABSTRACT: The mechanism of identification is a phenomenon which makes work the "ordinary people" approach. This approach aims to show that one person belongs to the group he/she tries to influence. The mechanism of identification is a commonly used tool in modern political life. The aim of this study is to demonstrate how this mechanism is implemented not only at verbal, but also at non-verbal level.

KEYWORDS: Donald Trump, identification mechanism, non-verbal communication, Vladimir Putin

1. INTRODUCTION

One of the most significant events of modern times is the invention of Charles Darwin's theory of evolution. The theory presented in "Origin of the Species" (1859) made a turning point in the concepts of living nature.

Darwin proves that all organisms in the world are constantly changing and developing, with other words evolving. At the core of the evolutionary process, Darwin places the variability of the living creatures.

Heredity and variability are essential properties of all organisms. Together with the natural selection, they can be considered as base of the evolutionary process.

The progress of organisms of any kind is accomplished through natural selection and the ability to adapt to the surrounding natural or/and social environment.

Yes, change is the basic law of nature. But the changes wrought by the passage of time affects individuals and institutions in different ways. According to Darwin's Origin of Species, it is not the most intellectual of the species that survives; it is not the strongest that survives; but the species that survives is the one that is able best to adapt and adjust to the changing environment in which it finds itself.[1]

Applying this theoretical concept to us as individuals, we can state that the civilization that is able to survive is the one that is able to adapt to the changing physical, social, political, moral, and spiritual environment in which it finds itself.

Living beings have developed a great number of behavioural patterns and strategies for adapting to their surrounding environment within millions of years of their evolution. One of them is the so-called "Chameleon effect".

---

[1] The earliest relevant evidence for this statement known to us appeared in a speech delivered in 1963 by a Louisiana State University business professor named Leon C. Megginson at the convention of the Southwestern Social Science Association

2. CHAMELEON EFFECT

There are many species in nature that have changed genetically to such an extent that they have begun to resemble other species in order to be perceived as one of their kind by potential hostiles.

The situational resemblance is very common. One living organism resembles another, more threatening, in order to expel the potential hostile. A good example can be a Costa Rican caterpillar that takes the form of a snake if it senses an approaching danger.

Of course, the most famous creature capable of such tricks is the chameleon. Chameleons have specialized cells under their transparent skin called chromatophors. They contain respectively yellow and red pigments. The cells below them are called iridophores. They contain a colourless substance that can reflect the blue spectrum of the visible light. By combining these three colours, the others are obtained. For example, to turn green, the yellow pigment is mixed with the blue light.

This allows the chameleon to change the colour of its skin depending on the circumstances of its surroundings. Changing colour can be also an expression of physical condition, a way of communication, and serve as a protection against predators. So, this animal species has developed a very interesting and yet very successful survival method of adaptation.

3. IDENTIFICATION MECHANISM

The psychological phenomenon "Identification" is mentioned for the first time in the scientific work of Sigmund Freud and his daughter Anna Freud, where it is described as a self defence mechanism of the ego. (Freud, 1937)

Thanks to it, it is possible for a person to take a model of behaving, motives, attitudes and values from another person or persons who, for one reason or another, are considered as authority by the recipient. In other words, it is a reincarnation of one person into another that has some attractive features, activities and interests. A person who possesses certain individual and / or social values.

The mechanism of identification can be observed not only in the animal world but also in human society. Tanya Chartrand and John Berg found this phenomenon for the first time:

We often mimic the gestures, manners, facial expressions, and other behaviours of our partner or our interlocutor. And that's what makes them sympathetic. (Chartrand & Bargh, 1999, pp. 893-910)

Copying elements of a partner's behaviour is very typical in a family environment and especially in older couples. Quite often facial expressions, poses, mimics and other elements of non-verbal behaviour leads to some great external similarities between the two partners. This is supposed to provide more mutual understanding and therefore more productive life together.

The human is a social animal, dependent on trust. And trust comes from a sense of common values and beliefs.

When we meet others for the first time, we need to assess quickly whether they are positive or negative towards us, just as most other animals do for survival reasons. We do this by scanning the other person's body to see if they will move or gesture the same way we do in what is known as "mirroring". We mirror each other's body language as a way of bonding, being accepted and creating rapport, but we are usually oblivious to the fact that we are doing it. In ancient times, mirroring was also a social device which helped our ancestors fit in successfully with larger groups; it is also a left-over from a primitive method of learning which involved imitation. (Pease & Pease, 2005, p. 250)

Non-verbally, mirroring says: "Look at me. I am the same as you. I feel the same way and share the same attitudes." (Pease & Pease, 2005, p. 251)

4. INFORMATIVE AND COMMUNICATIVE FUNCTION OF NON-VERBAL COMMUNICATION

There are two types of non-verbal communication. One of them is conscious. In this case both communicating sides exchange some information with the intention of communicating. On the other hand, information can be broadcasted very often independently, and even against the will of one or all communicating subjects. (Руменчев, 2006, p. 24)

Michael Argyle talks about "signs" (messages with intention of communicating) and "signals" (where intention of communicating is missing). (Argyle, 1970, p. 5)

Starting from the idea of the ambivalent nature of non-verbal communication, we come to the main part of this presentation, which is to observe how this knowledge can be used to manipulate the other communicant (a single individual or a collective subject, i.e. an audience).

Before we proceed to explain this process and to bring the necessary examples, we need to clarify the relationship of what has already been said and rhetorical science.

More than two millennia ago, Aristotle argues that rhetoric is an attempt to change thinking and action by giving knowledge, forming opinions, and provoking action. It is necessary for the listeners to be convinced in the veracity of one or another situation through arguments arranged in order and influenced by the logical and ethical characteristics of the audience. And yet, as the ancient Greek philosopher says rhetoric always aims to find the necessary means in every situation to convince.

Rhetoric deals with persuasive communication from its appearance to the present day. In Gorgias dialogue, Plato conveys Gorgias view that rhetoric is a creator of conviction, and that all its activity and essence lies in it. (Руменчев, 2012, p. 68)

In the Phaedrus, he speaks of the speaker's purpose of convincing the soul with its eloquence. (Руменчев, 2012, p. 98-99)

In general, rhetoric is oriented primarily on the study of arguments, mistakes, style, language, etc., and these are entirely verbal phenomenons. In this particular study, it is important to say that we will pay attention not only to the verbal, but also to the non-verbal instruments, used to achieve the orator's goal to convince.

We will use the following working definition:

All logical and non-logical, verbal and non-verbal non-violent means of influence used to pronounce an oral speech aimed at overcoming the resistance of the audience. An audience's resistance will be understood as every conscious or hidden response of the audience to the speaker and the verbal and / or non-verbal message that comes out of him. (Руменчев, 2006, p. 122)

5. THE MECHANISM OF IDENTIFICATION. VERBAL AND NON-VERBAL IMPLEMENTATIONS ON THE POLITICAL SCENE

The political scene of human society is complex and immense. An extensive and deep analysis would take a tremendous amount of time and probably could not be handled by a single researcher. However, taking into consideration all the risks of this endeavour, and considering the need to comply with the technical requirements of such texts, we are committed to try to show how the identification mechanism manifests itself.

We chose two applicable examples we think would be interesting to the audience.

The first one demonstrates the possibility to influence on the verbal level through the instruments of the language.

As an example of how the means of expression could lead to radically different assessments regarding the speaker, we could briefly look at the idiolect of one of the most discussed candidates for the US presidency in 2016 Donald Trump.

The term "idiolect" is primarily intended to be intuitively understandable. An encyclopaedic reference would indicate that the definitions of the idiolect are mainly oriented to the speaking habits of the speaker and their manifestation in the form of preference to certain linguistic means as well as paralinguistic components. The idiolect is also perceived as a result of individual selection and combination of units of different linguistic levels over a given time period. (Байчев & Виденов, 1988)

Donald Trump's idiolect is probably one of the reasons he has reached the top position in the presidential chair race. On the one hand, people have a negative impression: "It sounds meaningless", "His speeches are insignificant". On the other hand, Trump gathered many supporters, drawn precisely from his message. These people formulate their impressions of him in a completely different way: He is "authentic" and "consistent".

The image that Donald Trump offers during his election campaign in 2016 is directed primarily at the average American citizen. The presence of phrases and elements of non-verbal behaviour of the candidate, specific for informal daily communication, opens the door to convince the potential voters and create prerequisites for identifying their priorities and values with his. The argumentation of the image is further fuelled by the emphasis placed on the idea of an American dream. Trump points out as a wealthy and successful businessman who has turned his company into a business empire through his ingenuity and talent.

We can't say for sure whether this kind of public image influences the election result, but a quick glance at the distribution of voters and the voters' profile leads us to a positive response.

Trump wins the vote of most white citizens in the country, middle-class representatives, and for Clinton vote mostly Afro-Americans, Asian and Hispanic speakers. A curious fact is that people with higher education have given equal preference to both candidates. Most of Americans living in more urbanized areas along the two coasts of the country voted for Clinton, and the residents of the central and southern parts of the country preferred Donald Trump.

The public image thus constructed is not a rare occurrence. Similarly, though not so aggressively, the image of Russian President Vladimir Putin was created, especially at the beginning of his political career.

Our second example aims to demonstrate how the Mechanism of Identification works at a non-verbal level and, in particular, through the clothing of the communicating subject.

In order to see how this impact is taking place, we have analysed a video of the Russian State TV 1st Channel from a meeting in June 2009 with the leadership of the concrete factory in the town of Pikalyovo, which at that time belongs to the Russian oligarch Oleg Deripaska.

The meeting is attended by officials from the regional administration, the Ministry of energy, the Ministry of Finance, the oligarch Oleg Deripaska himself, as well as representatives of the factory's employees.

The strict formal suit is neglected and replaced by casual wear (jeans, shirt without a tie and lightweight sport jacket). This choice of clothing is not accidental. Common characteristic of Putin, and especially when he serves as Prime Minister, is to adapt his appearance to a particular audience and to the specific communicative situation.

Apart from a strict official suit, the Russian president can be spotted with work clothes, sportswear, even with a sweater, and so on.

The appearance may trigger the identification mechanism. It is also known as the "ordinary people" technique, which aims to show the person's belonging to the group, which he is trying to influence. This greatly reduces the criticism of the audience and opens the "gateway of trust" for the verbal messages.

At the meeting in Pikalyovo, Putin doesn't wear a tie, which supports the claim that his clothing aims to equate the status of the influential politician with that of the ordinary workers who attend the meeting. Vladimir Putin is making efforts to implement the identification mechanism. The message he sends by his clothes is clear: *I am one of you.*

Putin also carries his wedding ring, which is perceived as a symbol of conservative patriarchal values, and also provoke trust in part of the current audience. The aim of giving less formality to the event can also be seen in the language Putin uses during his speech. Such as the question: *And why, when you realized I am coming, you scattered like cockroaches?*

The effect that Putin achieved in the time of his visit to the town of Pikalyovo can be described with the final remarks of the 1st Channel TV host: *While the residents of Pikalyovo still discuss the meeting held, the news agencies have spread the news that the necessary funds have already been received in the bank accounts of the factory.*

6. CONCLUSION

In conclusion we can say that the Identification Mechanism is an instrument by which the active communicator deliberately imitates one or more elements of the verbal and/or non-verbal behaviour of their communicating partner in order to gain confidence, to persuade, to change opinion and/or incitement to a particular action.

Metaphorically It can be described by the comparison with the so-called Identification system Friend or Foe (IFF) which is operating by military aviation worldwide. Where the airplane is recognized as friendly based on its shape, heat signature etc.

Same way the recipient of the message recognizes the other subject of communication act as friend or foe depends on his verbal and non-verbal behavior.

Contemporary challenges to democratic engagement: Social media, fake news, and public argument in digital argument ecologies

JOHN M. KEPHART III

Communication Studies Department
California State University, Northridge
United States of America
John.iii@csun.edu

ABSTRACT: The transition to an increasingly digital public sphere reconfigures the terms on which public arguments are made, contested, and accepted. The increased use of social media, promulgation of fake news, online sorting algorithms, and online advertising shifts how ethos, pathos, and logos function as warrant-providing proofs in contemporary argument cultures. This paper considers constraints, challenges, and possibilities for democratic engagement in digital argument ecologies. The 2016 US presidential election is considered as a case study.

KEYWORDS: argument ecology, fake news, public sphere, rhetoric, social media

1. INTRODUCTION

Changing media conditions demand a change in how we think about argument in 21st century digital public spheres. Goodnight (2012b) suggests that technology like the internet "resets the horizons of inquiry" (p. 264) and invites a critical intervention to consider how technological changes implicate democratic participation. Such changes matter because "what is put at stake by contention and disagreement are the communicative practices invoked to articulate and enact a public sphere" (p. 261). The 2016 United States general election gives a glimpse into these challenges. Research demonstrates the substantial consumption of news online broadly, and on social media specifically. In 2016, 62% of American adults got at least some of their news from social media, a number that increased to 67% (Shearer & Gottfried, 2017). Almost one fifth, 18%, of Americans said they got news from social media often (Gottfried & Shearer, 2016; Shearer & Gottfried, 2017), with 35% of users under 30 saying it was the most helpful to learn about the presidential election (Gottfried, Barthel, Shearer, & Mitchell, 2016). During the election, two-thirds of Facebook users (66%) got news on the site, and 59% of Twitter users looked to Twitter for their news (Gottfried & Shearer, 2016). Today, 70% of Americans use social media ("Social Media Fact Sheet," 2018).

Argument in these spaces alters the terms of democratic engagement both on and offline. In 2010 and 2012, social media giant Facebook estimates that they increased turnout in elections by 340,000 people (O'Neil, pp. 180-181), enough votes to change the 2016 presidential electoral outcomes in 30 US states ("2016 election results," n.d.). Only 80,000 votes decided the election and 340,000 votes would have been enough to change the electoral outcome in Wisconsin, Michigan, Florida, *and* Pennsylvania, creating a landslide victory for Secretary Hillary Clinton. The election saw an unprecedented spike in the use of online advertising, and the emergence of "fake news", "news articles that are intentionally and verifiably false, and could mislead readers" (Allcott and Gentzkow, 2016, p. 213). The increased use of social media, promulgation of fake news, role of online sorting algorithms, and utilization of online advertising reflect a new digital landscape. As recently as 2013, it was estimated that 25% of time spent online globally is spent on social media, that each

month people spent 600,000 years on Facebook, and that one out of every seven minutes was spent online (Standage, 2013). Given the worldwide reach of social media, this is a global concern.

This paper considers the constraints, challenges, and possibilities for argument in digital environments. A digital landscape of social media, search engine optimization, and "fake news" impacts how argument functions and shapes deliberative argument in the US within those environments. This landscape operates on values of proliferation, immediacy, and confirmation, values that change how we make, evaluate, and refute arguments in a digital argument ecology and how those arguments are put to use to influence democratic engagement. This paper will consider this digital landscape as a distinct argument ecology, the ways that ethos, pathos, and logos function as warrant providing proofs in this ecology, and evaluate that ecology in the 2016 US Presidential Election.

2. DIGITAL ARGUMENT ECOLOGIES

James Klumpp's (2009) conception of argument ecology helps us consider how interactions between technology and media shape argument in digital spheres. Treating argument with the ecological metaphor studies the context of argument as a focus for evaluation, and uses it as a mode of critique. In studying democratic argument, attention should be paid to the "evolving patterns of reason giving and coordination that structure human understanding and action" (p. 184). Considering how we reason together towards common purpose invites us to think of argument as "a characteristic of the community because it is through argument that the contingent becomes coordinated action" (p. 187). This involves engaging the ways that arguments are made, taken up, circulated, responded to and rejected as folks try to make sense of democratic practice; to consider individual arguments and the ways they find a home.

Digital landscapes create an argument ecology that produces constraints on the process of deliberative reasoning. This includes social media such as Facebook and Twitter, internet-based news sources, search engines, and online discussion forums. In this ecology, arguments don't only take place online, but move between on and offline argument spheres as participants in public argument draw from digital spheres for argumentative resources, use online spaces to make arguments, and those arguments are taken up by other actors. While individual arguers may be pushing arguments in public, technical, or individual contexts (Goodnight, 2012a), the ecology through which they do so shares values that are particular to the means by which the information is circulated. Digital landscapes order and distribute the raw materials that become the building blocks of argument, and the interaction of arguers with that system make use of those materials in their creation and consumption of argument. To say that technology changes argument is not a novel claim. Theorists since Plato's *Phaedrus* have lamented the effects of new technology on our ability to reason. However, there are new technological features that argument scholars should attend to in considering contemporary argument.

The ways we reason are influenced by the technology through which those arguments are made. Considering the impact of internet on communication is critical because "a medium's content matters less than the medium itself in influencing how we think and act" (Carr, 2010, p. 3). This happens on a procedural level – how the arguments are created – and a neurological level – how the arguments are processed. Mediums of communication function as "intellectual technology", influencing our ability "to find and classify information, to formulate and articulate ideas" (p. 44). The internet reshapes the "circuitry in our heads", altering how we receive and process information on a structural level in the brain (p. 49). Nicholas Paliewicz and Guy McHendry (2017) argue we need to consider how argument

shifts from traditional dialectic models because "a networked society…has transformed the possibilities of argument" (p. 288). It is not only that digital arguments are hyperpublic, made rapidly, and networked with less access barriers, but also all that data is tracked, stored, and used to further sort and distribute information. We can see an argument ecology as a home for argument, one where processes of interaction work to site and produce a "community of…reasoned action" (Klumpp, 2008, p. 184). We need to consider how people enter into those networks to form communities and make sense of arguments.

3. (RE)CONSIDERING ARGUMENT IN DIGITAL ECOLOGIES

The interaction of digital landscape and democratic practice hasn't eliminated argument in traditional media, but has begun to reconfigure public deliberation. Arguments are shaped by a combination of technology and social values that shapes the availability of claims, the range of acceptable grounds, and the function of proof in argument. Considering how argument structures function in digital ecologies gives a sense of the possibility for argument in digital spheres, and establishes standards to evaluate and critique them. Robert Rowland (1987) suggests that Stephen Toulmin's argument model has descriptive utility because it identifies the form of an argument as a claim supported by reason and evidence, and as an evaluative tool to test the strength of that connection. Further, consideration of the warrant – the argumentative resource that authorizes the move from grounds to claim (Brockriede & Ehninger, 1960) – provides audiences and critics a means of evaluating the strength of arguments presented to them. We can translate these observations into evaluations of public deliberation. The model helps us see the distinction between "the known (data) and authorized procedures (warrant)" and "places his system into a social framework" (Klumpp, 2008, p. 186).

      Wayne Brockriede and Douglas Ehninger (1960) highlight how Toulmin suggests "a system for classifying artistic proofs which employ argument as a central and unifying construct" (p. 44). Viewing the connection among claim, data, and warrants this way – treating warrants as artistic proofs - establishes relationships among parts of an argument that make data and claims meaningful in their use. Warrants establish relationships among ideas and work towards moving us deliberatively. Because an "argumentative ecology teems with interaction" Klumpp (2009) argues, "argument within an ecology is rhetorical: it is addressed…" To synthesize the qualities of a given ecology, we should consider not only "refutation, conflict, controversy, but also advancement, refinement, and even resolution" (p. 187). Establishing the relationship among claim, ground, and warrant evaluates the conditions of possibility for argument in – and the healthy functioning of - a digital argument ecology.

      We need to examine not only the structure of an argument, but how relationships among parts of an argument are advanced. Jon Bruschke (2012) notes that while there is a difficulty in identifying the central structure to an actual occurring argument, structural inquiry is useful as "arguments unfold the same way a discordant jazz piece with shifting time signatures might; never separate from structure, but equally undisciplined by it" (p. 61). The increasing use of social media and online news as only a repository of information from which arguers draw and the arena in which their ideas are contested points to these digital forms as a place to consider how the relationship among claims, grounds, and warrants functions rhetorically. The ways the digital landscape encourages us to encounter information shapes our evaluation of that information (Carr, 2010). If we process info differently in digital argument ecologies, then we should also expect argument to works differently.

      Digital argument ecologies shape the deployment of the classic rhetorical concepts of ethos, pathos, and logos in contemporary argument cultures by shaping the relationship

between claims, grounds and warrants offered in public controversies, relationships that affect our evaluation of logical, emotional, and ethical assertions. Appeals to credibility, motivating fear or anger in an audience, or uses of the enthymeme still exist in digital arguments; what is read as ethical, pathetic, or logical, is distinct. Digital argument ecologies alter the terms for what counts as logical, ethical, or pathetic argument in contemporary democratic exchange: the consideration of ethos, pathos, and logos is influenced by corresponding values. Ethos is animated by a value of immediacy, pathos by a value of confirmation, and logos by a value of proliferation.

3.1 Ethos

Ethos acts an authoritative warrant, one that "affirms the reliability of the source" from which evidence is derived from "on or more factual reports or statements of opinion" (Brockriede & Ehninger, 1960, p. 51). The authority of that source is sustained with backing. In digital argument ecologies, immediacy makes a source authoritative. Immediacy is both chronological i – how recently was an argument made, creating a feeling of it being immediately present – and a relational one – the nature of social media creates relationships between arguers and audiences that feel personal regardless of offline interaction. The degree to which the argument is made immediate to the audience establishes persuasive character. In this sense, immediacy functions to blur backing and warrant – the existence of an immediate argument functions as the credentials that certify the source.

This happens as both a structural effect of the technology of the Web as well as a psychological effect of the ways we interact with media. Perelman and Olbrechts-Tyteca (1958/1969) argued that presence was a key factor in argumentation, and Klumpp (2009) suggests the "visibility of arguments is a key dimension in an ecology and argumentative style is key to that" (p. 191). Presence is reflected as immediacy in digital landscapes. Neurologically, the interactivity of social media and the Web privileges a cognitive cycle where frequency of updates equates with importance, and a processing style that craves rapid delivery (Carr, 2010, p 118). The valuing of recency is also a structural effect of the technology. The stream of information on the internet encourages a demand for constant updates in consumers of political news. Dan Pfeifer (2018) described campaigning in the digital era as a shift from a news cycle to a "content monster" (loc. 1689) where consumers demand updates continuously. Online publishing means that revision can become present immediately (Carr, 2010, p. 217). Sources appear credible – more trustworthy – as they appear more immediate to us.

The existence of a source in a newsfeed or web search acts as a determinant of its credibility. Google, which processes millions of searches every day, is driven by a circular logic of traffic. Websites are returned in its search algorithm in part by a factor called page rank – which includes how often a site is updated. The recency of an article plays into how highly a page is placed in search results (Wilson, 2017), impacting how soon you see it in a search result. Readers searching for information are more likely to click the first few searches they see, and less likely to search through several pages of results. The movement to online databases has led to scholars citing fewer articles, and "as old issues of printed journals were digitized…. scholars cited more recent articles with increasing frequency" (Evans, as cited in Carr, 2010, p. 217). Online search engines "serve as amplifiers of popularity…establishing and then… reinforcing a consensus about what information is important" (ibid). The more immediate something is – how high up it appears in a search result – makes it more authoritative.

Establishing character treats the presence of information as the same as a depth of information when backing is collapsed into the warrant. The provision of information makes

it more credible for neurological and structural reasons. This also makes certain types of arguments less credible as claims of historical inconsistency are less effective because they are harder to substantiate, and we have shorter digital memories to draw from in countering arguments with the next wall of immediate content. If a common argumentative tactic to challenge a warrant is to indict the connection between the source and the evidence, this ability is made more difficult in digital argument ecologies.

3.2 Pathos

Pathos acts as a motivational warrant, providing "a motive for accepting the claim by associating it with some inner drive, value, desire, emotion or aspiration" (Brockriede and Ehninger, 1960, p. 51). A person or policy or action is accepted or rejected because of whether it is judged as desirable based on such an association. In digital argument ecologies, confirmation motivates acceptance of evidence. Confirmation is the recognition or desire for sameness. Aristotle (1378a) says that one must know the audience's state of mind and then put them in a state of mind which is conducive to the judgment the speaker seeks. In digital argument, this functions to validate a drive as legitimate and/or certify that a person or policy or action is valued the same way as an arguer. What establishes the persuasive character of the evidence is that similarity of motivation confirms its validity to an audience. It functions to collapse the claim into the warrant – the making of a claim is seen as a reason for its acceptability.

As we reason, our brains develop preferred neural pathways, such that particular values get more locked in the more we appeal to those values (Lakoff, 2008). When we engage in political reasoning, we reward ourselves for making judgments that are consistent (Westen, 2008). We literally feel more pleasure and less pain when we reason in ways consistent with already held beliefs. The internet intensifies this process, making it harder to reason in ways that challenge those beliefs. The fragmenting of content presents a system that neurologically delivers rewards from continual engagement with the medium, encouraging repetitive, self reinforcing behavior that lessens motivation and drive to consider new and divergent sources of evidence (Carr, 2010, p. 116-117). When reasoning in digital political environments, we are less adept and interested in considering the emotional situations of others (Carr), which is a key feature of pathos. Instead, we are focused on our own pain or reward for reasoning in ways we already agree with, and sharing content that does the same.

Searching and sorting algorithms compound this effect. Cathy O'Neil (2016) argues search programs are models of information seeking, "opinions embedded in mathematics" (p. 21), importing the biases of their designers. Facebook has conducted research manipulating emotional expression in their algorithms, demonstrating that they can transfer emotional states based on which posts are displayed (p. 182-184). Online sorting creates "filter bubbles" (Pariser, 2011), where you tend to see information that is in line with what you or your friends already believe because of the data algorithms use to display results. This effect isn't uniform (Tucker et al, 2018), but investigations have repeatedly demonstrated that the organization of data on the Web can limit access to diverse viewpoints (Benkler, Faris, Roberts, & Zuckerman, 2017; O'Neil, 2016).

When collapsing the claim into the warrant, certifying motivation treats the confirmation of existing values as proof that the claim is backed up by the evidence. In seeing information that one already believes, the evidence is confirmed as relevant. This affects production and consumption of argument as arguers seek the approval and validation from an audience by establishing sameness. People on social media don't share things unless they expect their network to "like" it. Even putting something up for the purpose of argument, it is likely to be seen by a group of like-minded people who will already agree. If as arguers we

challenge the relevance of evidence, but have less access to diverse information, we don't know why folks believe what they do and we are discouraged from finding out.

3.3 Logos

Logos acts as a substantive warrant, one that "reflects an assumption concerning the way in which things are related in the world about us" (Brockriede and Ehninger, 1960, p. 48). This could be because of a demonstration of the existence of parallel cases, of cause and effect, or other similarity among phenomena. In digital argument ecologies, proliferation substantiates the presence of evidence. Proliferation is the acceleration of claims or data regarding a proposition. For Aristotle (1357a), an argument is persuasive when the chain of reasoning can be shown to be easily drawn from accepted premises. In digital argument, the frequency with which the claim is made shows the reasonableness of a claim. What establishes the persuasive character of the evidence is that it replicates. It collapses the claim into evidence - the repeated making of the claim or citation of data is evidence to support that same claim.

Proliferation problematizes the nature of evidence both because of how we process information on the Web, and the ways that arguments circulate in digital spaces. Another factor in page rank is the number of times a page is linked to, not merely the recency of those pages (Carr, 2010). Search engines and social media sites monetize their platforms through ad revenue, and the more "clicks" they get, the more money they make. When something is retweeted on Twitter or shared on Facebook, it ends up higher in search queries, such that the more a story is shared, the more it appears (O, 2017). This privileging of proliferation is pronounced for fake news sites driven entirely by ad revenue, creating a market incentive to publish the most outlandish claims to encourage virality. With no need to maintain credibility, fake news sites can push bad stories and update them frequently to boost their performance in search algorithms (Allcott & Gentzkow, 2017). Lower credibility sites can "update" their articles to improve their frequency while legacy media has to update slower to do things like fact-checking. Automated social media profiles (or bots) retweet the stories. Algorithms driven by retweets reinforce viral content, making some stories appear both more often than others, structurally privileging information that is viral regardless of content. Once a story is circulated enough it may be covered by legacy media, leading to more searches and more links. Searching for information on a topic, one will be treated to dozens of versions of the same story at the top of search results, amplifying the appearance of reasonableness because of a claim's prevalence.

Processing of arguments online also has a psychological effect on arguers' capacities to evaluate the reasonableness of claims. The constant movement across hyperlinks on the web creates engagement with online content based in interruption (Carr, 2010, p. 91). This makes it harder to engage the chain of reasoning in an argument because it interrupts the mental processes needed for deliberation (p. 119). Moving across digital argument fragments redirects mental resources in a way that can "impede comprehension and retention" (p. 122). As the brain adapts to considering content online, mental skills needed to "traverse thought" are lost, as are brain cells we use in considering "a lengthy narrative or an involved argument, the ones we draw on when we…contemplate an outward phenomenon" (p. 142).

The substantive reasons to accept a claim are demonstrated by proliferating reasons to boost the appearance of logical argument. The web diverts our attention through a proliferation of arguments, amplifying some at the expense of others, and challenging our capacity to assess the relationship among phenomena and draw conclusions. If arguers draw inferences from common values to establish reasoned arguments, but are less able to compare phenomena because of an overwhelming amount of data, it means that arguments hold more validity than they would under careful consideration.

4. ARGUMENT ECOLOGY IN THE 2016 US PRESIDENTIAL ELECTION

The 2016 US presidential election provides a case study to evaluate how immediacy, confirmation, and proliferation shape the argumentative capacity of reasoned decision makers engaged in democratic practice. Klumpp (2009) describes the pragmatic risk of argument ecologies whereby "beliefs, principles, and values help to shape a community's response" when "placed into the service of argumentative exchange" (p. 188). We can examine the ecology in which those arguments take place to see how communities are able to navigate that risk in the service of democratic practice.

Online news and social media had a significant effect on the 2016 election. There was a 15% jump in the percentage of people that used the internet to learn about campaigns, up to 28% (Gottfried et al., 2016) and 42% of 18-35 year olds learned about campaigns from the internet more than any other source. In one survey, 14% said social media was most important source of news in 2016 (Alcott and Gentzkow, 2016 p. 224). The election saw a dramatic uptick in online spending. The 2008 and 2012 campaigns saw all candidates combined spend $98 million on digital advertising (Leffel, 2016). During the 2016 election, Trump spent $150 million on Facebook and Instagram in the last month alone, and was spending $70 million a month on digital operations (Green & Issenberg, 2016). In terms of reader engagement, fake news outperformed real news on Facebook (Silverman, 2016). While cable news still led ad spending (Leffel), it often covered viral stories generated by social media – or covered social media such as Twitter directly. Breitbart and other right-wing media sources were able to significantly drive both social media conversation and broader news coverage of the election (Silverman, 2016). The combination of extensive use of big data and digital advertising, and the influence of online news and social media on mainstream news coverage, created an argument ecology that was substantively influenced by immediacy, confirmation, and proliferation.

4.1 Immediacy

The Trump campaign weaponized social media, using immediacy to create authority. The use of direct appeal through Twitter allowed Trump to avoid media chokepoints initially, make his own news cycle, and force coverage of his campaign, creating constant immediate content. The campaign used dark posts – nonpublic, paid posts shown only to users that a campaign choses (Winston, 2016) - and mountains of data from Cambridge Analytica and internal collection to target advertisements to specific demographics in hopes of suppressing the vote (Green & Issenberg, 2016). Voters experienced immediate ads targeted with surgical precision to them – and only them – based on a detailed social media profiling that indicated they were unquietly susceptible to such appeals. Turnout was down among key Clinton demographics actively targeted by the Trump campaign. The Trump campaign also used this data to determine rally locations by identifying relatively small clusters of voters that were deemed persuadable (Grassegger & Krogerus, 2017), creating immediacy offline as well.

Fake news was circulated by bots using "mirror profiles" to further muddy the argumentative waters. These are fake accounts that mirror typical swing voters – such as Midwestern Republicans – to then retweet or post fake news to amplify it (O'Connor, 2017). Former FBI agent Clint Watts testified that this was an effective strategy to engineer an authoritative warrant because if you're trying to "convince them that the information is true, it's much more simple because you see somebody and they look exactly like you, even down to the pictures" (O'Connor). Fake news encourages arguers to rely on immediacy to determine accuracy because there is a cost to inferring accuracy with the constant updating of information. There are social costs to "infer the true state of the world—for example, by

making it more difficult for voters to infer which…candidate they prefer" (Alcott and Gentzkow, 2017 p. 212). The digital argument ecology in 2016 created immediacy for Trump's appeal, and Clinton's lack of appeal.

4.2 Confirmation

Social media, fake news, and the circulation of stories worked to confirm the relevance and acceptability of evidence for claims about the 2016 election. Social media was ripe for such confirmation. Research consistently confirms that social media and online news engagement is often ideologically segregated when it comes to politics (Allcott & Gentzkow, 2017; Tucker et al., 2018) and highly political users curate their social media feeds, and comment more often (Duggan & Smith, 2016), sustaining an ideological echo chamber by generating more content that can be seen to confirm arguments circulating in the argument ecology. Mirror profiles and dark ads also serve as confirmation when they reaffirm fake news stories or other highly partisan news items. Seeing someone who is like you reinforces the affective reward for sharing content from someone who sees the world the way that you do. Retweeting, sharing, and accessing similar content on the web then provides advocacy groups the data they need to deliver "ideological bombs" based on targeted interests like immigration (O'Neil, 2016, p. 193). Arguers become more motivated to accept claims because they resonate with what they see, and what they see has been shaped by targeted data that emphasizes what they already value, and how they feel about that content.

The media environment from which arguers could draw was saturated with stories driven by emotion and image rather than substance. The need to generate buzz and speak the idiom of social media saw dueling social media burns as the Clinton and Jeb Bush campaigns worked to get people to "like" their posts (Sanders, 2016). Policy barely showed up on Twitter. According to Brandwatch (as cited in Sanders), aside from the debates there were only two policy driven conversations in the top 10 most tweeted days; both had to do with Trump. None of Clinton's biggest days on Twitter focused on policy, her electoral strength. Audience members across the spectrum where likely to share and consume news that confirmed the values they already held, authorizing the claims that came along with them.

4.3 Proliferation

This argument ecology also contributed to the proliferation of some claims over others, boosting their substantive appeal. Echo chambers limited diversity in social media, proliferating a limited set of arguments to drive broader agendas. Between the second and third presidential debates, nearly 33% of pro-Trump tweets and 20% of pro-Clinton tweets were automated accounts (Guilbeault & Woodley, 2016), which are targeted towards profiles deemed similar and persuadable. Hoax and conspiracy theory websites also dominated this media ecology of Trump supporters; while Clinton supporters linked more mainstream outlets, they still were on balance largely exposed to ideologically aligned news sources (Blake, 2017). Many of the most shared stories in conservative media were disinformation stories, and stories in that media sphere draw almost exclusively from like-minded sites. This created not only two distinct media universes producing ideologically aligned data, but the media sphere on the right drove conversation on the left, crowding out more neutral sources (Benkler et al., 2017).

The massive retweeting by automated accounts worked to boost their appearance in search results, proliferating the effect. The asymmetry in pro-Trump fake accounts vs pro-Clinton fake accounts was reflected in the nature of fake stories circulated as well. Alcott and Gentzkow's (2017) created a database that found "115 pro-Trump fake stories that were

shared on Facebook a total of 30 million times"; by comparison, there were only "41 pro-Clinton fake stories shared a total of 7.6 million times" (p. 212). Not only does belief correlate with political ideology (people are 15% more likely to believe partisan headlines), and fake news outperformed engagement of real news on Facebook overall (Silverman, 2016), but a Buzzfeed poll found that fake headlines fooled American adults "about 75% the time" (Silverman & Singer-Vine, 2016). Targeted ads, fake news sites, and automatic retweets caused a self-perpetuating loop where the same types of stories were amplified, made more accessible, and were harder to evaluate – thus appearing to be a part of the common values from which reasonable arguments could be drawn.

5. CONCLUSION

Through the concept of argument ecology, this paper has argued that the function of argumentative moves and rhetorical proofs shift in digital argument ecologies, privileging values of immediacy, confirmation, and proliferation. This is not to suggest that our old concepts are no longer relevant, but that we have to consider the ways that arguments operate differently in digital environments. The digital landscape encourages a superficial engagement with argument, which encourages both a particular type of consumption and a particular type of production in digital argument ecologies. Dan Pfeiffer (2018) argues the next election will be fought on Facebook and suggest we "abandon normal political spin to ensure that our statements, positions…are factually bulletproof" (loc. 2101). I disagree. Facts aren't enough. We need argument. But as argument scholars, we can confront this new task, figure out how to argue within it – and teach our students to do so with us.

Globalizing reasonableness: "The Law of Nations" and the creation of foreign policy in the early U.S. Congress

ABSTRACT: This paper critically evaluates the capacity of reasonableness to bend history toward peace. It compares the work of reasonableness in John Rawls' (2005) ideal theory of the "law of peoples" to the norm's appearance in the actual discourses of the "law of nations" in the early U.S. Congress. From that comparison, the paper draws out the rhetorical dimensions of reasonableness and its limits as an argumentative norm meant to guard against the legitimation of violence.

KEYWORDS: congressional discourse, feminist argumentation, foreign policy, justice, law of nations, Law of Peoples, Rawls, reasonableness, war rhetoric

1. INTRODUCTION

Argumentation theory, as Hicks, Margesson, and Warrenburg (2005) suggest, generally frames reasonableness in epistemic terms. In a parallel career, the concept works as an action-guiding device, a principle which helps distinguish between more and less justifiable judgments in a social milieu. Reasonableness is deployed as the less-ideal and more-real counterpart to rationality, but it nonetheless beacons towards ethical standards. John Rawls (2002), for example, sees reasonableness as an ingredient of a "realistic utopia" that operates within a political, in his case liberal, conception of justice. And as Darrin Hicks (2003) has argued, "the reasonable…is better thought of in purely political, that is non-epistemic, terms as the standard of justification concerned with the legitimacy of the social application of power" (p. 471).

The aspect of reasonableness that concerns this paper is precisely the concept's middle ground position between what can be deemed as ideal and real, normative and grounded argumentation theory. I concur with Hicks, Margesson, and Warrenburg's (2005) concern about the commonly observed discrepancies between reasonableness as a normative ideal and the concept's appearance in actual political discourse. Their point echoes those of political theorists who too worry that "the gap between liberal egalitarian ideal theories and our non-ideal circumstances might be unbridgeable" (Valentini, 2009, p. 333). Yet, to the extent that we can accept that as argumentation scholars we are always on the lookout for ways and means for orienting the world toward a more just and humane reality, we can hardly give up the aspirational energy of normative theory but still remain vigilantly fact-sensitive to actual discourse. What we need, in other words, is a useful and reasonable way out of the "paradox of ideal theory."

Political philosopher Laura Valentini (2009) offers such a pathway. She suggests that "there is nothing wrong with ideal theory *per se*, but rather…there can be good and bad forms of ideal theorizing" (p. 333). Specifically, she argues that "an ideal theory of justice," of

which I would emphasize a notion of reasonableness is an integral part, fails to provide meaningful guidance "if it *entails* an idealized account of the subject to which it is meant to *apply,* and not merely by virtue of it being constructed under idealized assumptions" (pp. 333-334). To put it simply, the idea is that we need not reject normative ideal theory simply for its distance from real-world circumstances, as *some* ideal theories can still be action-guiding. The question, instead, is how we can distinguish between better and worse ideal theories (Valentini, p. 355). Valentini, for one, advocates for a particular kind of "fact-sensitive approach" which pays most attention to "those facts that are *relevant* to the question we are attempting to answer" (p. 355).

For this project exploring how reasonableness organized foreign policy discourse in the early U.S. Congress, Valentini's approach is useful because it negotiates the empirical and evaluative aspects of the question that animates this work, namely whether reasonableness is an appropriately robust argumentative norm to promote justice in an ever globalizing world. In pursuit of this question, I highlight the work that reasonableness does within John Rawls' ideal theory of justice in international relations as expressed in his book *The Law of Peoples.* I then test his model against a historical proxy, the law of nations, a discourse that claimed to pursue ends similar to those of Rawls' project. From that comparison, I filter out and critically evaluate the points of accord and discord between the discursive features of reasonableness and its prescribed role in the normative ideal of global justice. I conclude by discussing why I find that reasonableness cannot live up to its promise unless it accounts for the gendered affective grammar of state conduct.

2. REASONABLENESS IN *THE LAW OF PEOPLES*

In most general terms, Rawls (2005) describes reasonableness as "a virtue of persons engaged in social cooperation among equals" (p. 48). It enables citizens in a liberal democracy to seek justice. Thus reasonableness for Rawls is both a "device of representation" and a "moral power" that captures a desire to cooperate with others in terms that are fair and reciprocal (pp. 48-50). Rawls (2005) posits that reasonableness is "part of a political ideal of democratic citizenship," which describes "what free and equal citizens as reasonable can require of each other with respect to their reasonable comprehensive views" (p. 62). The question that Rawls takes on in *The Law of Peoples* is whether reasonableness can guide the actions of peoples as well as people, given how in international relations the ability of actors to require reciprocity is limited. Rawls (2002) insist on an affirmative answer. He argues that we can reasonably anticipate that the Law of Peoples can indeed bring stability for "the right reasons" (p. 57) and even suggests that the historical record supports the model's plausibility.

For Rawls, a reasonably just Society of Peoples can be modeled after a domestic form of liberal democracy. He argues that such a model is *realistic* to the extent that the parties who are involved can be "understood to be the representatives of peoples" and they are involved in "ongoing cooperative political arrangements and relations between peoples" (p. 17). Rawls (2002) acknowledges that a reasonably just Law of Peoples is *utopian*, because as in the domestic case, it specifies moral and just political arrangements and distinguishes between the reasonable and the rational, the former being characterized as altruistic and the latter egoistic. Furthermore, all the essential elements of justice are conceived within the category of the political and these elements require the rhetorical work of institutions to maintain allegiance to the model. Next, like domestic liberal democratic politics, a reasonably just Society of Peoples does not require religious unity but promotes toleration (p. 17). In sum, "a (reasonable) Law of Peoples must be acceptable to reasonable peoples who are thus

diverse; and it must be fair between them and effective in shaping the larger schemes of their cooperation" (Rawls, 2002, pp. 11-12).

Importantly, extending the liberal position to the Law of Peoples also entails a distinction between the rational and the reasonable with the caution that Rawls models rational representation in the Society of Peoples with some particular conditions. Specifically, 1) people's representatives are reasonably and fairly situated as free and equal; 2) peoples are modeled as rational; 3) representatives are deliberating about the correct subject, in this case the content of the Law of Peoples; 4) deliberation proceeds in terms of the right reasons, as restricted by a veil of ignorance; and 5) selection of principles is based on a people's fundamental interests, in this case by a liberal conception of justice which entails a people's proper self-respect and historical self-awareness of themselves as a people as well as their insistence on receiving proper reciprocal respect and recognition from other peoples (Rawls, 2002, p. 32-35).

The analogy between a domestic liberal constitutional order and a Society of Peoples is not complete, however. For Rawls (2002), peoples may not have a *comprehensive* doctrine of the good, whereas citizens do (the idea of primary good). Second, while citizens conceive and pursue the good through their moral powers, a people's fundamental interests are specified by a political (rhetorical) conception of justice and the principles by which they agree to adhere to the Law of Peoples. Importantly, public reason in a Society of Peoples is to emerge from the ideals and principles of the foreign policy of a reasonably just liberal people (p. 55). A distinction needs to be made, however, between the public reasons of liberal peoples debating their own government and the public reason of the Society of Peoples where free and equal liberal peoples debate their mutual relations as peoples (p. 55). As Rawls (2002) puts it, "public reason is invoked by members of the Society of Peoples and its principles are addressed to peoples as peoples, not in terms of comprehensive doctrines of truth or of right but in terms that can be shared by different peoples" (p. 55).

Such reciprocal recognition is a major feature of reasonableness and it holds both between citizens as citizens and peoples as peoples, but not states. In fact, Rawls (2002) insists that peoples alone bear moral character through their commitment to "the reasonably just, or decent, nature of their regimes" (p. 27). Their prudent pursuits are to be distinguished from the rational interests of so-called reasons of state. The distinction is important because for Rawls peoples serve as a check on state power: "liberal peoples limit a state's right to engage in war to wars of self-defense (thus allowing collective security), and their concern for human rights leads them to limit a state's right of internal sovereignty" (p. 42).   Thus, Rawls speaks to argumentation theory in the way he promotes the Law of Peoples as tying together "political convictions and political (moral) judgments at all levels of generality" (p. 58).

Rawls' proposition, however, has not been met with full embrace. Some theorists, like Fernando R. Tesón (1995) and Allen Buchanan (2000) find his model too forgiving of serious forms of oppression in the name of liberal tolerance. Similarly, Thomas W. Pogge (1994) finds the Law of Peoples insufficiently egalitarian. William Connolly (1999) faults Rawls for developing a seemingly static model in which peoples are necessarily already formed (pp. 10-11). More significant, from my perspective, is Nancy S. Love's contrastive interpretation which finds Rawls engaging in an "increasingly international politics of becoming" (p. 132) which nonetheless presumes some level of orchestration. Her point echoes Buchanan's argument that peoples' representation requires acknowledgment of the historical presence of a "global basic structure" which shapes profoundly the prospects of both individuals and groups (p. 701). That basic structure, I believe, is political language itself.

Hence, as a next step I trace the degree to which the ingredients for Rawls' ideal form of reasonableness operate in actual foreign policy discourse. The Law of Peoples, as a

theoretical and ethical impetus, is certainly not to be found in its ideal form in actual discourse, but the "law of nations" appears to be a good enough proxy as it was a somewhat ubiquitous and aspirational concept which organized political decision making in the U.S. founding period. I turn specifically to exploring how the law of nations appears in the early years of debate in the U.S. Congress for two reasons. First, this was a moment when both the American people and the American state were under construction, so to speak. Thus these discourses capture an emergent process of defining and aligning relations among people as peoples. Second, examining this period is fruitful because it captures also a moment when the idea of representation itself was being reshaped and materialized. Thus these discourses provide ample grounds for assessing the role of reasonableness in drawing Rawls' distinction between the representation of people and peoples and, subsequently, its potential value for advancing a sound theory of justice.

3. REASONABLENESS IN U.S. CONGRESSIONAL DISCOURSE ON THE "LAW OF NATIONS"

In most simple terms, "the law of nations" was an informal regime of international relations that was a precursor to the rise of international law in the twentieth century. The law of nations escapes a simple definition, in part, because it was primarily a trope of political discourse and less so an act of written jurisprudence. Legal theorists commonly trace it to two seventeenth-century works, Suarez's *Tractatus de legibus ac deo legislatore* (1612) and Grotius' *De jure belli et pacis* (1625) and a century later to Emmerich de Vattel's *The Law of Nations* (1758). The law of nations is a migrant concept, the simultaneously visceral and material progeny of an expansive, vernacular, and transnational discourse of justice. As such, it is by no means a pure tradition of jurisprudence nor a formally institutionalized norm of conduct. Instead it would often be invoked as a god term for the sake of legitimizing political actions. For example, in the early 17th century, common law had to be aligned with civil law and the law of nations to make England's claims to territory in North America internationally intelligible and, therefore, legitimate (MacMillan, 2003).

All the while non-binding in a formal sense, the law of nations was persistently cited as a guiding principle in justifying foreign policy decisions. Writing for the *American Political Science Review*, in 1918 E. D. Dickinson pointed to this surreal quality of the law of nations when he argued that

> the unreality of modern law of nations is more a matter of theory than of substance. While jurists of all countries have shown an increasing disposition to derive substantive rules from positive sources, they have never ceased trying to reconcile substantive rules with a theory which, in most of its essential ideas, still rests upon the leading principles of the naturalists of the seventeenth and eighteenth centuries" (pp. 104-305).

In the 18th and early 19th century, in a context of globalizing trade and intensifying nationalisms, the law of nations was often invoked in response to matters of commerce (Sylvester, 1999/2000) and such basic problems of international diplomacy as "the just causes and conduct of war, treatment of prisoners, acquisition of sovereignty and booty through conquest, neutrality and intervention, maritime law, treaties, etc." (Stanlis, 1953, p. 397). In this period, as commercial and political interactions increased, the law of nations gained presence as a political imaginary guided by principles of reasonableness, such as consent, fairness, and reciprocity.

As a globalizing political discourse, the law of nations also guided conceptions of people's representation and their political incorporation. From the start, Article 1, Section 8,

Clause 10 of the U.S. Constitution invoked the law of nations in an assertion of the newly founded state's presence in a globalized terrain of interaction. By giving Congress the duty "To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations," the Constitution did not simply allocate the law of nations to the in-between spaces of political cartography. Rather, it established the consensual duty of the United States to uphold the law of nations as a universal system of reasonable interaction. Arguably, as written, the clause guided the way individuals, as symbolic outposts of national bodies, encountered each other on neutral territory. This interpretation of the clause has been applied to interactions between U.S. citizens and foreign nationals, as well as, arguably, to federal law (Currie, 1997, pp. 47-52). Yet, the power to define the behavior of such individuals and the power to own or disown their actions was also a way for the state to manage the body politic as well as to extend its presence, both materially and morally, beyond its borders (Mills, 2014). As J. Andrew Kent (2007) argues, this constitutional clause gave Congress the power not only to civilly or criminally regulate individuals when their conduct was found to be in violation of customary international law; it also gave Congress the "power to punish states, both foreign and U.S. states, for violations of international law" (p. 844). For Kent, this dual meaning of the clause as a method for regulating both individual and state action was due to the persistent analogy between individuals and states that guided eighteenth-century legal and political theory.

The persistent troping of international relations as interpersonal conduct in the early U.S. congressional debates on foreign policy, I would argue, poses a series of theoretical and practical challenges to the role that Rawls's ascribes to reasonableness in constructing a liberal order. To begin with, it challenges the notion that states and peoples can be analytically separated or held to different standards of reasonableness. For example, in 1794, the House of Representatives posited the protection of citizens and property from "the violence of nations, as well as individuals" (*Annals of Congress*, House, May 15, 1794, p. 162) as a primary rationale for the existence of civil government. In this framing, reasonable conduct was one which protected both the physical and moral integrity of the parties. In Congress's account, "many of the citizens of the United States have suffered great losses, by spoilation made on their commerce, under the authority of Great Britain, in violation of the law of nations, and the rights of neutrality" (*Annals of Congress*, House, May 15, 1794, p. 162). To restore the balance of reasonable relations and fairness, Congress resolved to guarantee an indemnification to all citizens of the United States whose property might have been captured and confiscated by Great Britain. This act of government to compensate its citizens at its own economic detriment and in response to what was perceived as a breach in norms of inter-state conduct sought to assert the law of nations as a moral code, a code in which the state's reproduction of principles of civility asserted the state's right to exist as well as the presence of dignified national character. It invoked reasonableness as reciprocity, the willingness to sacrifice self-interest in the name of social cooperation in a way that applied to states as much as to peoples.

Framed through a logic of interpersonal conduct, notions of reasonable cooperation under the law of nations would be expressed through practices of decorum and gestures of recognition that granted to states, and not only to people(s), the status of rights bearing entities. For instance, on May 16, 1797, President John Adams addressed both houses of Congress to update them on a diplomatic standoff with France, whereas the U.S. ambassador in Paris was forced to leave the French territory. While narrating the circumstances straining the relationship between the two governments, Adams pointed out that "the right of embassy is well known and established by the law and usage of nations," so disrespect toward an official representative of a government amounted to a demonstrative disavowal of a nation's integrity. Referencing back to the law of nations, Adams argued that "[t]he refusal on the part

of France to receive our minister, is then a denial of a right; but the refusal to receive him until we have acceded to their demands, without discussion, and without investigation, is to treat us neither as allies, nor as friends, nor as a sovereign State" (*Annals of Congress*, House, May 16, 1797, p. 7).

Refusing to perform recognizable and reciprocal gestures of hospitality, such as the reception of "hospitality cards," was unreasonable, according to Addams, because it breached the law of nations as a code of reciprocal, gentlemanly, chivalrous conduct. Thus, the conflict of interest between the two states was translated into a moral, and potentially existential, conflict that could only be resolved in dramatic, ethical terms. According to Adams, the incident had "passed on the great theater of the world, in the face of all Europe and America, and with such circumstances of publicity and solemnity that they cannot be disguised, and will not soon be forgotten: they have inflicted a wound in the American breast;" they had injured "the rights, duties, interests, and honor of the nation" (*Annals of Congress*, House, May 16, 1797, p. 8). Referring to states as entities with interests, rights, duties and honor, invoked the law of nations as a code of chivalry in which states acted like men. And like men's, their conduct and motives would be expressed in affective, embodied terms.

Framing the actions of the French government as an "injury" to the United States further merged the body of the state with that of the people in a way that poses a burden on notions of reasonableness to take into account not only the affective discourses motivating state action but also the way affect fuels the very notion of political representation. If, as Adams insisted, what held the nation together were the "laws flowing from reason, and resting on the only solid foundation, the affectations of the People" (*Annals of Congress*, House, May 16, 1797, p. 6), then the conduct of the French government was unreasonable and, therefore, existentially threatening, because it evinced "a disposition to separate the People of the United States from the Government; to persuade them that they have different affections, principles, and interests, from those of their fellow citizens, whom they themselves have chosen to manage their common concerns' and thus to produce divisions fatal to our peace" (*Annals of Congress*, House, May 16, 1797, p. 7). The breach of reasonableness in this occasion was attributed to France's failure to recognize the dual flow of representation between the people and the government of the United States. France's attempt to disassociate the American people from the American state was deemed unreasonable, in other words, for the precise reason Rawls insists that states and peoples need not be conflated.

Rawls' idea that a reasonable people can stand as a check on the reasons of state, especially in matters of war and peace, quickly evaporates in the face of the affective discursive co-construction of people and government. Adams's denouncement of such a proposition was swift: "Such attempts ought to be repelled with a decision which shall convince France, and the world, that we are not a degraded People, humiliated under a colonial spirit and sense of inferiority, fitted to be the miserable instruments of foreign influence; and regardless of national honor, character, and interest" (*Annals of Congress*, House, May 16, 1797, p. 8). He advised Congress to "prescribe such regulations, as will enable our sea-faring citizens to defend themselves against violations of the law of nations" (*Annals of Congress*, House, May 16, 1797, p. 8). Thus, the "ethos of sovereignty," namely, the mandate on states to act "in a dignified manner" so as to ensure their membership in the "family of nations" (Minkkinen, 2007, p. 33), was built on a notion of reasonableness that indeed invoked reciprocity, but in a specific and more narrow sense. It confirmed an obligation to not interfere with the political comportment of other states, but also did little to distinguish between war and diplomacy as forms of expressive state conduct.

Most significantly, then, when a discourse of honor and dignity envelopes conceptions of the right of self-defense, violence appears more reasonable and achieving statehood quickly becomes an existential prerogative for peoples. For example, the document with which the

U.S. Congress declared war on Great Britain on June 1, 1812 framed the issue of sovereignty as a moral issue, at the same time as it equivocated the search for peace with the means of war. It called for

> resistance by force; in which the Americans of the present day will prove to the enemy and to the world, that we have not only inherited that liberty which our fathers gave us, but also the will and power to maintain it. Relying on the patriotism of the nations, and confidently trusting that the Lord of Hosts will go with us to battle in a righteous cause, and crown our efforts with success, your committee recommend an immediate appeal to arms (U.S. House, June 25, 1812, p. 397).

Congress asserted that military actions would impress upon the "impartial world" that the U.S. had no choice but to "avenge the wrongs and vindicate the rights and honor of the nation" (*Annals of Congress,* House, June 25, 1812, p. 391). Republican discourses of virtue and national honor, echoing social norms for manly behavior, constituted the state's sovereignty and were legitimated through references to the law of nations. Thus, in the context of U.S. foreign policy, as Douglas J. Sylvester (1999/2000) has also demonstrated, the law of nations was not invoked only as a shield, as a way to compensate for the relative weakness and vulnerability of the U.S. military after the Revolutionary War (pp. 4-7). Rather, it was used "just as often as a sword to achieve specific policy goals for the young country" (p. 7). Appeals to reason and honor worked in tandem to assert U.S. sovereignty through a willingness to engage other states directly. Notably, the hallmarks of reasonableness, namely the principles of consent, fairness, and reciprocity, appeared to only fuel the development of affective and structural conditions for aggressive state action instead of guard against it.

4. CONCLUSION

This brief sketch of actual foreign policy discourse certainly confirms Darrin Hicks's (2003) observation that the concept of reasonableness is inherently oriented to the question of how power can be exercised legitimately (p. 471). To the degree that the law of nations can be used as a historical proxy to the Law of Peoples, however, some further qualifications can be advanced. One is that the weight of history bears down on the notion that states and peoples can be sufficiently disarticulated to open a viable opportunity for constructing an alternative moral order. Rawls might be appropriately cautious in asserting that norms of reasonableness can only be developed through sufficient buy-into the common political order. To go back to Valentini's point, however, his model becomes less plausible as long as it remains inattentive to the discursive constitution of states as well as peoples. Rawls (2002) appears to believe that states fail to maintain peace because they are guided by rationality, by what he calls "their prudent or rational pursuit of interests, the so-called reasons of state" (p. 27). In contrast, peoples would be willing "to limit their basic interests by the reasonable" (p. 29). A triumph of reasonableness over rationality then is offered as a solution for preserving peace. For Rawls, "[i]f *rationality* excludes the *reasonable* (that is, if a state is moved by the aims it has and ignores the criterion of reciprocity in dealing with other societies)—then the difference between states and peoples is enormous" (p. 28). State interests, I would point out, however, are hardly pre-discursive and thus they too can be guided by principles of reasonableness.

In the end, what prevents reasonableness from operating as a normative check on the excessive deployment of state power appears to be its very grounding in social discourse. Unfortunately, even a brief sampling of this rhetoric reveals a basic structure dominated by the grammar of patriarchy, a migrant political language that spills over and pushes across state borders. The persistent anthropomorphism and androcentrism of foreign policy discourse is well described in many feminist critiques of international relations (Hooper, 2001; Blanchard,

2003). Yet I don't believe that it needs to be taken for granted. As Rawls (2002) himself suggests, "we can to a greater or lesser extent change political and social institutions and much else" (p. 12). For reasonableness to be a part of such transformation, however, I would argue that argumentation studies needs to better account for the affective impeti of social behavior and the way gendered affect embeds itself in political notions of reasonableness. We need to do so with particular sensitivity to the way the relational, affective economies and intensities of gender allow reasonableness to traverse the scales of political behavior. Last but not least, feminist argumentation studies would be wise to re-examine and nuance our own investment in the principles of consent, fairness and reciprocity or else we too will fail to chart a plausible path toward justice and peace.

ABSTRACT: The purpose of this paper is to examine Ukrainian predispositions and understandings regarding interpersonal arguing. To our knowledge, no prior investigations have dealt with these matters in a standardized way in this part of the world. We compare Ukrainian and US views and report the Ukrainian data in such a way that other comparisons can easily be made to the many other investigations in this recent line of work.

KEYWORDS: argument frames, argumentativeness, culture, interpersonal arguing, taking conflict personally, Ukraine, verbal aggressiveness

1. INTRODUCTION

1.1 General orientation

The purpose of this paper is to examine Ukrainian predispositions and understandings regarding interpersonal arguing. To our knowledge, no prior investigations have dealt with these matters in a standardized way in this part of the world. We will compare Ukrainian and US views and will report the Ukrainian data in such a way that other comparisons can easily be made to the many other investigations in this recent line of work. The Ukraine is a nation of special interest for several reasons: its relatively recent re-emergence after nearly a century of censorship and speech restrictions implicit in Soviet rule; its independent importance in regional and global economics, politics, and cultural affairs; and its status here as the first investigation of any of the former Soviet nations' views on interpersonal arguing.

1.2 History, government, and importance of Ukraine

Ukraine is a country in Eastern Europe. It is the largest country among the European countries and the 46th largest country in the world. Its area is 603,623 km². Ukraine has a very large and multicultural society. In 2017 its population was about 42.5 million according to the official government statistics. 77.8% are Ukrainians "by ethnicity", and 17.3% are Russians. Also, the country is home to people from other nations.

Ukraine is a unitary republic under a semi-presidential system with separate powers: legislative, executive and judicial branches. According to the constitution, its state language is Ukrainian. Most native Ukrainian speakers are bilingual. The second language depends on the region (Russian, Hungarian, Romanian, Polish, Bulgarian, Crimean Tatar, Gagauz, and others).

The religious life of the country is quite diversified. Now, 70% of people living in Ukraine call themselves religious. The dominant religion is Christianity. Orthodox Christianity is the most popular religion among Ukrainians – 76% of believers keep to this confession.

In 2017, Ukraine had a nominal GDP of $107 billion, ranking 62nd in the world. It imports most of its energy supplies. Its most important trade partner is the European Union.

In 1991 Ukraine gained its independence from the USSR. However, the imperial and Soviet past is still alive. Today Russia continues to impose imperial views on Ukraine, using different instruments for this purpose. The main intention is to include Ukraine in a common Russia-led Orthodox East Slavic world and to falsify historical facts that witness to Ukraine's closeness to Europe. In order to get rid of the imperial and Soviet heritage and become a genuinely independent country, there were two revolutions in the modern history of Ukraine: the Orange Revolution (2004) and the Revolution of Dignity (2013-2014).

In the current context, the Ukrainian identity issue is crucial for the future development of Ukraine as an independent country. In this regard, any research intended to address this issue is highly important. Among them is the present project. Its results may have a significant impact on the understanding of key features of the Ukrainian identity.

1.3 Generational Considerations

According to the generational theory (Howe & Strauss, 2000), each generation has its own values. This theory labels and classifies various generations that participated in our survey. The earliest was the Baby Boomers Generation, Ukrainians, who were born mostly following World War II (from the early-to-mid 1940s and ending from 1960 to 1964). These were followed chronologically by Generation X - respondents, whose birth years were from the early-to-mid 1960s to the early 1980s. The third was Generation Y (Millennials): Ukrainians born in late 80's until the early 90's. Finally, was Generation Z, born between the early 90s and mid-2000s.

While these generation categories are quite typical for the Western world, they acquire additional meanings for the Ukrainian respondents, who took part in the survey.

For example, Ukrainian Generation X involves people who were born in the Soviet Union. When Ukraine became an independent state in early 90's they were about 30 years old. Generations Y and Z represent people of the same age as Ukrainian independence and those who are a decade younger- those who participated or witnessed two revolutions in the modern history of Ukraine (the Orange Revolution and the Revolution of Dignity) and those who were children during both events.

Our sample's average age was about 24 years. To sum up the age of the survey's respondents it should be stressed that despite the fact that it mainly focuses on young people aged 17 to 25 (Generation Z), it also provides a snapshot for several generations.

Hence the most respondents belonged to Generations Z and Generation Y. Joining them we got 78% of respondents.

This fact witnesses that Ukrainian youth took part most actively in the survey. 69% of respondents represented Ukrainian generation Z. In this regard, it should be noted that in this age range, as of January 1st, 2017, there were almost 8 million people, which makes up virtually a fifth of the entire population of Ukraine.

1.4 Vocabulary for argument

We experienced some challenges in translating the US instruments into Ukrainian and Russian. We paid particular attention to the key terms of argumentation theory: *argue argument*, *debate*, *discussion*, *conflict*, *disagreement*, *arguing*, and others. These terms often do not have a precise unambiguous meaning in English, where all the survey instruments originated. In this respect, we had difficulties in translating English terms into Ukrainian. In addition, some of the key survey terms are not commonly used in everyday Ukrainian. They usually occur in scientific discourse.

First, the term *argumentation* (аргументація/Ukr, аргументация/Ru) posed some problems. Other terms are more often used in Ukraine, namely *justification* (*обґрунтування*/Ukr, *обоснование*/Ru), and *reasoning* (*міркування*/Ukr, *рассуждение*/Ru). In this sense, *argumentation* is not a form of interaction, in which arguers resolve a conflict of opinions using real arguments. In Ukraine, we often encounter the definition of *argumentation* as reasoning, aimed at justification of arguer's point of view.

Second, let's consider the term *argument*. There is some genuine ambiguity about what *argument* means in English. It can mean both an exchange of reasons and a nasty verbal fight. Ukrainians often understand this term as a premise, or reason (*аргумент*/Ukr/Ru). Sometimes it can be translated from English as *резон*/Ukr/Ru.

Here the *argument* (*premise*) is a component of argumentation (*reasoning*). Thus, the argument for Ukrainians is a product, but not a process.

Furthermore, the translation of the phrase *real argument* from English into Ukrainian and Russian was a great issue. In order to provide an adequate translation, we used the Ukrainian expression *аргументативне міркування* (*аргументативное рассуждение*/Ru) (Хоменко, 2016).

Thirdly, the term *arguing* can have positive and negative connotations in Ukrainian and Russian. Here it should be stressed that the negative understanding is slightly more prevalent among Ukrainians. They interpret *arguing* in a face-to-face situation as speaking angrily to someone, having a heated discussion with somebody. The person not telling somebody that he disagrees with something. He expresses his anger in a loud voice. In this sense, the terms *arguing* (*суперечка*/ Ukr; *спор*/Ru) and quarrel (*сварка*/Ukr; *ссора, перепалка*/Ru) can be used as synonymous. For example, such expression as *базарна сварка/ базарная перепалка* are idioms in Ukrainian and Russian. They mean marketplace quarrel.

In this context, Ukrainians prefer to use soft power. They usually use instead of *arguing* such terms as *conversation* (*бесіда, розмова*/Ukr; *беседа, разговор*/Ru), *discussion* (*дискусія*/Ukr; *дискуссия*/Ru), *debate* (*дебати*/Ukr; *дебаты*/Ru), and *dispute* (*диспут*/Ukr/Ru). For example, these expressions are widely used in Ukraine: *політичні дебати/*Ukr; *политические дебаты*/Ru (*political debate*), and *наукова дискусія*/Ukr; *научная дискуссия/*Ru (*scientific discussion*).

Also, the term *face-to-face* can be translated as the Ukrainian idiom *віч-на-віч* (*eyes-to-eyes*) and the Russian one *тет-а-тет* (*twosome*).

Another interesting fact is if you would like to translate *arguing* into Ukrainian you should choose between two words – *суперечка* or *спор*. The first can be used for *face-to-face arguing*, and the second usually describes the legal sense of this term. This difference does not occur in Russian, where one uses the word *спор*.

In general, Ukrainians try to avoid expressions with negative, aggressive connotation in face-to-face arguing. They prefer friendly vocabulary aimed at cooperation and mutual understanding and not at the verbal fight. This can be explained by the peaceful and open-minded character of Ukrainian people.

1.5 Language choice

The language issue has never been easy in Ukraine, and it became even sharper after the country gained independence. Ukraine is a multilingual state where various languages are spoken. In 2003, Ukraine ratified the European Charter for Regional or Minority Languages and thus committed itself to protecting regional languages in the country. However, the most wide-spread languages are Ukrainian and Russian.

Keeping in mind the above, we offered our respondents a choice of language in which to participate. We prepared versions of the instrumentation in Ukrainian and Russian. We felt that respondents' choice might point to their preferred national identity, and allow us an indirect way to see if these identities were connected to understandings of interpersonal argumentation.

2. RESEARCH OBJECTIVES

This project is the first comprehensive attempt to understand and assess the sentiments of Ukrainians towards "face-to-face" arguing. Its main objective was to collect and analyze data summarizing fundamental orientations to arguing among Ukrainians.

It should be stressed that besides elucidating the argumentation predispositions in Ukraine this study advances the general project of comparing argumentation in various countries across the globe. This Ukrainian survey was a part of the survey series conducted in the United States and other countries (Chile, Mexico, Portugal, France, Netherlands, Turkey, United Arab Emirates, India, Malaysia, China, and South Korea). This allows us to compare and generalize the data collected in different countries and regions.

Due to the lack of prior data about Ukrainian views of arguing, we choose to pose research questions. Several of these compare Ukraine to the US. This is because the theories and instrumentation originated in the US, and we need to get some general indication of the degree to which the better developed US theories of interpersonal arguing are relevant to Ukraine. Other research questions are internal to Ukraine. Here are our explicit research questions:

RQ1: How do Ukrainian and US respondents compare in their average responses concerning arguing motivations, understandings, and reactions?

RQ2: Do Ukrainian men and women differ in their arguing motivations, understandings, and reactions?

RQ3: Do Ukrainian respondents who chose the Ukrainian language version of the survey differ in their arguing motivations, understandings, and reactions, compared to those who chose the Russian language version?

RQ4: What are the internal associations among arguing motivations, understandings, and reactions for the Ukrainian sample?

3. METHOD

3.1 Ukrainian sample

The empirical part of the project included a nationwide survey, which was conducted between September 2017 and April 2018.

The sample's average age was 23.9 years (SD = 11.1). Most (75%) were female. A similar proportion (77%) was enrolled in university at the time they completed the survey.

Presented a choice of language for the survey, 75% ($n = 325$) chose Ukrainian and 25% ($n = 108$) chose Russian.

Ukraine has the following regional composition: West, East, Centre, North, and South regions. The survey was conducted in all regions and the city of Kyiv, the capital of Ukraine. We excluded the population of the Autonomous Republic of Crimea and uncontrolled territories of Donetsk and Luhansk regions.

The poll was carried out via an online survey that was hosted on Survey-Monkey.com. Most respondents who participated in the survey were undergraduates from different Ukrainian universities. In addition, the members of their families, friends, and neighborhood were also poll respondents.

Because the average age of the resulting sample was about 24 years old, we chose a sample of US undergraduates for comparison purposes. These data have already been presented in Hample and Irions (2015), and details about that sample are available in the original report.

3.2 Languages

Due to the bilingualism of the majority of the Ukrainian population, two versions of the survey (Ukrainian and Russian) were composed. The participants had a free choice as to which to complete. Although this was done for the convenience of respondents, we felt that their choice of language might indicate something about their feelings of national identity. 75% chose the Ukrainian version and only 25 % preferred the Russian one. This indicates that Ukrainian was the preferred language for the majority of people, who participated in the survey.

3.3 Instruments

The survey was based on the methodology survey used in the overall global project summarized in Hample (2018). The English language versions of the main instruments can be found either Hample (2018), Infante and Rancer (1982), or Infante and Wigley (1986). Table 1 reports descriptive statistics on all the measurements. It indicates that all the measures achieved good internal reliabilities, as measured with Cronbach's alpha.

The first set of questions in the survey was devoted to ordinary demographics. Responses represented the respondents by gender, age, a region of residence, and student/employment status.

The second set of questions dealt with argument motivations and concerned argumentativeness (Infante & Rancer, 1982) and verbal aggressiveness (Infante & Wigley, 1986).

The third set of questions assessed the degree to which people take conflicts personally (TCP; the scales are in Hample, 2018).

The fourth set of questions was devoted to argument frames, a battery of instrument intended to capture people's understandings of the project of arguing face-to-face (current items are in Hample, 2018).

4. RESULTS

Our first research question was: How do Ukrainian and US respondents compare their average responses to items concerning arguing motivations, understandings, and reactions? Table 1 displays the pertinent comparisons.

Table 1: Mean Differences Between Ukrainian and US Respondents

	Ukrainian Data					US Undergraduates			
	# Items	N	alpha	mean	*SD*	mean	*SD*	t	r^2
Arg Avoid	10	433	.84	5.35	1.77	5.77	1.40	3.92[3]	.02

Utility	8	376	.78	5.17	1.64	5.32	1.26	1.43	
Identity	8	376	.76	6.26	1.51	6.57	1.40	3.05[2]	.01
Dominance	4	376	.79	4.68	2.00	4.44	1.86	-1.82	
Play	4	376	.71	4.73	2.10	4.44	2.16	-1.96[1]	.00
Blurting	10	376	.80	5.17	1.58	5.11	1.58	-0.60	
Cooperate	8	376	.78	7.28	1.57	6.83	1.50	-4.21[3]	.02
Civility	6	376	.77	3.83	1.90	6.26	1.16	21.73[3]	.38
ProfContrast	7	367	.88	5.56	2.25	6.29	1.86	4.99[3]	.03
Direct	7	337	.75	5.86	1.75	5.82	1.70	-0.39	
Persecution	6	337	.74	4.76	1.76	4.59	1.58	-1.40	
Stress	5	337	.55	5.26	1.66	5.70	1.61	3.79[3]	.02
Pos Relatnl	7	337	.78	5.13	1.70	6.02	1.45	7.75[3]	.07
Neg Relatnl	5	337	.79	6.75	1.86	6.06	1.40	-5.69[3]	.04
Pos Valence	7	337	.80	3.91	1.82	4.12	1.76	1.61	

Note. All items used a 1-10 scale. For the civility measure, all the negatively worded items were omitted to attain reasonable reliability. The US undergraduate data is from Hample & Irions (2015). *t*-tests were adjusted for unequal group variance when necessary.

[1] $p < .05$ [2] $p < .01$ [3] $p < .001$

Of the 18 possible comparisons, statistically significant differences between the Ukrainian and US samples appeared for 11 of them. Several of these had small effects sizes, as indexed by the r^2 values. One difference, civility, had an enormous effect size, and several others were noticeable.

Results indicated that Ukrainians were more inclined than Americans to engage in constructive arguing, with significant differences for both avoidance and approach. Ukrainians were also more prosocial than US respondents, but no significant difference appeared for antisocial inclinations. All these effect sizes were small, but they constitute a pattern in which Ukrainians were more inclined to argue politely and constructively.

The argument frames results showed that Ukrainians were less inclined to argue in order to display identity, marginally more likely to argue playfully, were more cooperative but far less civil, and less inclined to understand arguments as professionals do. The civility effect was especially large. It is consistent with the Ukrainians' low score on professional contrast, but inconsistent with the motivation results reported earlier.

The final section of Table 1 concerns Taking Conflict Personally. There, we see that Ukrainians were less stressed than US respondents, had lower estimates that conflict could improve relationships, and were more committed to the idea that disagreements could damage personal or workplace relationships. These last two findings are consistent with the earlier notice that Ukrainians found arguing to be far less civil than US undergraduates did.

Our answer to the first research question is that Ukrainians and US respondents did, in fact, differ in their mean responses to the instruments used here. The standout result was that Ukrainians felt that arguing was a far less civil activity than was the case in the US. This civility finding was paralleled by Ukrainians' beliefs that conflict tends to damage relationships.

Our second research question was: Do Ukrainian men and women differ in their arguing motivations, understandings, and reactions? These results are in Table 2.

Table 2: Mean Differences Between Ukrainian Men and Women and Between Ukrainian and Russian Language Choosers

	M	F	t	r^2	Ukr	Rus	t	r^2
Argument Avoid	4.78	5.54	-3.86[3]	.03	5.42	5.13	1.51

Stress	4.48	5.49	-5.51[3]	.07	5.16	5.61	-2.02[1] .01	
Pos Relational Effects	5.64	4.97	3.14[2]	.03	5.07	5.38	-1.34	
Neg Relational Effects	6.25	6.91	-2.79[2]	.02	6.76	6.68	0.33	
Pos Valence	4.75	3.65	4.88[3]	.07	3.89	3.98	-0.36	

Note. t-tests were corrected for unequal group variance when necessary.

[1] $p < .05$ [2] $p < .01$ [3] $p < .001$

The first four columns of statistics show that Ukrainian men and women were consistently different on our measures. Of the 18 comparisons, 14 were significant. This is a high degree of sex-typing (Hample, 2018), comparable only to the US and Chile, and far higher than found in Portugal, India, Malaysia, the United Arab Emirates, and France, where male-female differences were far rarer.

The pattern of male-female differences in Ukraine generally corresponded to the usual pattern in which men are more aggressive and women are more passive, nurturant, and sensitive. In particular, women were more avoidant and prosocial but blurted more readily. Women were higher in direct personalization, stress reactions, and pessimism about negative relational effects. Men, on the other hand, were more inclined to approach constructive arguing and engage in *ad hominem* attacks, saw more opportunity to use arguing for utility, identity display, and play had higher professional contrast scores, had more optimism about positive relational consequences, and had more positive valence for conflict.

Our answer to the second research question is that Ukrainian men and women were quite distinct in their orientations to the interpersonal argument. Generally, men were more aggressive and women more passive and easily hurt. However, two results – blurting and professional contrast – do not quite conform to the general pattern.

The third research question was, Do Ukrainian respondents who chose the Ukrainian language version of the survey differ in their arguing motivations, understandings, and reactions, compared to those who chose the Russian language version? These results are also in Table 2, in the final four columns.

The results are easily summarized: language choice made essentially no difference at all in people's orientation to arguing. Only two measures displayed significant differences, and both of those effect sizes were minor. Our conclusion on this point is that the surveys' language made no difference. To the degree that language preference implies something about national identity, we found no evidence that national identity carried any special predispositions about face-to-face arguing.

The final research question was: what are the internal associations among arguing motivations, understandings, and reactions for the Ukrainian sample? Pertinent results are in Tables 3, 4, and 5. These report correlations among the motivation items, among the argument frames, and among the TCP scales. Cross-instrument correlations are available from the authors.

Table 3 reports how the motivation measures correlated with one another. Of special interest are the correlations between argument approach and avoid, and between antisocial and prosocial motivations. These two correlations were clearly negative (-.48 and -.32, respectively). This matches US theory and results. Other nations – notably the United Arab Emirates, India, and Malaysia – do not return negative correlations for these measures (Hample, 2018). In addition, the two aggressive measures (approach and antisocial) had a positive correlation, as did the two avoidant measures (avoid and prosocial). These results also conform to US findings and theory.

Table 3: Correlations among Argument Motivation Measures (Ukraine)

	Arg Avoid	Arg Approach	VA Prosocial
Arg Approach	-.48***		
VA Prosocial	.29***	.04	
VA Antisocial	-.01	.26***	-.32***

*** $p < .001$

Table 4 indicates the correlations among the argument frames measures. The first five (utility, identity, dominance, play, and blurting) represent self-centered impulses and tend to correlate positively in the US. They did so in Ukraine as well. The more advanced measures (cooperation, civility, and professional contrast) also tend to correlate positively in the US, and they generally also did in Ukraine.

Table 4: Correlations among Argument Frames Measures (Ukraine)

	Utility	Ident	Domain	Play	Blurt	Coop	Civility
Identity	.52***						
Dominance	.42***	.35***					
Play	.41***	.50***	.38***				
Blurting	.21***	.17***	.22***	.12*			
Cooperation	-.01	.18***	-.26***	-.06	.00		
Civility	-.16**	-.25***	-.25***	-.07	-.25***	-.20***	
Prof Contrast	.18***	.26***	-.03	.23***	.00	.23***	.05

* $p < .05$ ** $p < .01$ *** $p < .001$

Finally, Table 5 displays the associations among the TCP measures. As in the US and elsewhere in the world, the scales indicating personalization (direct personalization, persecution, stress, and negative relational effects) correlated positively with one another. The two scales indicating an absence of personalization (positive relational effects and positive valence) correlated positively, as they generally do. In addition, the personalization measures tended to correlate negatively with the positive scales, as is common.

Table 5: Correlations among Taking Conflict Personally Measures (Ukraine)

	Direct	Persec	Stress	PosRel	NegRel
Persecution	.53***				
Stress	.57***	.47***			
Pos Relatnl	-.14**	-.06	-.21***		
Neg Relatnl	.42***	.46***	.36***	-.22***	
Pos Valence	-.41***	-.21***	-.38***	.38***	-.50***

*p < .05   ** p < .01   *** p < .001

So our answer to the fourth question is that the Ukrainian results were generally quite conformable to US results. Motivations had US patterns, as did the argument frames and the TCP measures.

5. DISCUSSION

It is difficult to understand the results of the project without a consideration of the Ukrainian mentality (values, traditions, stereotypes etc). Certainly, it is impossible to give a precise answer to the question: What is the Ukrainian argumentation mentality? However, we can figure out some key features of Ukrainian lifestyle.

Firstly, individualism appears as one of the key traits of Ukrainians, perfectly described by the famous Ukrainian proverb "*Моя хата с краю, нічого не знаю*" ("*My house is located at the end of the village, so I do not know anything*"). The Ukrainian protects himself and his individual world and tries to live within that word. Sometimes the view occurs that Ukrainians are indifferent to other people's problems, except their own.

Secondly, the family plays a great role in the personal world of Ukrainians. Ukrainian word equivalent to *family* is *родина* (*rodyna*). It means belonging to the genus (*рід*/Ukr). Family memory is an uniquely Ukrainian phenomenon. Typically family members are familiar with their genealogy up to the fifth or even seventh generation. Ukrainian children are brought up to respect their ancestors and their genus.

Other important traits of Ukrainians are emotionality and sensitivity. Ukrainians focus on the inner emotional-sensual world, where the Heart, as a rule, dominates over the Head. This feature is called in Ukrainian *кордоцентрізм* (*cordocentrism*).

Thus, the crucial features of Ukrainian mentality are individualism, the great importance of family, and the emotional perspective on life. Taken together they can explain

the orientation of Ukrainians to creative activity in everyday life to strengthen their own well-being. "*I would like to improve my well-being. I wish that my family is happy and my children and parents live comfortably. I try to have good relations with the environment. I respect others. However, I do not interfere in other people's lives and I wish that the others do not disturb me and my family.*" This is the usual standpoint of the ordinary Ukrainian. Hence, on the one hand, there is intolerance to any aggression, violence and destructive activity. On the other hand, that Ukrainians are ready to defend their main values but only in the case of huge personal and national hazard.

Taking into account the ideas mentioned above, it becomes possible to explain some results of our project.

(RQ1). Ukrainians do not like to be involved in face-to-face arguing, because it is considered to be a hostile incursion into their personal world or a conflict and aggressive activity that tends to destroy their life and aggravate the interpersonal relations. If they are obliged to participate in such form of communication they mainly will not behave aggressively, offend people, incite hatred and provoke violence. The majority of Ukrainians are predominantly tolerant, peaceful, friendly, and open to others. In most cases, they try to be polite, to express respect for others and to argue constructively.

On another side, understanding of face-to-face arguing solely as a destructive conflict tending to damage relationships may be considered as the reason why Ukrainians are less inclined to understand arguments as professionals do.

(RQ2). Another interesting result of our project is the difference between Ukrainian men and women in their arguing motivations, understandings, and reactions

Despite the fact that women always play a great role in a family and in society there is still no gender equality in Ukraine. We can see the manifestations of inequality, largely caused by the impact of old social stereotypes and patriarchal norms that establish different public expectations with regard to gender-based social roles, and behavior patterns accepted by the society.

The family is the main origin of the understanding of these matters for Ukrainians. The traditional gender roles are still strictly defined in modern Ukrainian society. Men hold a role of the family breadwinner and women's role is mostly connected with caregiving and responsibilities related to household work.

Besides, the problem of the gender-based violence is quite large in Ukraine. Unfortunately, Ukrainian men are quite tolerant to aggression and domestic violence. "Almost one-third of men recognized that they used to perpetrate emotional violence in their partnerships over the life course, one in seven men used economic violence, while 13% of men had experience of physical violence against their partners. A few percents of the respondents reported that they forced their partners or other women to have sex with them despite the women's unwillingness. The prevalent manifestations of men's controlling behaviors are also closely linked to their wish to dominate in partnerships." (Masculinity today: men's attitudes to gender stereotypes and violence against women, 2018, p. 7).

Thus, gender inequality, fixed in social stereotypes of Ukrainian society, appears as the reason for different men-women behavioral patterns in face-to-face arguing (men are more aggressive and women are more passive, nurturant, and sensitive).

(RQ3). One more interesting result of the research concerns the language issue. It should be pointed out that in the Soviet times the Ukrainian language was the local language of the Ukrainian Soviet Socialist Republic. But actually, it was banned. The Russian language dominated in education and social communication. Only after the USSR collapse in 1991had the Ukrainian language received the status of the official language of independent Ukraine.

It is interesting fact that a lot of Ukrainians used *суржик* (*surzhyk*) in the Soviet times. It was a mix of Russian and Ukrainian. In modern Ukraine, *surzhyk* is also widely spread.

Taking into account that the majority of Ukrainians are bilingual and they can speak Ukrainian and Russian fluently, we found no evidence that survey language choice had a significant impact on respondents' answers.

6. CONCLUSION

This paper presents the results of a cross-cultural research project that is focused on argumentation.

Its empirical part included surveys conducted in Ukraine and the USA. We collected data summarizing understandings of argumentation and fundamental orientations to arguing in these countries and then compared them, using such research questions:

RQ1: How do Ukrainian and US respondents compare in their average responses concerning arguing motivations, understandings, and reactions?

RQ2: Do Ukrainian men and women differ in their arguing motivations, understandings, and reactions?

RQ3: Do Ukrainian respondents who chose the Ukrainian language version of the survey differ in their arguing motivations, understandings, and reactions, compared to those who chose the Russian language version?

RQ4: What are the internal associations among arguing motivations, understandings, and reactions for the Ukrainian sample?

To sum up, we conclude that with few exceptions the Ukrainian results were generally quite conformable to US results.

Also, our research concerning Ukrainian respondent's views on arguing sheds light on issues of national identity, which play a crucial role for modern Ukraine.

Auditory arguments – importance of sound in an argumentative discourse

GABRIJELA KIŠIČEK

Faculty of Humanities and Social Sciences
University of Zagreb
Croatia
gkisicek@ffzg.hr

ABSTRACT: Recent research in the field of multimodal argumentation argue that there are more than just verbal modes which can support conclusion in argumentative discourse. Following the work on multimodal argumentation this paper aims to explore the methods for analyzing and assessing auditory arguments in correlation to traditional argumentation schemes and set of critical questions which accompany them. It will provide examples for arguments from sign, causal arguments which will then be reconstructed into the premise conclusion form.

KEYWORDS: auditory argument, argumentation scheme, argument from sign, argument from consequences, prosodic features, sound

1. INTRODUCTION

Recent research in the field of multimodal argumentation presented many examples which show that sometimes sound can be of the great importance in an argumentative discourse.

Sound i.e. auditory mode is only one of various nonverbal modes such as visuals, tastes, movement (gesture and facial expression) which can be included in a multimodal argumentative discourse and which may have an essential role providing support for the conclusion.

So, what is auditory argument and what does it mean? Groarke (2018, p. 1) defines it "as an attempt to provide rational evidence for a conclusion using non-verbal sounds instead of or (more frequently) in addition to words." It seems that the most obvious "sound" which appears in argumentative discourse is the sound of human voice i.e. prosodic features which include voice quality, tempo, intonation, pitch and pitch range, volume etc. Several research in recent years tried to determine the role of prosody in argumentation (Kišiček, 2014; Kišiček, 2016; Groarke & Kišiček, 2016; Van den Hoven & Kišiček, 2017).

Spoken language is the source of different prosodic features which have different meanings and have been frequently researched by nonverbal communication scientist. Prosodic features are the source for recognizing the speaker's emotions and personality traits. Recent reviews have shown that vocal expressions of specific emotions (e.g., anger, fear, happiness, sadness) are generally recognized with above-chance-accuracy, also cross-culturally, and to be associated with relatively distinct acoustic characteristics (Juslin & Laukka 2003; Laukka, 2008). Besides a correlation between prosody and emotions (Davitz, 1964; Scheerer, 1972; Vroomen, Collier & Mozziconacci, 1993; Neuman & Strack, 2000), prosodic features are connected to the perception of a speaker's personality, credibility, his *ethos* (Kramer, 1964; Kramer, 1978; Berry 1991, 1992; Kimble & Seidel, 1991; Zuckerman & Miyake, 1993; Hickson et al. 2004; Zuckerman & Sinicropi, 2011). Past research has particularly confirmed that, among other elements of nonverbal behavior, prosodic features are associated with the persuasiveness of the speaker and the audience's change of attitudes (Burgoon, Birk & Pfau, 1990; Knapp et al, 2013). All of these findings are frequently used in the public sphere e.g.

political discourse, promotion, radio or television commercials, judicial discourse, business discourse etc. with different communicative, rhetorical or argumentative role.

Kišiček (2014, 2016) analyses television commercials and the role of prosodic features in the persuasion process. Sometimes prosody contributes to the strength of an argument but in some cases prosody is essential. This means that altering or omitting the prosodic features changes the argument reconstruction. Van den Hoven and Kišiček (2017) analysed the role of prosody in judicial discourse on the example of the clemency video in which a death role prisoner argues that he should not be executed. Among many different modes of argument (verbal part being a dominant), prosody also contributed to the strength of his argument. Further on, Groarke and Kišiček (2016) analysed a debate broadcasted on Israeli television when commentators defended or criticized the Israel incursion. A key turning point in the debate was a phone call between a television reporter and a Palestinian doctor who lost his daughters during the Israeli attack. Analysis showed how prosody of the phone call influenced the success of an argument which then reached the audience and in the end contributed to the temporary cease-fire in the Israeli Palestinian conflict.

The overall conclusion of these findings is that prosodic features clearly have an importance for the assessment of a speaker's personality, persuasiveness and emotional state but can also, in some cases have an important role in argument reconstruction providing essential support for the conclusion. Therefor they should be taken into account in a serious argumentative analyses of a multi-modal discourse.

This paper is a step further in trying to understand their role, to identify cases when they are important and to provide tools for evaluating them. It should also be mentioned that specific account of the use of sounds in argument has been developed by Eckstein (2017a, 2017b), who has used the principles of strategic manoeuvring to explain the use of sounds in radio presentations. Also Pietarinen (2010) and Champagne (2015) developed a formal approach to sound determining their logical relations.

The most recent Groarke`s work (2018) aimed to analyse and understand ways of using and evaluating auditory arguments as a significant part of everyday argumentation. As Groarke (p. 18) explains:

> The proposed account of auditory argument can significantly expand the scope of informal logic and the range of arguments it is able to encompass. In dealing with complex arguments, it allows us to deal with the auditory components of multimodal arguments which support conclusions with many kinds of evidence: verbal, auditory, visual, and so on. The most important reason for including auditory arguments in the corpus we consider is because this is a way to subject them to critical assessment.

One of the most difficult problems we need to overcome in dealing with auditory arguments is to find an appropriate way of analysing and assessing them. This paper suggests one possible solution for auditory argument analysis and assessment and that is to borrow tools from verbal argumentation.

This paper will follow up Groarke`s findings and expand the research from prosodic features to various different (human and non-human) sounds which can occur in argumentation. The paper will propose one way of reconstructing auditory arguments, identifying their importance and propose tools for their critical assessment.

2. ARGUMENTATION SCHEMES

Traditional view of an argument is that argument (and argumentation) is verbal activity. It consists of conclusion and evidence that support that conclusion. Argument can be simple or it can be complex but it always has those key components: conclusion and evidence that supports it.

Argumentation theorists dealing with verbal arguments developed argumentation schemes which are defined as stereotypical patterns of reasoning (Walton, 1990) with a corresponding set of critical questions, namely defeasibility conditions. They represent patterns used in everyday conversational argumentation, and in other contexts such as legal and scientific argumentation. Groarke & Tindale (2013: 146) write:

> When a particular pattern can be isolated and then treated as a standard for judging and constructing arguments, we call the pattern an argument scheme. The argument scheme that characterizes a particular argument is identified by the kinds of premises and conclusions involved.

Van Eemeren et al. (2014: 19) explain argumentation schemes:

> An argument scheme is an abstract characterization of the way in which in a particular type of argumentation a premise used in support of a standpoint is related to that standpoint in order to bring about a transfer of acceptance from that premise to the standpoint. (…) The critical questions that are associated with an argument scheme capture the specific pragmatic rationale for bringing about the transition of acceptance from the premise to the standpoint. Thus the argument scheme that is used in a specific type of argumentation defines, as it were, how the "internal organization" of the argumentation is to be judged.

Macagno, Walton and Reed (2017) emphasize that schemes are becoming even more important in recent times for various practical reasons. First, argumentation schemes are instruments for analysing and recognizing natural arguments occurring in ordinary and specialized discourse. Second, schemes are instruments that can be used for the purpose of teaching critical thinking. Further on, according to authors, schemes can be used in education both for teaching students how to argue and for learning through argumentation. And in the end, schemes have now been recognized as important for argument mining, and it has also been recognized that there are too many schemes for handy use.

Walton & Macagno (2015, p. 9) present different criteria, categories and classification systems of argument schemes emphasizing:

> The primary use of the classification system is to increase the understanding of an argument analyst, let us say a student in a course on argumentation, to be able to situate an argument in relation to other arguments it is related to, so that the student can carry out the task of fitting the right scheme to a given text of discourse assumed to represent an argument.

I believe that argument schemes and their application to multimodal argumentation can help us in similar way: to identify different types of non-verbal (primarily auditory argument), to distinguish important and reasonable auditory argument from sound with purely esthetical or any other non-argumentative role, to reconstruct auditory argument (translate sound into words) and to assess its defeasibility by using a set of critical questions.

3. AUDITORY ARGUMENTS AND ARGUMENT SCHEMES

3.1 Argument from sign

Walton (2006, p. 122) explains argument from sign:

> In many cases of argumentation, data observed in a case are taken as a sing of something that fits a familiar pattern. This form of argumentation is a defeasible at the first stages and may lead only to a plausible conclusion in the form of tentative hypothesis.

To explain even further, Walton provides an example of a patient with yellow skin which is a sign or indicator of hepatitis. Groarke (2018) uses similar, patient-physician example but instead of visual sign (yellow skin) suggests auditory (heart malfunction discovered by listening with stethoscope).

Many sounds in everyday life and everyday argumentation can become an argument from sign and can support a conclusion. Let us examine several examples.

One example is a recording of a domestic dispute available on YouTube[1]. It represents a real life situation in which neighbours heard yelling and screaming coming from the house next door and recorded it. Recording was taken during the night so there was no visual proof of violence. However, based solely on sound it was recognized as a life threating situation in which neighbour suggested calling the police. This example can be recognized as argument from sign and reconstructed as follows:

SPECIFIC PREMISE: A (a finding) is true in this situation
GENERAL PREMISE: B is generally indicated as true when its sign, A is true.
CONCLUSION: B is true in this situation.

Based on this scheme pattern we can reconstruct an argument in domestic dispute:

SPECIFIC PREMISE: Crying, screaming and yelling is coming from the neighbour's house
GENERAL PREMISE: Sounds of crying, screaming and yelling generally indicate domestic dispute.
CONCLUSION: There is a domestic dispute in neighbour's house.

As Walton (2006, p. 113) writes: "It is easy to see why argument from the sign, in the scheme displayed above, is defeasible. The general premise is not an absolute universal generalization."

So, let us examine the general premise of the domestic abuse: do sounds of crying, screaming and yelling indicate domestic abuse? Is it possible that there are just passionate people having a heated discussion? Our question for this example corresponds with critical question suggested by Walton (p. 114): "Are there other events that would more reliably account for the sign?" We can answer that sounds of crying, screaming and yelling are more likely to be connected to the abuse than to any other event. This is the reason why neighbour even suggested calling the police because he immediately recognized the auditory sign of domestic abuse.

Another critical question raised in the context of argument from the sign is: What is the strength of the correlation of the sign with event signified? We can reply on the grounds of experience that there is a strong correlation between screaming and violence. We can then conclude that in this example auditory argument from sound supports a conclusion of domestic violence.

---

[1] https://www.youtube.com/watch?v=0E_I2GPzVzI

However, let us consider the second example. Believers in extra-terrestrial life claim that there are other living forms in our galaxy. To prove it they used a recording capturing sounds from out of space, which allegedly NASA recorded for years and which cannot be explained scientifically[2]. It is also an argument from sign reconstructed in following way:

SPECIFIC PREMISE: Sounds are detected on the different planets in our solar system.
GENERAL PREMISE: Sound generally indicates existence of living forms. CONCLUSION: There are living forms on planets in our solar system.

In this example, compared to the first one, general premise is weaker which makes argument defeasible. There might be (and are) other ways (electronic, artificial) to produce sounds. Ways which do not include living forms. So the correlation between unidentified sounds and living forms is weak.

However, both of this examples are actually examples which demonstrate how sounds can be arguments and that auditory arguments do exist. They can be reconstructed using the tools from verbal argumentation and they can be critically assessed. In the end, they can be weaker or stronger just like verbal arguments can be. Auditory arguments from sign reconstructed above were assessed by the audience (neighbours, public sphere) and based on the critical assessment, results are following: neighbours in first example suggested police intervention while extra-terrestrial followers in the second example did not get much attention.

Walton (2006, p. 114) writes about argument from sign:

Quite often, argument from sign is a weak form of argument that cannot be relied on uncritically. Even so, it is a presumptive form of argument that can sometimes help point an investigation or chain of reasoning to a plausible conclusion.

Several following examples will demonstrate how auditory argument from sing can be a part of chain of reasoning that Walton writes about. For instance, the manner of speech (especially a certain type of accent) is a sign of speaker's background, social status, level of education. Numerus studies in sociolinguistics (Labov 1966; Lippi-Green, 1997; Kontra 2002; Pomeranz, 2002) in different languages conducted empirical research and provided us with proof that some accents are perceived as more "prestigious" than others, that some accents are connected with higher level of education, social status, occupation etc. It is commonly known that British English is especially "notorious" for judging people based on their accent. John Honey, British sociolinguist said that in Great Britain as soon as you open your mouth you are instantly positioned on the social scale. In argumentative discourse, manner of speech can function as a part of chain of reasoning together with the argument from authority for instance. Someone can "sound" as an authority, as a truthful, credible or trustworthy person which can be especially important in testimonial claims. As Govier (1993, p. 93) explains:

Testimonial claims are especially important for a variety of reasons. Human knowledge is utterly dependent upon our acceptance, much of the time, of what other people tell us. Only thus can we learn language and pass on knowledge from generation to generation; only thus have we access to times, places, and cultures we do not and cannot experience ourselves.

Although testimonial claims also feature in judicial or political discourse, advertising is probably the best example because it almost fully relies on testimonies of those who experience a certain product or are involved in its development.

SPECIFIC PREMISE: X is speaking with Y (RP in British English) accent.

---

[2] https://www.youtube.com/watch?v=gFO5VFRU5TU

GENERAL PREMISE: Y accent is connected with higher level of education, social status and socioeconomic background.

CONCLUSION: X is well educated and belongs to higher social status.

The chain of reasoning than continues:

SPECIFIC PREMISE: X says that this book is worth reading.

GENERAL PREMISE: Well educated people know how to evaluate literature.

CONSLUSION: We need to read this book.

Based on manner of his speech, X was perceived as well educated person. And it is generally accepted that well educated people are well read and therefor competent in judging the quality of the book. We believe in what he says.

Similar chain of reasoning often occurs in a political discourse during the election campaigns when competence, trustworthiness of a politician is evaluated based on his "appearance", the perception of his qualities. The prosodic features (voice quality, tempo, pitch, intonation etc.) contribute to the perception his personality traits. For instance, one possible argument reconstruction is:

SPECIFIC PREMISE: Politician X has deep voice, speaks little bit louder, has no disfluencies.

GENERAL PREMISE: People who speak in specific style (deep voice, little louder, without disfluencies) are determined, self-confident, strong and trustworthy.

CONCLUSION: He is determined, self-confident, strong, and trustworthy.

Further on,

SPECIFIC PREMISE: Politician X is determined, self-confident, strong, and trustworthy.

GENERAL PREMISE: Highly ranked politicians (presidents, prime-ministers) have to be determined, self-confident, strong, and trustworthy.

CONCLUSION: Politician X has to be our next president.

The manner of speech, or speaking style is a sign of speaker's background, personality traits or emotional state. And those signs can be used to support a conclusion about someone's ability to perform a function or take over a position.

Let us look at one more example from the advertising industry. It is an example of Public Service advertisement which is primarily design to inform and educate people. However, this type of advertisement also needs to be creative to fulfil its purpose. Very good example (for both creativity and complex chain of reasoning which includes auditory arguments) is anti-abuse Amnesty International commercial.[3] The intent of the commercial is to raise awareness of possible perpetrators and the victims of domestic violence, particularly by countering the stereotypical view according to which perpetrators are generally of low social status, lack education, and come from rural areas and—similarly, that female victims are weak, poor, uneducated, and unintelligent. Its main message is: Everybody can be a perpetrator, and everybody can become a victim. Do not judge people based on their appearance alone. As mentioned earlier, many sociolinguistic research confirmed that accent is connected with the perception of speakers' status, occupation, intelligence, economic situation and prestige. And Amnesty International commercial makes uses of these insights, in order to launch an argument, as the commercial presents what in effect is an "audition for the best perpetrator." During the audition, however, the viewer cannot see the candidates, merely their fists. This body part then is a nonverbal metonymy. The audition is conducted by a female, who the audience can only hear speak, with all the qualities representing her as an educated, strong, intelligent woman with authority and dominance. She even chuckles the moment that the perpetrator displays his aggressiveness by growling. Not intimidated, however, she does not take the obviously aggressive "candidates" seriously. This changes, however, when she faces the third candidate who speaks in perfect RP English with an attractive voice quality. Initially, his tempo is

---

[3] http://www.youtube.com/watch?v=FzOZey7ZGMk

reduced, showing him to be under control, calm but dominant; then his manner of speaking changes, and towards the end he is annoyed because the female speaker interrupted him. These prosodic features typically reveal aggressiveness: louder speech (yelling), modulation (staccato rhythm), determined, dominant, giving orders. Also the female speaker changes feature of her speech toward the end, as she begins to stutter, and speaks quietly, being on the verge of tears.

Prosodic features (both of male and female speakers) are the essential part of an argument which can be reconstructed as an argument from sign.

Arguments scheme can be constructed as following:

GENERAL PREMISE: Only low social status and men of low education level are abusers.

SPECIFIC PREMISE: X sounds like well-educated person and a member of high social status.

CONCLUSION: X cannot be abuser.

In this example, the general premise is the stereotype which is proven to be wrong (in the continuation of the commercial) so the main intent is to refute this general premise. And in the end to alter the conclusion using the argument by example.

Premise 1: Example 1 is an example that supports claim P.

Premise n: Example n is an example that supports claim P.

Conclusion: Claim P is true.

Or in our case of abuse:

Premise 1. X is well educated (and classically trained) but he is an abuser.

Conclusion: Well educated (and classically trained) people can be abusers.

It is, of course, well known that one example is not enough to make a generalisation (otherwise we make a fallacy of hasty generalisation) but it this specific example, the prosodic features represent a group of well educated, high social status men to make a statement that even this group of population may become domestic abuser. Schellens and de Jong (2004) explain argument from example which can be used in support of various sorts of claims.

> The propositions being supported are of a general nature: a case is made for the fact that something is always, often or sometimes the case. The proposition being supported may be descriptive or normative in nature: it may relate to something that is always, often or sometimes true, or something that is always, often or sometimes good, justified, beautiful or appropriate.

In Amnesty International commercial prosodic features function as a representation of a group supporting the claim that sometimes well-educated men can be abusers.

4.2 Argument from correlation to cause

Walton (2006, p. 100) writes: "Although scientists, particularly in practical fields such as engineering and medicine, sometimes make claims about causal relationship, there is no settled theory of causality." However, Walton explains when something can be considered to be an argument from correlation to cause:

> As a presumptive form of reasoning, argument from correlation to cause has the following form. CORRELATION PREMISE: There is a positive correlation between A and B. CONCLUSION: A causes B.

Many conclusions in medical field are based on argument from correlation to cause. A certain type of behaviour increases or decreases risk of certain illness. Examples of this specific argument scheme can also be found in the context of auditory argumentation. Consider a tutorial from car mechanic who gives possible causes of car malfunction[4]. Tutorial starts with a car

---

[4] https://www.youtube.com/watch?v=0y0PqQHGUXQ

mechanic saying: We will talk about 4 most common car noises and the problems associated with them.

1. Engine noise commonly caused with belt
2. High pitch squealing while applying your brakes is associated with worn out brake pad which has to be replaced (the more metallic noise is the more brakes are damaged)
3. Clicking while turning noise correlated with worn out CV joints
4. Tire noise while driving correlated with low tire pressure

Argumentation scheme for one of the problems can be reconstructed in a following way:

CORRELATION PREMISE: There is a positive correlation between high pitch squealing while applying your brakes and worn out brakes

CONCLUSION: If you hear high pitch noise while applying your brakes, it means they are worn out.

FINAL CONCLUSION: You need to change car brakes.

Walton (2006, p. 103) suggests three critical questions that should be asked when argument from correlation to cause is put forward:

1. Is there really a correlation between A and B?
2. Is there any reason to think that correlation is any more that a coincidence?
3. Could there be some third factor, C, that is causing both A and B?

In the example of car tutorial, a noises which are symptomatic for a certain problem, are explained by an experienced car mechanic who makes a correlation based on his experience, knowledge. However, even in tutorial he leaves room for the C factor that can also cause problem. But the number of possible reasons is limited which makes argument from correlation to cause stronger.

4.3 Argument from consequences

Walton (2006, p. 105) writes about argument:

> One very common form of argumentation is used when one party in a dialogue says to another, "This action would not be good, because it could have bad consequences." And this form of argument, called argument from negative consequences, cites foreseeable negative consequences of a proposed action as the premise. The conclusion is a statement claiming that the action is not recommended. (…)

Argument from consequences can also be used in a positive way, where a policy or course of action is supported by citing the positive consequences of carrying it out. Argument from consequences is often used in economic and political deliberations where two parties (or groups) disagree on what is the best course of action to pursue."

Further on, Walton (1999, p. 252) writes about historical origins of argument from consequences:

> Argument from consequences is an important form of reasoning for informal logic. It is a type of argumentation that is very common in everyday argumentative discourse, and its structure underlies many of the best known informal fallacies – like the slippery slope argument, for example. (…) This type of argumentation may be broadly characterized as the argument for

accepting the truth (or falsity) of a proposition by citing the consequences of accepting that proposition (or of not accepting it).

Whenever we want to emphasize how good or how bad the certain action or a type of behaviour is, we demonstrate positive or negative consequences. Argument scheme for argument from negative consequence is as follows:

PREMISE: If A is brought about, bad consequences will plausibly appear
CONCLUSION: A should not be brought about.

We can recall many, so called educational campaigns promoting a certain type of behaviour: do not take drugs, do not smoke, do not sell alcohol to minors, do not text and drive, eat healthy, exercise etc. One of the most frequent campaigns is to raise awareness of danger while drinking and driving. One of this commercials which will be analysed is not directed to the consumer itself but to those drinking with him. The main message of the commercial is: do not let your drunk friend drive home because he might die.

The argument in the commercial can be reconstructed in the following way:

PREMISE: When friends don`t stop friends from drinking and driving (sound of an accident) will happen.
PREMISE: Accidents can result with death (Drinking and driving kills friendship)
CONCLUSION: Friends should stop friends from drinking and driving.

This is an example of an argument which advocates a certain type of behavior (don`t drink and drive). And it follows the simples form that Schellens & De Joong (2004: 302) write about:

In argumentation from consequences, an action or behavior is advocated or opposed on the basis of a single desirable consequence (a pro) or undesirable consequence (a con): Action A leads to B. B is desirable. Therefore, action A is desirable. Action A leads to B. B is undesirable. Therefore, action A is undesirable.

In the case of TV commercial, following this simple form, argument can be reconstructed as: Drinking and driving (action A) leads to death (B). Death is undesirable. Therefore, drinking and driving is undesirable.

What is especially interesting in this video is the fact that accident is not articulated verbally. The voice over says: When friends don`t stop friends from drinking and driving……will happen. Instead of saying the "accident" there is a soundtrack of a car accident (breaking glass, squealing wheels, and loud crash). The overall effect is much stronger and in more layers than the word itself. So, the sound in this example has more of a rhetorical than argumentative function.

Similar example with more obvious appeal to emotion is the projection of the world confronted with a World War III.[5] It represents a sort of warning for everyone thinking about the possibility of provoking conflicts which could result in war. It can also be seen as an argument from negative consequences.

This short film is broadcasted via YouTube with one sentence beneath: *Close your eyes, imagine that you are outside in night and begin to hear these sounds...*Unlike the previous commercial which is a combination of verbal, visual and auditory, this video relays solely on sound. The only visual representation is a symbol for nuclear danger throughout the video without any verbal message. Just different types of emergency sirens and alarms (civil defense sirens, air-raids). Sirens which are used to provide emergency population warning of approaching danger. This sounds are well known to people who ever experienced war or any

---

[5] https://www.youtube.com/watch?v=E7_4m7rS1t8 World war 3

other disasters event. But to wider audience those sounds are usually connected with World War II when they were initially designed.

We can reconstruct the argument in this video as an argument from negative consequences.

PREMISE: Sirens are a warning of approaching danger in war.
PREMISE: War endangers people.
CONCLUSION: We should avoid possibility of war.

This auditory anti-war argument can be seen as combination of appeal to fear (from the possibility of war) and appeal to pity (to all the victims of war who witnessed those sounds) and that sort of combination is very common in media argumentation (according to Walton, 2007, p. 128).

5. CONCLUSION

Auditory mode in a multimodal argumentative discourse may sometimes be of the outmost importance for argument reconstruction. Everyday argumentation in a public discourse often consists of different modes which include not only verbal message but can also include visuals, sounds and nonverbal signs of a speaker. Serious argumentative analysis must therefore develop tools for analysis, reconstruction and assessment of different argument modes. Hopefully, this paper is one step toward finding the appropriate and most suitable way of dealing with auditory arguments (both human and non-human sounds). One approach, which is presented in this paper, is to borrow tools from verbal argumentation and to test whether it can be applied. Argument schemes from the realm of informal logic and critical questions accompanying them can be successfully applied for auditory arguments as well. Since, sounds (human sounds especially) are frequently difficult to separate from verbal part of an argument, complex chain of reasoning may be involved – argument from sign, argument from authority, and argument from example. For instance, specific accent of a speaker may be a sign of a well-educated person which can than support an argument from authority which depends on trust in competence of the source that is consulted.

Critical questions just as they are formulated for verbal arguments can also be used to assess the defeasibility of an auditory argument. However, the question that remains for further research of auditory arguments is to detect a specific differences in argument scheme patterns between verbal and auditory arguments and to develop a specific critical questions which can test possible weak parts of auditory argument in a multimodal discourse.

The rhetoric of shame in the immigration debate

JENS E. KJELDSEN

Department of Information science and Media studies
University of Bergen
Norway
jens.kjeldsen@uib.no

ABSTRACT: In political debates on immigration, refugees, and asylum seekers, the rhetoric of shame is frequently used. This paper examines the use of such shaming-arguments during the 2015 refugee crisis. It especially examines the rhetorical use, function and public value of inflicting collective shame, and it analyses how members of the shamed collective respond to such arguments.

KEYWORDS: argumentation, collective, debate, Denmark, identity, immigration, newspapers, public, rhetoric, shame

1. INTRODUCTION

Expressions of shame has become more common in the public sphere. This is certainly true in the debate on immigration and refugees in Denmark, where an increased number of citizens express that they are ashamed about the way their nation treat immigrants and refugees and accuses others for shameful behaviour and attitudes.

Shame is a particularly relevant feeling in connection with rhetoric and immigration because it presupposes a community, which at the same time is the community that immigration seems to challenge. Like many other countries, the citizens of Denmark are divided in their views on immigration, and the way the nation welcomes refugees.

2. RESEARCH QUESTION AND METHOD

The aim of this paper is to determine *the rhetorical use, function, and public value of inflicting collective shame*. This is carried out through rhetorical criticism of selected Danish newspaper articles expressing or inflicting shame, as well as rhetorical criticism of articles responding to such accusation of shameful behaviour. The collection of articles was gathered from the database *Infomedia,* covering the period September 1 to September 30, 2015. This was a period when a large amount of immigrants arrived in Denmark during the refugee crisis that affected all of Europe. This period naturally gave rise to debate about how to treat immigrants and refugees, including questions of personal and national shame.

The search query was "shame" ("skam" in Danish), which gave 578 results in regional and local newspapers, and 307 in national newspapers. I manually examined these results in order to determine which articles and reader's letters actually dealt with shame in connection with the immigration debate, and sorted out occurrences that did not. In case of several occurrences of the same article or reader's letters in different papers, only one is included. Articles that deal with shame in connection with immigration or refugees outside Scandinavia are also excluded. In my search a handful of other articles dealing with shame appeared.

Three from previously in 2015, two from 2014, and three from October in 2015. These are also included.

After the manual sorting out the material was reduced to 59 articles, editorials, and reader's letters dealing explicitly dealing with shame in connection with immigration and refugees in Denmark. I then carried out careful readings of the texts, while looking for systematic differences and similarities. This led to the division of the material into two main directions of the use of shame in the debate: accusing (i.e. shaming oneself and/or others) and defending (repudiating the accusation). The material also formed four categories of the rhetoric based on felt versus inflicted shame and individual versus collective shame. I explain this in more detail below.

3. WHAT IS SHAME?

There are many definitions of shame (Shweder. 2003, pp. 1113-4). One says that shame is a particular form of embarrassment Based on the fear of the disdain, indignation, disapproval. The cultural anthropologist Shweder defines shame as: "the deeply felt and highly motivating experience of the fear of being judged defective" (Shweder, 2003, p. 1115). Shame, he explains, is a feeling of anxiety for real or expected loss of status, love, self-regard: "a feeling that comes with the realization that one is vulnerable to the disappointed gaze or evaluation of others" (Shweder, 2003, 115).

Aristotle defines shame as a social phenomena. It is: "a kind of pain or uneasiness in respect of misdeeds, past, present, or future, which seem to tend to bring dishonour" (*Rhetoric*, B.6.1). We do not feel shame towards everyone, he explains Shame is felt towards those we esteem and admire or want to be admired by In the same way we do not feel shame towards people We do not identify with or whose opinion we do not value.

Shame and guilt is closely connected (Tangney & Dearing, 2002). Most scholars agree that shame has a more socially condemning character. While guilt is especially related to the individual's evaluation of herself, shame is primarily connected to the condemning gaze of others. While guilt thus concerns a gap between our values and our behaviour, shame is more connected to a general assessment of our "acceptability as people" (Brown, 2008). Therefore, the feeling of shame are more fundamental than the feeling of guilt: it is easier to admit errors and change our behaviour than it is to change ourselves and admit that we do not adequate as human beings (Tangney & Dearing, 2002; Tangney et al., 2005).

So, while guilt concerns the relation between your behaviour and yourself shame concerns the relation between you and the others. Shame involves someone seeing you in ways you do not want to be seen. We become shameful if someone sees us naked, when we did not mean for it to happen and we become shameful if someone sees us fail, if someone notice that we have done something dishonest, unethical, selfish, or evil.

4. FOUR CATEGORIES OF SHAME

As suggested my analysis of the 59 texts dealing with shame and immigration uncovered four main categories of shame consisting of different rhetorical acts having four specific functions.

The first category is *feeling and admitting personal shame*. To say as an individual that one is ashamed (the act) entails an admission of a transgression of social norms and accept of possible sanctions. The *function* is to recognize that one has committed offense to social norms and seek for forgiveness. This category relates to how an individual feels about

his or her own behavior or attitudes. It is the most common and well-researched form of shame, however, it is limited to the individual and her personal feelings.

In my material on the public debate of immigration, I did not find examples of such personal shame. There was no appeal to forgiveness for individual transgressions. Instead, as we shall see, *expressions* of personal shame were used as rhetorical appeals to establish a collective national shame.

The second category found in my material is the *infliction of individual shame*. This form, as well, is well-researched. My material did contain examples of such individual infliction of shame. In the following example, a reader's letter criticises a leading member of the Danish People's Party:

(1) "Søren Espersen should be ashamed of his comments about the mentioned politicians, however, he probably isn't [.....] In my opinion, he is not a good Dane. He is the kind of politician one should distance oneself from, if one seeks to sustain benevolence and mercy"
(08.01.2015, p. 13 in *Frederiksborg Amts Avis*. Title "Espersen burde skamme sig")

As this example indicates, one inflicts shame to another individual (shaming him or her) by expressing that the person should be ashamed (the act). The function can be to sustain social norms and values to seek the individual's recognition these, or to seek community with people sharing these norms and values. The function of such shaming, however, can also be to promote oneself and dominate the individual who is shamed.

These two categories are individual forms of shame have been extensively explored in psychological research (cf. Tangney & Dearing 2002), however, these categories were not frequent in my material, which was instead dominated by expressions of shame on behalf of a shared collective and by infliction of collective shame to another group (i.e. shaming a group). The first of these, *feeling and admitting shame on behalf of a collective* is the third category in my material. This happens when an individual express shame on behalf of a group that the individual is affiliated with so closely, that he considers it part of his identity. This could be the person's family, friends, city or country.

My material contained twelve instances of this third category of shame felt on behalf of a collective. The rhetorical act is expressing to be ashamed of a collective one is part of. The rhetorical function is accepting that a collective one belongs to has violated social norms, in order to recognize and sustain these norms. In one reader's letter, a citizen expressed shame on behalf of a collective in this way:

(2) "I have begun being ashamed of being Danish. Where has the human compassion of the Danes gone? We are just busy being self-sufficient run by what I will call Danish Selfish People's Party"
(08.09.15, *Frederiksborg Amts Avis*. Title "Welcome in Frankfurt")

Another reader's letter expressed it this way, while transforming the surname of the Danish immigration minister into an insult ("Scrambler"):

(3) "With Inger Scrambler in the lead of the immigrant and refugee-policy of our country, I am ashamed of being Danish. With the lack of action from the city of Svendborg: Should I start being ashamed of being a Svenborgian as well?"
(04.10.15, *Fyns Amts Avis*. "Skal jeg skamme mig?", p. 3)

The examples demonstrate that just like we may feel national pride, we may also feel national shame. As in instances of personal felt shame, this also requires the condemning gaze of others. I may experience Danes that treat refugees in an inhuman or racist fashion, however, this is not sufficient to make me feel ashamed. It may make me sorry or furious, but if I am to feel ashamed, I must also have the experience that others are seeing this. If I in a discussion with a close family member experience that this person acts in a racist way, I will be not necessarily be ashamed, but rather sorry and angry. If I see a close family member – my sister, father, wife or my daughter, writing racist posts on Facebook, where my friends and colleagues can read them, then I will be ashamed, because I will be exposed to the condemning gaze of friends and colleagues.

The fourth category of shame in my material is the attempt to *inflict shame on a collective* (i.e. shaming a collective). The rhetorical act is to express that a collective should be ashamed (direct shaming) of itself; or expressing that one is ashamed on behalf of a collective (indirect shaming). As in shaming of individuals, the function can be to 1) sustain social norms and seek society's recognition of these norms, or to 2) promote oneself and dominate part of the collective. An example of direct shaming can be found in the reader's letter "Mirror of shame" in the regional newspaper *Skive Folkeblad* (17.09. 15, p. 31)

(4) "There are shameless and incoherent views. They are part of the democratic debate, of course, that is the condition of democracy. However, the ignorance, the shamelessness and the incoherent face of the ugly should be pointed out. Nice and decent, but clear and plainly", "I will strongly recommend EM and his like-minded to be ashamed and stay ashamed Even though that will probably not aid the validity of the arguments put forward."

The four categories of shame with their rhetorical acts and functions can be seen in figure 1 below.

	Felt shame (admission)	**Inflicted shame (outshaming)**

Personal shame	*1. Feeling and admitting personal shame*
	  Act: Saying that you are ashamed
	  Function: accepting that one has violated social norms and seeking forgiveness.
		2. Inflicting individual shame
		  Act: Saying that an individual ought to be ashamed
		  Function: 1) Sustain social norms and seek the individual's recognition these, 2) Promote oneself and dominate the individual

Collective shame	*3. Feeling and admitting shame on behalf of a collective*
	  Act: Saying that one is ashamed of a collective one is part of.
	  Function: accepting that a collective one belongs to has violated social norms, in order to recognize and sustain these norms.
		4. Inflicting shame on a collective
		  Act: Saying about a collective that it ought to be ashamed (directly) or saying that one is ashamed *on behalf of* a collective (indirectly)
		  Function: 1) Sustain social norms and seek society's recognition of this norms, 2) Promote oneself and dominate part of the collective

Table 1. Four Categories of Rhetorical Shame

These four categories of feeling and inflicting shame belong to the *direction of accusing*. It is noteworthy that the public debate in my material contains more occurrences belonging to the *direction of defending*: There are more instances of reactions to infliction of shame than there are of shaming or admission of collective shame. Admission of collective shame occurred 12 times, infliction of shame 10 times, while denial and refutation of shame occurred 31 times. The most common topos in the texts was variations of the expression "We have nothing to be ashamed about", which for instance occurred 10 times in the headlines. The material also has six occurrences of writers claiming that immigrant friendly citizens should be ashamed of their attempts to shame the immigrant sceptic citizens. I the next part I will describe in more detail the rhetoric of responding to shaming.

The occurrences of infliction of shame (shaming) are fewer; however, they demonstrate a language use expressing indignation and contempt. They define attitudes and actions as inappropriate and confront immigration sceptics with the privileges they have, in comparison to the vulnerable situation of the refugees.

The reader's letter "Both pride and Shame" (*Kristelig Dagblad*, 14.09.15, s. 8) also demonstrates a concern for how the nation is conceived of in other countries. This underscores the importance of "the gaze of the other" in relation to feelings of shame:

(5) "If one can be united in a feeling of national pride of the first Danish person sent into space; then one can also be united in feeling shame about the image that Denmark has received as xenophobic. One could have saved the quarter of a million Danish kroner on ads [telling about restrictions in the immigration policy], because it is sad, yes it is a disgrace for us that the refugees that are now coming to the Danish border, escapes further or in order *not* to be registered in Denmark […]. How does one explain … that we are not a xenophobic country?"

5. REACTIONS TO INFLICTION OF SHAME

As suggested, the primary rhetorical function of shaming is to confront humans with their behaviour and the consequences of this behaviour. The rhetorical aim of such confrontation is to expose the behaviour and attitudes of individuals or groups and thereby produce a feeling of shame, which may lead them to change their attitudes and behaviour. However, shaming often risks defeating its own end. This is clear in the wording itself: "You should be ashamed" which suggest what the addressed *should feel, but does not feel.*

To feel shame requires that we share the values, which we are accused of having offended against. Real shame can only be felt by those who consider themselves connected to the group who declare the shame – *and* thus support the values, norms, and practices of this group. This is the reason Aristotle says that we may feel shame towards people whom we admire, who admires us, or who we want to be admired by (*Rhetoric*, B.6.14-15). Rhetoric is about gaining adherence, however, shaming as we shall see, runs the risk of increasing resistance and conflict, of weakening empathy and awareness, and leading to more antisocial behaviour (cf. Every, 2013, p. 671).

Instead of leading to changes in behaviour, shaming generally leads to a strengthening of the community and resistance of those who are shamed uniting them rejection of the accusation of shameful attitudes or behaviour.

This has been argued, for instance by the social psychologist Danielle Every, who has examined shame as rhetorical strategy in an Australian immigration debate. Every (2013, p. 674) found that shaming was used in two ways: Firstly, as a form of language expressing disgust and contempt and defining attitudes and behaviour as inappropriate. Secondly, by

confronting the opponents with their privileges seen in relation to the disadvantages of the asylum seekers. Every also found three forms of response from the shamed: 1) The *denial* is a plain refusal (I am not racist), and a re-framing of identity or views; 2) The *avoidance* expresses viewpoints, however attempts to avoid be called for instance a racist; 3) The *counter-attack* answers with name-calling or insults, or accuses the accuser, often attempting to outshame the shamers.

In my material, I found similar responses to the shaming as Every. However, I also found examples of discourses that Every apparently did not encounter. My results differs in two ways: Firstly, more of the responses relate to the fact of the issue. Secondly, more of them are embedded in a populistic discourse about the elites suppressing the ordinary people (cf. Mudde & Kaltwasser, 2013, Fryklund 2013).

First, some examples of responses that were parallel to the ones Every found. One is denial and fighting back. An example of this is found in an article with the title "We have nothing to be ashamed about", written by the Culture- and church minister Bertel Haarder and printed in the newspaper *Berlingske* (17.09.15, p. 32)

> (6) "Denmark has nothing to be ashamed about. We take our part. Those, who should be ashamed, are those who spit in their own nest and slander Denmark. I remember this very well from my time as Minister of integration"

Denial and reframing also occurred in an editorial in *Berlingske* (09.09.15) with the title "No reason to be ashamed", chief editor Tom Jensen wrote:

> (7) "Maybe they are concerned for our nations' welfare, or for its possibility for survival in a globalized world, however, this concern is not due to hatred and contempt, but just that they care for a welfare system that may take care of the weakest. They would like this to continue to do so. We have nothing to be ashamed about. People are well of in Denmark. Also the newcomers. We can be proud of ourselves in this country. That is the big pictures. When other pictures are used to dominate, they are distorted. Remember that. Just occasionally."

The editor responds to the criticism of the effort towards the refugees by defining who the Danes are and stressing that they are generally decent people. He also mentions that Denmark makes an effort to take care of immigrants. While denial through re-framing of identity and viewpoint did occur, the responses in my material were dominated by statements of what Denmark has contributed with in the refugee crises. As we see in this reader's letter titled "We have nothing to be ashamed about" (25.11.2014, p. 11 in *Kristelig Dagblad*)

> (8) "Denmark has nothing to be ashamed about. We have already received a large amount of refugees, not least from Syria. They have been welcomed and placed across the country … ".

One of the most predominant topoi in the responses were attacks on those who argued that Danes should be ashamed, for being an *elite*. One example of the topos *the elite is shaming ordinary people* can be found under the headline "We have nothing to be ashamed about" (18.09.15, in the newspaper *Sjællandske*)

> (9) "The know-all chattering class around Zenia Stampe and Stine Bosse, should put their embarrassing attempts of shaming away. Denmark has nothing to be ashamed about.

On the contrary, many of the experts should figure out if not we could help more in the neighboring areas, instead of within the borders of Denmark."

As in many other articles, the author attacks the so-called elite *and* describes what Denmark actually does for the refugees. Another example of this is the reader' letter "Danes argue about refugees. The good, the bad and the smug" (08.10.15, p. 12 in *Kristelig Dagblad*):

(10) "To appoint oneself to be especially good, suggest a lack of humility, however appointing others to be especially evil, well that is evil.

7. SHAME AS A POLITICAL AND PUBLIC PHENOMENON AND PROBLEM

The material from the Danish newspapers points to two rhetorical points: *Firstly*, the responses seem to confirm that shaming in public have limited rhetorical efficiency in gaining adherence from those upon which you inflict shame. *Secondly*, the responses suggest that admitting or inflicting collective shame will have negative consequences for a good deliberative public debate.

That shaming has limited rhetorical effect is suggested by the fact that refutations and denials of shame (31+6) are almost three times more common that infliction of shame (10). Even if we add up the number of admissions of shame (12) with the inflictions, the amount of dismissals are still larger.

The rhetorical character of the refutations point to the same. As suggested, there were three dominant types of refuting:

1. Reference to factual circumstances:

(11) "It was an impressive amount of money raised to help the Syrian refugees. [...]. So, let us get rid of the caricature of us as a xenophobic, scared and selfish nation" (*Fyns Stiftstidende* 22.09.15, p. 24)

2. Counter attack on tone and debate style

(12) "I am deeply disappointed and appalled that a former director of culture can sink this deep, and use such poisonous inquisitorial and tendentious labeling on two elected politicians. Shame on you. You should be embarrassed"
(*Dagbladet Holstebro-Struer*: 15.09.15, p. 11)

3. Populist attack on the elite

(13) "However, the most disappointing and probably the most damaging in the long term is probably is the collapse of the debate culture of the elite. By elite I especially mean those people, who through education should have both the capability and will to remain sober and base their comments on knowledge and facts", "On the contrary the elite has contributed in the choir of empty emotional outburst, where the degree of demonization's of political opponents are similar to those of the spitting man in hatred, anger and arrogance"
(*Berlingske* 18.09.15, p. 31)

These examples show clearly the kind of resistance that the rhetoric of shame will evoke. The conclusion that shaming has limited rhetorical efficiency is also in accordance with theoretical assumptions about the character of shame. While feelings of guilt have a tendency to evoke apology and reparation, feelings of shame are more inclined to evoke denial and avoidance. Contrary to what one might expect shame also has a tendency to prevent empathy. Because shame is such a fundamental and painful feeling, it will sometimes be so self-centred that it prevents emphatic reactions towards others. The shameful person will be so occupied with his own pain and self-reproach that he will find it difficult to recognize the pain, which the shameful acts have created (Tangney & Dearing, 2002, p. 83).

This, of course, is most relevant in relation to felt shame. If a citizen is preoccupied with how shameful it is to be Danish; then she will not be equally concerned with the victims of the alleged heartless and merciless refugee policy. These theoretical assumptions also support the assumption of limited rhetorical effect in relation to infliction of shame. Such a rhetorical act will only be successful if the shamed feel the shame and react with admission, reparation or some other change in attitude or action. In this light shaming will not only have limited effect when the accused do not feel shame (and thus reject that there is anything to be ashamed of); shaming may still have limited effect even if the accused does feel ashamed, because avoidance may be the dominant form of response.

These circumstances are closely related to the problematic in the use of the rhetoric of shame in public deliberation. Different traditions of normative evaluation of rhetoric and deliberation provides a number of rules and criteria. Pragma-dialectics provide us with models and rules for critical discussions (Eemeren & Grootendorst (2004). Informal logic argues that arguments must be evaluated on the basis of acceptability, relevance, and sufficiency (Blair 2012). Rhetorical studies teach us about the characteristics of good and of dishonest rhetoric (Kock 2011, Jørgensen 2011). Within the tradition of Habermas, good deliberative argumentation and debate has been characterised by: 1) being open to participation, 2) justification of assertions, 3) considering the common good, 4) treating each other with respect, 5) arrive at rationally motivated consensus (Steenbergen et al., 2003). These types of qualities – concerning relations of equal exchange of viewpoints in a debate on the issues and focus on arguments instead of character – will lose ground within the framework of a rhetoric of shame.

This is partly due to the fact that infliction of shame is closely connected to moral transgressions and focus on negative traits in the accused. However, it is also due to the fact the infliction of shame is not primarily a deliberative, but an epideictic – and partly forensic – type of rhetoric. It is a rhetoric that is based on social norms that are so strong that they work more as force than as appeal.

Thus, shaming works more as a technique of domination than deliberative rhetoric in the Aristotelian sense. Accusations that someone should be "ashamed of themselves" has more in common with judgmental rhetoric such as name-calling and condemnation than it has with how we should act in the future. That is why public admission of shame or infliction of shame almost never lead to conversation or debate, but instead leads to *rhetorical polarization.*

As we see from the Danish examples, the use of shaming as rhetorical strategy tend to unite those who agree about the shaming against those who are shamed. Generally, then, shaming tends to works against its own end, at least when it is meant to make people change their attitude or behavior (cf. Every, 2013).The reason for this lies in the nature of the accusation of being ashamed: What are you supposed to do, when someone says that you should be ashamed? If you *do not want to subject* yourself to the accuser, the only possible answer is either "*No, I should not*" or "*No, I do not*".

Social scientists are generally critical to the use of shaming in public, because such rhetoric may threaten democratic participation and deliberation by bringing the shamed to silence and make them withdraw from the public conversation. Infliction of shame may isolate groups, because it put forward norms for the acceptable and prevents or hides deviating voices (Tarnopolsky, 2010). Through history victims of such stigmatizing shaming has been Jews, Gypsies, and homosexuals (Tarnopolsky, 2010).

Because shaming always happens from a position of moral superiority it can very easily be challenged by a populist framing claiming that *the elite deride and suppresses ordinary people* (cf. Mudde & Kaltwasser 2013, Fryklund 2013). As we have seen, both the reader's letters and the editor's responses on the infliction of shame expressed this populist argument. Paradoxically, one of the persons who expressed this arguments most succinctly is himself a part of the elite, the chief editor of the regional daily *Fyns Amts Avis* (26.02.2016) Troels Mylenberg. He wrote that to say that you are ashamed of someone, is to give judgment that *prevents further conversation*:

(14) "You are above those you are ashamed of, and by using the aggressive wording "I am ashamed", you put yourself at a higher ethical and moral place, and indirectly you say: "I am not like them" To be ashamed is not an argument, but a convenient way of putting distance. And you can use it when you do not have words to make arguments"

Does infliction of shame have rhetorical and deliberative value? Social scientist have argued that shame may teach individuals to develop personal initiative and responsibility and respect for shared values. It does so because it expresses society's collective disapproval of certain acts and point to the moral issues where a society cannot compromise (Tarnopolsky, 2010, 4). As I have described (and illustrated in table 1), it is a central rhetorical function to sustain social norms and seek approval of these, and shame is part of such rhetorical work in society.

8. CONCLUSION

In my material, it seems that the admission and accusations of shame mostly restrain and damage the public debate on refugees: Shame seems to derail the conversation. It increases the polarization between discussants and hinder good dialogue. It does not even seem to allow for the kind of "agonistic pluralism", advocated by Chantal Mouffe (2013). At the same time, it is important to remember that the effect and the deliberative quality of rhetorical utterances, should also be considered beyond their initial rhetorical situation. In spite of the polarization, the accusations and refutations of shameful behavior may work in the long term. If we, in this way, consider the infliction of shame and the reactions to this as an ongoing conversation, then it becomes possible to view the exchanges as a particular form of *rhetorical working through* (Kjeldsen, 2016) of the issue of immigration and refugees. The accusation, admission, or rejections of shame may then be seen not only as a way for citizens to explore the issues, but also the values and identities, which form the foundation for the political standpoints. If such a rhetorical working through can have positive consequences remains to be seen. That would require a study of the value of shame as a kind of rhetorical working through

ABSTRACT: Modern legal systems are characterized by a tension between the arguable character of law on the one hand and the ideal of the rule of law on the other. Analogical reasoning plays an important role in the reconciliation between these two characteristics. In order to understand this role, it is in the first place necessary to solve a key misunderstanding regarding the nature of analogical reasoning: the idea that analogical reasoning is to be reduced to deductive reasoning based on legal principles. In the second place, it is necessary to reconsider the ideal of the rule of law in relation to legal reasoning and the interpretation of legal norms. In this contribution, we will first try to solve this key misunderstanding about the nature of analogical reasoning. We will then show the relation between analogical reasoning and a reconsidered ideal of the rule of law: the 'third layer' of the rule of law.

KEYWORDS: legal argumentation, analogical reasoning in law, deductive reasoning in law, Rule of Law

1. INTRODUCTION

In *Rhetoric and the Rule of Law* (2005) Neil MacCormick argues that modern legal systems are characterized by a tension between two commonplaces: the arguable character of law on the one hand and the rule of law on the other. According to the first commonplace legal argumentation is not characterized by the certainty of demonstrative arguments with undisputed premises and deductive proof. The antithetical commonplace is the *rule of law* with legal certainty and predictability as central values. Where the rule of law is observed, people can have reasonable certainty in advance concerning the rules and standards by which their conduct will be judged.

The central thesis of *Rhetoric and the Rule of Law* is that a reconciliation is possible between the rule of law and the arguable character of legal argumentation. According to MacCormick, achieving such a reconciliation is the task of a theory about of rational argumentation, a theory of how we can draw non-deductive, yet rationally supported conclusions.[1] We agree with MacCormick's view on the important function of argumentation in the context of the rule of law. One of the main incentives for the growing interest in legal

---

[1] As MacCormick points out in his *Legal Reasoning and Legal Theory* (1978), one of the central questions in these different approaches is the search for criteria of soundness of legal argumentation. According to MacCormick, legal reasoning is an activity conducted within more or less vague or clear, implicit or explicit, normative criteria. Any study of legal interpretation and argumentation – he argues – is an attempt to explicate and explain these criteria as to what constitutes an acceptable or an unacceptable type of argument in law.

argumentation is the result of the changing views on judicial tasks within the context of the rule of law. In modern legal systems, a judge not only applies legal rules but also resolves interpretation problems and justifies these in a reasoned decision. Analogical reasoning plays an important role in the justification. In order to understand this role of analogical reasoning, it is necessary to solve a key misunderstanding regarding the nature of analogical reasoning: the idea that analogical reasoning is to be reduced to deductive reasoning based on legal principles. It is furthermore necessary to reconsider the ideal of the rule of law in relation to legal reasoning and the interpretation of legal norms. In this contribution, we will first try to solve this key misunderstanding about the nature of analogical reasoning. We will then show the relation between analogical reasoning and a reconsidered ideal of the rule of law: the 'third layer' of the rule of law.

2. ANALOGICAL REASONING AND THE REDUCIBILITY THESIS

Analogical reasoning is used to defend a standpoint in cases where the law provides no, or no direct, answer to a legal question. In these cases, analogical reasoning results in an interpretation of existing rules laid down in statutes or precedents or (re)constructed rules in cases of gaps in the law. A much criticized example of this analogical reasoning is offered by Posner (2008, p. 186). A court was called upon to answer the legal question about the ownership of the natural gas and oil in the underground: the owner of the property, or the neighbour who pumped up the oil and gas at the boundary of both properties. The court ruled in favour of the neighbour, reasoning that natural oil and gas in the underground are similar to wild rabbits and hare: just like rabbits and hare, oil and gas in the underground are not fixed at one place, but move. And just as the owner of the property is not the owner of the rabbits that live on his terrain, but one becomes the owner only by catching the wild animals (which is called the rule of capture), the owner of the property is not the owner of the oil and gas, unless he has caught it.

Many theorists consider analogical reasoning characteristic for legal reasoning (Levi, Hart, Brewer, Weinreb). But despite the fact that it allegedly abounds in legal reasoning, it is also treated with suspicion by others (Schauer, Kaptein), whereas some theorists (Posner, Alexander) even deny that it is a reasoning method at all. Most critique boils down to the critique that, compared to deduction, analogy is a subjective form of reasoning, a method to arrive at a decision that is, to a greater of lesser degree, uncertain, and even an irrational form of reasoning.

We will use a very simple Dutch case to redress these concerns. A few years ago male postal workers desired to wear shorts during warm summer days. The employer forbade it. The response of the postal workers can be summarized in the following question: 'Why are female postal workers allowed to wear divided skirts, while we are not allowed to wear shorts?' Aristotle would analyse this question as an *enthymeme* - an incomplete argumentation with implicit assumptions that everyone immediately adds to the reasoning, so that a complete and valid reasoning results:

> 1 We may wear shorts.
>   because:
> 1.1   Women are allowed to wear divided skirts.
> 1.1a   Men and women, shorts and divided skirts
>   are relevantly similar.
> 1.1b   Equal cases should be treated equally.

Of course, one can criticize this argumentation in many ways, but according to the common-sense definition of logical validity, there is nothing wrong with this argumentation: accepting the premises implies that one cannot deny the conclusion.

Yet the 'logic' of analogical reasoning leads to endless discussions in legal philosophy. An extreme position in these discussions is that analogical reasoning 'does not exist' as a form of legitimation. There are many variants of this position. Well known is the variant in which the analogical reasoning is analysed as an abduction, inductive or deductive reasoning or a combination thereof. According to this perspective the analogical reasoning does have significance in the *heuristics* of argumentation, in the process of finding arguments, but never as an instrument for the justification of a legal decision. In the end the justificatory force of analogy argumentation is based on underlying legal principles. In fact there is no *argument* from analogy. A good example of this perspective is the analysis of Kaptein (2005, p. 501), based on a well-known example from US case law:

> 'Waking up in the morning, a man travelling on a river steamboat found money missing from his cabin. He sued the steamboat company for damages. Though there was no precedent, the court still ordered the company to pay, because innkeepers had such liability by precedent and because 'steamboat circumstances' were found to be sufficiently like 'inn circumstances', regarding the legal issue at hand. What matters here is the underlying principle, and nothing else. If there is a general duty or obligation of care on parties offering night accommodation, then both inn-keepers and steamboat companies are under such a duty or obligation. But of course there is no logical relationship at all between the original analogon (the inn precedent) and the general principle of care. Things are the other way round: if the general principle holds, than there are inn liability implications, and steamboat company implications as well.'

So, according to the analysis of Kaptein only reasoning from the general principle results in a rational logical, deductive argumentation. Other theorists defend more sophisticated versions of this analysis. Brozek (2008) for instance reduces analogy partially to the *balancing* of legal principles. He distinguishes the following steps in the reasoning:

1. One encounters a problematic case, i.e. a case for which there is no directly applicable legal rule.
2. One identifies cases *prima facie* similar (or similar$_1$) to the given one, for which there exist definite solutions, i.e. for which there are directly applicable legal rules.
3. One identifies principles standing behind (backing) the legal rules that govern the *prima facie* similar cases.
4. Through the balancing of principles, one decides which of the principles should govern the case at hand. (This also establishes which of the *prima facie* similar cases is relevantly similar – or similar$_2$ – to the case at hand.)
5. The course of action dictated by the prevailing principle(s) is the decision in the case at hand.

According to Brozek, analogical reasoning can be divided into two phases. The first phase consists in identifying cases which are *prima facie* similar to the unregulated case. The second – justifying – phase consists in balancing of the legal principles which govern the *prima facie* similar cases.

We will label Kaptein's and Brozek's position as the *Reducibility Thesis*: analogical reasoning is a surface structure phenomenon that should be reduced to argumentation based on underlying principles in order to have rational force. According to us, these reductionist analysis of analogical reasoning lead to strange and unacceptable consequences, as our postmen example will show. The postmen try to convince their employer with an accepted premise which follows from an existing case – the women wearing divided skirts – together with the adopted relevant comparability and the commitment to the normative principle of equality. But according to those theorists who argue that the analogy argumentation provides no justification, the argumentation does not end here: the next step concerns the argumentation for the relevant

comparability. And this argumentation always results in an underlying rule. Something like: all postmen and women may have partly bare legs during the summer. According to the critics, what remains is thus a simple deductive reasoning using this rule as an argument! This sounds reasonable, but the problem with this position is: why did the male postal workers not use this rule to convince their employer? The answer is: because this rule 'was not yet there'.

The presupposed need to explicate the underlying principles or rules in analogical reasoning is a corollary of the idea that rational reasoning should be deductive reasoning. Since analogical reasoning is not deductive it is not rational. Edward H. Levi (1949) famously argued that analogical reasoning is a basic pattern of legal reasoning but that it is 'imperfect' and logically not valid. One of the arguments for this view is that logically valid argumentation consists of propositions with a truth-value. Since analogical reasoning also contains normative statements (without truth value) it is unsuitable for a logic analysis. This analysis is remarkable for several reasons. First, this criticism also holds for deductive reasoning in law, since the reasoning in law is also partly based on normative ~~statements~~ premises (e.g. the general legal rules or principles). Second, logics are developed to analyse normative statements. Therefore, a logical analysis of analogy reasoning is possible.

Finally, the critique that attributes a lack of logical validity of analogical reasoning is often the result of confusing the logical form with the acceptability of the premises. In *The New Rhetoric* of Perelman, one can find nice examples of this misconception. An illuminating example is the *a fortiori* reasoning, a variant of analogical reasoning. *A fortiori* reasoning is based upon the premise that 'what applies to the lesser, holds for the greater even more'. For example, if the law forbids to cycle with a pair of two cyclists, it is of course not allowed to bike with three cyclists. Now according to Perelman (1976) you cannot formalize this reasoning as a form of logical valid reasoning. To demonstrate this claim, he discusses an example taken from the 'famous' Belgian law Vandervelde (1919). A provision of this law banned the sale of alcoholic drinks to the extent that it was a quantity of less than two litters. Reason: the worker had to be protected against alcohol abuse and since he couldn't afford to buy two litters or more with his weekly salary..... According to Perelman, this provision shows that *a fortiori* argument is not purely formal in nature. But that is not the claim of those who reconstruct this reasoning as a formal reasoning. No argumentation or reasoning is 'purely formal'. The logical analysis is always conditional: it is based upon the presupposed acceptability of the premises. *If* you accept that in this case the premise 'what applies to the lesser, holds for the greater even more' is applicable and if you accept that *a* is greater than *b,* then you have to accept that what applies for *b* also holds for *a*. In our view, Perelman's observation is based upon a misunderstanding. In his example, the reasoning *a fortiori* does not apply, since the premise 'what applies to the lesser, holds for the greater even more' is not accepted. The same is true for the 'simple' scheme of analogical reasoning: if one accepts that two things, situations, persons are comparable and one accepts the principle 'treat like cases alike' then one cannot deny the conclusion of the reasoning.

3. THE RULE OF LAW AS THE RULE OF REASONS

The critique on analogical reasoning and the wish to reconstruct this reasoning as deductive reasoning are in our view connected with a traditional, *thin* conception of the rule of law. According to the thin conception of the rule of law, government, officials and citizens are bound by and act consistent with the law. These requirements entail a set of minimal formal characteristics: law must be set forth in advance (be prospective), be made public, be general, be clear, be stable and certain, and be applied to everyone according to its terms. According to

a more *substantive* or *thick* ideal of the rule of law, these formal characteristics should be complemented with a set of fundamental rights, democratic principles , and criteria of substantive justice . According to both conceptions of the rule of law, the judge should decide cases according to clear rules with the help of deductive logic. Once the facts of a case are given, the judge must merely decide whether or not the facts of the case can be subsumed under a statutory rule. The decision then follows with logical necessity. It is obvious that the more the statutory rules are 'clear, plain, and precise', the less the judge has to interpret, and the better the judge can function as impartial arbiter.

From the perspective of legal adjudication and interpretation, we might speak, not of the rule of law, but of the 'rule of rules', for it is through an existing body of clear, plain and precise *rules* that the law, not its executors, rules society. However, this classical idea of the rule of law is revised in recent rule of law research. In several publications, Jeremy Waldron argues for a 'third layer' in the rule of law: the procedural aspects relating to 'natural justice' or 'procedural due process'. According to Waldron (2010) these aspects have been neglected in the jurisprudential literature devoted specifically to the idea of the rule of law and they deserve much greater emphasis. Waldron argues that procedural values go beyond elementary principles like the guarantee of an unbiased tribunal or the opportunity to present and confront evidence. They include the several procedural aspects of rule of law related to sound argumentation such as a right to make legal argument about the bearing of the evidence and about the bearing of the various legal norms relevant to the case and right to hear reasons from the tribunal when it reaches its decision, which are responsive to the evidence and arguments presented before it.[2] According to Waldron these requirements are important parts of the rule of law. Waldron argues that a procedural understanding of the rule of law does not just require that officials apply the rules as they are set out; it requires that they apply them in accordance with ideals such as natural justice and procedural due process. H This renders the role of reasonable argumentation central. Waldron is of the opinion that there is no opposition between the thin conception of the rule of law and his procedural – argumentative – conception.. The thin conception emphasizes the importance of predictability, determinacy and settlement. This view on the rule of law is closely connected to a positivistic concept of law. It highlights the role of rules rather than standards, literal meanings rather than systemic inferences, direct applications rather than arguments. In this positivistic conception, a tension exists between the rule of law and the uncertainty that arises out of law's argumentative character. Waldron claims that no such tension exists in a non-positivistic concept of law . He concludes that there is a natural correlation between a conceptual account of law that emphasizes rules, on the one hand, and a rule of law conception, on the other, that emphasizes characteristics such as generality, determinacy and predictability. Similarly, there is a natural correlation between, on the one hand, a conceptual account of law that focuses not just on the general norms established but on the distinctive procedural features of the institutions that administer them, and on the other, an account of the rule of law that is less fixated on predictability but more insistent on the opportunities for argumentation.

---

[2] As a preliminary sketch, Waldron proposes the following procedural aspects of rule of law: 1 A hearing by an impartial tribunal that is required to act on the basis of evidence and argument presented formally before it in relation to legal norms that govern theimposition of penalty, stigma, loss etc..2 A legally-trained judicial officer, whose independence of other agencies of government is assured. 3 A right to representation by counsel and to the time and opportunity required to prepare a case. 4 A right to be present at all critical stages of the proceeding. 5 A right to confront witnesses against the detainee. 6 A right to an assurance that the evidence presented by the government has been gathered in a properly supervised way. 7 A right to present evidence in one's own behalf; 8 A right to make legal argument about the bearing of the evidence and about the bearing of the various legal norms relevant to the case. 9 A right to hear reasons from the tribunal when it reaches its decision, which are responsive to the evidence and arguments presented before it. 10 Some right of appeal to a higher tribunal of a similar character.

This connection between the rule of law and argumentation is also defended by Cohen (2010). Cohen examines whether argumentation, or reason giving, is *necessarily* connected with the rule of law, in the sense that a legal system would not conform to the ideal of the rule of law if its decisions were not supported by publicly articulated reasons. According to Cohen, reason giving warrants both procedural and substantive conceptions of the rule of law. Reason giving is an essential element of the procedural conception, because all the procedural accounts seems to require that the state does whatever it does in a predictable and consistent way and justifies it by reasons. Reason giving also characterizes the core of the substantive conceptions of the rule of law. These conceptions claim that the rule of law's central purpose is to ensure certain just outcomes. In that perspective, requiring that legal decision-makers give reasons is more likely to protect us against abuse than other forms of decision-making. Cohen argues that theoretical reflections on the rule of law should pay more attention to the legal duty to give reasons than has been done in the past, thereby leading to a context-sensitive assessment of the rule of law and its virtue(s). Understanding the rule of law from the point of view of reason giving enables us to view the rule of law not as an all-or-nothing matter, but rather as a matter of degree. The rule of law may obtain more or less and the extent to which a legal system provides reasons is a good indicator of this sensitivity to context.

4. CONCLUSION: THE RULE OF REASONS AND ANALOGICAL REASONING

In the foregoing we started with MacCormick's observation that modern legal systems are characterized by a tension between the arguable character of law on the one hand and the rule of law on the other. His central thesis is that a reconciliation is possible between the rule of law and the arguable character of legal argumentation. According to MacCormick, achieving such a reconciliation is the task of a theory about of rational argumentation, a theory of how we can draw non-deductive, yet rationally supported conclusions. In this contribution, we have tried to show how this reconciliation can be achieved for an important form of non-deductive reasoning in law: analogical reasoning. We argued that this reconciliation is possible if we do not try to reduce analogical to a form of deductive reasoning and that this reduction is not necessary in light of a modern version of the rule of law. When the rule of law is interpreted as the rule of rules, an ideal of legal certainty resulting in rule based reasoning, than deductive reasoning is also the central ideal. But when rational argumentation is not equated with deductive reasoning, then analogical reasoning is a specific form of legal reasoning with rational force. Ultimately, analogical reasoning rest on a choice. But a choice is irrational, not because it isn't, and cannot be, conclusively determined by reason, but because it cannot be supported by good reason. The justification raises the choice above subjectivity, and connects it to the institution of the law so as it gets shape in innumerable decisions and judgments.

Fairness and legal gaps in Aristotle's *Rhetoric*

MIKLÓS KÖNCZÖL

Department of Legal Philosophy
Pázmány Péter Catholic University
Hungary
konczol.miklos@jak.ppke.hu

ABSTRACT: In Aristotle's *Rhetoric* 1.13, arguments from fairness are based on a combination of filling gaps (*elleimma*) in the law and an extensive or restrictive interpretation of the rule, with the latter being performed through the former. This paper examines how the concepts of 'legal gaps' and 'open texture' can contribute to our understanding of Aristotelian fairness (*epieikeia*).

KEYWORDS: fairness, legal gaps, open texture, Aristotle, *Rhetoric*

1. INTRODUCTION

In this paper I consider some consequences of a reading of Aristotle's account of arguments from fairness that connects gap-filling and rectification, making the latter happen through the former (cf. Könczöl, 2013; 2016). In what follows I shall look at the roles the concepts of legal gaps and open texture, both referred to by interpreters of Aristotelian *epieikes,* can play in such a reading. I first (2) give a brief summary of what I think follows from the example Aristotle gives in the *Rhetoric*, then I examine explanations based on the concepts of (3) legal gaps and (4) the open texture of law in turn. Finally, (5) I seek to interpret both concepts from the perspective of arguments from fairness, arguing that orators may not want either to appear in their reasoning.

2. ARISTOTLE'S EXAMPLE

In Book 1, Chapter 10 of his *Rhetoric*, Aristotle starts to discuss the topics specific to the judicial branch of rhetoric by providing a definition of injustice. An unlawful (unjust) action consists in harming another person intentionally and violating the law (*Rh.* 1368b 6–7). Having explained the motives potentially grounding intent, which can also be used in argumentation to prove the fact of committing the wrongful act and the presence of wrongful intent, he comes to the problem of unlawfulness in Chapter 13. There are two ways in which an action can be unlawful: it can violate either written or unwritten law. The latter, again, falls into two groups: it may be the case that there is no written law relevant to the action (Aristotle explains that with 'a high degree of virtue or vice', but also that the relevant written law is incomplete. That incompleteness (*elleimma*) may be due to two reasons, one beyond and one corresponding to the legislator's intent. It may happen that the legislator is unaware that the law does not cover a possible case. But it may just as well be the case that they know they cannot make a regulation applicable to each possible case (*Rh.* 1374a 18–32). With respect to unlawfulness based on written law, Aristotle refers to the importance of definitions (*Rh.* 1374a 19–20). The complete lack of regulation can also be used as an argument, even if not a very strong one (see e.g. *Rh.* 1375A 4–6 and 15–17). Finally, the incompleteness of the

written rule is the case in which the orator should argue from fairness, as it belongs to the domain of 'justice beyond the written law' (*to para to gegrammenon nomon dikaion*).

Aristotle gives an example of the latter situation: if the action classified by the written law as 'assault' (*trōsai*) only requires that the perpetrator attacks the other party 'with iron' (*sidērō*), then a person wearing an iron ring 'commits injustice according to the written law, doing wrong, while in reality he does not, which is the fair [decision]' (*Rh.* 1374a 28–1374b 1).

The example and the preceding conceptual explanations are clearly separated from the second part of Aristotle's discussion of fairness, where he brings examples of the realisation of fairness, where fairness as a virtue is exerted. These can be partly reconciled with the argumentative structure illustrated with the example, but partly require a decision that is clearly *contra legem* (from a rhetorical perspective: one that is difficult to support with positive-law arguments, which is therefore unacceptable for a court of justice, cf. Carey, 1996). Thus, it seems more plausible that these are not examples of arguments from fairness focusing on the interpretation of law, but of appeals to *ēthos* or *pathos*: the character or experience of the orator or the audience (cf. Könczöl 2016).

To come back to the example of the iron ring, here the orator has to suggest that the text of the law needs to be 'supplemented', to make the decision based on it conform the (alleged) intent of the legislator. Such a reading is also suggested by a passage in the *Nicomachean Ethics*, where Aristotle explains that 'when the law speaks universally, and a particular case arises as an exception to the universal rule, then it is right – where the law-giver fails us and has made an error by speaking without qualification – to correct the omission. This will be by saying what the law-giver would himself had he been present, and would have included within the law had he known.' (*EN* 1137b 21–24, quoted after Crisp, 2000, p. 100). Yet it is only in the *Rhetoric* that Aristotle makes completely clear how an argument to that effect can work: by way of supplementing the text, e.g. the kind of the iron object can be specified, or an exception can be added to make obvious that hitting someone with one's hand (even if wearing a ring) does not qualify as 'assault'.

3. GAPS IN THE LAW

The wording of Aristotle's explanation, and the term *elleimma* in particular, suggests that the concept of legal gaps may help us understand the functioning of arguments of fairness. It has been argued, indeed, that fairness works in the gaps left by the legislator. As Constantine Georgiadis put it, '[t]he equitable is not a competitor to the legally just but is adjoined to it for cases which are not envisaged or adequately covered by the law. […] The question arises regarding the task of filling out the gap in the law in an exceptional case. The decision on the particular matter has to be made, presumably by a judge. But how the gap is to be filled is not left to the free discretion of the judge. Aristotle introduces for this purpose the hypothetical judgment of the legislator' (Georgiadis, 1987, pp. 162–163). Challenging Georgiadis' interpretation, and siding with Roger Shiner (cf. Shiner, 1987), Jacques Brunschwig argued that '[s]trictly speaking, the law does not manifest "gaps", but "deficiencies" in the etymological sense of the word, *i.e.* it falls short' (Brunschwig, 1996, p. 139).

It seems that the disagreement is, partly at least, due to the fact that they use the word 'gaps' in different senses. Given that Georgiadis speaks about 'exceptional cases', he seems to be referring to what has been termed 'axiological gaps' in jurisprudence, i.e. cases that are 'covered by a general rule but where […] the author of the rule has forgotten to make an exception' (Soeteman, 1989, pp. 135–136, quoting Alchourrón and Bulygin, 1971, see also

Peczenik, 1989, p. 24). Brunschwig, in turn, apparently has in mind 'normative gaps' (or 'insufficiency gaps', cf. Peczenik, 1989, p. 24), i.e. cases not covered at all by the law.

To begin with that latter, Brunschwig is certainly right in the sense that Aristotle's example is one in which there is a rule that is *prima facie*, i.e. on a literal interpretation, relevant for the case. That is exactly where the problem stems from: the requirement to apply it in a situation where the resulting judgement would be an unjust one. Thus, the aim of argumentation here is not to fill a gap, making it possible to adjudicate in a case where no rule-based decision could be made otherwise. Quite the contrary, what the orator should aim at here is to dissuade the judge from applying that rule.

But what about cases where the argumentative goal is quite the opposite of that suggested by Aristotle's example? What if the orator wants to persuade, rather than dissuade, the judge to apply the law invoked in the case? That, too, may be regarded as a kind of argument from fairness, or at least it does not contradict Aristotle's conceptual reconstruction (cf. Hamburger, 1971, pp. 94–95). Within the framework of the example, that would be the case if someone attacked another person with a weapon made not of iron but a different kind of metal. There, justice as equality would require the action to be classified as 'assault', too. The 'deficiency' consists in the legislator not having taken into account – or at least not included in the law – that possibility, but having focused on the most usual material for making weapons. 'Supplementing', then, would result not in narrowing but broadening the scope of the rule. Yet can we say that that would be filling a gap in the law? Certainly not, at least in the sense that it would not be impossible to reach a verdict. If the rule referred to in the accusation is not relevant – without being supplemented – for the case, then the judge does not find the defendant guilty (or not of the wrongdoing (s)he was accused of), and makes a decision accordingly, which would be considered unjust by one of the parties. But that is exactly what Aristotle's explanation is about: there is a gap in the text, which results not in a lack of normative content, but – if seen from the purpose of the law according to Aristotle – in its unsuitability.

Rereading Georgiadis' remark in light of the above, we then see that it needs to be qualified in the sense that the two cases (i.e. whether the law 'does not count' with a possibility, or 'fails to provide an adequate rule of decision') are not alternatives. Aristotelian fairness works in cases where the rule is inadequate because some relevant circumstance is not covered by (included in) the text of the law – of course, one may think that that is due to the legislator's failing to anticipate it.

It is in that sense, then, that we can speak of an 'axiological gap'. It is not necessary that an exception had to be added to the rule. A more general formula may be in order, stating that a somehow exceptional situation should be provided for by the law – which may just as well mean that it should be subsumed to the general rule in order to reach a just decision.

4. OPEN TEXTURE

For those at least superficially acquainted with 20th-century legal theory, Aristotle's example of the iron ring shows striking similarity with the concept of 'open texture' brought into jurisprudential discourse by H. L. A. Hart in his celebrated book *The Concept of Law* (1961). By open texture Hart refers to the inevitable indeterminacy of legal language, which explains why legal rules need to be interpreted. When deciding what a given legal rule requires one to do in a given situation, Hart writes, one has to determine the meaning of certain concept-words used in the relevant laws. In some cases this is not a problem, as there is a general consensus about what is covered by the relevant terms. In Hart's example, if a sign bans 'vehicles' from a public park, most people would agree that a car is a vehicle and, therefore,

cars are not allowed to enter the park. Cars, then, belong to what Hart calls the 'core' of the concept of 'vehicle'. There are, however, cases where the decision is far from being so evident: 'What about airplanes...' These latter cases belong to the 'penumbra' of the concept: focusing on the judicial decision, one may wonder whether these, too, are meant by 'vehicle' in the context of the park sign (cf. Hart, 1961, p. 126). An answer to that question may well involve extra-legal considerations, but the decision based on that interpretation will be a legal one.

The link between open texture and *epieikeia* has been pointed out by Edward Harris, stating that '[t]he need for *epieikeia* arises as a result of "law's open texture"' (Harris, 2013, p. 284). Moreover, open texture not only necessitates fairness but, from the perspective of legal argumentation, also enables the speaker to put forth arguments from fairness without urging the judges to decide against their oath which requires them to decide cases 'according to the laws and decrees of the Athenian people' (cf. Harris, 2013, p. 301). Harris also discusses the connection between Aristotle's topic of definition related to the *epigramma* and open texture (Harris, 2000, pp. 29–30), and it is precisely here, I think, that the link with *epieikeia* can be discovered.

Arguments from fairness, as we have seen, are not directed against written law. The speaker goes beyond written law by way of interpreting it. There are cases, called 'plain cases' by Hart, where there is no place for *epieikeia* arguments, as the law is unambiguous, that is to say, the speaker cannot plausibly offer an alternative interpretation of one or more of its terms. For Aristotle, these are the cases where the legislator would not add anything to the written text. From a moral perspective this also means that these are the cases where justice does not have to go beyond the written law.

Aristotelian fairness, then, can (and indeed has to) work in cases where there is place left for competing interpretations of the law. What the orator has to do is to supplement the legal definition, or even to offer one of his own, in order to eliminate the ambiguity of the text. This is not to say that he has to explicitly state that something is missing from it (cf. Harris, 2000, p. 45). A more persuasive argument can be made through offering an interpretation as the single right reading of the text (and this is what usually happens in Attic oratory). While Hart distinguishes between two sources of open texture, 'a relative ignorance of fact' and 'a relative indeterminacy of aim' (Hart, 1961, p. 125, cf. Harris, 2013, p. 284), and Aristotle seems to do the same at least in the *Nicomachean Ethics* (see the passage quoted above, 1137b 21–24), the reference made in a speech to the legislator's intent does not allow the indeterminacy of aim to appear in the argument.

5. INVISIBLE GAPS

The above considerations suggest that Aristotle is serious about *elleimma*, the gap – but it seems also clear that one can hardly identify it with any current interpretation of the concept of legal gaps. The lesson here, I think, may be related to that very contrast, and by helping us realise it, the passage from the *Rhetoric* may actually contribute to our understanding of the functioning of 'legal gaps'. Gaps, then, are deficiencies in the text, and arguments from fairness are meant to tackle these. Yet reading Aristotle's example, one should see that one cannot see any gap there. The allegedly deficient text gives, as Aristotle himself highlights it, a clear rule of decision: 'if someone wearing a ring raises his hand and strikes, he commits injustice *according to the written law*', he writes, opposing the written law to reality (*to alēthes*). Nothing seems to be omitted from the text of the law, as we do not find any reference to the ambiguity of the text either. And yet it needs to be supplemented. That would

suggest that the gap appears, if anywhere, in the argumentation of one of the parties of the debate. Or maybe not even there.

The point of arguments from fairness, as reconstructed by Aristotle, is to make the decision resulting from the application of a general rule conform the legislator's intent and the purpose of the law by – intellectually – supplementing it. But is there any point, one would ask, in making that explicit in one's argumentation. It is difficult to give a universally valid answer to that question. What Athenian orators thought fit may perhaps be inferred from an example taken from one of the greatest judicial speechwriters of the generation preceding Aristotle.

In Lysias' speech *Against Theomnestus,* the argument runs as follows: 'Perhaps, judges, he […] will say to you too what he had the nerve to say before the arbitration, that it is not one of the forbidden terms if someone says that a man has killed his father; the law does not forbid this, but does not permit someone to call a man "murderer". But it is my view, judges, that you should take issue no with expressions but with their meaning, and that you all know that all who have killed are murderers and all who are murderers have killed. It would be an enormous task for the lawgiver to write down all the words which have the same meaning; no, in mentioning one term he indicated them all' (Lys. 10, 6–7, quoted after Carey, 1997, pp. 234–245). This text provides the clearest exposition of the problem discussed so far, to my knowledge at least, in extant judicial speeches of classical Greek orators. In addition to mentioning the legislator, the reference to the 'enormous task' is a clear parallel, perhaps the model, of the explanation Aristotle offers for how the gaps come about. Yet the contrast is just as clear: Lysias emphasises the plainness of the statutory text. The lawgiver only used one word, and he still made reference to all its synonyms at the same time – in the Greek original, he literally 'made it clear' (*edēlōsen*), and, according to the orator's claim, the judges 'all know that'. The lack of a longer list of forbidden expressions in the text is not due to the intention to keep the rule general or indeterminate: there is no longer list because no such list is necessary. The text is sufficiently clear, and relevant to the case. It may be not very far-fetched to speculate that in an actual speech, Aristotle's example would take a similar form. The orator would claim that it need not be said (or written) that an iron ring is not a weapon that could be used to perform an action qualifying as 'assault'.

6. CONCLUSION

Where do we find the gap, then? Nowhere else, it would seem, than in Aristotle's *explanation*. The judicial speaker wishes to convince the audience, to persuade them to make a certain decision in the given case. Aristotle, however, is writing a textbook, a *technē,* with the aim to make the audience understand how arguments from fairness (among others) work. Aristotle's legal gaps are not in the law, nor in the text of the statute, and not even in the arguments pertaining to the interpretation of that text. Their function is only to model a certain way of argument. And that modelling is also indicative of the novelty of Aristotle's work, and his presentation of judicial argumentation in particular. His way of discussing arguments from fairness really differs from contemporary textbooks in that it gives advice on how to make an efficient argument within the limits of the rule of law.

Informal logic and the first international conference on argumentation

TAKUZO KONISHI

Department of English Language and Communication
Showa Women's University
Japan
QYZ01167@nifty.com

ABSTRACT: This paper will describe the first International Conference on Argumentation in 1986. A primary focus of the paper is how scholars who led, or were informed, by the informal logic movement expressed their voices at the conference and interacted with argumentation scholars in fields other than philosophy. A second focus is describing the infrastructure of (or the media for) knowledge production coming out of the conference— the conference proceedings, the journal *Argumentation* and the International Society for the Study of Argumentation (ISSA).

KEYWORDS: critical thinking, informal logic, informal logicians, infrastructure of or media for knowledge production, Pragma-dialectics, three perspectives of argument

1. INTRODUCTION

Professionalization and specialization of argumentation studies as a field of inquiry started in the late 1970s when scholars in various countries started to organize conferences. In the United States, the National Developmental Conference on Forensics was held in 1974, and the first ALTA conference was held in 1978 by the Speech Communication Association (SCA) and the American Forensic Association (AFA). In the Netherlands, Argumentation and Rhetoric Sections were a component of the conferences of the Dutch-Belgian Speech Communication Association (VIOT), the first of which was held in 1978. Also in Groningen, the Netherlands, an international conference on the theory of argumentation was held by Else. M. Barth and J. L. Martens in October of the same year[1]. In Windsor, Canada, Ralph H. Johnson and J. Anthony Blair held the First International Symposium on Informal Logic (FISIL) in 1978[2]. These conferences ignited scholarly discussion on argumentation in the countries involved.

In addition to these conferences, scholarly work from these three perspectives on argumentation studies—rhetoric and communication, dialogic logic and dialectics, and informal logic—started to be published in the form of proceedings and journal articles.

---

[1] An oral history interview with Erik C. W. Krabbe (2018) conducted during the 9th International Conference on Argumentation and email correspondence with him after the conference (2018) informed me that, on February 20, 1976, Else M. Barth at the University of Utrecht organized a "Dag voor de argumentatieleer [Day for Argumentation Theory]" and started what was later to be named the "Koh Wah group": an interdisciplinary discussion group on the theory of argumentation. For some time, the group met at Barth's apartment in Amsterdam, and after Barth had moved to the University of Groningen it continued to meet at other locations, mostly in Amsterdam. Participants were, besides Else Barth: Johan van Benthem, Frans H. van Eemeren, Rob Grootendorst, Robert Heeger, Maarten Henket, Paul van Hoven, Erik Krabbe, Tjark Kruiger, Jo Martens, Joop van der Pligt, Peter Jan Schellens, Frank Veltman, Gerard Verhoeven, and Roel de Vrijer. While specialization of European argumentation scholarship and the role Barth played in the process are beyond the scope of this article, further research into these areas is needed.

[2] The exact name was Symposium on Informal Logic, which Johnson and Blair later called the First International Symposium on Informal Logic when they (1980) published the proceedings with Edgepress, a small publishing firm owned by Michael Scriven.

Forensics as communication: The argumentative perspective, the proceedings of the National Developmental Conference on Forensics, was published in 1975. The SCA/AFA published the proceedings of the ALTA conferences, and the American Forensic Association, since the 1970s, gradually transformed its *Journal of American Forensic Association* (*JAFA)* from a medium on education and practices of academic debate into one on scholarship on argumentation. Barth and Martens (1982) published *Argumentation: Approaches to theory formation*, the proceedings of the Groningen Conference. Johnson and Blair started to publish *Informal Logic Newsletter* in 1978 and turned it into the peer-review journal *Informal Logic* in 1984. They also published *Informal logic: The first international symposium* in 1980. These proceedings, newsletters and journals served as a "public sphere" among scholars in the field, which helped them form common senses and public opinions on key theoretical and practical issues on argumentation.

While these various conferences and publications no doubt promoted scholarship on argumentation, the above perspectives of argumentation did not fully interact with one another until after the first International Conference of Argumentation was held at University of Amsterdam in June 1986 by van Eemeren, Grootendorst, Blair, and Charles A. Willard. Because of the significance of the 1986 Conference, which promoted in Blair's words (2007) a "profusion of scholarship" and because of the time and place in which this article is orally presented, it can justifiably said that the rhetorical situation of the 9th International Conference on Argumentation urges us to look back on and commemorate the 1986 Conference. The author (2009, 2011, 2016a, 2016b) has written on the history of argumentation scholarship with an emphasis on the informal logic movement led by Johnson and Blair, and this article also builds on his earlier studies and brings to the fore what the 1986 Conference meant for those who led, or were informed by, the informal logic movement[3]. Two main focuses are how those scholars voiced their opinions at the Conference, and what consequences the Conference's proceedings, the new journal *Argumentation*, and the foundation of ISSA brought about in the community of argumentation scholars.

To provide a historical account surrounding the 1986 Conference, the author draws on published materials such as *Informal Logic Newsletter*, the journals *Informal Logic* and *Argumentation* and the proceedings of the 1986 Conference, as well as oral history interviews of key persons and archived research at the Leddy Library at the University of Windsor. While the published materials serve as public or official records, they do not account for what happens behind the scenes. The use of oral history interviews and archival research either corroborates evidence in those public records or helps revise them by uncovering voices that have not been heard. With the combined use of various types of evidence, the author hopes to construct a clearer and more accurate historical picture of the key events in the community of the study of argumentation.

The second section of this article examines how key informal logicians developed relations with scholars in other fields, particularly with van Eemeren and Grootendorst, who created and developed Pragma-Dialectics. This section also discusses the positions Blair, Johnson, and other scholars influenced by the informal logic movement developed at the 1986 Conference. The third section of this article lays out outgrowths of the Conference, focusing

---

[3] The phrase 'those who led, or were informed by, the informal logic movement' raises an important practical question for this article. For the sake of simplicity, the author regards Johnson and Blair as leaders of the movement, and those who attended the FISIL or the Second International Symposium on Informal Logic (SISIL) and those who submitted articles to the *Informal Logic Newsletter* or *Informal Logic* as having been influenced by the movement. While this approach may fail to include some persons who read the *Informal Logic Newsletter* in Europe and presented their papers at the 1986 Conference, it surely includes all those who participated in one of the two symposiums or expressed their voices in the communal media for scholarly discussion. The registrants of the FISIL appear in *Informal Logic News Letter*, vol. 1.1 (1978), and those in the SISIL in *Informal Logic Newsletter*, vol. 5.3 (1983).

on infrastructure of, or media for, knowledge production. The final section draws conclusions about the significance of the conference, the development of argumentation studies emerging from it, and suggestions for further research.

2. VOICES OF INFORMAL LOGIC AT THE 1986 CONFERENCE

2.1 Informal Logic and Other Related Fields up to the 1986 Conference

Although the interaction of scholars across the lines of discipline was somewhat limited before the 1986 Conference, those engaged in informal logic movement did build some meaningful relations with scholars in other fields of inquiry. One notable interaction was the one with critical thinking scholars, which led to the creation of the Association of Informal Logic and Critical Thinking (AILACT) at the SISIL in 1983. As a sponsoring organization, AILACT helped informal logicians and critical thinking scholars exchange their ideas at conventions of the American Philosophical Association (APA) and the Canadian Philosophical Association (CPA).

While the interaction between informal logic and critical thinking is publicly present, that between informal logic and Pragma-Dialectics before the 1986 Conference is less obvious. However, Pragma-Dialecticians made a few attempts to construct a relation with the informal logic camp before 1986, which led Blair to be a convenor of the 1986 Conference, together with van Eemeren, Grootendorst, and Willard.

On January 31, 1983, Grootendorst, on behalf of himself and van Eemeren, wrote a letter to Blair and Johnson. He (1983) expressed interest in attending the SISIL and asked for information about it. In his letter, he refers to his co-authored articles with van Eemeren, published in *Journal of Pragmatics*, and *Journal of American Forensic Association*, as well as *Study of Argumentation* published along with Tjark Kruiger and *Speech acts in argumentative discussion* to be published by Foris. The final paragraph of the letter states that "(a)s you can see, our work is closely related to your main activities. We find the existence and the content of *Informal Logic Newsletter* very stimulating, and we hope to be in the position to publish some material of ourselves in it in the near future. Perhaps it would be possible to make some preliminary arrangements when we meet you at the Symposium."

On February 18, Blair replied to Grootendorst and van Eemeren on behalf of himself and Johnson. He thanked them for the off-prints sent with their letter. While neither Blair nor Johnson had had a chance to read them, Blair (1983, par. 2) expressed his positive feelings about Pragma-Dialectics, stating that: "(w)e were both delighted to learn of your work, and to discover that what we call informal logic is presently flourishing in the Netherlands." In Blair's recollection (2018), the two did not come to the SISIL, and the list of registrants at the SISIL published in *Informal Logic Newsletter* 5.3 (1983, pp. 16-20) confirms his oral testimony. However, since the undated anonymous short memorandum on the outcomes of the SISIL refers to "the amsterdam (sic) connection" and other consequences[4], Blair and Johnson seemed to recognize the value of the connection with van Eemeren and Grootendorst.

---

[4] The ten consequences listed include (1) the creation of AILACT, (2) presentation of papers at American Philosophical Association meetings, (3) AILACT's arrangement with informal logic, (4) conversion of *Informal Logic Newsletter* into the journal *Informal Logic*, (5) publication of papers in *Informal Logic Newsletter* and *American Philosophical Quarterly*, (7) related outcomes like a conference held by John Hoaglund, (8) the Amsterdam connection, and (9) the education connection. One negative aspect of the conference was that attendance was not as high as had been expected. Some of these consequences are covered in the report to Social Science and Humanities Research Council in Canada (SSHRC).

The off-prints that Grootendorst sent to Blair and Johnson led them (1983b) to introduce van Eemeren and Grootendorsts' "Speech acts of arguing and convincing in externalized discussions" to the readers of *Informal Logic Newsletter* in volume 5.2. What attracts attention more than the inclusion of the article, though, is how Blair and Johnson (1983a p. 2) talked about it in the 'from the editors' section of the same issue of the *Newsletter*. Blair and Johnson state that: "(w)orth reading in its own right, this article is also evidence that informal logic has a presence outside of North America, and it signals the need for all of us to become more familiar with work being done by colleagues in other parts of the world. We need to avoid, once again the dangers of being insular. (Forgive us if, in saying this we merely project our own sense of provincialism.)" In Blair's letter to Grootendorst and van Eemeren, as well as this description in the from the editors' section, Blair and Johnson seemed to equate informal logic and Pragma-Dialectics in 1983, when *Speech acts in argumentative discussion* was not yet available to English-speaking readers.

Although van Eemeren and Grootendorst did not attend the SISIL, they stayed in communication with informal logicians after the conference. Having contacted David Hitchcock, the first president of AILACT, van Eemeren and Grootendorst came to the 1984 APA meeting in New York, met him and Blair, and announced the upcoming 1986 conference. Not long after their meeting, van Eemeren and Grootendorst asked Blair to convene the 1986 conference together. Blair (2007) recollects the meeting with Pragma-Dialecticians, stating that "the idea was that I would try to encourage philosophers in North America to attend the conference that they were going to hold in Amsterdam in the following year, which I tried to do."[5] After the meeting in New York the announcement of the 1986 conference appeared in *Informal Logic* vol. 6.3 in December 1984, and also in vol. 7.1, in 1985.

To sum up the interactions beyond the lines of discipline, suffice it to say that they existed even before the 1986 Conference, partly due to the infrastructure of or media for knowledge production. The interactions between informal logic and critical thinking led to the creation of AILACT after the SISIL, which sponsored sessions at the APA and CPA meetings. Thanks to *Informal Logic Newsletter*, the SISIL and AILACT, van Eemeren and Grootendorst could communicate with Hitchcock and Blair and develop professional working relations. *Informal Logic Newsletter*, published by Blair and Johnson, served as a place to introduce Pragma-Dialectics and the 1986 Conference to the readers of the *Newsletter*. The infrastructure of or media for knowledge production played a pivotal role in the 1980s by introducing similar but different views on argumentation studies. The next subsection will observe how informal logicians and scholars informed or influenced by the informal logic movement voiced their ideas at the 1986 Conference.

2.2 Informal Logic and Informal Logicians at the 1986 Conference

When Blair initially corresponded with Grootendorst in 1983, his (and presumably Johnson's) impression of Pragma-Dialectics was that it was simply another type of informal logic, but on the other side of the Atlantic Ocean. Although Blair and Johnson (1983a, p. 2) acknowledge potential provincialism in saying so, they were not fully aware of the enormous impact of Pragma-Dialectics on the study of argumentation. Given that the initial communication was conducted before the publication of *Speech acts in argumentative discussion*, their assessment of Pragma-Dialectics at the time, if charitably read, makes sense.

When both Blair and Johnson were invited to present their papers at the 1986 Conference, they showed more comprehensive understanding and deeper appreciation of

---

[5] Besides announcing the 1986 Conference to the philosophical community, Blair read abstracts for the Conference and helped prepare the conference program in English.

Pragma-Dialectics. Toward the end of Johnson's (1987) paper calling for the naturalization of logic, he expresses his emotions on the four key ideas on argumentation presented in van Eemeren and Grootendorst's book (1984, pp. 4-18): externalization, functionalization, socialization, and dialectification.

> When I first read this monograph [*Speech acts in argumentative discussion*], I had two simultaneous reactions. The first reaction was: 'How perfectly right they are.' This was followed by a wave of despair, for it seemed to me that they have said about the concept of argumentation just about all that I wanted to say. Which left with me the uncomfortable question: What do you say after someone else has already said it? My dilemma was resolved and my despair eased when I reminded myself that van Eemeren and Grootendorst have had the good fortune of not having been educated in the narrow tradition of logic that has dominated tuition in North America. (Johnson, 1987, p. 54)

While Johnson sounded a little overwhelmed by the spirit of Pragma-Dialectics and its conception of argumentation, Blair (1987) was more directly influenced by the substance of Pragma-Dialectics and engaged in applicability of the project to the solo unexpressed (non-externalized) argumentative inquiry, as well as the uncooperative argumentative exchange. In Blair's view (1987, p. 198) the former is the internalized two-person critical discussion aimed at settling differences of opinions. The latter has a point if arguers recognize a third-party audience and attempt to answer their doubt or question. Although he (1987, p. 198) recommends removing "the requirement of prior agreement about the procedures to be used to test propositional commitments and validity rules," he states that the revision would significantly expand the scope of application of Pragma-Dialectics.

These remarks on Pragma-Dialectics by Johnson and Blair at the 1986 Conference do not reveal any of the provincialism observed in their initial interaction with van Eemeren and Grootendorst. Instead, they laud and extend the scholarly significance of Pragma-Dialectics, respectively, after reading *Speech acts in argumentative discussion*. Their respect for Pragma-Dialectics was so strong that Blair and Johnson (1987) later wrote "Argumentation as Dialectical" in the inaugural issue of *Argumentation* as their response to Pragma-Dialectics.

If we turn our attention away from Blair and Johnson to others who were informed by their initiative in informal logic and presented at the 1986 Conference, two things become apparent. The first is a communal sense of informal logic and informal logicians that FISIL, SISIL, *Informal Logic Newsletter*, *Informal Logic* and AILACT arguably helped to nurture, and the other is the continued value of the research agenda that Johnson and Blair (1980, pp. 25-26) offered in the proceedings of the FISIL.

When given opportunities to present ideas at the 1986 Conference, those informed by informal logic used the key phrase 'informal logic' to distinguish it from other types of logic or other perspectives of argumentation. Michael Scriven, one keynote speaker at the 1986 Conference, elaborated the notion of probative logic with reference to informal logic. He (1987, p. 15) stated that: "Probative logic (PL) is intended to be in part a successor to and in part a supplement to common versions of 'informal logic' (IL), the name used here to refer to the important recent efforts at improving on the limited utility of formal logic for the analysis of common forms of argumentation."

Discussing a synthesis between logic and rhetoric, Christopher Tindale and Leo Groarke discuss the potential benefit to informal logic. Reviewing logicians' view that an argument is autonomous independent of context and audience, and rhetors' obligation to persuade even with bad reasoning, they (1987, p. 275) state that: "(i)f these two views can be revised through a synthesis of logic and rhetoric, then informal logic, viewed broadly dealing with reasoning in ordinary circumstances, will be both better focused and better equipped for its task."

From Scriven and Tindale and Groarke, it is clear that informal logic is a key term that covers common reasoning or argumentation in ordinary situations. John Hoaglund, in contrast, uses the terms "informal logicians" and "informal logic" to describe situations surrounding logic education. He (1987, p. 389) states that: "(a)t a conference on logic recently, it was surprising and encouraging to hear informal logic acknowledged as a wave of the future for the introductory logic course (for many students, their only logic course). We informal logicians have thought for some time--the surprise was that our view is now more widely shared." What all these scholars reveal is that the phrases like "informal logic" and "informal logicians" were beginning to be presupposed among those informed by Blair and Johnson's initiative. Whether or not informal logic is real might well have been open to argumentation in the philosophical community at the time, in light of the work of John Woods (1980), Gerald J. Massey (1981), or Jaakko Hintikka and Merrill Hintikka (1989). However, these phrases better represent realities about logic and argumentation and make sense to philosophers in pushing the informal logic movement forward.

While we see those influenced by informal logic movement expressing their commitment to informal logic at the 1986 Conference using "informal logic" and "informal logicians," we can find more substantive signs of the scholarly development of informal logic. Turning to the list of problems and issues for the research on informal logic that Johnson and Blair (1980, p 25-26) presented in the proceedings of the FISIL, we find some of them discussed by presenters at the 1986 Conference[6]: the theory of fallacy was discussed by Douglas Walton as well as John Woods; the fallacy approach vs the critical thinking approach by Richard Paul; the viability of the inductive-deductive dichotomy by Trudy Govier, Perry Weddle, Stephen P. Norris and James Ryan; the problem of assumption and missing premises by Hitchcock; the problem of pedagogy by Paul and Mark Weinstein; the nature, division and scope of informal logic by John Hoaglund and Michael Scriven; and the relationship of informal logic to other inquiry by J. Anthony Blair, Christopher Tindale and Leo Groarke, Scriven, and Weinstein. Although some of these issues had already been covered in *Informal Logic Newsletter*, *Informal Logic* and the SISIL, discussing them in front of the audience constituted by non-philosophers and philosophers might arguably help to shape views on the nature of informal logic as a scholarly endeavour.

To summarize this section, the 1986 Conference served three purposes within the informal logic community. First, for Blair and Johnson, it provided opportunities to express their thoughts about Pragma-Dialectics. Second, for those influenced by the informal logic movement, it offered another forum in which to describe what informal logic was and their commitment to it. Finally, it served as a place to present substantive research informed by Johnson and Blair's research agenda. Since the audience consisted of truly international and interdisciplinary scholars, the 1986 Conference was a historically important event for the community of informal logicians.

---

[6] Unlike Pragma-Dialectics that started with a comprehensive theory and later paid more attention to actual practices, informal logic, or at least 'pedagogy-led' informal logic, started with practical interest in improving logic education, which partly explains why textbooks preceded more theoretical monographs, as exemplified in Govier's (1987) *Problems in Argument Analysis and Evaluation* or Johnson's (2000) *Manifest Rationality*. Johnson and Blair's (1977, 1983) *Logical Self-Defence* classifies various types of fallacies, refines descriptions of each of them with actual examples, and makes them available to students as analytical, interpretive, and critical tools. In this respect, Johnson and Blair were guided by more practical concerns rooted in empirical practice, which echoes Barth's call to make logic a more empirical endeavour.

3. OUTGROWTHS OF THE 1986 CONFERENCE

The previous section of this article has revealed how informal logicians' interactions within and beyond their own community culminated in their contributions to the 1986 Conference. The description of the historical period has also drawn our attention to the importance of the infrastructure of or media for knowledge production such as conferences, proceedings, the newsletter and the journal, and the professional organizations before the 1986 Conference. This leads the author to consider what infrastructure of or media for knowledge production that the 1986 Conference produced. The conference proceedings published by Foris, journal *Argumentation* and International Society for the Study of Argumentation (ISSA) are the three key outgrowths of the Conference.

The three-volume proceedings of the 1986 Conference, featuring 131 papers selected from more than 150 presentations, serve as a resource in printed and online media available to the public for further scholarship[7]. The four organizers of the Conference—van Eemeren, Grootendorst, Blair, and Willard serve as co-editors of the proceedings. Although Blair (2018) does not recall exactly how much actual editing and proofreading of the manuscripts he did for the proceedings, he remembers making suggestions about which papers should be published in the proceedings. The first volume—*Argumentation: Across the line of disciplines*—in the editors' words (1987, p. 2), assembles "(t)he papers read by the invited speakers, which have a more general interest for argumentation theory." Papers by Scriven, Govier, Johnson, Blair, and Hitchcock, to name a few, appear in this volume. The 1986 and 1990 Conferences adopt thematic arrangements for the proceeding, but the 1994 and proceedings for later International Conferences on Argumentation arrange papers in alphabetical order by the authors' family names. This is probably because arranging them thematically would be more time-consuming.

The journal *Argumentation* provides another forum for argumentation scholars to inquire into key issues on argumentation on a regular basis. Given that the informal logic camp had *Informal Logic Newsletter* and US communication scholars had *Journal of American Forensic Association* (now *Argumentation and Advocacy*), *Argumentation* provided a parallel space for European dialectical scholars as well as scholars from other regions and disciplines. In the Editorial Preface of the inaugural issue of *Argumentation*, the editor-in-chief Jean-Blaize Grize characterizes the journal as follows:

> *Argumentation* is a new international journal. Its aim is to gather contributions from all schools of thought—ranging from literary rhetoric to linguistics, from history to logic, from theological arguments to legal reasoning, from natural inference to the argumentative structure of science.
>
> The basic principle which will guide *Argumentation* is openness to all currents of thought. The journal is meant to gather scholars from all traditions and from all countries. (Grize, 1987, v)

Besides the openness of the journal to scholars with various traditions from around the world, Grize (1987, v) explains its original editorial principle: "(E)ach issue is devoted to a specific theme, and is under the responsibility of a guest editor. We hope thereby to cover the widest variety of subjects in which argumentation plays a role." In this respect, *Argumentation* was not a regular journal with open submission and peer-review process. The journal extensively used this guest editor system, and it was about ten years before the journal became a regular one, starting with volume 11.1 in 1997, when van Eemeren, Grootendorst, Joseph Wenzel, and Woods served as its editors.

---

[7] In 2018, when the 9th International Conference on Argumentation is held, the proceedings are available at http://rozenbergquarterly.com/category/language/issa/

Instead of publishing mainly guest-edited issues on specific themes, the editors have decided to put more emphasis on the publication of 'regular' issues, restricting the annual number of guest-edited issues to one. Regular issues consist of papers sent to the editors and submitted to 'double-blind' refereeing by experts in the fields who maintain high quality standards. In this way, the editors hope to create a genuine and interdisciplinary platform for argumentation scholars who wish to present their views on subjects in the study of argumentation to an international forum. (F. H. van Eemeren, R. Grootendorst, J. Wenzel, and J. Woods, J. 1997, 1)

The final notable feature of *Argumentation*, at least when it started, was its advisory board members. They consist of argumentation scholars from different disciplines such as Blair, Sally Jackson, Walton, Weddle, Wenzel, Willard, and Woods, as well as prominent public intellectual figures like Umberto Eco or Jurgen Habermas. While the actual work of these advisory board members and their relations to editor-in-chief, editors, managing editors, and editorial board is beyond the scope of this article, the historical trajectory of the journal's development is worth future research.

Whereas the conference proceedings and *Argumentation* both produce written records of research on argumentation, the International Society for the Study of Argumentation (ISSA) has held the International Conference on Argumentation since its the second time in 1990 and awards excellent researchers in the field. Created at the end of the 1986 conference[8], ISSA took over the International Conference on Argumentation, with the same four people— van Eemeren, Grootendorst, Blair, and Willard serving as co-convenors of the conference until Grootendorst's death in 2000. Thanks to ISSA and the Pragma-Dialecticians of the University of Amsterdam, the International Conference on Argumentation is now the largest conference of its kind and continues to attract scholars from a range of disciplines and from many countries.

A key event during the international conference is when ISSA presents four winners with the Annual ISSA Distinguished Research Award to scholars making significant contribution to the study of argumentation. The first winner was Douglas N. Walton in 1990. Three out of the four winners have gone on to be keynote speakers at the international conference. The first Award winner was Douglas N. Walton in 1990.

4. CONCLUSION

Although North American informal logicians, European dialog logicians and speech act theorists, and U.S. communication scholars independently professionalized the study of argumentation as a field of scholarly inquiry, true interdisciplinarization and internationalization of the field occurred after the 1986 International Conference on Argumentation. Arguably, the 1986 Conference was one of the defining moments in the contemporary study of argumentation in that it promoted interaction across fields and prepared an overarching infrastructure of or media for knowledge production. This final section summarizes what has happened in informal logic and argumentation communities.

Judging by the activities of informal logicians and other argumentation scholars, the consequences of the conference are clear. Blair and Johnson jointly or individually presented and published their ideas in various outlets. They (1987) published "Argumentation as Dialectical" in an inaugural issue of *Argumentation*. Also, they spoke at the ALTA Conference in 1993 and published their papers in the proceedings. Individually, Blair was more active than Johnson in this respect partly because he was a convenor of the 1986 Conference. He presented at the ALTA conference in 1987 and publish it in the proceedings

---

[8] Blair (2018) speculates that ISSA was in the minds of van Eemeren and Grootendorst before the 1986 Conference and was 'officially' created at the end of the 1986 Conference.

as well as norms on argumentation conference held in Utrecht in 1988. Additionally, he served as a board member of Armenian Association of Argumentation.

In addition to participating in argumentation conferences and publishing in publication outlets for other disciplines, Blair and Johnson made efforts to make informal logic more inclusive. The Third International Symposium on Informal Logic (TISIL) demonstrates the field's international and interdisciplinary growth. They invited scholars in other disciplines, such as van Eemeren and Grootendorst (Dutch Pragma-Dialectical scholars), Barth and Krabbe (Dutch dialog logicians), Willard and Joseph Wenzel (U.S. rhetoric and communication scholars), and Richard E. Nisbett (a U.S. psychologist). Out of the TISIL, they (1994) published *New essays in informal logic*.

Turning to two other scholars influenced by informal logic, Govier (1987) wrote *Problems in argument analysis and evaluation*, published by Foris Publication located in the Netherlands. Walton started contacting Erik C. W. Krabbe and met him at the 1986 Conference, which eventually led to their (1995) *Commitment in dialogue: Basic concepts of interpersonal reasoning*. Walton (1997) also co-edited *Historical foundations of informal logic* with Alan Brinton, another participant in the 1986 conference. Contributors to this book include other participants such as Raymie McKerrow, Grootendorst, Johnson and Blair. While Walton (2016) did not state in the interview whether the 1986 conference had led him to contact Brinton, we can presume so, based on the fact that the two participated in the conference.

While it is beyond the scope of this article, because of its significance, the 1986 conference should be examined by argumentation scholars with disciplinary backgrounds other than informal logic, for example rhetoric, dialectic, and other perspectives. Also, in light of the lack of historical projects on the study of argumentation, the author would like to urge scholars in other disciplines to research the history of study of argumentation in general, though rooted in their respective disciplinary backgrounds.

Trumped-up arguments: Lies, 'alternative facts' and deception in political debate

MANFRED KRAUS

Philologisches Seminar
University of Tübingen
Germany
manfred.kraus@uni-tuebingen.de

ABSTRACT: Recent political disputes have revealed a persuasive efficiency of lies in public debate and social media. In the public sphere, in which mass audiences are addressed, honesty and truthfulness in argumentation appear to be decreasingly relevant. While ancient theorists were divided on the issue if a speaker might resort to false statements in the interest of persuasiveness, modern approaches such as informal logic or pragma-dialectics rather focus on acceptability of premises, which does not necessarily include truthfulness. The paper analyzes the role of deception in political debate by looking at a taxonomy of mendacities, the effects of made-up 'alternative facts' within argument schemes, the limited ability of mass audiences to tell truth from lies, and detrimental effects of normative language and thought regulations on confidence in the honesty of arguments.

KEYWORDS: alternative facts, argument, deception, fake news, lie, truth, truthfulness, statement, premise, visual argument

1. INTRODUCTION

When I first submitted the proposal for this paper, I did not anticipate how relevant the topic was going to become. My motivation then arose primarily from the experience of the UK Brexit campaign and the 2016 U.S. presidential elections, two events that deeply disconcerted my until then fairly unshaken confidence in the rationality of argumentation in the public sphere. Yet at that moment, I was still convinced this would only be a temporary and transitional disorder. In the meantime, however, things have developed for the worse. Since then, we have seen a general election campaign in Germany, a heated debate on migration in Germany and other European nations, and a series of profound controversies between the U.S. president and the European Union. As a consequence, I had to realize that not only has the use of blatant lies in political debate become more widespread in certain political circles, but – which is worse – also much more efficient and successful than I had ever imagined.

For these reasons, I find it more necessary than ever to shed some more light on the structures of arguments that are based on falsehoods and on the reasons for their obvious persuasiveness. I will start from a definition of what is a lie and some statements on truth and lies from ancient rhetoricians as well as modern argumentation theorists. I will then present a few pertinent cases, from which I will derive a taxonomy of different forms of lies and deceptions and their respective impact on various types and schemes of argument. In a final step, I will try to survey potential reasons for the efficiency of such arguments, and will close with suggestions on possible remedies.

2. DEFINITIONS

A standard definition of a 'lie' would be that it is "a believed-false statement [made] to another person with the intention that the other person believe that statement to be true." (Mahon, 2015, section 1). This definition is a more detailed specification of earlier definitions given e.g. by Isenberg (1973, p. 248) and Primoratz (1984, p. 54, note 2).

This basic definition contains four elements, none of which has been uncontested: First, it presupposes that a lie must have the form of a statement (statement condition). This condition comprises statements made by way of any conventional sign code, including also visual means or bodily gestures. Against the statement condition, it has been objected on the one hand that a statement is not a necessary condition for lying, but that lying may consist in any form of behavior apt to create a false belief in the addressee (Smith, 2004, p. 14; Vrij, 2000, p. 6), including also withholding information with the intent to deceive (Ekman, 1985, p. 28; Scott, 2006, p. 4), but on the other hand that it is an insufficient condition, and that for there to be a lie, not only an untruthful statement, but an untruthful assertion must be made (thus excluding ironic, joking, fictional or 'acted' statements; see Chisholm & Feehan, 1977; Fried, 1978; Simpson, 1992; Williams, 2002; Faulkner, 2007; Sorensen, 2007, p. 256; Fallis, 2009; Stokke, 2013a).

Second, it requires that the speaker knows and believes the statement to be false (untruthfulness condition). But may it not be possible to lie unconsciously, based on insufficient or incorrect information? Some critics have in fact postulated that the statement must also be objectively false, not only believed by the speaker to be false, others that it will be sufficient if the statement is at least not believed to be true (Carson, 2010, p. 18). What, however, if a speaker unwittingly tells the truth, although she believes the statement to be false and intends to deceive (Isenberg, 1973, p. 248; Lindley, 1971; Faulkner, 2007), or if she knowingly tells the truth, but with an intention to deceive (e.g. by omitting relevant details) (Adler, 1997; Saul, 2012), or if a person makes a statement she believes to be neither true nor false, but meaningless (Chisholm & Feehan, 1977, pp. 155-156)?

Third, the untruthful statement must be addressed to another person (addressee condition; see Simpson, 1992, p. 626). Yet may it not be sufficient that the untruthful statement is just made (Griffiths, 2004, p. 31; Shibles, 1985, p. 33), and may it not be possible to lie to third parties that are not directly addressed (such as eavesdroppers), or to institutions (such as a bank or the tax authorities, Newey, 1997, p. 115)?

And fourth, it requires that the speaker intends that this other person believe the untruthful statement to be true (intention to deceive condition); this requirement has been most objected to (e.g. Shibles, 1985, p. 33; Griffiths 2004, p. 31; Sorensen 2007; Fallis, 2009; Carson, 2010; Saul, 2012; Stokke, 2013a; 2013b). For there may be situations in which someone utters a lie, yet without the intention to deceive anyone (for instance a witness who pretends not to have been on the spot, so as not to be dragged into the case; see Mahon, 2015, section 1.5.1).

But most importantly, this definition as it were only shifts the problem to another, no less inaccessible and spiny field, since it presupposes the availability of a reliable definition of truth, which however is equally difficult to attain (see, e.g. Weinstein, 2007). Independently of whether one tries to define truth in terms of logical coherence (coherence theory), or as correspondence between our beliefs and reality (correspondence theory), or on a purely linguistic level (semantic theory), or more pragmatically as a product of trial-and-error reasoning (pragmatic theory), "it is far from clear that truth is a definable notion" at all (Halbach & Leigh, 2018). None of these definitions is easily accessible, nor do any of them warrant a standard of incontestable truth.

Perhaps, after all, the borderline between truth and lies (or, in a more sympathetic term: fictions) is not as easy to draw as it may seem. The Israeli historian Yuval Noah Harari has recently pointed out that 'fake news' and 'post-truth' are not new phenomena, but "humans have always lived in the age of post-truth. *Homo sapiens* is a post-truth species, whose power depends on creating and believing fictions. Ever since the Stone Age, self-reinforcing myths have served to unite human collectives." (Harari, 2018, p. 238). According to Harari, some long-lasting fictions (such as religions, national myths etc.) may turn into truths, and lies told over and over again may become truths. All human communities need myths for their cohesion. From this point of view, the border between truth and fiction gets blurred.

3. TRUTH AND LIES IN ARGUMENTATION THEORIES

Of ancient theorists on rhetoric and argumentation, it is Aristotle who is most adamant on the requirement of truthfulness in all argumentation. For him, although rhetoric is mainly concerned with probabilities, "the true and that which resembles it come under the purview of the same faculty, and at the same time men have a sufficient natural capacity for the truth and indeed in most cases attain to it; wherefore one who divines well in regard to the truth will also be able to divine well in regard to probabilities." (*Rhetoric* I.1, 1355a14-18, trans. Freese, 1926, p. 11). In the *Poetics*, however, he seems to be conscious of the fact that factuality does not necessarily implicate plausibility, which is why poets prefer fictitious plots (1451 b 30-31). But he insists on an orator being truthful as part of his ethos. Compared to this very strict position, it is Plato (would one believe it?) who under certain circumstances, and especially in political contexts, does allow for lies if employed by philosophically skilled rulers, as a kind of medicine: see e.g. *Republic* III 389b-c: "The rulers then of the city may, if anybody, fitly lie on account of enemies or citizens for the benefit of the state; no others may have anything to do with it […]." (trans. Shorey, 1937, p. 213; see also II, 382c-d; III 414b-c).

In that respect, Roman rhetoricians were much more indulgent; perhaps least so Cicero. But the author of the *Rhetoric to Herennius* (around 85 B.C.E.) is perfectly willing to allow for fabrications of facts in the interest of plausibility, even so in a judicial context. But: "If the matter is true, all these precautions [for plausibility] must none the less be observed in the Statement of Facts, for often the truth cannot gain credence otherwise. And if the matter is fictitious, these measures will have to be observed all the more scrupulously." (*Rhetoric to Herennius* I.9,16, trans. Caplan, 1964, p. 29). And Quintilian in that respect follows suit: "They allege also that rhetoric makes use of vices, which no art does, in speaking falsehoods and exciting emotions. But neither of these is disgraceful when it is done for a good reason; therefore it is not a vice either. To tell a lie is sometimes occasionally allowed even to the wise man; and as for rousing emotions, the orator is bound to do this if the judge cannot be brought to give a fair judgement by other means." (*Institutio oratoria* II.17,26-27, trans. Russell, 2002, p. 389). Yet who decides what counts as a good reason for being untruthful?

Yet not even modern theories of argumentation seem to require perfect truth of propositions as a basis for good argument. Especially Hamblin (1970, pp. 234-246) objected to truth as a precondition for the acceptability of premises and opted for their actual acceptance by the recipient instead (see Blair, 2012, p. 94). But such a position would make even mendacious premises acceptable, if they are accepted, which is often the case, as we are experiencing today. Hence, although Johnson basically defends "the truth requirement" against Hamblin (Johnson, 2000, pp. 197-199; see also 1996), Johnson and Blair resort to acceptability; they regard a premise as "acceptable when it is reasonable to expect a member of the audience to take the premise without further support" (Johnson & Blair 1994, p. 297),

or when it is appropriately supported if challenged (p. 76). Other informal logicians have concurred (e.g. Govier, 1985; Freeman, 1988; Little, Groarke & Tindale, 1989).

Nor does pragma-dialectical theory strictly require truthfulness of a statement advanced (see van Eemeren, Grootendorst & Snoeck Henkemans, 2002, pp. 182-183; van Eemeren & Grootendorst, 2004, pp. 190-196). According to the second of the 'ten commandments', a party that advances a standpoint is only obliged to defend it when requested to do so by the other party, i.e. when the standpoint is challenged. And commandment 6 only requires that a premise may not be falsely presented or denied as the accepted starting point for a critical discussion, regardless of its propositional content. Otherwise, there are only rules on procedure or logical validity, but none on propositional contents.

Are lies then acceptable after all as starting points for argumentation in the interest of efficiency and persuasiveness, or for a good cause? Some theorists, including Benjamin Constant (1796, in a controversy against Immanuel Kant's moral rigorism), John Stuart Mill (1863), and Henry Sidgwick (1907), or, more recently, Sissela Bok (1978); Alasdair MacIntyre (1995) or Shelly Kagan (1998) have actually gone as far as that.

4. SIX SAMPLE CASES

To find out how such arguments work, let us look at a few recent cases from the political sphere.

4.1 The NHS millions case

In the course of the Brexit campaign in 2016, champions of Brexit, including especially Boris Johnson and Nigel Farage, used as one of their strongest arguments the promise that the 350 million pounds the UK allegedly paid to the EU every week should better be used to fund the suffering British National Health Service. Then, after the referendum vote in their favour, it turned out that such a redeployment of financial resources was neither intended nor even possible. Suddenly there were 'no guarantees'. Farage even denied that such a promise had ever been made and claimed he had been misunderstood. But, as he and Boris Johnson liked to campaign in front of a giant poster saying "Let's give our NHS the £350 million the EU takes every week", it can hardly be denied. That promise had very clearly been deceptive.

As Kirsty Major wrote on Johnson in the *Independent* of 27 June 2016: "But then what did we expect from a man who has been fired not once but twice for lying?" (Major, 2016). In fact, as Sonia Purnell, author of a biography on Boris Johnson, reports, in 1988 Johnson had been sacked from *The Times* for fabricating a quote in an article, and in 2004 he had been "relieved of his duties" as shadow arts minister of the Conservative Party for allegedly lying about an extra-marital affair. Colleagues from his time as Brussels correspondent for *The Daily Telegraph* also well recalled "Johnson's half-truths", and it was likewise remembered that he had not kept many of his promises made during his tenure as Lord Mayor of London (Purnell, 2011).

4.2 The inauguration crowd case

After the Inauguration ceremony of Donald Trump in January 2017, White House press secretary Sean Spicer accused the media of lying about how small the crowd had been compared to Barack Obama's and actually claimed it was "the largest audience ever to

witness an inauguration, period, both in person and around the globe", in spite of manifest photographic evidence and figures from public transport.

Famously, in her defence of Spicer's allegations, Kellyanne Conway, Counselor to President Trump, coined the expression 'alternative facts', which has meanwhile become a kind of ironic label for the use of false statements in political argumentation. In her view, what Spicer had presented were not lies, but 'alternative facts'. Basically, this expression is an oxymoron, since 'facts' refer to an unambiguous reality of things, which by definition will not allow for 'alternatives'.

4.3 The Bowling Green massacre case

The same woman Kellyanne Conway was also responsible for what is known as the Bowling Green massacre case. In justifying Donald Trump's immigration ban on people from some Muslim countries, she spoke about a "massacre" allegedly committed by Iraqi refugees in the town of Bowling Green, Kentucky, which would have led to an immigration ban on Iraqi people decreed by President Barack Obama. Yet such a massacre had never happened. In truth, two Iraqi individuals had been arrested at Bowling Green and tried for terrorist activities against US soldiers in Iraq. But never was there any attack at Bowling Green, nor was there ever a subsequent immigration ban on Iraqi people decreed by President Obama. The Bowling Green case may hence rightly be regarded as a clear case of manipulation of facts.

Let me add three more cases from recent German politics:

4.4 The Käßmann citation case

In May 2017, German female Protestant bishop Margot Käßmann publicly criticized the ideas on family policy expounded by far-right populists, who stipulated that "biologically German parents" should give birth to more children. What she actually said in a speech given on the occasion of the German Protestant church congress was: "Das ist eine neue rechte Definition von 'einheimisch' gemäß dem sogenannten kleinen Arierparagraphen der Nationalsozialisten. 'Bio-deutsch' soll nämlich bedeuten: Zwei deutsche Eltern, vier deutsche Großeltern: Da weiß man, woher der braune Wind wirklich weht." ("This is a new, right-wing definition of 'domestic' quite similar to the Nazi paragraph on Aryan descent. For "biologically German" is meant to say: two German parents and four German grandparents. There you know whence the brown wind really blows.")

Yet in negligent press reports and very soon also in right-wing social media her statement was cited in a curtailed and decontextualized form, so that it appeared to say: "Two German parents and four German grandparents: There you know whence the brown wind really blows." As a consequence, she was maliciously accused by right-wing conspiracy theorists of bluntly denouncing as Nazis all Germans born from German parents and grandparents (see Sängerlaub, Meier & Rühl, 2018, pp. 25-30). This is an example of how curtailment or decontextualization of a statement may completely distort its message.

4.5 The fake police instruction case

In August 2017, on various websites there appeared an official-looking instruction dated July 13, 2017, allegedly issued by the Secretary of the Interior of the land of Northrhine-Westphalia to all police forces, to the effect that all crimes committed by refugees or migrants should be hushed up on superior orders. This 'document', however, was a complete fabrication: Yet in spite of a plethora of spelling mistakes it was nonetheless shared and forwarded massively in right-wing circles (see Sängerlaub, Meier & Rühl, 2018, pp. 40-43).

In this case, the fake was debunked almost immediately by an official statement from public authorities (Polizei NRW, 2017), a measure that had an instant effect and led to its swift disappearance from the web, which is quite rare in fake news cases (Sängerlaub, Meier & Rühl, 2018, pp. 42; 79-80).

4.6 The Münster amok driver case

On April 7, 2018, a car driver ploughed full speed into a group of people sitting outside a restaurant in the German town of Münster. There were a number of casualties. Because of similar terrorist attacks that had happened in Britain and Germany, suspicions were quickly raised about a possible Islamic terrorist background. And before long, in some social media a screenshot from an Austrian TV news show was presented that featured a bearded, Arabic-looking man. Combined with a footer saying "Car ploughs into crowd – several casualties", the picture was taken to be showing the attacker. Again, that picture was instantly exploited by certain political circles as an argument against liberal immigration policy. Yet it soon turned out that the individual shown was quite simply a harmless eyewitness, who had been interviewed after the incident. The actual driver was later discovered to be a mentally insane German. This misinterpreted picture is thus a good example of a deceptive visual argument, arising from a hasty and unfounded association of picture and accompanying text.

5. A TAXONOMY OF TYPES OF LIES AND DECEPTIONS

From this random selection of cases, a taxonomy of types of lies and deceptions can be derived. The majority of cases are indeed based on false statements. A taxonomy proposed by a recent study on fake news by a German think tank subdivides these in 'misinterpreted content', 'manipulated content' and 'fabricated content' (Sängerlaub, Meier & Rühl, 2018, p. 23). Of our cases the case of Margot Käßmann may be categorized as misinterpreted content, since the quotation had already been infelicitously curtailed and decontextualized in the press release. Misinterpreted content may perhaps also be attested in the Münster amok driver case. Kellyanne Conway's Bowling Green massacre story might or might not be regarded as misinterpreted content. It could just as well have been manipulated content. Yet content may also be completely fabricated, or trumped-up, as the English language felicitously has it. The inauguration crowd case, for instance, is at least manipulated, if not fabricated content. Most clearly fabricated is the case of the fake police instruction.

Our examples, however, also exhibit two special cases. The NHS millions case does not—strictly speaking—involve a false statement, but a dishonest promise. It is hence obviously possible to lie also by making promises one has no intention to keep. In political campaigning, this is of course a very frequent strategy.

The Münster amok driver case, on the other hand, demonstrates that it is not only by way of verbal statements that it is possible to lie, but visual documents may equally be deceptive or made to deceive. A picture may either unwittingly or intentionally be misinterpreted or even manipulated. With modern technical means, it will certainly even be possible to fabricate a picture entirely from scratch.

It may be noted as well, although this is less prominent in our examples, that a lie may also consist in the concealment of relevant facts. This may be partly involved in the NHS millions case, or in the Käßmann case.

Finally, a rather mild form of lying or deception may also be identified in what Daniel Kahneman and Amos Tversky have called 'framing', that is the method by which one and the same fact may be presented in linguistically and syntactically different ways, so as to have

some influential impact on its perception by the recipient (Kahneman & Tversky, 1984). The way a certain statement is interpreted and processed may be decisively (and purposefully) influenced by such linguistic manipulations (see Schulze, 2013).

6. EFFECTS OF LIES ON DIFFERENT ARGUMENT SCHEMES

How would untruthful premises affect various argument forms and schemes? In an argument reduced to standard syllogistic structure, of course, any of the premises, or even both, may happeon to be false. Yet this does not necessarily affect the truth of the conclusion, which may still be true despite the falseness of premises. The conclusion just does not follow from the false premises in that case. So what we have there is rather a problem of relevance. The same is true for all kinds of enthymematic reasoning. Certainly, an argument can also become invalid because of its invalid formal structure. But such cases are not at issue here.

In argument forms of propositional logic, according to the scholastic principle "ex falso quodlibet", a false antecedent will make any implication truth-functionally true. Yet this will not necessarily make the conclusion true as well. Since any implication with a false antecedent is true, no matter whether the consequent is true or false, the consequent may just as well be false; and one runs into a relevance problem here as well. For example, even if it may be truth-functionally true that if the crowd at his inauguration was the biggest ever, Donald Trump is a popular president, this does by no means prove that he *is* a popular president, or at least this does in no way follow from the antecedent, which in that case is irrelevant. But such arguments may still psychologically impress an audience.

If an argument is laid out according to the Toulmin model, it is mostly the data that may be represented by false or deceptive statements, thus depriving the inference of its factual basis. A completely made-up warrant is harder to imagine, but perhaps not entirely impossible, but it may be more easily detected. Yet, on the Toulmin model, lies may be involved also in some other way, namely by way of a concealment of relevant rebuttals. This is probably the most efficient and most covert way of manipulating such a type of argument.

In inductive arguments, made-up facts may be efficiently adduced to strengthen a case by adding more corroborating instances. But it is obvious that such manipulation is guilty of wilful deception and will weaken or invalidate the entire argument, if it is detected.

Finally, in an argumentation that involves visual elements, a lie or deception may consist either in a picture that is entirely fabricated (such as in a photomontage), or else in the misattribution of a picture and its accompanying paratexts, such as in the attribution of a false name or date to a portrait.

7. POTENTIAL REASONS FOR ACCEPTANCE OF LIE-BASED ARGUMENTS

It should have emerged from the preceding considerations that premises consisting of lies or untrue statements are not normatively acceptable and that arguments based on such premises are practically always logically or ethically invalid. But why then are they so efficient and apparently broadly accepted? Several reasons for this come to mind:

First, in such arguments, the argument structure itself basically looks impeccable. Unless the falsity of at least one of the premises is laid bare, the outward appearance of a logically valid argument makes them appear sound.

Second, fake premises are as a rule tailor-made for the purpose they are intended for. Hence they usually fit in with the overall argument as nicely as can be and thus create the impression of a perfect inference.

Third, made-up premises are practically always very simple, simpler than genuine arguments, which naturally tend to be more complex and intricate. In his contribution to the last ISSA conference, based on theories by Evans (2008) and Kahneman (2011), Jan Henning Schulze has introduced a dual-process account of reasoning: "System 1 consists of cognitive processes that are fast, automatic and effortless. System 1 is driven by intuitions, associations, stereotypes, and emotions. […] System 2 is able to think critically, to follow rules, to analyse exceptions, and to make sense of abstract ideas. […] These processes take effort and concentration." (Schulze, 2015, p. 1313). As Schulze emphasizes, in most cases these two different systems of cognitive processes interact. System 1 tends to replace difficult questions and answers by simple ones and to impose simple inferences on the reasoner. System 2, if activated, would normally be able to detect and correct fallacies committed by System 1. Yet the question is whether or not an audience is willing to activate System 2. As we may learn from the Elaboration Likelihood Model, this is often not the case (see Petty & Cacioppo, 1986). Therefore, especially mass audiences with a low cognitive interest, but high personal involvement quite readily jump to simple solutions if they are offered them, and especially so if the conclusion is something they like to hear, and in accordance with their own predisposed world-view. This effect is further enhanced by the fact that supporters of populist political positions prefer to get their information from a closed circle of like-minded sources that tend to buttress and reinforce their own views and create a self-reinforcing bubble, whereas alternative sources of information are regularly shunned off and duly denigrated by demagogic populists as 'fake news' or the like (thanks to David Hitchcock for pointing to this fact in discussion).

Likewise in accordance with the Elaboration Likelihood Model, made-up arguments are usually deliberately made to be quite spectacular and provocative, and are therefore eminently attractive to mass audiences with low cognitive interest, but with high personal involvement. By the same token, such arguments are often accompanied by supportive persuasive measures on the ethotic and pathetic level (such as pathetic gestures, loud voice, or patriotic bombast), meant to distract addressees from any weaknesses of the argument on the central route of processing. For mass audiences with a reduced capability of telling truth from lies as a rule strongly tend to rely preferably on the peripheral, ethos-and-pathos-oriented route of argument processing.

Finally, after years of normative speech and thought regulation for political correctness, the broader general public have frequently lost confidence in the honesty of arguments brought forward in political debates and have developed a certain distrust in the traditional media as sources of information, which they think to be controlled by the elites; hence they rely more on the completely uncontrolled and uncontrollable social media, which however are open to any kinds of unchecked statements that may look interesting, appealing and new to them, regardless of their ultimate reliability.

8. CONCLUSION

Now that we have seen how lies operate in argumentation and why they are so efficient, we are finally in a position to ask if there may be any hope for a remedy against them. On the one hand, this may ultimately be a matter of political culture, of a disciplining of political rhetoric and debate from mere mutual gainsaying toward something more like a critical discussion. What will also be needed is a more efficient routine of fact-checking by independent agencies; and debunking of fakes must be instant, lest it be inefficient. Furthermore, social media also need to be better controlled for the reliability of their contents. And, as Yuval Noah Harari stipulates, scientists should be much more engaged with current public debates

and make their voices heard, since the scientific community has been our most reliable source of knowledge for centuries (Harari, 2018, p. 248).

On the other hand, public audiences must be persuaded to at least partly switch back from the peripheral to the central route of argument processing. They should be made more sensitive to the difference between truth and lies and to methods how lies can be detected. This is very clearly an issue of protracted, even life-long education. In that context, tenacious education in critical thinking will be paramount, even more so today than in any previous period.

Why the Gambler's Fallacy is really a paradox

A.J. KREIDER

Miami Dade College
Homestead, Florida 33030
United States of America
akreider@mdc.edu

ABSTRACT: The Gambler's Fallacy is often characterized as using past outcomes of independent probabilistic events to inform one's expectations of similar future events. Such reasoning is taken as fallacious, because the outcomes of past flips are irrelevant to the probability of outcome of the next flip. I defend the idea that the Gambler's and Reverse Gambler's fallacies cannot simultaneously both be genuine fallacies. Reason requires that we choose one of these instances of supposed bad reasoning.

KEYWORDS: coin-flip, fallacy, gambler's, Guildenstern, paradox, prior, probability, reasoning, reverse, surprise

1. INTRODUCTION

The Gambler's Fallacy is often characterized as the using of past outcomes of independent probabilistic events (like coin flips) to inform one's expectations of similar future events. One might conclude that, since there have been 5 heads flipped in a row, chances are higher that the next flip will also be heads. Or conversely, one might conclude that after 5 straight heads, chances are higher that the next flip will be tails (the Reverse Gambler's Fallacy). These are taken to be fallacious, because the outcome of past flips is irrelevant to the probability of outcome of the next flip (the outcomes are really equiprobable). In his paper, "Why throwing 92 heads in a row is not surprising", Martin Smith attempts to explain away one of the psychological motivations for committing such fallacies – that some probabilistic outcomes are surprising (and thus less likely). He uses a famous exchange between the main characters in the play, "Rosencrantz and Guildenstern are Dead", to make the case – siding with Guildenstern – that even 92 heads in a row should not surprise. Both Smith and Guildenstern are mistaken. In this paper, I defend the idea that in cases such as these, the Gambler's and Reverse Gambler's fallacies cannot both be genuine fallacies. Instead, reason requires that we choose one of these instances of supposed bad reasoning.

The Gambler's Fallacy will be familiar to anyone who has spent any real time in a casino. The most prominent examples seem to occur at the roulette table, no doubt due in part to the fact that casinos provide information as to the results of recent spins of the wheel. In the past, patrons could request tally sheets, on which they could track the results themselves. However, technology has made this unnecessary. Now, one is much more likely to see an electronic screen that shows the recent percentage of black, red, and green results, which areas of the wheel are "hot" or "cold", as well as the last 15 or so numerical results. That the casino provides such information is evidence of its demand by patrons, and the awareness on their part that patrons having such information encourages their betting – which of course, benefits the casino. Since the roulette table represents a Dutch book betting scenario (a scenario where equal bets placed on each option guarantees a win for the house), what matters is that people keep betting. Many bettors, on seeing a string of, say, three consecutive "red" results, conclude that red is "hot", and place another bet on red. Others, thinking that a black outcome

is overdue, bet on black. There are examples of the Gambler's Fallacy and Reverse Gambler's Fallacy respectively. They are both considered fallacious for the reason given above, that past spin outcomes, being independent events, are irrelevant to the current outcome. It is not uncommon for such fallacies to be discussed at the table, and even pointed out as fallacies (though this seems to have little effect on the betting). They indeed have a strong psychological pull. Seemingly implicit in the fallacy is the belief that there is some mysterious causal factor at work (luck, perhaps) that could explain the surprising result. In the first act of the aforementioned play, Rosencrantz and Guildenstern speculate wildly as to such causes – even supernatural ones.

2. BEING SURPRISING VS. BEING UNLIKELY

Smith attempts to ground the psychological pull of these fallacies in the supposed surprising nature of the outcomes. If we think of the odds of a black outcome as being very nearly 50/50 (or ½), then 3 consecutive non-black outcomes is "surprising", and thus we are motivated to adjust our probability assessment for the next outcome. Smith believes this is a mistake, for a couple of different reasons. One is his endorsement of what he calls a 'conjunction principle' (that he attributes to Wolfgang Spohn). Roughly, the idea is that if two independent events are each unsurprising in their own right, then the conjunction of those events will also be unsurprising. Applied to coin flips, if it is unsurprising that each of two individual coin flips results in a heads outcome, then it is unsurprising that there are two heads results. And so on for as many flips as you like – even up to 92 flips. Since no particular heads result is surprising, the entire sequence is unsurprising (or shouldn't be, anyway).

He recognizes that this will seem counter intuitive to many, so Smith goes to great lengths in justifying the claim that seemingly surprising results (like 92 straight heads) really are not (or shouldn't be) that surprising at all. But why? Shouldn't we be surprised at a series of 92 consecutive "heads" flips. After all, the probability of such an occurrence is approximately 1 in 5000 trillion trillion.

Though he doesn't say so explicitly, it is clear that Smith thinks that at the bottom of such suspicions is a confusion between something's being surprising and something's being unlikely. He correctly points out that though such a "HHHHHHH ……" result is unlikely, it is not more or less unlikely than any other combination of results from 92 flips. The all-heads result may stand out, but not for good reason. Calculating the odds of "HTHTHTHTHT …..", or "TTTTTTTT . . .", or "THHTHTTTH ….." (for 92 flips) comes to 1 in 5000 trillion trillion as well. And since each of these possibilities is equally probable, we shouldn't be surprised when one such outcome arises – one such outcome must arise. The all-heads result may stand out too us, appearing patterned. But that says more about us than the probability of the flip outcomes.

Consider perhaps a more common case – that of poker. A royal flush is a five-card hand in which one has the A-K-Q-J-10, all of the same suit. It is a very good hand – indeed the highest hand one can get in standard poker. One is unlikely to get such a hand (I have never gotten one, myself). However, such a hand is not more unlikely than getting the hand – 3 of clubs, 5 of diamonds, 8 of hearts, jack of spades, and queen of clubs. The standard deck has one each of these cards, as is the case for those cards making up the royal flush. Of course, the royal-flush hand stands out to us, because it will win us that hand of poker. The queen-high hand will almost certainly lose. And as far as winning goes, the frequency of getting hands <u>like</u> the queen-high hand is much greater. There are many such card combinations that are likely losers. But, and this is Smith's point, each "loser" hand is equally

likely, and equally as likely as a royal flush. While we should be happy about seeing a royal flush upon turning over our cards, we shouldn't be more surprised by it than by seeing the particular queen-high hand.

I take it that what Smith thinks genuine 'surprise' is, is the calling for of an explanation of an event's occurring - an explanation that is not already in use, so to speak (though again, he doesn't define "surprise" explicitly). Though unlikely, the royal flush is not surprising in that its appearance doesn't require our searching around for a special explanation of its occurring. There's nothing going on here that can't be explained by mere probability. Similarly, the 92-heads result, though unlikely doesn't require explanation either. The all-heads result is "patterned", just like the royal flush is. But that doesn't in itself require an interesting causal factor to produce it. And so, to return to the roulette wheel, even if a large number consecutive red results occurs, believing that these results should inform expectations as to future results is to reason fallaciously. There is no special causal factor at play (producing all the heads outcomes). And so, the psychological pull towards extreme Gambler's Fallacy- type cases is really motivated by a confusion between something's being surprising and something's being unlikely.

3. THE PROBLEM

As I suggested above, this is correct, up to a point. But it doesn't get to the heart of the matter. Smith goes too quickly past the crucial issue, as is evidenced by this passage:

> When faced with this result, of course, it is sensible to check (as Guildenstern does) whether the coins are double-headed or weighted or anything of that kind. Having observed 92 heads in a row, one should regard it as very *likely* that the coins are double-headed or weighted. But, once these realistic possibilities have been ruled out, and we know they don't obtain, any remaining urge to find *some explanation* (no matter how farfetched) becomes self-defeating. As difficult as it may be to accept, there *doesn't have to be* an explanation for this – and it's not rational to search for one. (Emphasis his. Smith 2017)

What is so peculiar about this passage is the bit about it being "sensible" to check to see whether or not the "likely" event of the coin's being weighted. I very much agree that it is sensible, but It's worth asking *why* it is. After all, if the 92 straight heads result isn't surprising (supposedly), what is the motivation to look these other causes? It doesn't seem at all sensible to look for "weighted coin" issues when faced with a "HTHHTTTHTHHTTHTH…" set of results.

The issue here is that the all-heads result prompts us to question are initial probability assessment regarding the flipping of the coin. Was I correct when I initially set the probability of an individual heads outcome as ½? One should worry that one erred in assigning that probability, and that is why one is checking for things like special weighting. If the coin were a double-sided heads coin, then I should not have assessed the probability of a heads outcome at 1/2. I should have assigned it a probability of very nearly one. Bayesians have a name for this: conditionalizing one's prior probabilities. But one need not be a Bayesian to see the point.

If Smith is correct, then there is no upward limit here. Why concern ourselves with just 92 heads? How about a 1000, or a million in a row? (Other than for stylistic reasons of being able to use the play as a foil). The same reasoning could be used for any of these other

cases. If, say, a coin were flipped with a 1000 straight heads, I ought to worry that there is some causal factor at issue. Whether I know the causal factor, or can find one upon some sort of investigation, is beside the point. Let's try some thought experiments.

Suppose I'm playing poker, and I get the queen-high hand referenced earlier. Not surprisingly, I lose. No big deal. Suppose the next hand, I get the *very same* queen-high hand. "OMG!", I say to my table-mates. "What are the odds of that?!" Then in the next hand, I get it again. I should get up and walk away from the table. It is reasonable to believe that there is some causal factor here. That should not have happened, if the probability for getting that particular hand were as I had thought they were. (A parallel can be drawn between this case and the 92-heads case, if you consider the above sequence as just three consecutive 30-heads sequences.)

It is important to note that, contra Smith (and Guildenstern), it does not matter that I can pinpoint the nature of the cause. There could be a shuffling issue, or cheating, or God knows what else. (Even to the point of being "farfetched". Guildenstern's speculation about supernatural causes seems less ridiculous when faced with a one in 5000 trillion trillion event.) The idea that "checking" for some of these causes, and finding nothing out of sorts, should set my mind at ease reminds of illusionists inviting onlookers to see if there is something up their sleeve. They find nothing, and the audience expected as much. But they audience knows there is a trick coming, though they've no idea what the mechanism is. It is also important to note that this is not to reject the idea that the flips are not truly independent of each other. It is not the claim that past flipping that affects the probability of the future flips. There is, perhaps, a causal mechanism governing both past and future flips, that produces heads. Indeed, this is what is wrong with the conjunction principle. The flips may be independent, and individually the results may not be surprising. But the entire string is surprising – surprising that is, unless there is such a causal mechanism producing these results.

Another example: Suppose we are in a possible world where there are lots of coins, but none have yet been flipped, as a decision-making tool – or even just for fun. Smith says, "Hey, if we flip this coin, what are the odds of a heads coming up?" One might reasonably expect observers to place the odds at ½, since there are two options. Suppose though that the next one million flips produced a heads, each time. Surely, the probability would no longer be assigned at ½. It would very likely be assigned a probability closer to one. It might even be speculated that there is a natural law of coin flipping, such that coins, of necessity, come up heads. Smith cannot say this, of course, as the million heads-flips is compatible with a probability of ½ for heads for each flip – and on his view, the million-heads result is just as likely as any other million-flip result. (So similar reasons, he might not see the need to get up and walk away from the poker table.) This is, I think, and absurdity. The point is that the 92 consecutive heads case is like these others.

Another problem Smith faces has to do with a seeming confusion regarding what one commits oneself to by saying the odds of a heads are ½. While it may be true that the all-heads result is equiprobable with each other outcome, one is also committed to an account of number of heads (or tails) one should expect to see after 92 flips. Those different possible outcomes are not equiprobable. Remarkably, Smith discusses this, but responds with a reply similar to the one above. Smith admits that we should "expect" between 40 to 50 heads in the sequence (73%), and <u>really</u> expect somewhere between 30 to 60 heads (99.9%). But, failing to see such a result is not "surprising" for Smith in the sense that a special explanation is called for. After all, the 92 heads result is on the (very far) end of the distribution curve. Apparently, this is enough for Smith. In fact, it hard to see how any improbable event, short of a supposed

metaphysical impossibility, would count as unlikely enough to count as surprising – and thus warrant positing the existence of an explanation beyond mere chance.

4. THE GAMBLER'S FALLACY AS REASSESSING PRIORS

So, something has gone wrong in Smith's account – we should, in fact, reject the conjunction principle. Instead of chalking up such results to mere chance, we should instead use the evidence of the outcomes to (re)inform our initial probability assessment. The result is improbable, *on the assumption that the initial probability assessment is correct*. Somewhere, probably well before we arrive at heads number 92, we should seriously worry that the odds of a heads is not ½ on each flip. Rather, it's higher than that. But this is just the Gambler's Fallacy. If such a reassessment is rationally called for, then the Gambler's Fallacy, in such cases, is rational (and thus not fallacious at all).

What can Smith (and Guildenstern) say, at this juncture? Smith is worried by the sequence (as he should be) so he does the checking – though he's worried that the checking for things like the coin's being weighted is not exhaustive (again, as he should be). But (let's speculate), he knows that there are lots of coins being flipped all over the world and over a long stretch of time. Given this, is it <u>that</u> improbable that a fair flipping of a particular coin yields this result? So perhaps Smith wants to remain firmly committed to the idea that, all along, the coin flips have had a probability of ½. Let's assume that it is reasonable to be so committed. What should he say about upcoming flips? He should believe that the results of this coin flip should begin to "revert to the mean". That is, he should expect the tails results to begin to catch up.

Just to be clear, I am not here claiming either that the tossing of a fair coin cannot result in 92 straight heads, or that after 92 straight heads, the tossing of a fair coin will result in more tails than heads. Those are both claims about the metaphysics of probability, and they are (probably[1]) both false. My claim is about the epistemology of probability claims. After 92 straight heads, one should not assert (or one should retract) the claim that the coin flipping is fair. If, however, one wishes to continue asserting its fairness, one should also expect future flips to be tails. For, if yet more heads come, it becomes yet more unlikely that your initial probability assessment was correct - thus making you yet more epistemically unjustified in your maintaining it. Seeing tails results "catch up" would make the maintaining of the fairness of the flipping justifiable.

And here we begin to see the paradoxical nature of the reasoning at issue, because to expect a return to the mean requires accepting that the odds of non-heads (tails) result occurring in subsequent flips is higher than ½. But this is just the Reverse Gambler's Fallacy - that the 92 heads in a row should inform the probability assessment. Except that in his case, one should assess the probability of subsequent heads as being less than ½.

Let's look at another case. Suppose we consider a basketball player that has been in the NBA for 8 years, during which he has been a consistent 35% shooter from three-point range. In year nine, by the half-way point in the season, he's shooting at a 45% clip. What are we to say here? There are two choices, it seems: one is to conclude that something has happened between years eight and nine (perhaps some new training regimen or shooting technique) that would explain the leap in success. In which case, we should expect the 45% success rate to continue. Or, we should believe that this is just the kind of streak that one

---

[1] Whether they are false depends in part on how probability statements should be interpreted.

might expect (once in a while) from a 35% shooter, and that we should his total shooting percentage for the year will reflect that. This means that we should expect the shooting to be below 35% for the rest of the year.

These are just the Gambler's and Reverse Gambler's fallacies at work. They pull against each other, but they are not BOTH simultaneously fallacious. I suppose, one might of course simply want to bite the bullet and say, "But no, the chances of his hitting the next shot are 35%!" (while stamping one's feet). At which point, I want to ask, "How long must the shooting streak go (or, the string of consecutive heads) before you give this up?" In the coin flip case - a choice must be made – the choice between concluding that one should adjust one's probability assessment such that it is now rational to expect that the next result will be a heads, or, concluding that the initial probability assessment was correct, and that it Is rational to expect (as being more than a 50/50 chance) that the next flip to be a tails. The longer such a string goes, the greater the tension between these two options.

I have not here addressed when, exactly, during one of these streaks, a reassessment of the probability of future flips is called for. I've just argued that it occurs somewhere. (Bayesians claim to put a finer point on it). I'm not here suggesting that no instances of the Gambler's Fallacy are fallacious. It may still be fallacious to reason towards a reassessment when no reassessment is called for. Lurking near the bottom here is the question of what it means to make a probability assessment. Is it a claim of the frequency of flips over time, or some subjective claim given evidence? Happily (for me), that is beyond the scope of this paper.[2]

ABSTRACT: When can exerting pressure in a public controversy promote reasonable outcomes, and when is it rather a hindrance? We show how negotiation and persuasion dialogue can be intertwined. Then, we examine in what ways one can in a public controversy exert pressure on others through sanctions or rewards. Finally, we discuss from the viewpoints of persuasion and negotiation whether and, if so, how pressure hinders the achievement of a reasonable outcome.

KEY WORDS: argumentation, fallacies, negotiation dialogue, persuasion dialogue, pressure, public controversy

1. INTRODUCTION

In public controversies, the discussants are not only arguing for their point of view but also playing in a social arena. They argue to convince others to get their consent, but at the same time they are negotiating and exerting pressure to get things their way. We focus on the exertion of pressure by threatening people with sanctions or enticing them by rewards. When do such means of pressure promote a reasonable outcome of a public controversy, and when do they only constitute a hindrance to its achievement?

We try to answer this question by adopting a dialogical perspective. Thus, we deal with a "public controversy" as an assembly of various types of dialogue, among which *persuasion dialogues* and *negotiation dialogues* are prominent. In a persuasion dialogue, the participants try to reach a *resolution on the merits of the case* for their difference of opinion. In a negotiation dialogue their goal is to reach a *compromise that will be acceptable for all*. Both kinds of outcome can be reasonable.

Ideally, pressure has no role to play in a persuasion dialogue; but pressure is part and parcel of the negotiating process. In practice, both kinds of dialogue are often intertwined so that pressure exerted in the negotiation dialogue can also influence the persuasion dialogue. With this in mind, we want to contribute to the development of instruments for the analysis and evaluation of argumentation in public controversies, focusing on the role of conditional sanctions and conditional rewards (Amgoud & Prade, 2006; van Laar & Krabbe, 2016a).

In Section 2, we discuss the use of persuasion dialogues and negotiation dialogues for achieving a reasonable outcome in a public controversy. In Section 3, we examine the ways one may exert pressure in the context of a public controversy. In Section 4, we discuss whether and how these means of putting pressure on one's opponents hinder or further the achievement of a reasonable outcome. We conclude that pressure can indeed – but need not – degenerate into committing a fallacy such as, on the one hand, an *argumentum ad baculum* ("wielding the stick") or, on the other hand, an *argumentum ad carotam* ("swaying the carrot").

We illustrate our findings by examples taken from the public controversy about the energy transition in the Netherlands.

2. PERSUASION AND NEGOTIATION DIALOGUES IN PUBLIC CONTROVERSIES

A public controversy comprises a mosaic of dialogues of various kinds. Its starting point is usually a combination of: (a) conflicting interests, (b) differences of opinion, and (c) open problems. The prominent role in such controversies of dialogical exchanges in which the parties involved put forward their considerations points to a shared aspiration to reach a *reasonable outcome,* that is an outcome that will be acceptable for all parties and will stand the test of criticism.

We focus on the persuasion dialogues and the negotiation dialogues. In a persuasion dialogue, the participants try to *resolve* a difference of opinion, on the basis of the merits of the case, by an exchange of arguments and argumentative criticisms. But participants in a public controversy are often also involved in a social interplay of forces trying, in a negotiation dialogue, to *settle* a conflict of interests by a reasonable compromise that reflects an exchange of offers and counteroffers. In a negotiation dialogue they use offers and counteroffers (van Eemeren & Grootendorst, 2004, p. 58). A reasonable outcome of a public controversy can be a resolution but it can also be a compromise. In the latter case, the parties may stick to their different opinions but agree to consent to a policy that is, in their eyes, though not wholly satisfactory, yet preferable to a situation without a compromise. In both cases, the outcome has in some way been put to the test.

Sometimes a particular contribution to a dialogue must obviously be evaluated from a normative perspective that applies to persuasion dialogues; sometimes from one that applies to negotiation dialogues. But for fragments of discussion in which both kinds of dialogue are intertwined an evaluator may legitimately apply either or both perspectives, depending upon his or her interests.

Usually, negotiating involves arguing (van Laar & Krabbe, 2016b, 2018). Consider an offer, such as "You may buy this piano for no more than 6000 Euro!" Such a conditional offer instantiates the pattern: "If you are prepared to do X for me then and only then I will be prepared to do Y for you." It can be understood as expressing simultaneously an "expediency argument": "It will be expedient for you to accept my offer because you value this piano at 6000 Euro at least and I ask no more than 6000 Euro." A counteroffer, such as "No, but I am prepared to give you 5000 Euro for the piano!" expresses a critical reaction to the preceding expediency argument but also introduces a new expediency argument. Expediency arguments instantiate the following argumentation scheme: "Accepting my offer will be expedient for you because if and only if you accept my offer you will obtain X at the expense of Y, while getting X at the expense of Y is expedient for you". This scheme is a variant of the one for pragmatic argumentation (van Eemeren, 2016, p. 17).[1] Such an argument, accompanying each offer, can be interpreted as a contribution to a persuasion dialogue (in each case about a slightly different standpoint) embedded in the negotiation dialogue. Embedding is a kind of being intertwined, but not the only one.

---

[1] The arguments that manifest themselves in an exchange of offers and counteroffers can be looked upon as a dialogical variant of an *argumentative pattern* that may characterize a certain institutionally embedded communicative activity. According to van Eemeren, "an argumentative pattern is characterized by a constellation of argumentative moves in which, in order to deal with a particular kind of difference of opinion, in defence of a particular type of standpoint a particular argument scheme or combination of argument schemes is used in a particular kind of argumentation structure" (van Eemeren, 2016, p. 14).

In argumentation theory, the subject of exerting pressure comes up primarily when discussing the *ad baculum* fallacy (Walton, 2000, 2014). But one may also exert pressure by enticing others with a reward. We shall therefore, following Woods, also discuss the "*ad carotam* fallacy" (Woods, 2004, p. 80). According to our usage of these terms, one deals in both cases with contributions that exert pressure on an interlocutor in a way that infringes upon the norms for reasonable persuasion dialogues. But that a contribution to a discussion is illicit from the perspective of persuasion dialogues doesn't tell us much about the legitimacy of that contribution from the perspective of negotiation dialogues, since both perspectives have their own normativeness (Walton & Krabbe, 1995, Walton, 1998).

The term 'fallacy' we reserve, as in pragma-dialectics, for illicit moves in a persuasion dialogue (van Eemeren & Grootendorst, 2004). We adopt the following dialectical definition of the fallacy of *argumentum ad baculum*: Discussant A commits in contribution *c* vis-à-vis discussant B the fallacy of *argumentum ad baculum* if and only if through *c* A makes it clear to B that A will proceed to punish B if B maintains his or her contribution (standpoint, criticism, argument, critical question, etc.) to the persuasion dialogue. Thus we stay in line with the pragma-dialectical theory of fallacies according to which this fallacy counts as an infringement of the *freedom rule* (van Eemeren & Grootendorst, 2004, p. 190). For clearly discussant A is trying through the threat contained in contribution *c* to muzzle B. Let it also be noted that such infringements of the freedom rule are in our opinion not restricted to the confrontation stage of the discussion, where the initial difference of opinion is specified, but may also occur intermingled with the exchanges of arguments and criticisms.

We propose to define the fallacy *argumentum ad carotam* in a parallel fashion. Discussant A commits in contribution *c* vis-à-vis discussant B the fallacy of *argumentum ad carotam* if and only if through *c* A makes it clear to B that A will proceed to reward B if B retracts his or her contribution (standpoint, criticism, argument, critical question, etc.) to the persuasion dialogue. The *argumentum ad carotam,* too, infringes upon the freedom rule and constitutes a fallacy that can also be committed beyond the confrontation stage

3. THE ROLE OF PRESSURE IN THE PUBLIC CONTROVERSY ABOUT THE ENERGY TRANSITION

In a public controversy persuasion dialogues and negotiation dialogues are intertwined in different ways. Not only can dialogues of some type be *embedded* in a dialogue of another type, but there are also *hybrid* contributions: these contain not only a move in a negotiation dialogue but also one in a persuasion dialogue. Further, there are contributions with a *dual function*. We first give an example of a hybrid contribution.[2]

> Example (1) *Transition offers opportunities*
> [The companies] "Siemens, Eneco, Shell, Heineken, Schiphol, Van Oord, and Rotterdam Harbor make their appeal on Wednesday in a letter in the *Volkskrant* [a Dutch newspaper]. In this way, they support the initiative of Samsom and Klaver [members of parliament] to enact a national climate law. (…)
> 'We are convinced that the energy transition must go ahead in order to counter climate change and also see the acceleration of the transition as an opportunity for the development of a new economy', the companies write. (…)
> But then, the companies do have a need for clarity 'outlasting the successive governments', they argue. That's why it needs to be arranged in a law. 'The

---

[2] All examples are taken from Dutch sources and were translated by the present authors.

arrangements must be binding, because our investments will be based on them.'" (Du Pré, 2016, p. 2)

On the one hand, the companies argue in favor of a climate law and an (accelerated) energy transition; on the other, they appear to make an offer: in exchange for a long-term commitment of the politicians, specified in a climate law, the companies are willing to invest more.

The next example is a case of dual function.

> Example (2) *Shut down all coal-fired power stations!*
> In its election program D66 (a progressive liberal party) writes: "Dirty energy originating from coal is, all in all, much more expensive than clean energy. Unfortunately, it is not yet the case that all costs are taken into account when calculating the price. Therefore we must give the market a hand. D66 wants to shut down, as quickly as possible but in 2025 at the latest, all coal-fired power stations in the Netherlands – starting with those that cause the greatest pollution. We safeguard the power supply by the growth of the share of sustainable power, the use of existing gas-fired power stations, and good transport links with surrounding countries." (D66, 2016, p. 32)

In this example, D66 argues for a shut-down of all coal-fired power stations and thus contributes to a persuasion dialogue on this issue. But, since this is a fragment of the election program, there is at the same time an underlying message that the policy preference here expressed will figure as a demand in possible future coalition talks.

In such cases, the kind of pressure that characterizes negotiation dialogues may influence a persuasion dialogue. A party in a negotiation dialogue can be motivated to steer a persuasion dialogue in a particular direction to prevent unwelcome results of this dialogue from restricting its options or undermining its bargaining power in the negotiation dialogue. Suppose, for instance, that a conservative and a green party agree about the climate targets but are negotiating about the ways to get there. Suppose that, in an intertwined persuasion dialogue, both parties come to agree that the climate targets can only be achieved if all coal-fired power stations will be shut down within five years. Then the conservative party can, in the negotiation dialogue, no longer seriously ask the green party to go along with shutting down the last station only after ten years. Therefore the first party may be inclined the use the pressure that is normal in a negotiation dialogue also to redirect the persuasion dialogue.

That some degree of pressure is normal in a negotiation dialogue results from the circumstance that in negotiation every offer one makes involves the application of some kind of power. Offering to do Y is an enticement to get the other to do X. Refusing to do Y is a sanction for the other's refusal to do X.[3] Thus each offer contains a "threat": The promised concessions Y will be canceled if the other does not deliver X.

By applying pressure a speaker changes the social circumstances for the continuation of the conversation. For, as a *result* of the pressure, accepting the offer becomes expedient for the other party. At least, that is what the speaker hopes for. Through expediency arguments, the participants test whether a situation has been created in which the last offer that was put forward can be convincingly argued for on the basis of premises that are then and there accepted.

---

[3] Our analysis of an offer matches Ihnen Jory's analysis of the speech act of making a conditional offer (Ihnen Jory, 2016).

Pressure is a matter of degree. We distinguish two methods of increasing pressure: by the message that there is no room for further negotiation and by upgrading awards or punishments.

The first method increases pressure by suggesting that after a rejection of one's offer there might be no further offer: the parties will be back to square one. One may even point out that this is really the final offer: "no room for maneuver."

The second method would be to increase the rewards for accepting the offer or aggravate the sanctions for rejecting it: "raising the stakes." It is often a plausible assumption that, at the outset of a negotiation dialogue, the parties agree about the inventory of assets that may figure as negotiable: the counters of the negotiation game. When buying a piano the means of exchange is the amount of money, and perhaps also the mode of payment. You may raise the stakes and thus increase pressure by offering more money than you did at first or by proposing to pay cash right now instead of paying by giro later on.

You may also raise the stakes by basing your offer to the seller on an extension of the inventory of negotiable assets, for instance by proposing that, in exchange for a lower price, you are willing to visit the shop from time to time and play the pianos. After such a proposal, the other party should have the opportunity to accept the idea of extending the inventory ("OK, let us discuss that") or to reject it ("No thanks, we accept only money"). When this party accepts the idea, it may still opt for rejecting this specific proposal and for trying to get a better deal.

Moreover, you may raise the stakes by basing an increase of the rewards on a kind of inventory extension that one cannot expect to be overtly accepted. Suppose you not only offer the owner of the piano store 5000 instead of 6000 Euro but also promise her that you as a member of the city council will vote in favor of a proposal for extra parking space next to the store's entrance. That would be called "bribery.' So bribery is also a way to increase pressure.

Finally, you may raise the stakes by aggravating the sanctions, threatening the other party in a way that goes way beyond what this party should have been expecting at the start of the dialogue: for instance, by threatening to blacken the store's reputation on social media if they don't let you have the piano for the sum you are prepared to pay. That would be called "blackmail." Like bribery, blackmail increases pressure.

In Example 3 there is no room for maneuver.

Example 3. *We cannot be stopped*
"They yelled: We cannot be stopped, climate change can! And that's the way it is. This is only the beginning. Today's climate parade in Amsterdam (...) was one of the actions within the rapidly growing movement against climate change (...) It is not a matter of some nice trees or a pretty forest for hiking in the weekends. It is a matter of survival. Within 30 years CO_2 emissions down to ZERO in order to have any chance of a habitable planet. We accept no give and take, no bullshit. (...) We are now at the end of our patience. It is not a matter of cars, airplanes, televisions, and smart phones. It is a matter of rising sea levels, food production, and survival." (Wij Stoppen Kool, 2015)

The fragment contains this offer: "We are prepared to end our actions but only if you check the climate change." Pressure is increased by indicating that there will be no give and take, i.e. no exchange of concessions, making it obvious that this offer will be the last one that the action group is prepared to make.

Example 4 might contain a case of bribery.

Example 4. *Phone calls after office hours*

"Minister Henk Bleker denies that his officials have put pressure on the well-known conservationist Jaap Dirkmaat in order to stop the legal battle against his [nature] policy. (…) But indeed Dirkmaat accuses Bleker's officials of such methods. He refers to phone calls from officials after office hours. They promised to support him in Brussels if he would abandon the fight. Dirkmaat: 'They told me that Bleker would, in Europe, support my Association for the Dutch Countryside. But in that case, I had to forgo all legal action against him and retract the critical letter I sent him mid-March about his nature policy.' Dirkmaat filed in Brussels a formal complaint against the Kingdom of the Netherlands because he thinks that Bleker's cutbacks go against international treaties." (Nieuwsdienst, 2011)

This can be looked upon as an example of a kind of bribery: Bleker's officials offer a reward to entice Dirkmaat to do something in return that is not included in the inventory of negotiable assets, while it is also not to be expected that Dirkmaat could overtly extend this inventory to include this kind of act.

According to our analysis, an offer will always result in some pressure, because it goes with a threat and an attempt to entice, but the degree of pressure may vary. How then to evaluate cases of pressure?

4. THE EVALUATION OF KINDS OF PRESSURE

From the perspective of persuasion dialogue, exerting pressure is irrelevant because pressure does not contribute to a resolution of a difference of opinion. For negotiation dialogues, to be able to threaten with sanctions and to entice with rewards constitutes a *sine qua non* and such tactics must therefore in that context be considered as *prima facie* legitimate.

Also increasing pressure by suggesting that you are approaching, or even have reached, your last offer – "no room for maneuver" – belongs to the permissible strategies of negotiation. For, in negotiation there is often pressure of time and a need to come to the end of the dialectic of offer and counteroffer. But even without pressure of time each party should always be free to prefer a script without a deal to one with a bad deal and to let the other party know that it thinks so.

Extending the inventory of negotiable assets also is to be looked upon as a legitimate kind of strategy. In the literature on negotiation, it is generally recommended as a means of facilitating "integrative negotiation" (Raiffa et al, 2002, p. 191). But this strategy also has a somewhat risky side: proposing to involve more issues in a negotiation can also be seen as a reprehensible kind of horse-trading, or even as blackmail or bribery.

Not all degrees of pressure are in keeping with the goal of a negotiation dialogue. From a normative point of view, the parties in a dialogue of this type are supposed to use reasonable and legitimate means in order to reach a compromise that they will voluntarily subscribe to. Blackmail and bribery are therefore out of order. They are instruments for overwhelming the other party so that their use would endanger the reasonable and voluntary character of a possible agreement. What would count as a case of blackmail or of bribery will, however, be different for different kinds of negotiation. It is not unlikely that the officials in Example 4 (*Phone calls after office hours*) tried to bribe Dirkmaat, but that a similar exchange of services would be entirely appropriate in certain kinds of business negotiation. Thus threats to freeze bank accounts may be inappropriate in a bank-client relationship but not in a context of diplomatic negotiation.

It could happen that two parties are involved in both a persuasion and a negotiation dialogue without letting proceedings in either dialogue influence proceedings in the other dialogue. That might even be possible when both dialogues are intertwined (as explained in Section 3). But in that case one would sooner expect that proceedings in one dialogue would influence the proceedings in the other dialogue. In Section 3, we already pointed out that a persuasion dialogue may affect the available options in a negotiation dialogue. But how may pressure in a negotiation dialogue affect a persuasion dialogue?

The effect of such pressure could be that the party under pressure forgoes further attempts to elaborate her position in the persuasion dialogue or bites back its points of view, critical remarks, or arguments. When the message is delivered that the other party had better keep her mouth shut on a certain issue in the persuasion dialogue if she wants to avoid a sanction or pocket a reward in the negotiation dialogue, this will hinder the normal proceedings of the persuasion dialogue. The more the pressure is increased the more it obstructs the kind of cooperation that is needed for a persuasion dialogue; ultimately, as a consequence of distrust, fear or irritation, a party under pressure may no longer be able or willing to continue the persuasion dialogue.

Negotiation dialogues admit a certain degree of pressure but then the kind and degree of admissible pressure depend on the kind of negotiation dialogue. Persuasion dialogues do not admit pressure. Therefore, as soon as a party in a public controversy exerts pressure within a persuasion dialogue, but also when it does so within a negotiation dialogue that is intertwined with the persuasion dialogue, and as a consequence – intentionally or not – hinders or even blocks the other party in its attempt to put forward a standpoint or express a critical stance in the persuasion dialogue, we say that there is a fallacy committed with respect to the persuasion dialogue: a fallacy of *ad baculum* if the pressure is more like a kind of threat; a fallacy *ad carotam* if enticement is more prominent.

In case the pressure is exerted in a negotiation dialogue but hinders a persuasion dialogue, we shall say that a fallacy has been *induced*. Such effects cannot always be avoided, but even if they occur it is not excluded that the public controversy will as a whole achieve a reasonable outcome. Moreover, one party may have good reasons to exert pressure, for instance in order to counterbalance pressure exerted by the other party and to get this party to adopt a more reasonable attitude (Jacobs, 2009; van Laar & Krabbe, 2016a).

5. CONCLUSION

Exerting pressure in a public controversy will sometimes be necessary. In negotiation a certain amount of pressure is unavoidable, but even in that case that does not mean that all kinds of pressure are equally legitimate. Nor does it mean that there are no *ad baculum* or *ad carotam* fallacies: indeed, such fallacies may occur in the persuasion dialogues that also belong to the controversy. Because negotiation dialogues and persuasion dialogues are intertwined, the legitimate kind of pressure that is exerted in the former dialogues may induce these fallacies in the latter dialogues. From the normative perspective of negotiation dialogues nothing much may be the matter yet from that of persuasion dialogues the argumentation is somehow defective.

It is a task for argumentation theory to provide the means of defense also for this kind of situation, where contributions to the discussion are normal from one normative perspective but abnormal from another.

We conclude, on the one hand, that the exertion of pressure, whether in the form of threats or in that of enticements, can further the achievement of a reasonable outcome of a public controversy as long as the kinds of pressure one applies do typically belong to the

kinds of negotiation dialogues in which they are applied but, on the other hand, that the exertion of pressure can be an obstacle for a reasonable outcome when it affects (directly or through negotiation dialogues) the proceeding of a persuasion dialogue that belongs to the same public controversy.

Situating in a dialogical perspective the tensions between rhetoric and argumentation

ALAIN LÉTOURNEAU

Philosophy and Applied Ethics Department
Université de Sherbrooke
Canada
Alain.Letourneau@USherbrooke.ca

ABSTRACT: With references to teaching and research practices, this article aims at reflecting the specificities of two approaches, the argumentative and the rhetorical, suggesting they complement each other. Their differences might be better understood considering disciplines involved, but they also are typical of linear and spatial processes in communication and thinking, which are described. I suggest to replace them inside a dialogical perspective that does not decide on priorities between figures and inferences.

KEYWORDS: argumentation, dialogue, practical philosophy, rhetoric, tensions, theory

1. INTRODUCTION

Some people work on argumentation, by analyzing discourses and researching for argumentation schemes, which respects the general structure of inferences (notably with Walton, Reed & Macagno, 2008; Kienpointner, 1992). All kinds of modalities and reservations have already brought us quite far from the classical syllogism, but in any case, there still is a number of premises leading to some conclusion. Some others do work on rhetoric, looking at advertisement, images, different kinds of messages but without really focusing on explicit inference: the insistence might be put on the metaphors, what we can call meaning by connotation, association and dissociation, framing decisions and presuppositions that might be shared (or not) between speaker and audience. There is an intersection space and connections between the two trends, but there are differences. Some tensions between these will surface as a challenge in the practical requirements that come with teaching, it might also surface in research projects. But this tension is also quite relevant in the concrete life of interactions, commanding very different strategies and approaches with our co-workers, colleagues or familiar ones (expression well used by Gilbert, 2014).

We should not forget that this also corresponds to concrete schools, with professors situated in departments and research users having to work inside specific curricula. I did not do the whole empirical survey, but let us broadly say that on the one side, we have Critical thinking classes and philosophical approaches to rational thinking, and on the other side courses given in Speech communication, for instance English, German or French etc, treating writing and discourse. In that sense there is also a "disciplinarity" dimension in that tension – I call disciplinarity the fact that people are situated in disciplines, while sometimes looking afterwards for "interdisciplinarity" or even "transdisciplinarity".[1] A few programs are devoted specifically to argumentation, notably in Amsterdam, Windsor and Brussels (those are the most commonly known, but there certainly are lots of others; Poland and Portugal are countries with

---

[1] Létourneau (2008); Thompson-Klein (1990).

important hubs that come to mind).[2] In the case of the writer of these lines, the proper context would be situating argumentation and rhetoric inside a practical philosophy of dialogue aimed at ethical and environmental governance issues – which covers on the one side my teaching, on the other my applied research. This means that from a professional point of view, I have to take into account both sides.

We certainly can differentiate, with Michael Gilbert and Harald Wohlrapp, between product and process in argumentation studies (Gilbert, 2014, 80 f.).[3] The natural tendency will be to discuss products, for instance the written argument. But what happens in discussion and dialogue is something else, and not much is available on that side. And of course there is the special case about written exchanges, for instance on social media, which are a subject of study in themselves. But in any of these three settings, there can be a focus on contents of inference on the one side, and on interactions between partners on the other, effects produced in communication. The possibility that all of this is only a matter of focus and priority might be an appealing possibility, it would be in coherence with what is often called theoretical pluralism.

Furthermore, one central difficulty with the current trends in argumentation study is that most of the time, they do not lead to action but to conclusions. The results of the process as products is a statement, that is going to be discussed in terms of validity, relevance and acceptability. But the situation is not different in rhetorical studies understood as criticism and analysis: there is most of the time no orientation to action, we are going to analyze and comment on given speeches, their sometimes very delicate use of figures. But let me recall that according to Aristotle, argumentation has to do with the probable in dialectics. Rhetoric and the practical syllogism are both supposed to guide us in the action domain, where the probable is the best we have in terms of reasons to decide and act (a point well made by Kock, 2017).[4]

This simple enumeration of different issues aims only to introduce the rest of the development. I will now give more details on the context of the reflection here.

2. CONTEXT: HOW THE DIFFERENCE BETWEEN ARGUMENTATION AND RHETORIC APPEARS

From a practical philosophy point of view, argumentation and rhetoric are precious because they do not aim at encompassing everything in a systematic whole. Even if some will deplore a kind of dispersion in the field, diversity can be seen instead as refreshing and reassuring. Philosophy should allow a bigger place to rhetoric and argumentation, instead of a focus placed only on logic. Philosophers have to grasp the fact that a given knowledge or supposed truth still has to be appropriated by someone, if it is to have meaning for the person in such a way that she can take it practically into account. Lessons given by Toulmin about the field-dependency of argumentation have not completely been learned as of yet.

Many authors mention the importance of context to be able to situate discourses, so here are a few details for this particular writer. Since many years, I get to teach to graduate students coming from different backgrounds in a program asking them to develop knowledge and competence in applied ethics. Applied ethics then is not understood as the simple idea of applying principles to situations. On the contrary, it is supposed possible to study the situation in its context, and let the axiological and normative issues be expressed by inquiring on the situation in its context. This means mostly to consider a situation inside a larger referential of

---

[2] In the United States, there are certainly an abundance of people doing argumentation study, even though it is my understanding that rhetorical studies are more important in the picture.

[4] Kock (2018).

time and space, called here context, but linked to specific issues deemed relevant.[5] Issues of valuation and norms do surface in the practice of any professional, often in the form of dilemmas, but also in the form of a plurality of ends and values to take into account. They are in no case dependant on one particular ethical metatheory, be it the utilitarist, the deontologist or the virtue ethics approaches (this list is not complete). In this particular case, a class of argumentation takes place regularly in Longueuil (Québec), Université de Sherbrooke, for a group of diversified students who enlist in a graduate program in philosophy/applied ethics. We started mostly with people from health disciplines a little more than twenty years ago, because of the primacy of bioethics at the time, but now it is more MBA's, lawyers, notaries, public servants at the provincial, federal or municipal levels, future educators, young philosophers, playwrights, etc. In those condition, the reader will understand that "the audience" is not something really easy to define, since it is always changing from one year to the other.

A constant difficulty is to provide the basis of the discipline involved (Aristotle, some history of rhetoric, Perelman and Toulmin, analytic tools provided in handbooks) with more advanced tools (Walton, Govier) with encompassing accounts like Amossy or a general frame like the Amsterdam school – again, this list is not complete). Seriously considered, this is almost an impossible task for a single graduate course. A first level of difficulty is to provide tools, opportunities to come to an understanding of rhetoric as analysis, and not as a technique allowing to destroy sophisms as they supposedly surface in other speeches and discourses. In the short time available (and for people who most of the times have full time employment during the day), hard choices have to be made – aiming at a larger culture or at getting better with fewer approaches? I went for the cultural and larger approach. After having hopefully gave them to opportunity to appropriate some basic tools, a cooperative strategy is used by putting them to work in teams. It permits me to assign them the complex task of reconstructing the discourses held in some controversy area that happens to be flourishing when the class occurs: as an example, the recent debate on the program on medical assistance in dying was a good case study to reconstruct differing arguments. Hopefully, in the course of this teamwork, they can become a "public" in Dewey's sense (Dewey, 1927). This means that they could formulate their critical opinion in an involved way, after having better understood the battlefield of positions and interests as one might say, but it is still difficult to bring them to come up with the required mastery of analysis and criticism without falling into an oversimplification of the issues. And the passage from that analysis to the ability of nuancing their own arguments is another matter entirely.

Graduate students get situated between Aristotle's tradition, Perelman's sensibilities for the publics, and critical thinking seen as close to informal logic, since Toulmin through Douglas Walton, Van Eemeren, Trudy Govier, Michel Meyer and others. For developing a kind of reflexivity, Wohlrapp might also be referred to. As a way of showing the difficulty, I will recall that refutation is a normal and required thing in dialectic, but almost forbidden if we want to preserve the sensibilities of an audience with whom the speaker is supposed to have shared presuppositions, or even to communicate on the basis of mutual recognition.

Disagreement can certainly be recognized in a rhetoric approach; we will then look for what is shared in common as a way to get over the possible dissensus (Gilbert, 78-79), but this is not always required, possible or even useful in face of deep and protracted disagreement. Between rhetoric and argumentation, pragma-dialectic certainly has linked speech acts constructed from and for people with normative aspects of argumentation (Van Eemeren &

---

[5] Bakhtin (1981). The notion of chronotope in Bakhtin might be useful here. Reference to context will most of the time focus on a selected number of issues, for instance the economic, political or environmental factors. The choice of relevant issues that permits us to talk about "context" is of course greatly variable. If it is to be taken seriously into account, context should be theorized and not only left to spontaneous thinking. I consider these issues as topoi to be discussed and evaluated on a case by case basis.

Grootendorst, 2004), but some would say the balance seems to be tipping on one side. There the discussion is about standpoints, and there is an aim to resolve differences of opinion, and a set of rules to aid in that direction. Sometimes there is no difference of opinion, instead we have the absence of a clear position, and the issue is precisely to establish a standpoint. What if we want to make people discover things, in a perspective leading to action, which implies decision? Those kinds of preoccupations are central both in practical philosophy and in applied ethics; it is the heuristic way already documented in Aristotle, and discussed more recently (Gilbert, 2014).

Furthermore, the speech acts are not only those of "the speaker", if we are to understand the situation as dialogical. Initiative speech acts give place to responses that somehow fulfill the claim, by agreeing, disagreeing or postponing the issue (Weigand, 2009). It is possible to organize as best as possible some discussions between students. But as I had a chance to listen very closely to them, they hardly follow a consequent and linear way. To what point the same seems to go with group work in teams in a practical perspective remains to be analyzed and discussed.[6]

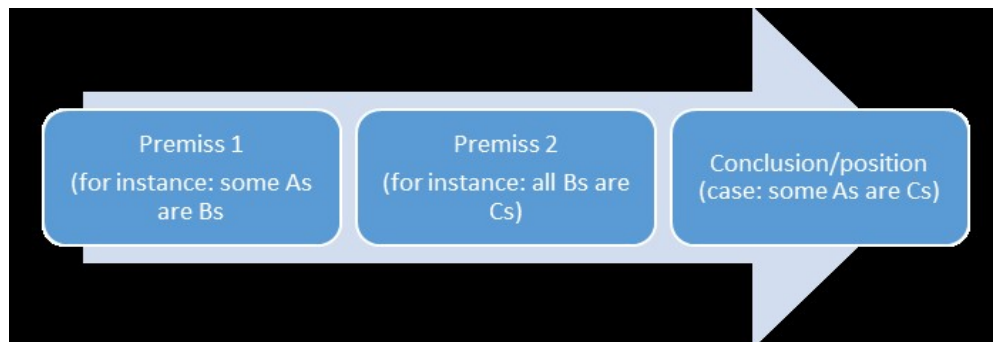
There cannot be fixed barriers between these poles of reflection and action, even if some characteristics are given and tensions surface notably around fallacies (Tindale, 1999). Is it possible to reconcile these friendly brothers, one leaning on language and poetics, the other being closer to logic and formal analysis of validity? We probably can, provided we accept to keep together the inference process as something done by an individual and as something that can be produced by many persons acting together in a dialogical or heuristic way. Here, an ethic of dialogue might help us avoid abuses that can be both rhetorical or argumentative (Létourneau, 2012). But we should keep in mind that dialogue is not to be understood as something devoid of tensions and contradictions (Létourneau, 2017; Létourneau, 2007).

In the first years of my teaching I learned to consider the students as an audience (in Perelman's sense) but switched more recently to seeing them as readers in Umberto Eco's sense: this means having to explicitly construct what I understand of their characteristics (Eco, 1984). As explained before, this means recognizing their plurality, identifying it as best possible. But I am also trying to help them becoming publics in Dewey's sense, which means to be both critical and involved on issues.[7] In principle, rhetoric and argumentation analysis should be and are compatible. In practice, it is a challenge pertaining to interdisciplinarity, between (let us say) literary studies and logical analysis- between the focus on schemes which work according to logical and quite linear sequences on the one side, and presentations which take into account co-speakers or participants on the other side. These are not only truth-seekers, they also are relation-seekers, of different kinds. Situations that are plural could be seen as rhetorical; therefore they are hesitating, plural in their nature, nonlinear. I will take here the time to show and comment on a few schemas that will make my point clearer.

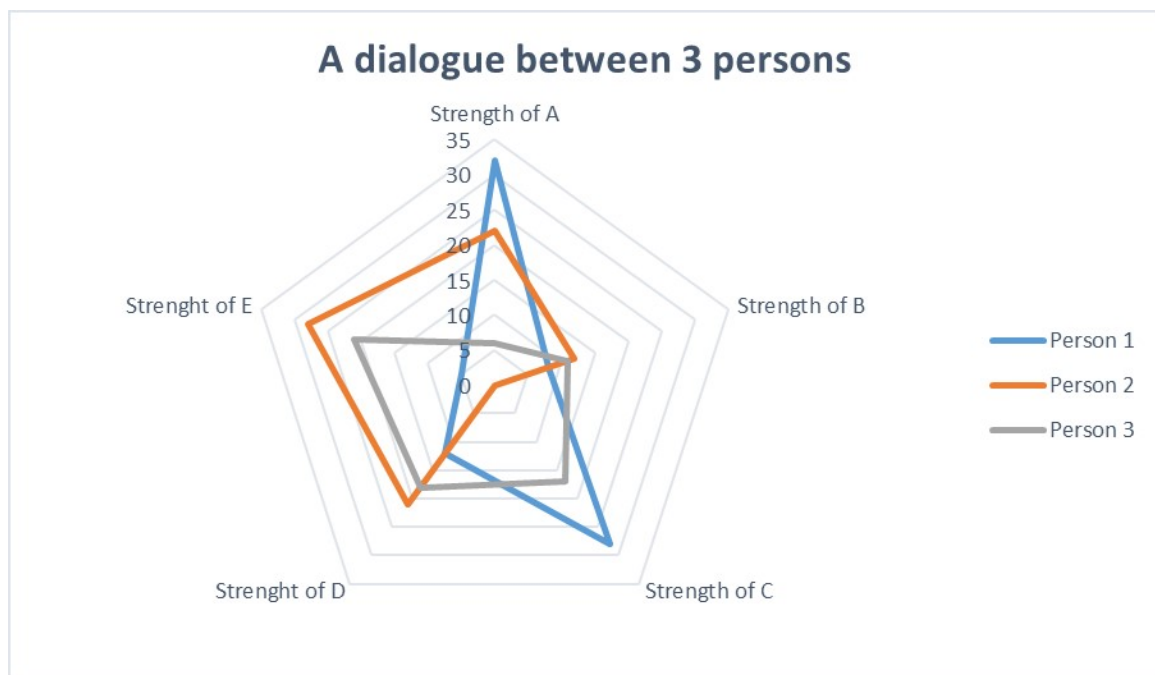
---

[6] I currently co-lead with Isabelle Thomas a project on adaptation to climate change at the local level, but I will have to wait for a later presentation to be able to discuss more in detail the observations that we started to collect are not yet thoroughly analyzed. The projects runs until 2020; see the website of the Ouranos consortium, section Built Environment, www.ouranos.ca.
[7] Dewey (1927).

1. First group of schemas

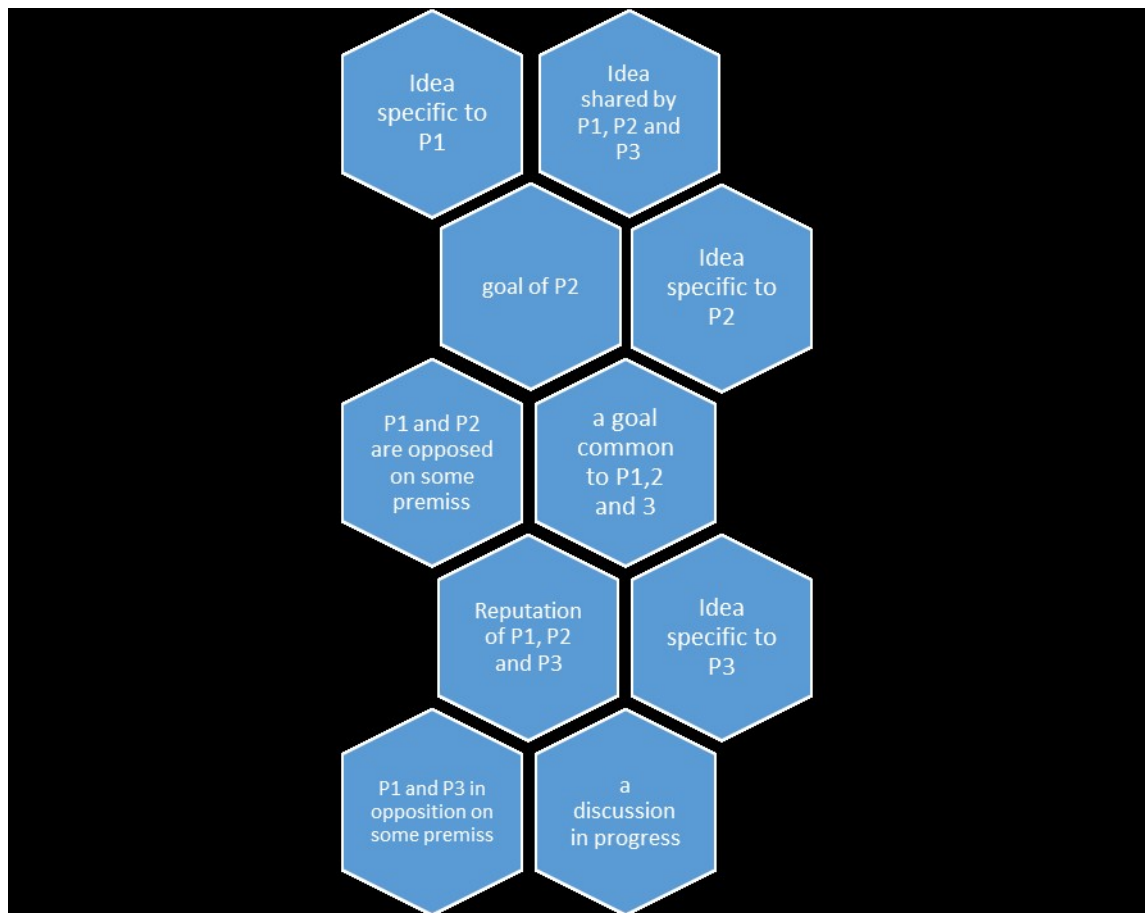
1.1 A simple syllogism


1.2 The Toulmin model : version of 1984, book published with Rieke and Janik

Clearly both schemas of the First group are very linear, they do not require more than one person to produce a reasoning process that would fit into it, and in each case they lead to a particular conclusion, figured in both schemas on the right hand side. [8] An appeal to expertise in Walton's sense, an ad populum or an argument by analogy all fit into the first schema; with some rebuttal and further backing for a given warrant, we structure these elements in the revised Toulmin model, quite linear too. In that group, we could also put all the "tree figures" which are often produced in informal logic, for which normally the conclusion appears below, with or without the help of software (Blackburn, 1989). All of this seems to me typical of argumentation and of argumentation analysis.


---

[8] The second figure in the First group of schemas is the well-known Toulmin model as reworked in 1984. Image borrowed from Hayes, John R. (2006).

2. Second group of schemas
   2.1 A representation of positions unevenly distributed


2.2 A representation of varying strength of positions among actors

Data set for 2.2

	Person 1	Person 2	Person 3
Strength of A	32	22	6
Strength of B	8	12	11
Strength of C	28	0	17
Strenght of D	12	21	18
Strenght of E	5	28	21

In the Second group of schemas, the figures were created, because I did not find published and relevant elements that can serve the discussion. Model 2.1 is not a generalization, it is one particular possibility of a given situation of exchange, provided as an example here. The schema does not include interests of the different persons, their specific belief systems or circumstances, which it should if it were to be more complete. In this figure, we can suppose goals and premises which are shared or not, between some of the partners but in an unequal way. It gives the overall impression of a loose distribution, without any ordering.

In the 2.2 graph, the supposition is that the different persons might attribute a different importance to a number of elements, premises A-E. Here, I suppose a number of six basic elements in discussion, but the number could obviously be different. And of course, strength cannot be strictly calculated: here the highest number should be seen as a symbol of a practical acceptation of a postulate and zero is to be understood as the rejection of the postulate. In both these cases, we are facing something else then linearity. We can sometimes accept to function on the basis of a given idea without being totally certain about it, because the premiss or argument seems good enough. People might not estimate with the same force the value of a given premiss, even if they are not in total disagreement about it.

Both 2.1 and 2.2 graphs indicate a situation where people exchange, but do not share the same positions on all elements, without being in total disagreement on all points. These graphs only permit us to imagine where people are situated or to represent their distribution of ideas. It does not yet tell us how they might discuss with the aim of finding common ground or reaching some basic shared points, as they would do in a heuristical/rhetoric perspective (Gilbert, 2014); but it gives us at least a sort of starting point, a kind of map. It helps us figure the fact that 1) a basic supposition might or might not be held in common, and 2) they could be held but not with the same relative importance in the whole of a person's perspective. If a person is relatively convinced of the value of an argument, the argument might still be put forward in a convincing manner, provided it serves a given purpose in the conversation. On the contrary, if the same argument has a very low value in a person's understanding, the person might be very hard to convince of its importance. All kinds of different combinations of these rhetorical and argumentative issues present themselves in practical life.

What I propose to call the rhetoric-argumentative continuum is certainly not a peaceful realm to navigate, and an easy domain to theorize. A first hypothesis would relate it to the "dialectic" dimension, deemed crucial to many thinkers as a third element between argumentation and rhetoric (Tindale, 1999, 2-3). Then it would really be a kind of "in between" for argumentation theory as preoccupied with the logical either formal or informal, and the rhetorical understood in terms of relationships with audiences (Perelman and Olberrechts-Tyteca, 1970 (1958)). But the dialectical is at home with structured discussion (as with the pragma-dialectical school), with a proponent and opponent. The Amsterdam school and informal logic certainly have this in common. This is perfect in structured debates, but it does not really coincide with a cooperative approach as structured by a heuristic process that I would like to put forward, in classes and also in other action projects on the field. In the practice of

action research, we do not have to choose between having a rigorous argument and presenting it in a vivid way. To not take into account issues of face (cf. Goffman, 1967) while discussing questions in argument would certainly be a profound mistake. I suggest that this continuum between rhetoric and argumentation might be better understood in a dialogical perspective, where there is an inquiry to be done, and oppositions might and should happen but in a constructive perspective. An ethics of the recognition of the other is part of a good way to actually present ideas and proposals. Furthermore, as the schemas before tried to show, it seems to me that whereas argumentation looks quite two-dimensional, heuristic-rhetoric is three-dimensional because it has to do with the complexity of a situation among different speakers. There is no way a diversified crowd of stakeholders can come to some agreement if partners do not take into account claims made or implied by the partners in discussion, that have to do not only with the position taken (as content) but also with the social "position" of the person – a problem for rhetoric as communication. The relative weight of arguments might also differ, and distinctions can be shared unevenly among persons.

Should we decide on the primacy of the one or the other? We know that Tindale argues that all argumentation is grounded in rhetoric, but I would say it is based and sustained in dialogue, especially if we see dialogue as involving tensions and pluralities (with Bakhtin; see Létourneau, 2017). A rhetorical exchange into which no valid inference occurs would not be completely satisfying, at least from a knowledge point of view, even though it might be interesting otherwise. Said differently, the perspective I want to defend here is not to attribute primacy of one or the other element, but to resituate them inside a practical philosophy of dialogue. How are things looking when considered in a dialogical perspective? In a continuum that is already interdisciplinary, quite complex and diversified, how are we to successfully articulate competence in performance (Weigand, 2009), which are also different things even if practically combined all the time? It will not be possible here to do more than just to indicate this general line of reflection.

3. CONCLUSION

Maybe it is because of an assumed situation in a practical philosophy of dialogue, but inside such a perspective, the problem of the relationships between argumentation and rhetoric is more practical than of pure theory. I hope that I have helped theorize their specificity a little more, especially by representing and discussing their characteristics. It seems clear to me that they both are useful and necessary, they complement each other nicely and are assumed in practice by many people, including one famous philosopher even though this combination of abilities is certainly not a propriety of philosophers alone.

The evolution of manipulative argumentation in "Law and Justice's" propaganda. Comparative analysis of *ad populum* argument usage in 2007 and 2017

ABSTRACT: Since 2015, Poland is ruled by a populist party "PiS". The aim of this paper is to disclose the essence of PiS' propagandistic activities, namely argumentative manipulation, which is achieved both through the activation of multiple emotions as well as psychological defense mechanisms, especially in frustrating situations resulting from the failure of the society to recognize important values related to the concept of human rights, democracy and the EU.

KEYWORDS: emotions, manipulation, PiS, Poland, politics, propaganda

1. INTRODUCTION

Since 2015, Poland is ruled by a populist party PiS <Law&Justice, Polish: Prawo i Sprawiedliwość>, which has previously ruled between 2005 and 2007. An abbreviation of the party's name is being sarcastically read by the opponents Populism&Socialism, against their actual political agenda. The main objective of every populist movement is to maintain the power, and to obtain public approval to appoint own nominees for the highest offices.

Since the previous time in office in 2007 the aggressiveness and ruthlessness of propaganda has increased dramatically. Over the past three years the current ruling power has made a lot of changes in the language. It imposed various peculiar interpretations (i.e. the rule of law). Moreover, it has commonly used fallacies such as bifurcation or generalization.

The years 2007 and 2017 are mentioned in the title of the paper, as most of the analysed material comes from these particular years. The analysis covers specifically the entire period of the first government of Law and Justice (PiS), 2005-2007, and the current government, from 2015.

2. SITUATION IN 2005 AND 2015

PiS is a national-conservative, and Christian democratic party. With 237 seats in Sejm (lower house) and 66 in Senate, it is currently the largest party in the Polish Parliament. In the 2005 general election, PiS took first place with 27.0% of votes, which gave it 155 out of 460 seats in Sejm. Lech Kaczyński won the second round of the presidential election on the October 23, 2005 with 54.0% of the votes, surpassing Donald Tusk, the Civic Platform (Polish: Platforma Obywatelska, PO) candidate. In July 2006 PiS formed a right-wing coalition government with the agrarian populist party "Self-Defense" and nationalist "League of Polish Families", headed by Jarosław Kaczyński (president's brother). Association with these parties and inept governance led to the loss of power and premature elections in October 2007, this time in favor of PO.

On April 10th 2010, president of Poland Lech Kaczyński died in the 2010 Polish Air Force Tu-154 crash in Smoleńsk. This event was a shifting point in political discourse in Poland.

In parliamentary elections to both Sejm and Senate that were held in Poland on October 25, 2015 Law and Justice (PiS) won with 37.6% of the vote against the governing Civic Platform (PO). In such a way PiS gained 235 of 460 seats (51 percent).

2.1 The electorate of PiS

In 2005 Law and Justice was a party of the Catholic right wing and Civic Platform of the liberal right wing. The electorates of both groups, originating from the same anti-communist, post-Solidarity root, did not differ significantly, except for the frequency of participation in religious practices. At the time, both parties were even considering political coalition.

The present electorate of PiS is religious, less educated, progressively more older, living in the countryside, and slightly more often experiencing economic difficulties. PiS has more than an average number of supporters among retirees, pensioners, housewives and farmers. Those who are currently professionally inactive constitute more than a half of PiS voters (53%), with one third of them being retired (Pankowski, 2017, pp. 4-8).

According to Maciej Gdula (Gdula, 2017) from the Department of Sociology of the Warsaw University, currently three types of PiS voters can be distinguished, as follows:

1. Anti-communists. People from the middle class who are convinced that the whole world is against them, that someone definitely wants to harm them and make their life harder. For them, PiS is a party that can change their lives and help them to even out the bills, also in terms of personal matters. This group is particularly driven by the urge of destruction of the old, unfair, communist world. At the same time it does not recognize some of the less comfortable, hypocritical facts, for instance a former communist prosecutor - Stanisław Piotrowicz - is currently in charge of Judiciary Reform.
2. Religious. People who have a sense of moral superiority, convinced that an order based on moral rigor is an ultimate solution. For them, support of PiS manifests their superiority.
3. Working class. This group supports PiS because it gives it a sense of community, and a government, which does not neglect the needs of simple man, but acts in his favor instead.

3. WHY PiS IS A POPULISTIC PARTY?

Jan-Werner Müller reads that populism is a particular moralistic imagination of politics, a way of perceiving the political world that sets a morally pure and fully unified—but ultimately fictional – people against elites, who are deemed corrupt or in some other way morally inferior (Müller, 2016, p. 20).

According to the author, every populism is characterised by certain intrinsic features:
- It is always a form of identity politics: populists claim that they, and only they, represent the people, and anyone who does not support them is not properly part of the people.
- The claim to exclusive representation is not an empirical one; it is always distinctly moral.
- Anti-pluralism: other political competitors are just part of the immoral, corrupt elite

- Populist governance exhibits three features: attempts to hijack the state apparatus, corruption and "mass clientelism" (trading material benefits or bureaucratic favors for political support by citizens who become the populists' "clients"), and efforts systematically to suppress civil society (Müller, 2016, p. 7)

In turn, Doug Walton in a thorough and comprehensive study of the *ad populum* argument, defines its following characteristics:

- It is an appeal to emotion, the mass enthusiasms or popular sentiments of the crowd;
- It is a subjective argument that directs an appeal at the prejudices or sentiments of a particular audience the argument is designed to persuade;
- It is a failure of relevance insofar as it tries to evade, cover up, or substitute for a failure to bring forward good evidence or reasons by appealing to the enthusiasms of the multitude;
- It assumes a direct relationship between an argument's validity and its popularity;
- It involves an illicit shift from the critical discussion of an issue to a self-interested bargaining or negotiation dialogue that appeals to members of a special interest group while excluding all those who do not belong to that group from the dialogue. (Walton, 1992, p. 66)

3.1 PiS as a model populist party in 2005-2007

In the first period of the PiS' rule, it was an example of a model populist party that met all the criteria mentioned above. That government was heavily criticised by its opponents (what led to its imminent collapse). Only because PiS did not have an absolute majority in the Sejm, its actions were not as radical as they are in case of the current government. The critics of the regime brought several serious charges against PiS (quotes come from my archive):

1. Propaganda instead of real decision-making.

Never before, apart from the communists, Poland have been ruled by such radical political formations. There has emerged an elite of power that could threaten liberal democracy. Hate speech returns to the political debate. It comes from a government camp – PiS' politicians brutally attack the Constitutional Tribunal, journalists, the opposition and the intelligentsia. (Paweł Śpiewak, Gazeta Wyborcza, 9.06.2006)

2. Ruling and building influence instead of governance:

The positions, appointments and promotions are determined by blind obedience and a demonstration of faith in the political genius of J. Kaczyński and his brother. (Stefan Niesiołowski, Gazeta Wyborcza, 14.07.2006)

3. Illegibility, opacity and unpredictability of governmental actions and decisions:

The events in the Sejm show that after three months of PiS government the state has become dysfunctional and is not able to act effectively. This is very bad news for Poland and very bad moment for Poland. In Poland, we are dealing with a deep crisis in the institution of the Parliament. (Jan Rokita, PAP, 12.01.2006)

4. Corruption:

PiS party caused a new type of corruption, which had not existed in Poland before - political corruption. This party is destabilising the foundations of democratic governance. People from different political parties are offered lucrative positions for their transition to PiS. Almost every parliament member has been offered such an offer. Laws are traded. Such a bribery, on such a scale, has not taken place so far in Poland. (Janusz Palikot, PAP, 28.01.2006)

5. Totalitarism:

Someone called PiS party the post-communist right. And there is something about it. On one hand, it uses right-wing rhetoric, and in fact it is based on what communism was based on - the reluctance to be different, to be anti-intelligent, to be opposed to independent institutions. (Donald Tusk, Gazeta Wyborcza, 22.07.2006)

6. Constant search for enemies:

After just two years in power, PiS is in conflict with all parliamentary parties. J. Kaczyński came into conflict with all the professional and social groups, NGOs and entourages. He has led to the isolation of Poland in Europe. Continuing his rules would be a disaster, a tragedy for Poland. (Stefan Niesiołowski, Gazeta Wyborcza, 10.08.2007)

7. Conflict with the European Union:

Our position in the EU has been weakened, we are alone, we do not have the capacity to attract partners and allies. (Donald Tusk, TVN24, 25.09.2007)

As it turns out, the majority of PiS activities masked by propaganda were similar to the present actions. The following analysis will show the topics and methods of PiS' propaganda.

3.2 PiS as a particular populist party in 2015-1018

Nowadays, PiS is not only a populist party in the traditional sense of the word, but also it has gifted to its voters a new, attractive, coherent and communal identity. This idea of PiS is based on an emphatic offer for real and imaginary victims of the Third Republic of Poland. The most important components of this offer are, on the one hand, fairer redistribution and class promotion, and, on the other hand, revenge and resentment. On the emotional level, PiS' narration is reinforced by alleged assassination of Lech Kaczyński and Polish parliamentary members in the plane crash in Smoleńsk.
I will discuss features of populism in PiS' execution in 4 basic fields:
1. External social relations
2. Internal social relations
3. Culture and knowledge
4. Mentality

3.2.1 External social relations

External social relations concern the way of perceiving foreigners, including other countries and nations, immigrants and the EU. One of the key factors in this approach is the Stereotype of Collective Soul (SCS).
SCS is a form of collective representation of the enemy and refers to the external group as a whole, which is given certain characteristics of intentional existence (hence the „soul") and is assigned certain intentions and the ability to deliberately implement the „will of the group" through its members. Such a group can be defined as any „they": Smolensk criminals, vetting liars, secret agents, Jews, Masons, Russians, Germans, etc. SCS is based on the application of diabolic causality to a foreign group, i.e. treating this group as „forces of evil" (Kofta & Sędek, 1999, p. 173).
A common subject of conspiracy theories is „remote control" of hostile group by some distant centre of command, located outside of "our" territory, (global government; secret

centre coordinating actions against „us", e.g. European Union, Brussels, Venice Commission).

Thus in PiS propaganda we have "coalition against Poland" consisted of total opposition and EU bureaucrats. For example, the conflict with the EU calling for compliance with the law in Poland was presented as an attempt to interfere in its internal affairs. When in 2016 Minister of Foreign Affairs, Witold Waszczykowski, asked the Venice Commission for their opinion on the Polish crisis around the Constitutional Tribunal, Commission's verdict definitely did not support the actions of Polish government. Then Waszczykowski admitted that he regretted his decision and that he felt cheated by the Venice Commission. According to the minister, the Commission „insults the Polish government and Polish society because it presents untruthful, false, unilateral reports on Poland".

3.2.1.1 Nationalism, racism & xenophobia;

Germany plays a special role among the „forces of evil". Kaczyński said in an interview for the "Rzeczpospolita" daily, that the EU was dominated by one state, in fact by one person (Kaczyński, 2017). When Donald Tusk in 2006 said, that it is not possible to talk about a stable, secure Europe without good, friendly Polish-German relations, he was recognized as Germanophile. The ruling party believes that the activities of the parliamentary opposition and of the entire EU are arranged and dictated by Germany.

The news' strips from the Polish Television (TVP Info and „Wiadomości" from TVP1), which often underscore the achievements of the PiS government and sharply criticise the actions of the opposition, have gained particular popularity. In addition, the process is done in a pathetic, exaggerated way. The effect is sometimes quite bizarre, as in the case shown in Figure 1.

Figure 1. Germany is sponsoring anti-governmental protests (source: TVP1, 06.09.2017, 19:30)

There are some other examples of anti-German propaganda retrieved from TVP strips:

German policy risky for Europe again.
Germany does not want strong Poland.
Democracy in Germany in danger.
German television lies.

Previously discussed Stereotype of Collective Soul causes immigrants to be counted among the "forces of evil", and fear of them is fervently fueled by party's propaganda. Jarosław Kaczyński during the election meeting in Maków Mazowiecki on October 10, 2015, said:

> The influx of refugees to Poland may mean an epidemiological threat related to tropical diseases (…) Different types of parasites, protozoa, which are not dangerous in the organisms of these people, can be dangerous here."

Moreover, in order to dilute responsibility, the propaganda suggests that this is the case throughout Europe. They warn Poles against being persuaded that the aversion to refugees is something wrong, and that we are no exception in Europe.

3.2.1.2 Belief in conspiracy theories

After the plane crash in 2010, PiS' leaders would not accept the official report explaining the causes of the accident. A lot of conspiracy theories, explaining how the Polish president was assassinated, emerged. Many books, articles, and documentaries were published, and even a feature film was created. After PiS regained the power, the Smolensk Commission, headed by Antoni Macierewicz, received almost unlimited funds from the state budget. Its task is to find any evidence in support of the theory of assassination.

3.2.2 Internal social relations

Internal social relations concern the way of perceiving one's own country and nation, including women, people with different opinions, sexual orientation or beliefs.

3.2.2.1. Antipluralism and visualizing the nation as a monolith expressing common will

According to the already quoted opinions of Walton and Müller, propaganda appeals to members of their own group while excluding all those who do not belong to that group. For PiS' propaganda, the opposition simply has no justification or is extremely stupid:

> We are dealing with a political opposition, which is not able to oppose the government in a factual manner. "Banana opposition", which has nothing to offer for the nation. That is why they didn't even choose to fully oppose the government, but instead they're trying to use a blunt axe of an ever-drunk lumberjack. [Whatever it actually means...] Men with no honor, women with no shame (Januszewski, 2016).

Even the public media is being "silenced" when it does not agree with the party's policy and tries to criticise it. Ryszard Terlecki, the Parliamentary Caucus Head of the PiS, commented in an interview the progress of the work on a new media law in such words:

> Even if it would require some haste now, if the media imagines, that in the coming weeks, it could occupy Poles with criticism of our changes or our proposals for changes, it must be stopped (do, 2015).

In short: anyone who is against the government is against Poland. Because the state means the government. Figure 2 presents another interesting example of TVP stripe:

Figure 2. Government's opponents insult the Polish people (source: TVP1, 13.08.2018, 19:30)

In the Manichaean image of the world "we" represent goodness and sincere intentions, "they" are bad by definition, i.e. the presidential veto against the unconstitutional bills regarding the National Judicial Council and the Supreme Court was presented by the propaganda as an act against the nation.

3.2.2.2 Recognition of different points of view as a sign of betrayal;

Betrayal has become a key concept for PiS. Of course, anyone who does not support Jarosław Kaczyński's party in 100% is a traitor and belongs to "the worse sort of Poles". During the interview in TV Republika on December 11, 2015 Kaczyński said:

> In Poland, there is such a fatal tradition of national betrayal. And that is the reference to it. It seems to be in the genes of some people, the worst sort of Poles.

A division into "we – they" is at the root of every populism, and the clearer are the separations, the easier it turns out to be a non-alternative choice. Therefore, traitors are: a) opposition, b) the supporters of the EU, and, of course, c) Kaczyński's greatest enemy, Donald Tusk.

a) On July 19, 2017 in Sejm, when Borys Budka, the member of Civic Platform, said that Lech Kaczyński understood the division of power, Jarosław Kaczyński just exploded, taking the floor "without any procedure" and shouting:

> I know that you are fearful of the truth, but do not wipe off your treacherous snouts with the name of my late brother. You destroyed him, you murdered him, you are the rascals! (available at https://youtu.be/g1mqMRpKZ6E)

b) The vote to extend the term in office of Donald Tusk as the Head of the EU Council, which Poland had lost with the result of 27 votes to 1, by Kaczyński was commented as follows:

> This is a success which, in fact, simply discredits them, because this 'one' - is Poland, and 27 are the other countries, and it all fits into a very bad tradition of national betrayal, which has been in existence since at least the 17th century (Kaczyński, 2017).

c) In 2005, PiS' propaganda promoted a belief that Donald Tusk is an enthusiast of a "Prussian party" and Germanophilism, and that Germany plays an unclean game against Poland by using the servility of a large part of our political elites:

I report to the Prosecutor General on the suspicion that Donald Tusk has committed a crime of treason in favour of the Federal Republic of Germany; evidence: collecting money from the BND (Wyszkowski, March 4, 2016, *Twitter*)

The Figure 3 presents disgusting cover of "Gazeta Polska" with Tusk in a Nazi uniform. Even the extreme right-wing historian Sławomir Cenckiewicz had a negative opinion about it:

The cover is terrifying and absurd, and what about the fact that I am going to express my opinion on this issue, since, as you can see, my colleagues who make such covers are die-hard persons (Cenckiewicz, 2017).

Figure 3. Cover of "Polish Newspaper" 15.03.2017 (source: https://www.gazetapolska.pl/archiwum/okladki)

3.2.2.4 Propaganda of success

Same as under the communist regime, all the activities of PiS have been presented as epochal successes. For instance, according to the propaganda, the reduction and marginalisation of Poland's position on the international arena is a great achievement of the government of Jarosław Kaczyński. According TVP news, the government of a united right wing builds strong position of Poland in the world and Polish economy is breaking subsequent records.

3.2.3 Culture and knowledge

In the times of the communist regime, the "political correctness" of science, art and culture was ensured by the ubiquitous censorship. Today, censorship does not officially exist, but some of the government's actions are a living reminder of it.

3.2.3.1 Lack of space for development of knowledge

The attempt to take control of universities and subordinate them to politicians is explained by the alleged leftism of universities:

> University employees shaping the minds of new generations of Poles communicate leftist and communist ideas. Some of them do not even have any scientific skills, and are part of academia just for the merits towards the old system. It is worth noting that the University of Warsaw is mostly associated with this environment. Recently, it held a conference on the legacy of Karl Marx. It is this university that promotes all leftist cultural and moral patterns, but does not allow to conduct conferences on the defense of life. (Ł.B, 2018)

Meanwhile, dr Adam Puławski, a valued Holocaust researcher, was removed from scientific research by the Institute of National Remembrance. The historian is repressed for the fact that the results of his research do not agree with the PiS' historical policy. Many Polish and foreign scientists, including prof. Norman Davies and prof. Timothy Snyder, have signed the protest letter in regard to this matter.

3.2.3.2 Cultural appropriation

Obviously, not understood as the adoption of the elements of a minority culture by members of the dominant culture, but as hidden censorship, re-organization and re- financing of the culture under the nation-state control.

As much as PLN 28 million will be spent on the latest film „Legions" by Maciej Pawlicki, producer of „Smolensk". Thus, the movie telling the story of the legendary Polish military force, will become one of the most expensive productions in the history of Polish cinematography. The decision to grant the subsidy was made by the Minister of Culture Piotr Gliński, despite the fact that the critics evaluated the scenario very harshly. The situation was commented by propaganda as follows (again Germans!):

> It seems that the Germans are bothered that Poles are taking care of their patriotism. They do not want Poland to make films about our victories or about throwing away of the German yoke. It could be understandable somehow, they got used to the Polish submissiveness and timid acceptance of the German narration about Polish history. But there is no choice for them - now they have to get used to the fact, that in Poland we have another „oath crisis", there is no obligation for us to obey the Kaisers and Chancellors from Berlin. (TK, 2018)

At the same time many events and institutions of international recognition and great importance for Polish culture have been deprived of state funds:

- Subsidies for Malta International Theatre Festival in Poznań, one of the most important artistic events in Central and Eastern Europe, were cut by The Ministry of Culture and National Heritage. The reason for that was the fact, that Oliver Frljić, Croatian director of the controversial spectacle „The Curse", was one of the supervisors of the Poznań festival.
- For the same reason subventions for Theatre Festival Dialog-Wrocław, have also been reduced.

- The international reputation of Polish Theatre in Wrocław has been destroyed due to inappropriate administrative decisions.

3.2.4 Mentality

Life in Poland after the fall of communism was far from perfect. Some people forget that we left the communism with luggage of the great backwardness. We are developing dynamically but we are comparing ourselves to wealthy west countries that built their prosperity from times of the Marshall's plan. PiS has capitalized on the frustration with the post-communist transition — uneven economic advancement and a failure, so far, to catch up with the West. Norman Davies wrote that contemporary Poland "is still paying for the ravages of the Second World War and of the People's Republic. Three generations of exploitation and oppression were never going to be overcome instantaneously." (Davies, 2001, p. 401)

3.2.4.1 Resentment and redefinition of history

The paradox of Polish history is that today the importance of crucial dates and events has been lost amid currently parliamentary squabbles and disputes. On 4 June 1989, that communist bloc's first partially democratic elections were held. For the first time, voters could decide through the use of ballots who would hold seats in parliament.

However, achievements of III Polish Republic during past 26 years have been really impressive: they managed to restore democratic institutions, master inflation, assure the economic growth, make huge civilization jump and enter RP membership to UE and NATO. Instead of any satisfaction at the role we were able to play, PiS' propaganda concentrates only on disenchantment and fault-finding. June 4, 1989, the day of first democratic elections, has been called by TVP strip "the symbol of treason and collusion of elites".

Fault-finding and negation of what we have managed to achieve between 1989-2015 has now become PiS' specialty. That attitude to a large extent runs counter to objective facts. It also differs from the way our country has been evaluated by those who come from abroad. By contrast, PiS tends to dismiss achievements we ourselves have scored, replacing them with the martyrdom of the president Lech Kaczyński fallen in Smoleńsk, throwing away of the German yoke and arising from knees, etc.

3.2.4.2 Traditionalism, especially religious

In a country, where the secularity of the state is guaranteed by the constitution, purely religious events commonly become state proceedings.

First example: the idea of Jesus' enthronement dates back to the first half of the 20th century. It is associated with visions that the Polish nurse Rozalia Celakówna was to experience. Internal voices were to tell her that Jesus was asking the Polish authorities to recognize him as the King of Poland.

Unsuccessful attempts to create the Act of Enthronement were made both before and after the war. The real intensification of these activities, however, took place in the last dozen of years. In 2006, a parliamentary initiative was launched in the Sejm to give Christ the title of Jesus, the King of Poland. But even the Church was against it. In March 2008, the Episcopate asserted that proclaiming Christ as the King of Poland was „inappropriate and unnecessary". However, eventually they have changed their mind. In January 2016, Bishop Andrzej Czaja declared: „We have found that recognition by a native community of the reign of Jesus Christ over her is theologically acceptable." (mako & TS, 2016)

In accordance with this findings, the Jubilee Act of the Reception of Christ for the King and Lord was adopted in April 2016, and during the official ceremony on November 19, 2016 Christ was enthroned „King of Poland". About 6,000 people took part in the ceremony with the President Andrzej Duda and other politicians from the government ahead. (ds, 2016)

Second example: on April 7th, 2017, the secular Sejm of the Republic of Poland, with 245 votes in favor, adopted a resolution for the commemoration of the 100th anniversary of the Fatima revelations.

4. METHODS

4.1 The structure of TVP News

TVP news are no longer an information programme - it is impossible to find out any reliable information about the situation in Poland and in the world, if the information is not consistent with the party's message. These inconsistencies are simply tacit, such as the lack of any information about the awarding of The Man Booker Prize to the Polish writer Olga Tokarczuk, disliked by PiS.

The "TVP News" structure contains several fixed elements:
- a unit of boasting about the achievements of the current government;
- an appreciation for the cooperation with the USA (including the justification for Donald Trump's actions);
- criticism of EU activities;
- criticism of the previous government;
- an attack on opposition activities;
- the opinion of an expert (usually affiliated at a Catholic university);
- presentation of pro-social activities of Law and Justice (PiS);
- a 'man-in-the-street' opinion on a radical improvement of living conditions;
- some statistical data showing support for the government or criticism of the poor methodology in the case of data unfavourable for PiS.

4.2 Framing

Thomas Nelson defines frames as alternative descriptions or interpretations of the same information, problem, or solution. Frames guide our understanding of a problem's origins and offer suggestions about how to evaluate solutions. One way that frames accomplish the latter is by articulating the criteria by which decisions should be made and problems solved (Nelson, 2004, p. 582). Frames are created, for example, by the use of specific words or sayings, quotations, metaphors and examples, or by the relevant summary of the speech.

For instance, all of the government's actions are good and cannot be subject of criticism, they are all a „good change". There are some examples of newspeak and loaded language (Głowiński, 2017):
- antipolonism - criticism of actions of the PiS government;
- volksdeutching[1] - addressing the institutions of the European Union looking at the unconstitutional actions of PiS authorities;
- incontrollable, independent media - media having a similar or the same worldview as PiS;

---

[1] During II WW, Volksdeutsche were Poles of German ethnicity who signed German People's List (Deutsche Volksliste). Those who joined this group were given a lot of benefits in the occupied country.

- normality - PiS rule;
- Polish-language German media or media published on the Vistula River not always by Polish publishers - „Gazeta Wyborcza", „Newsweek", „Fakt"

5. CONCLUSION

The objective of propagandistic message is to publicise every slightest success of the government, to glorify every action, even those that violate the law, Constitution or any European standards. The information should be provided either unilaterally or hushed. It is an everyday practice to discredit the opposition or non-governmental organisations.

The viewers are fed mainly on fear and hatred. Since the problems with the rule of law in Poland begun, to which the European Union authorities have actively responded, we have been dealing with a cycle of anti-European programmes. The aim is to build hate both towards the Union as an institution, and towards its individual members. The European Union is presented as an external aggressor, which only wants to harm Poland.

The scale of manipulation, bias and partiality of statements, opinions and information is comparable to that of the communist regime. Propaganda creates a world parallel to reality and, unfortunately, some people ensnared by propaganda believe in its existence.

On Aristotle's maxim argument

RUNCHENG LIANG

Institute of Logic and Cognition
Sun Yat－Sen University
Guang Dong 510275, China

ABSTRACT: A maxim is a proposition that tell people how to act. The use of maxim is a maxim argument. Such argument can show the character of the speaker, which is mainly used in deliberative speech. The reasoning mode that practical wisdom makes people possess is the normative structure of maxim argument. Thus, normative argument has "ends-means" scheme and "rule-case" scheme.

KEYWORDS: Aristotle, maxim, maxim argument

1. INTRODUCTION

First, maxims are the norm of action. Aristotle pointed out that maxims are general assertions about actions and illustrate actions that people should choose or avoid. It can be seen that maxims do not reflect people's choice of actions in specific contexts, but rather guidelines that explain how people should act. Therefore, the specific maxim is a specific code of action. It has two meanings. First, the maxim is an action choice proposition. It expresses actions that people should take or avoid. Second, propositions contained in proverbs are normative and can be used as actual situations. Reason for action selection. For example, "minded people should not educate their children to be too clever" is a maxim that supports the "I should not educate children too intelligently" action choices.

Second, the use of maxims is a maximal argument. Aristotle pointed out that maxims are the premise or conclusion of enthymeme, and for confusing or controversial proverbs, the speaker must give reasons when using it. When maxim is the conclusion of the argument, the speaker gives the reason to prove it, and at this time, he explains the maxim or defends the maxim, not use it. Maxims are a code of conduct. It contains principles of action and rules of action. When people choose specific maxims as premise, they generally use it to make action choices. Therefore, the use of maxims is a maxim argument. One of the premise of this argument is a specific maxim, and its conclusion is a concrete action choice.

Third, maximal argument can show character. Aristotle pointed out that the advantage of using a maxim is to make the speech "ethical". When a prudent choice is displayed, the speech can demonstrate the character. All the maxims have such an effect, because people talk about a maxim and express it. Preference, if the maxim is good, then the speaker shows good character. (Aristotle, 2007, p.168) We know that there are many maxims, and the choices of different people may be quite different. For example, Christians and non-believers have very different behavioral norms. It can be seen that the selection and use of maxims reflect people's characteristics. One of the premise of the maximal argument is a specific maxim, and its conclusion is a concrete action choice. In order to give a maximal argument, people need to pick out a number of maxims as a prerequisite for the argument. Moreover, based on the same context and maxims, people's choice of actions may also be different. Therefore, the maximal argument fully reflects people's value choices and rational capabilities.

2.

The persuasion is accomplished by character whenever the speech is held in such a way as to render the speaker worthy of credence. If the speaker appears to be credible, the audience will form the second-order judgment that propositions put forward by the credible speaker are true or acceptable. This is especially important in cases where there is no exact knowledge but room for doubt. But how does the speaker manage to appear a credible person? He must display (i) practical intelligence (phronêsis), (ii) a virtuous character, and (iii) good will.

Showing practical wisdom is the core of showing good character, this point is based on the following three reasons: First, ethical virtues make people have the right purpose, but it cannot make people have good argumentative capabilities; secondly, the audience's goodwill to the speaker derives from his behavior of giving arguments, because Aristotle believes that the argument is the backbone of the speech, and the audience judges the speaker through the speech; finally, the practical wisdom makes people have excellent argumentative capabilities, which can help people to get the action choices that can realize the goal set up by ethical virtues, so practical wisdom combine people's ethical virtues and goodwill into good arguments.

Practical wisdom is the ability of people to use good arguments and seek correct action choices. It reflects a specific argumentation mode. Practical wisdom and ethical virtues are closely linked: Ethical virtues establish the correct purpose, and practice wisdom to seek means to achieve their goals. Moreover, people's practical wisdom means that he can perform good deliberation: First, deliberation is a kind of inqury, it faces uncertainty, the information that has been identified does not need to be explored, and secondly, good deliberation contain reasons, the acquisition of correct results requires the support of a good argument. Finally, the practical wisdom lies in good deliberation that is, the search for the right means to achieve the goal.(Aristotle, 2004, pp. 112-113.) Also, practical wisdom gives commands because it gives people what they should or should not do.(Aristotle, 2004, p.114.) In summary, practical wisdom has the following characteristics: First, ethical virtues establish goals for practical wisdom. Second, Practical wisdom seeks action choices that can accomplish the purpose. Third, this seeking process can be expressed as correct arguments. Fourth, the action choices given by practical wisdom are fully justified.

According to Aristotle's description of practical wisdom, scholars have summarized two modes of operation: (1) means-purposes, (2) rules-cases.(Zhu Qinghua, 2014) Practical wisdom is an ability of good deliberation, and good deliberation is a process in which people use good arguments and seek correct actions choice. Therefore, these two operation modes are two kinds of argument modes. The first mode refers to people choosing actions based on their purpose. For example, if I need cover, the cloak can cover the body, so I should make a cloak; the second mode is that people can confirm the action selection based on the action rules. If everyone should walk, you are alone, so you should walk.

The above two reasoning models involve two dimensions of action. Some scholars have pointed out that practical wisdom involves two levels: "What should be done?" and "How should we done it?" The former establishes the direction of action, and the latter defines the specific approach or method.(Yang Guorong, 2012)The revelation for us is that the ethical virtues establish only the general purpose. These purposes are the root causes of action. Practical wisdom combines the purpose set by the ethical virtues with the specific situation and gives people the direction of action, and the ways to achieve it.

From a functional perspective, action choices should be divided into action claims and action plans. Directly based on the purpose of the action choice is the action claims, it is the beginning of the action selection sequence, illustrates the action that can achieve the purpose, and the rest of the action options in the sequence is the action plan, they are in the existing action claims, explain how to Execute action claims. In order to make the action plan normative, people will resort to specific rules of action. These rules are special action options that people have concluded through long-term practice in concrete situations. They can make the process of implementing action claims is standard and ensure that the action claims can be successfully implemented.

3.

Maxim argument needs to reflect the argument mode of practical wisdom. We have argued that showing practical wisdom is the core of displaying character: When practical wisdom is showed, audience will judge speaker have ethical virtues and good-will. In this case, the maxim argument must showcase practical wisdom. Otherwise, the speaker is not showing the good character that Aristotle thinks, but is showing other characteristics. This means that, under the requirement of displaying good character, the reasoning mode of practical wisdom is the normative structure of the maximal argument, and there is a corresponding relationship between them.

Reasoning or inference is the inner psychological process of people, and the argument is the language reconstruction of the psychological process. Argument scheme is not a specific argument, it reflects the basic elements of a particular argument type, and is equipped with a corresponding critical question to evaluate the type of argument. If we want to figure out the argument type which can display character, we need to give the argument schemes of these arguments. This paper will adopt the pragmatic argumentation argument schemes system, because it is the most concise argument schemes system, and it has only three types: causal types, symptom types, and analog types. Based on specific research areas, people can dig out more detailed patterns based on these three categories.

The general form of practical argument is: Action X should be taken because action X will bring a positive result Y, and type X action [such as X] that brings a positive result of type Y [such as Y] should be taken.(van Eemeren FH, 2016) This argument scheme can portray "means-purposes" model, because the realization of the city state goal, are some positive results. From this, we can modify the general scheme: "Accept action X" is the action claims; positive result refers to the result of achieving city-state goals. So we have the following scheme:

Action X should be taken.

Because Action X will result in the achievement of a city state outcome Y, and if the action can lead to the achievement of a city-state goal, the action should be taken.

For practical argument, pragmatic argumentation gives five corresponding critical questions: Is the result worth pursuing? Does the reason given by the argument lead to this result? Are there other factors and causes together to produce the result? Is there any side effect? Can the results be obtained by other reasons?(van Eemeren FH, 2007, p.166) The response to critical questions determines the quality of the argument: the positive answer implies that the argument is good. On the contrary, the argument is bad. In the "means-purpose" model, the critical question will also change: the result refers to the achievement of the goal of city-state, whether it is worth pursuing depends on the purpose it represents; the reason refers to the action advocated by the speaker.

The general scheme of a causal argument is that Y is correct for X, because Z is correct for X and Z leads to Y.(van Eemeren FH, 2007, p.164) This type of argument can describe the arguments reflected in the "rule-case" model because establishment of applicable conditions is the reason why people choose specific actions. From this, we can modify the general pattern: X refers to the scenario delineated by the speech topic, it is already known to the speaker and the audience, so there is no need to mention; Z refers to the conditions of application of action rules; Action Y" is the action plan. Therefore, we have the following scheme:

Action Y should be taken.

Because, the speaker pointed out that the application condition Z is established, and when Z is established, action Y should be taken.

For the causal argument, pragmatic argumentation gives three critical questions: Does the cause lead to the result? Is the reason mentioned need other factors to lead to this result? Is the result caused by other factors?(van Eemeren FH, 2007, p.168)In the context of "rule-case", the critical question will also change accordingly: the reason refers to the applicable conditions; the result refers to the action plan. Question 3 applies to abduction argument, but the goal of using the

action rules is not to explain the facts in front of them, but to determine the action plan. Therefore, question 3 does not need to be considered. However, the second problem is to be dealt with, because the result of action Y is assumed to contain a lot of information in addition to the application of conditions. In these information, the suitability of the process which speaker judge the application conditions true in the situation, the feasibility of Action Plan Y, and the relevance of the action rules and action claims are the three most important ones: The first determine whether the action rule can be applied in this scenario; the second determine is whether the action plan Y can be implemented; the third is the reason for selecting a specific action rule.

Are conductive arguments a distinct type of argument?

YANLIN LIAO

Modern Logic and Application Institute / Department of Philosophy
Nanjing University
China
alanliao9101@foxmail.com

ABSTRACT: Whether conductive arguments are a distinct type of argument or not is a highly disputed and fundamental issue in argumentation theory. Firstly, this paper reconstructs the debate about the legitimacy crisis of conductive arguments, which focuses on coping with "Adler's problem" and its variant, and presents my criticism of Blair's logical approach, and Xie and Xiong's rhetorical approach. In order to better defend the legitimacy of conductive arguments, a perspective of argument evaluation is provided and it is claimed that the logical role of counter-considerations lies in changing the criteria of argument evaluation. In conclusion, conductive arguments are a distinct type of argument.

KEYWORDS: Adler's problem, conduction, conductive arguments, counter-considerations, negative considerations, pro-con arguments

1. INTRODUCTION

In 1971, the American philosopher Carl Wellman came up with a distinct type of argument "conduction", which was claimed to be "neither deductive or inductive" or "refuse to fall into the two traditional categories of reasoning" (Wellman, 1971, pp. 50-51). According to Wellman's definition, conduction has four characteristics below (Wellman, 1971, p.52):

1) a conclusion about some individual case; 2) is drawn non-conclusively; 3) from one or more premises about the same case; 4) without any appeal to other cases.

Conductive arguments (conduction) are very common in everyday life. For example, "he is graduated from a prestigious university, so his comprehensive capabilities are great", "logic can not only improve people's reasoning abilities but also the sense of humanities; therefore, it is the right thing to study logic". Wellman divided conductive arguments into "three distinct patterns" based on the differences of the premises group (Wellman, 1971, pp.55-57), while the third pattern "pro-con arguments" is the most controversial and high-profile one.

Pro-con arguments are a type of argument whose conclusion is drawn from both positive and negative considerations (Wellman, 1971, p. 57). Some examples provided by Wellman are (Wellman, 1971, p.57): "in spite of a certain dissonance, that piece of music is beautiful because of its dynamic quality and its final resolution" and "although your lawn needs cutting, you ought to take your son to the movies because the picture is ideal for children and will be gone by tomorrow". And the weighing process of whether pros outweigh cons or not, is the key to evaluate conductive arguments. In view of its distinctive features (including positive and negative considerations) as well as everyday practicality, conductive arguments have been an important and popular topic of argumentation theory.[1]

---

[1] Recently, the discussion of conduction generally focuses on the third pattern "pro-con arguments". Therefore, if without special indication, the term "conduction" or "conductive arguments" in this paper refers to pro-con arguments.

J. A. Blair and R. H. Johnson published *Conductive Argument: An overlooked Type of Defeasible Reasoning* in 2011, which covered a variety of issues, such as historical antecedent of the concept of conduction, the definition, analysis, evaluation of conduction, etc. This book drew much attention to the studies of conduction (Blair & Johnson, 2011). Among these issues, the legitimacy of conduction is generally viewed as a fundamentally important topic. For this topic, Zenker (2011), Adler (2013), Blair (2016), Possin (2016), Xie and Xiong (2013, 2017) actively participated in the discussion and debate in recent years. However, researchers have been far from reaching an agreement on the legitimacy of conduction. Possin expressed his concern, "After decades of debate, the nature of conductive arguments has become progressively less clear." (2016, p. 564) This essay tries to clarify and evaluate the legitimate crisis of conduction, and present a new perspective to the justification of conduction.

2. "ADLER'S PROBLEM" AND ITS VARIANT

In view of the characteristics and common usage of conductive arguments, a brief definition of it can be presented:

An argument is a conductive argument if and only if: 1) it satisfies four characteristics of conduction mentioned by Wellman; 2) its premises include positive and negative considerations.

Adler (2013, p.249) argued that the definition of conduction implies two "incompatible" claims, which make conduction impossible. It is called "Alder's Problem":

(I) The counter-considerations are irreducible or ineliminable—the conclusion, C, is reached without nullifying the counter-considerations.
(II) C is accepted as true, which issues in belief. C is detached from these premises (reasons), so that what is accepted or believed is C itself.

Though the claims above are not clear and understandable enough, Blair (2013, pp. 111-114) summarized Adler's points in an explicit manner based on a careful examination on Adler's text. According to Blair's clarification, I think the two conflicting claims can be concisely presented below:
(I') Conductive arguments are "non-conclusive", so the negative considerations remain viable (continue to weaken the argument) even though they are outweighed by positive considerations.
(II') The conclusion of conductive arguments should be without any qualification, such as the term "prima-facie", "probably", etc.
For Adler, it seems that (I') and (II') are obviously conflicting. He contends that (I') is just "the standard view" while (II') is "the crux of" conflict that requires defense. Therefore, he makes much effort to justify (II') from different aspects, like the relevant illustrations of Wellman and Hitchcock, the primary purpose of argument and the significance of unqualified and so forth (Adler, p. 250). Unfortunately, researchers do not intend to attack (II') but their actual target is (I'), especially in the term "non-conclusive".
Blair finds that (I') indicates that Adler misunderstand the term "non-conclusive" or "inconclusive". Adler thinks "non-conclusive" means "undermining reasons remain viable" (Adler, p. 248), but after reviewing Wellman, Govier and Pinto's text, Blair makes a clarification: in the context of conductive arguments, "non-conclusive" means "premises do not deductively entail their conclusions—that they are defeasible" (Blair, p.116). Moreover, Adler (2013, p. 252) mentioned that conductive arguments can be defeasible. It seems that that as long

as Adler corrects his misinterpretation of "non-conclusive", there will be no self-conflicting problem in the definition of conductive arguments any more.

Then, has "Adler's Problem" been resolved by Blair's clarification? I do not think so. Firstly, suppose we put Adler's misunderstanding of the term "non-conclusive" aside, the proposition "the negative considerations remain viable even though they are outweighed by positive considerations" still holds. In Adler's view, the proposition is still obviously inconsistent to (II'). As Xie and Xiong pointed (2013, pp.3-5), regardless of the fact that Adler's misunderstanding, the incompatibility that he detected "might still be there". Secondly, although Adler said that conductive arguments can be defeasible, the term "conductive arguments" he used does not refer to pro-con arguments. Therefore, there is a variant of "Adler's problem": how is it possible that the conclusion of conductive arguments is unqualified while the negative considerations remain viable? In order to answer this question, we have to further clarify the role of negative considerations in conductive arguments. The rhetorical perspective presented by Xie and the logical perspective presented by Blair can be regarded as two main solutions to the question.

For Xie, the distinction between thinking and arguing can be used to clarify the role of negative considerations in conductive arguments (2017, p.18):

Roughly speaking, weighing and balancing is a process of thinking in which we critically inquire into an issue, trying to consider both the pros and cons in order to reach a certain (reasonable) view. The use of a conductive argument, on the other hand, is an act of arguing by which we intend to persuade some other to accept a particular view that we have already reached and currently hold.

This is to say that the negative considerations are only viable during thinking, which is a stage prior to arguing. But as soon as entering the stage of arguing, the negative considerations are not viable anymore because the particular view has been already reached and currently hold. The next question is: what can the negative considerations do during arguing if they are not viable in this stage? Or what is the role of negative considerations in conductive arguments? From the rhetorical perspective, Xie claims that the negative considerations are not intended to enhance the justificatory power of arguments, but to increase its persuasive effect (2017, p.6). In this connection, he presents his argument in different aspects (2017, pp. 5-13).

Firstly, the negative considerations are often followed by adverbials of concession, like "even though", "although" and "notwithstanding". From the theory of Gricean conventional implication, these adverbials could serve to convey that "these reasons against the conclusion are outweighed" or that "the speaker has taken account of not just favorable considerations, but unfavorable ones as well". In a word, the mention of negative considerations is to make the argument appear to be more persuasive, thereby making the conclusion appear to be more solid.

Secondly, Xie conducted an empirical study about the role of negative considerations in conduction. 401 Subjects were asked to compare two arguments: argument A consists of one conclusion and two supporting reasons (considerations) while argument B is made from the argument A by adding two more negative considerations for the conclusion. The research shows that most of subjects (80.7%) thought that argument B is more persuasive.[2] Importantly, 89.3% of subjects did not recognize negative considerations as reasons or premises. They gave some explanation of the role of negative considerations, such as "made the argument appear to be well-considered", "serve as a foil stressing the significance of the posive reasons", "retreating in order to advance". The result provides empirical foundation for the rhetorical perspective of conduction.

---

[2] Subjects are college students from various majors, but all of them are taking an introductory course on logic when they take this survey.

Thirdly, Xie gives a precise characterization on the rhetorical mechanism of negative considerations in conduction from "topical potential", "audience demand" and "presentational devices", which are the conceptual tools of the Pragma-dialectical notion "strategic maneuvering".

So far, through the rhetorical perspective, the variant of "Adler's problem" is able to be solved in the following: in conductive arguments, the negative considerations are purely rhetorical tool so that they are not viable (continue to weaken the argument). If so, it is very reasonable that the conclusion should be unqualified in conductive arguments. In other words, the rhetoricians solve the variant of "Adler's problem" by denying "the negative considerations remain viable". The legitimacy of conductive arguments, however, would be dissolved at the same time in this way. As Blair said, if weighing and balancing is only taking place before arguing, then conduction might be regarded as a pattern of reasoning rather than argument (Blair, p.123).

As a proponent of the logical perspective of conduction, Blair does not want to solve the variant of "Adler's Problem" at the cost of sacrificing the basic legitimacy of conduction (conduction is a type of argument). Blair (pp.122-125) contends that negative considerations not only appear in one's reasoning, but also can "legitimately" appear in arguments. Because negative considerations do not function as purely rhetorical tools, but has their own logical role in conduction (p. 124):

  The mention of the con considerations indicates that the argument is weaker than it would be thought to be if only the pro considerations had been mentioned. For example, "she deserved first prize in the literary contest because, although her prose style did not stand out, her plot was so ingenious and her characters so interesting" is not as strong a case for first as, "She deserved first prize in the literary contest because her plot was so ingenious and her characters so interesting."

The example above is intuitively correct. Although Blair makes a very important point here, he does not give an elaboration of it. In order to better reveal the strength of the arguments, I will illustrate more about this example:

(1) Her plot was so ingenious and her characters were so interesting, she deserved first prize in the literary contest.
(2) Although her prose style did not stand out, her plot was so ingenious and her characters were so interesting; therefore, she deserved first prize in the literary contest.

Generally speaking, the prose style decides whether the article is special enough or not, which is probably a key factor of article evaluation. Blair thinks (2) is weaker than (1), probably because the negative considerations of (2) is obviously powerful. Unlike the rhetoricians, the variant of "Adler's problem" can be solved in a logical way: It is possible that the conclusion of conductive arguments is unqualified while the negative considerations remain viable. However, the argument (has both positive and negative considerations) is weaker than that only mentions positive considerations. This is to say that the logicians resolve the "contradiction" by transferring the qualification for conclusion to argument strength (support degree between premises and conclusion).

Xie comes up with a doubt for the logical approach. He argues that the weakness of conductive arguments does not lie in the existence of negative considerations, but some kind of incompleteness (2017, p. 17): "arguing conductively has arbitrarily presumed as acceptable a working outweighing-relation that has played too fundamental a role in justifying the conclusion, hence cannot be left assumed and unexamined." Nevertheless, I think that the negative considerations and outweighing-relation are an indivisible "pair" in conductive arguments. It is because of the existence of negative considerations, a working outweighing-

relation is supposed to be assumed. In other words, the root of weakness of conductive arguments still lies in the logical role of negative considerations.

To sum up, appealing to the strength of arguments can indeed solve the variant of "Adler's problem". Is it, however, sufficient to justify the logical role of negative considerations?

3. THE LOGICAL ROLE OF NEGATIVE CONSIDERATIONS

There is a subtle situation which should not be ignored: When positive considerations are much more powerful than negative considerations (making them appear to be trivial), it is very hard to say that the negative considerations really weaken the argument. But it is necessary to discuss the situation, because this is even the most typical case of conduction in some logicians' mind. For example, Freeman (2011, p. 28) thinks that the argument is not a conductive argument unless its negative considerations are much weaker than its positive considerations. And this is the reason why the arguer merely needs to mention the negative considerations but needs not to explicitly illustrate the rebuttal of them. In this situation, appealing to argument strength is probably not able to justify the logical role of negative considerations. For instance:

(3) Although her article was not very long, her plot was so ingenious and her characters were so interesting; therefore, she deserved first prize in the literary contest.

Even though we admit that the argument strength of (2) is intuitively weaker than (1), the argument strength of (3) is not clearly weaker than (1). Compared to plot and characters, the length of article is very trivial for article competition. At this time, we may not intuitively confirm that the strength of (3) is weaker than (1). It is easy to imagine that when the positive considerations are much more powerful than negative considerations in certain conductive argument, it will be very doubtful to say the negative considerations can weaken the argument strength. More importantly, argument strength is like a "spectrum" (from the strongest to the weakest), which is essentially different from the concept of "validity" (all or nothing). In terms of the evaluation of conduction, theorists have come up with various methods. For instance, Govier (2013, pp. 361-363) offered a concise method of "the range of exception", and Fisher (2011) gave a more elaborative examination of some crucial concepts mentioned by Govier's method (e.g. "case", "ceteris paribus"). Besides, Pinto (2011) also criticized Govier's method and tried to evaluate the strength of conduction through the concept of "relative strength". Unfortunately, these methods seem not to cope with the comparison between the strength of (1) and (3).

Here we can conclude that the strategy of appealing to argument strength cannot solve the "subtle situation", which means the logical role of negative considerations cannot be well justified in such cases. From a perspective of the criteria of argument evaluation, I try to provide a new proposal for the justification of the logical role of negative considerations. (1), as a single-premise defeasible argument, its criteria of argument evaluation only lies in whether the premise provides sufficient support for the conclusion. As soon as becoming (2) or (3) by adding some negative considerations, the criteria of argument evaluation become two conditions: (A1) positive considerations can outweigh negative considerations; (A2) positive considerations provide sufficient support for the conclusion. Only when the two conditions are met can the conductive argument be counted as a good argument. Surprisingly, many researchers seem to emphasize condition A1 only but overlook condition A2. For instance, Wellman (1971, p. 57) mentioned that one decides whether the argument is valid by weighing the pros against the cons. However, if only condition A1 is met, the argument will not be good. For example, when the

positive considerations are weak (cannot provide sufficient support for the conclusion) while the negative considerations are much weaker than positive considerations, the conductive argument cannot be counted as a good argument even though its positive considerations can outweigh negative considerations. As a result, the presence of negative considerations is able to change the original criteria of argument evaluation (just one condition) into the new criteria of argument evaluation (two conditions).[3]

There might be two potential doubts of the new proposal. Firstly, perhaps someone queries that since the negative considerations are very weak, does it mean that condition A1 must be met? Then, why does it matter that mentioning condition A1? I think this query "inverts" the process and products of argument evaluation. As soon as introducing the negative considerations, the criteria of argument evaluation will be changed from A2 to A1 & A2. And the weakness of negative considerations is one of the products of argument evaluation based on A1. In other words, it is not the case that A1 is meaningless because the negative considerations are very weak. Instead, since we do the argument evaluation based on A1, we are able to know that the weakness of negative considerations.

Secondly, some may say that the presence of negative considerations does not change the criteria of argument evaluation. Because for every argument, the criteria of argument evaluation always should be a "combination" of two parts: (P1) positive considerations can outweigh negative considerations (if any); (P2) positive considerations provide sufficient support for the conclusion. For the arguments without negative considerations, P1 is satisfied trivially. Although the "combination" seems to be a little strange, I can agree with its point. However, the "combination" fails to cover up the logical role of negative considerations. For the arguments without negative considerations, P1 is always trivially true. But when negative considerations come into the arguments, P1 is not a vacuous condition (trivially true) anymore and become a substantial condition. Therefore, the logical role of negative considerations can still be justified from the change from "vacuous condition" to "substantial condition".

The discussion above does not take the rhetorical perspective into consideration, but purely focuses on the logical analysis—analyzing the supporting degree between premises and conclusion. Although the strategy of appealing to the criteria of argument evaluation seems to be simple, it can reflect the logical role of negative considerations, which is changing the criteria of argument evaluation from one condition to two conditions.

In summary, the legitimacy crisis of conductive arguments can be completely solved. Firstly, when the negative considerations obviously weaken the argument, "Adler's problem" and its variant can be solved by appealing to the strength of argument. Secondly, in the case that the negative considerations are very trivial, the logical role of them can be justified by appealing to the criteria of argument evaluation. It is noteworthy that I do not reject the rhetorical perspective of conduction. On the contrary, the uniqueness of conduction may lie in that its negative considerations have both logical and rhetorical roles or functions.

---

[3] It is not helpful to focus on the criteria of argument evaluation when we discuss "Adler's Problem" and its variant, so I do not mention it at that part.

Argumentation and the pedagogy of uncertainty

ABSTRACT: This paper examines the legal dispute between ancient Roman rhetoricians Cestius Pius and Cassius Severus. Severus challenges Pius to defend his teaching in the Roman Forum. Pius fails due to dependence on structure to formulate arguments. This challenge is relevant to contemporary teachers as it indicates the need for uncertainty in the teaching of argumentation. Severus's challenge can be answered by making the argument classroom the site of Universal Teaching as proposed by Jacques Rancière.

KEYWORDS: argumentation, classroom, pedagogy, Rancière, rhetoric, Rome, uncertainty

1. INTRODUCTION

Cassius Severus, a Roman forensic orator with a record and reputation of being effective and aggressive, challenged the famous rhetoric teacher Cestius Pius several times to prove his teaching was ineffective. Cassius charged Cestius with 'unspecified damages' due to his claiming to teach good oratory, with being ungrateful for saying he was as good as Cicero, and due to his lack of providing reasonable defenses to these charges, asked the Praetor to appoint a legal guardian for Cestius as anyone incapable of handling his own affairs would need (Seneca, 1974, sec. cont. 3 preface). What Cestius Pius was doing wasn't unusual; wealthy Roman families hoped to send their sons to study under a Greek rhetorician to learn how to speak, argue, think, and master the oral world that was Imperial Rome (Lupi, 2015). Declamation was universally seen as a way to learn how to argue and speak, and students would use the ancient methods of *repetitio* in both copying and doing a speech again and again for revision. Severus attended one of Pius' declamations, interrupting him as one would during a forensic oration with heckling. Pius could not respond and asked to have him removed. This confirmed Severus' feelings about declamation. Severus told Seneca, "It is one thing to fight, quite another to shadow-box"(Seneca, 1974 Cont. 3: 13 preface).

Severus did not follow the rules of declamation when he challenged Pius, he offered arguments against him as would happen in a Roman court. According to Pablo Schwartz, "If Cassius' goal was to show the rhetor's inability to distinguish between scholastic and real-world legal contexts, his trick results in sanctioning a mixture of the two contexts. . .the boundary between the two activities is blurred; oratory and declamation are no longer separate entities" (Schwartz, 2015, p. 72). Cassius Severus was not opposed to declamation as such but was opposed to it as instruction for argumentation. What he hoped to prove is that Cestius Pius was making his students unprepared for the uncertainty that is embedded in the practice of arguing.

Cassius Severus is the person we should have in mind in the back of our classes when we are teaching students argumentation. Instead of stepping back to teach the theory of fallacy, or the role of style in argumentation, we should seek to ensure the presence of Cassius in our recitations, ready to call us out as he did to Cestius over two millennia ago. We should reconsider all we do in our classrooms as governed by the inevitable encounter with uncertainty. Severus' challenge to Pius is to show that when things go in a surprising way, the great master

of argument is unprepared to respond. In this paper, I will analyze the specific charges Cassius Severus made against Cestius Pius and what challenge they make to teachers of argumentation today. I will then suggest that the solution is to embrace a pedagogy that not only allows uncertainty into the classroom but depends on that uncertainty as an ethic. Cassius Severus, like all of us, wants students to be prepared for an unknowable future, ready to marshal arguments as needed and when needed.

2. THE CHARGES AGAINST PIUS

Seneca tells us about Cassius Severus in his collection of declamations. A formidable forensic orator, Seneca praises him as someone who could command feelings from the audience, came well prepared with notes and arguments but wouldn't hesitate to ditch them if needed, and was more dangerous cornered than prepared. Seneca wrote, "everyone was afraid when he was speaking, in case he should stop."(Seneca, 1974 Cont. 3 preface 2) Severus was also praised by Tacitus as the orator who moved forensic tradition away from the Asiatic style to the Silver age in Rome.(Tacitus, 2006) This speech style was less concerned with formal requirements and more concerned with motivating audiences. It was direct, it was passionate, and in a Latin word it was *acerbitas* – "bitter" speech. Not what declaimers would consider to be the height of elegant argumentation. "According to several ancient sources, Cassius Severus belonged to the last generation of orators whose eloquence was put to use in its proper place, the senate, assembly or court of law, and which enjoyed, more or less, freedom of speech" (Connolly, 1997, p. 119). In the early empire, speech norms and practices were changing. Severus was at the forefront of these social adjustments. It is strange to think that the rise of empire at the cost of the republic led to a more aggressive, less formal, more impromptu form of argumentation. Seneca gives us the details of Severus's position in relation to the famous rhetoric teacher, Cestius Pius, in a sort of recorded "interview" he did with Severus in his collected letters on declamation and his collection of topics used in teaching, the *controversiae*. Seneca details the start of the conflict from the point of view of Severus:

> I recall going into his school when he was going to recite a speech against Milo. Cestius, with his usual admiration for his own works said, "If I were a Tharcian, I should be Fusius. If I were a minme, I should be Bathyllus. If I were a horse, I should be Melissio.' I couldn't' contain my rage. I shouted: 'If you were a drain, you'd be the Great Drain.' Universal roars of laughter> the schoolmen looked at me to discover who this bull-necked lout was. Cestius, who had taken on himself to reply to Cicero, could find nothing to reply to *me*, and he said he wouldn't go on if I didn't leave. I said I wouldn't leave the public bath until I'd had my wash"(Seneca, 1974 Cont. 3, 16-17).

Severus's confrontation is more stylistic than substance – but that is his point. He's injecting an element of uncertainty into the proceedings as would happen in argumentative conflict. His use of Pius's carefully-crafted style as the butt of a rude joke (saying he would also be the city sewer, more or less) is an invitation for Pius to respond by putting Severus in his place. After all, Severus is on Pius's home turf. But Pius retreats to the rules of *declamatio*, refusing to continue until Severus leaves. This prompts another joke by Severus -- he is 'cleaning up' his opponent. Severus is not interested in the particulars of the Ciceronian exercise on Milo. What he wants to show is that outside of a carefully scripted speech, Pius has no rhetorical ability to engage with those who would oppose him.

Cassius Severus then takes Cestius Pius to the forum to see how he fares in a legal rhetorical situation. But Severus is not interested in being completely unfair to Pius. Seneca's interview with Severus continues:

I resolved to revenge Cicero on Cestius, in the courts. Soon, I met him and summoned him before the praetor, and when I'd had enough of deriding and abusing him, I requested the praetor to admit a charge against him under the law on unspecified offences. Cestius was so worried that he asked for an adjournment. Next, I hauled him off to a second praetor and accused him of ingratitude. Finally, before the Urban Praetor, I requested a guardian for him. His friends, who had thronged to the spectacle, put in a word for him, and in response to them I said I should give no further trouble if he swore he was less eloquent than Cicero. But neither joke nor serious argument would induce him to do that (Seneca, 1974 Cont. 3 17).

Severus believes Pius has insulted Cicero by comparing himself to the 'father' of rhetoric. He wants to show that Pius is nowhere close to Cicero's ability to adapt. Scholars agree that these charges are not very realistic and might not hold up in actual Roman law (Schwartz, 2015). However I argue that Severus isn't interested in winning a conviction. He wants there to be exchange. He seems to want Cestius Pius to give a display of rhetoric and argumentation away from the familiarity of his classroom and rhetoric school. But it seems Pius is either unwilling or unable to adapt his abilities to the situation he faces.

The account ends here in Seneca's writings, but Severus's actions raise questions about the teaching of argument today: Could we, or our students, deliver arguments worthy of situations and challenges that might appear before us? Classroom analysis of argumentation and the classification of types of fallacies and their moving parts seem like only part of what is needed to answer this question. In the next section, a detailed examination of Severus's claims will show us precisely the challenge he has left for us.

3. THE SEVERUS CHALLENGE TO ARGUMENTATION PEDAGOGY

Examining Cassius Severus's intervention, I divide it into four different arguments, performed in the *acerbitas* style. Severus tries to prove not only the inferiority of Cestius Pius, but also the inadequacy of the type of argumentation pedagogy that Pius stands for. Severus's main argument is that pedagogy of argument must be rooted in acceptance and work with the uncertain. Severus argues through his performance that Pius is unable to handle novel situations that do not have much time for rhetorical preparation. Severus could prove this via traditional debate, but such an attempt would invalidate his claim that Pius cannot handle uncertainty. To do so, Severus must create the conditions of uncertainty for both of them as the background of their performance.

The first move is to heckle Cestius Pius in front of his students at a planned, public declamation demonstration. Severus uses Pius's style and form in speech to make fun of his comparison of himself to the greatest Romans in different fields. Interruption by someone who has a stake in the argument is something that might be against the rules in a declamation, but is not against the rules in other forms of argumentation. Severus interrupts Pius with a depreciating joke in order to see how Pius responds. When Pius says he won't continue, he reveals his dependence on institutional and formal structure to produce his arguments. Severus notices this which is why he makes his bath metaphor. For Severus it is not the teaching of rhetoric to limit oneself to the rules of the procedure to be able to generate arguments, any more than it is proper to leave a bathhouse without having washed. Meant with a double meaning, Severus is accusing Pius of being too dependent on where he is and not the fluid argumentative situation for his motive to speak.

Secondly, Severus files a charge against Pius with the Praetor for "unspecified damages." Although a real court filing, the charge is one any educated Roman would recognize as being right out of a textbook. Such a case was often given as the context of the lawsuit in early *progymnasmatic* exercise designed to get students familiar with accessing the commonplaces around legal disputes. The penalty was less important than the arguments about why damages would or would not be justified. Severus here is pushing Pius to prove that his teaching is applicable with a very straightforward case. The uncertainty is that the case is proposed in the forum, instead of the classroom. Severus hopes to prove that even the most basic exercise given to every class has no application when faced with a new situation. Pius's call to have time to prepare his case and delay the trial is evidence to Severus that Pius teaches rhetoric that exists within a very controlled set of rules and policies, not rhetoric that can deal with multiple situations, or uncontrolled situations such as the forum.

Severus tries to argue via performance again by charging Pius with ungratefulness or ingratitude. As he told Seneca, he hoped to get revenge for Pius's treatment of Cicero. Severus here sets up the perfect scenario for Cestius Pius to prove he is Cicero's equal by offering a speech of praise and admiration for Cicero in a style that would indicate he's Ciceros equal or better. But Pius does not do this. Overwhelmed by the situation he's not sure what to say to the praetor in the court. Severus points out through this charge that even when given a perfect venue and opportunity to display what he claims he teaches, Pius cannot do it. He can't offer the defense precisely because the rhetoric he teaches is not rooted situationally. It's rooted in rules of its own making that are not connected and do not account for the fluid nature of public situations. In the end Pius' inability to respond to Severus is disappointing, but proves Severus' point – Cestius Pius is not able to overcome this aporia which rhetorically could be dismissed as easily as it was created. Severus as a professional rhetoric teacher should be able to offer a defense of his position in some capacity, not succumb to the rules of the court which Severus, it could be argued, is using in a weak manner to strengthen his position.

Finally, is the request for a guardian, which does not need a lot of interpretation. Severus is indicating to his audience that the only reasonable response to such a lack of response is to assume that Cestius Pius is incapable of reason. As such, he becomes a ward of the state. This capstone move is nothing short of arguing that Pius is the opposite of Cicero, who held the highest positions in the state government. But it is also an indictment of his pedagogy, which apparently makes men incapable of the basics of being a Roman citizen.

Cestius Pius' pedagogy is the "masterwork" approach to pedagogy indicted by Geoffrey Sirc who describes this teaching as, "the docent's tour (explaining how the great masterpieces are put together) with the hands-on workshop of family day (now that the gallery-goers understand how the masterpieces work, they get to try to make one)" (Sirc, 2002, p. 4). By referring to a model as already "the best," creators are merely trying to replicate a particular iteration of an argument. Cassius Severus believes that arguments must fit situations and cases as they come. Pius wants his students to produce a masterwork or a close proximity, Severus wants the production of effective argument, which then might be considered masterful, but only situationally.

Severus starts with the assumption that the study of argumentation is inseparable from the practice of a productive art. Pius starts from the assumption that argumentation is a critical art. Neither has the entire picture, but Severus is right in pointing out the ineffective nature of critical argumentation toward production. As he tells Seneca, "When I am declaiming, I feel I am struggling in a dream" (Seneca, 1974). We can understand this feeling if we understand that argumentation is less about getting it right than getting it effective. Teachers of the form, such as Pius, not only miss the point, their practice is ineffective in situations where they have no control and are unsure what to do.

4. RESPONDING TO SEVERUS'S CHALLENGE TODAY

Responding to Severus is to reconfigure our relationship to our material and our students. Argumentation, in the way Severus sees it, is something that is responsive to situational demands, not responsive to a dictated form or structure. Of course, argumentation must be prepared by considering the case, the audience, and the situation, but the arguments are not beholden to a structure of engagement here. They are to be evaluated by listening to them and seeing if they are persuasive. What Severus suggests can be met by teaching argumentation under the sign of Universal Teaching, a theory developed by Jacques Rancière.

To understand the difference between Universal Teaching and traditional argumentation instruction, examination of some methods of teaching argumentation are in order. In the American pedagogical tradition, the teaching of argument quickly moved across the twentieth century from one oriented around production to one focused nearly totally on criticism of arguments already produced.

Uncertainty has been an enemy as long as formal, professional rhetorical instruction has existed in the United States. Charges like those Pius faced are familiar to American teachers of debate and argumentation, who, at least since the publication of President Teddy Roosevelt's memoirs in 1913 have had to grapple with his admission that he was happy to never have been part of the Harvard debate society, where people are taught to speak "glibly on the side to which he is assigned, without regard either to what his convictions are or what they ought to be" (Roosevelt, 1926, p. 23). The professionalization of teachers of speech, argument, debate, oral reasoning, appeal – whatever you wish to name this part of argumentation – has always been on the defensive to justify what it is they teach. Since Plato, suspicion on teaching argumentation has been high due to its lack of clear substance and identity. But since the situations we argue about are novel, no teacher could know the 'correct' answer for an argumentative composition.

Reliance on Stephen Toulmin's model of argumentation is perhaps the most popular attempt to eradicate uncertainty from our curriculum. The Toulmin model is ubiquitous in American education in any subject that requires the formulation of arguments, as Ellis points out (Ellis, 2015). As William Keith and David Beard note, "scholars are not in agreement on what a warrant is or how to identify it, either theoretically or for purposes of teaching and criticism" (Keith & Beard, 2008, p. 21). As far as creating arguments, James Crosswhite asks: "Where do arguments come from? The Toulmin model may be a reasonably good way of diagramming an isolated argument for purposes of analysis and evaluation, but it does not provide an answer to that question" (Crosswhite, 2008, p. 170). Cassisus Severus might agree, telling Seneca, "[declaimers] are used to being clever at their own rating" (Seneca, 1974 Cont. 3, preface, 13-14). Perhaps these terms, pedagogically, are good at generating text that fits them, rather than arguments that engage others.

Across time, we can see the textual trace of the shift from production to assessment that takes final form under Toulmin-dependent pedagogy. Frances Perry in his 1906 textbook *Argumentation* offers that, "The purpose of argument is to make other believe as we believe. We argue only when we offer reason and evidence to sustain our assertions" (Perry, 1906, p. 11). Further, "argumentation proper postulates or assumes a proposition to be proved" (Perry, 1906, p. 14). In 1914, V.A. Ketchum wrote in the introduction to his text, *Theory and Practice of Argumentation and Debate,* "Argumentation is the art of persuading others to think or act in a definite way. It includes all writing and speaking which is persuasive in form" (Ketcham, 1919, p. 1). James O'Neill and James McBurney offered in 1932, "The art of influencing others, through the medium of reasoned discourse, to believe or act as one wishes them to believe or act" (O'Neill & McBurney, 1932, p. 2). As the more isolated practice of the debate tournament began to extinguish the public-facing practice of campus

debates, the popular 1938 textbook by Baccus and Nichols drew a very clear line between argument and debating:

> The position of this book is that English debating and legislative debating are persuasion, making occasional use of argumentation as a support, and that American academic debating is argumentation. One type uses humor, persuasive appeal, and entertainment, with occasional argument . . . the other uses fact, evidence, inference, conclusion, and proof (Nichols & Baccus, 1936, p. 20).

Such a distinction can be characterized as continued worry about the state of certainty around the practice of teaching the production of argument without clear guiderails. There isn't a correct answer per se, but there are things that instructors and students can find to be effective and good. The 1951 definition in the third edition of *Argumentation and Debate*, although now authored by McBurney and Mills without O'Neill, shows how quickly argumentation has moved away from production to criticism:

> In an earlier edition of this book, argumentation was defined as 'the art or activity by which one person, through the use of reasoned discourse, seeks to get other persons to believe or do what he wants them to believe or do.' Our present view is that this definition neglects the critical function of argumentation and overemphasizes the personal involvement and desires of the advocate" (McBurney & Mills, 1964, p. 2).

As the role of Americans shifted from producers of their civic environment to the consumers of the civic as a media product, the shift in training students for life in this world shifted with it. Critical consumption of argumentation becomes more vital than producing persuasive texts. In the 1963 book *Decision by Debate* we have the first iteration of what became standard argumentation instruction. The text casts debate as a tool that assists third parties in drawing conclusions. "Debate is a mode of critical decision-making in which the contending parties appeal to an adjudicating agency acting in the role of arbitrator and agree to abide by the decision that agency hands down" (Ehninger & Brockriede, 1971, p. 10). The Toulmin model is central in this operation: "An extension of Toulmin's analysis of argument provides a formula whereby personal, emotional, and logical proofs may be reduced to a common structure and made subject to comparable tests. The debate is thus able to bring all three modes of artistic proof within the framework of critical controversy" (Ehninger & Brockriede, 1971, p. viii). Now there is a form, complete with rubric, to see if the argument is done correctly to satisfy the decision-maker. The role of the arguer is no longer creative, it is beureaucratic: "critical decision-making is pre-eminently a fact-centered process, as attested by three of its cardinal rules (1) Begin your study of a subject by searching for facts, rather than by making guesses or assumptions. (2) Test each hypothesis and each new step in inference by carefully checking it against the facts. (3) Accept no conclusion that fails to square with the facts" (Ehninger & Brockriede, 1971, p. 33). Facts are now completely in charge. Argumentation draws decision-maker attention to them. This is far removed from the situational response that Severus believes is so vital.

An alternative mode of teaching argument is needed to address Severus's critique. Jacques Rancière's conception of "universal teaching" places uncertainty not simply at the forefront of pedagogy, but as the only appropriate pedagogy for emancipation of the human mind. The idea of universal teaching is "to learn something and to relate it to all the rest by this principle, all men have equal intelligence" (Rancière, 1991, p. 18). It is the idea that the disciple makes the master by teaching *him* the material, not recalling it to his specifications.(Rancière, 1991, p. 19) It is "the desire to understand and be understood. . . not the derisive power to unveil

things, but the power of translation that makes one speaker confront another."(Rancière, 1991, p. 63). Such an understanding of education, of pedagogy, is amplified when we realize that students and professors, teachers, experts, and any human being can fall into persuasion and assent to arguments that are not good as well as generate fallacious claims in support of motives that would be beneficial to audiences. Universal teaching reveals and amplifies the rhetorical character of the teaching of argumentation – there are no experts here as any human can be deceived by reasons. "Universal teaching is summed up in one question: What do you think about it?" (Rancière, 1991, p. 36).

Argumentation's long tradition with oral production is also a strong connection for universal teaching, as Rancière notes, "The student must speak about the art he wants to learn."(Rancière, 1991, p. 65). Articulation of the subject pre-supposes knowledge on it, just as declamation pedagogy assumed in Rome. Students would speak on a topic in order to be able to speak on a topic. "This was an essential exercise in universal teaching: to learn to speak on any subject, off the cuff, with a beginning, a development, and an ending."(Rancière, 1991, p. 42). In argumentation, the speaker and the audience who is interacting with the argument are participating in a pedagogy focused on, "learning, repeating, imitating, translating, taking apart, putting back together" (Rancière, 1991, p. 68).

What Cestius Pius represents is Lacan's discourse of the university, where knowledge organizes itself in a headless, neutral whole, and demands that we desire to fold ourselves into it. Knowledge is created not by someone, but by rules and processes that can be mastered, making us subject to it. There is no Master pulling the strings; all is organized by a system of neutral rules that produce knowledge. "No provision is made for individual subjects and their desires and idiosyncrasies. Individuals are to act, think, and desire only in ways that function to enact, reproduce, or extend the system. Bureaucracy thus functions to educate, in the root sense of that term: it forms particular types of subjects" (Bracher, 1994, p. 115). Cassius Severus responds with what Lacan calls the discourse of "true science" or the hysteric's discourse, which seeks to show that the master's knowledge is incomplete, that the claim to perfect knowledge is false – exactly what Severus is doing through his four charges against Pius. "In addressing the master, the hysteric demands that he or she produce knowledge and then goes on to disprove his or her theories" (Fink, 1997, p. 134). The inability to respond is not evidence of an uncivil action on the part of Severus. On the contrary it's Severus' attempt to show that Pius does not produce knowledge of argumentation, but deference to what is known about arguments. Severus is using the civic institutions of Rome – the very thing that Pius is preparing his students to engage – to show how elimination of preparation for the uncertain is the opposite of what prepares people for participation in civic institutions. So if adoption of the method of Universal Teaching – confronting persuasive argumentation with the human mind in dialogue – is to address Severus's challenge, what would this look like in the classroom? For this, I have two suggestions.

The first is to return to the oral production of argumentation in response to cases. This is very much the 'bare-bones' model of declamation, but without the conformity to precepts of 'good speaking.' The advantage here is that there are no correct or even right answers to such argumentation. In declamations conducted this way, there seems to be a Roman obsession with topics that do not appear to be resolvable. Calling them "inexhaustible" topics, Zinsmaier believes Roman declamers found pleasure in discussing certain issues endlessly due to the nuance and novelty of the *ingenium* surrounding them (Zinsmaier, 2015) . Such topics are not good for coming to a conclusion about a policy or social matter, but they are excellent if your purpose is to teach and practice compelling argumentative commonplaces. We have a sense of this: In assigning very real, very current topics for the generation of argumentation, we can recognize student speech that is simultaneously good quality and unexpected. What I propose is an expansion of this into all areas of the argumentation curriculum. The more unsolvable, the

more evergreen the speeches. And the more students practice the interrelationships of social and cultural values and beliefs.

Secondly, topics in declamation test the limits of social norms. Dealing with tyrants, pirates, women, foreigners, slaves and former slaves, sons who murder fathers, and fathers who abandon their sons, the topics that Roman students engaged suggest concern with the limits of Roman law. Such topics are evergreen. There is no shortage of questions about the limits or breadth of any state. Placing this at the center of the classroom in the contemporary context is teaching argumentation under the sign of Universal Teaching. This practice makes all participants the subjects of the generation of doubt and response to contemporary issues. This is excellent practice in argumentation that focuses argument quality away from meeting standards argumentation has for its own quality. Of course, this can be considered, but within the swirl of uncertain response to contemporary issues, all minds are somewhat equal and persuadable, leading to a different conversation about quality.

5. CONCLUSION

As Seneca tells us, Cassius Severus was not against preparing his arguments. He always arrived at the forum with a well-planned case. "He never spoke without notes, and . . . to a large extent the whole would be written out" (Seneca, 1974). But he quickly dismissed it as the arguments developed, preferring instead to engage his opponent in the context of the moment, generating argumentation and rebuttal based on what was happening there in the court. Severus believes no pedagogy of argumentation is acceptable unless it teaches students how to locate and compose arguments for uncertain situations. Severus offers a challenge to contemporary pedagogy, which might speak more toward arguments being made correctly rather than being made persuasively for others. When teaching argumentation, argumentative rules ought to be a starting point to help students discover what is possible in argumentative invention. The trouble for Severus, and for us, is when argumentative rules become both the starting point and the point of assessment. For Severus, the only possible assessment of argumentation was the Forum, the audience, the people of Rome. To substitute anything else was to teach argumentation that feels like "struggling in a dream." To teach argumentation is to invite confrontation with uncertainty. Reliance on formal rules and processes was to hamper the students, making them as incapable as their teacher in dealing with novel, unexpected, or surprising situations which for Severus, and perhaps us, is where argumentation really lives.

ABSTRACT: The ability to reflect on ideas implicit in our standpoints is fundamental for critical thinking. To question principles by which we interpret our experience requires breaking the circle of our prejudices. We must go beyond our experience.
We discuss examples of philosophical argumentation that help in this endeavor and relate them to analogies and comparisons used in Philosophy for Children, showing how some philosophers like Plato and Descartes have used them in a similar way.

KEYWORDS: analogies, argumentation, controversies, philosophy for children, teaching argumentation

1. INTRODUCTION

The purpose of the present paper is to analyze some crucial problems for the teaching of argumentation. Our main interest stems from our work with college students and in teacher training in Philosophy for Children; it concerns the proper guiding of a philosophical discussion with children and youngsters so as to further reflexive thinking. One of the most important difficulties, in our view, lies in learning to grasp the implicit ideas that may hinder the resolution of a controversy.

The process of advancing reasons in favor of a standpoint and refuting the reasons advanced by an opponent in a discussion must end at some point. To be sure, a controversy does not end definitively, in the sense that new evidence can reactivate it, but this does not mean that it cannot be pronounced satisfactorily resolved at a given moment. How do we understand, then, a controversy's resolution while considering it provisory?

According to pragma dialectical critical rules (van Eemeren & Grootendorst, 1992, p. 209), a reasonable controversy's resolution is achieved when the proponent of a standpoint withdraws it, in view of the opponent's doubts, or else the opponent withdraws his/her doubts, in view of the reasons advanced by the proponent.

This means that a controversy can be resolved if, despite their differences, a reflexive spirit predominates in the participants, and they are willing to show collaboration and respect. Unfortunately, this does not often occur in everyday life. On the contrary, people tend to cling to their standpoints and are unwilling to abandon them, in spite of powerful reasons offered by their opponents. This unwillingness to reflect and to cooperate towards reasonable mutual understanding results in a lack of models for the students of what it means to achieve a controversy's resolution and may even produce the impression that it is impossible to achieve.

In Philosophy for Children, cooperative thinking is fostered by philosophical discussion encouraged by provocative stories.

2. CONTROVERSIES AND IMPLICIT BELIEFS

The intricacy of beliefs may be illustrated by a question that arises in the Philosophy for Children novel *Pixie* (Lipman, 2018, p. 58) about which of two stories concerning our origins is more unbelievable: that in the beginning we were as tall as mountains or that we were really small and grew to become just as we are now. Pixie contends that both stories are equally unbelievable. The question is: what is the relationship between truth and belief? Can we believe what we know to be true or must we be uncertain in order to believe?

Why do people cling so obstinately to their standpoints? We think that the positions people take regarding a controversial issue are dependent on their beliefs, and these are the result of their experiences and education. Beliefs are, therefore, unbound, in the sense that they are not rigorously defined, their limits are unclear and they relate to other beliefs in an irregular and flexible way. Moreover, they vary according to context and the passing of time. In contradistinction, scientific beliefs are expressed in clear concepts. For example, a person might think that whales are fish, because they live in the sea, but he/she would be mistaken, because scientists have defined fish in such a way that whales are excluded from the concept of fish.

Conversely, concepts we use in everyday life, and which are indispensable to understand what happens in our society, are not at all like that. For instance, there is no unanimity about what should be understood by 'democracy'. Some may think that democracy is defined by personal freedom and certain control over the government. Others may think that this is not enough and that an egalitarian social basis is required. Most people think today that democracy also requires egalitarian universal respect for human rights.

These discrepancies arise from the way how concepts like freedom, equality and discrimination are defined, concepts that furthermore are related to other beliefs in a flexible way. All these beliefs, as mentioned, lack a rigorous definition, validly accepted by all, so that we might, because of its fluidity, come to maintain positions based on concepts that we deem universal, but aren't accepted by all and may be questioned. For instance, an assertion might be made that implies a certain concept of what is morally correct without the speaker's awareness that his/her idea might be questioned.

These ideas remain implicit because they are generally assumed without stopping to define them more precisely. On the other hand, if one tried to define all the beliefs in which our postures are based, the argument would become too long and complex and this would hamper communication.

Therefore, when a difficulty in resolving a controversy arises, it is necessary, in addition to the analyses of the reasons offered in support of the standpoint, to analyze the beliefs that are at its basis, examining their boundaries and relations with other beliefs. This analysis of the implicit can be a long and complex task, as stated. Therefore, we shall limit our analysis here to argumentation involving comparison, not necessarily analogical argumentation.

3. COMPARISONS, ANALOGIES AND FICTIONAL CASES

In argumentation involving comparison the implicit elements seem to be easier to identify, since in comparing different situations, we must select and take into consideration only those elements that are relevant for the comparison. In controversial issues, however, strong beliefs may cloud our ability to understand the emotional factors that are sometimes involved in the other person's position. This ability often depends on our individual capability to imagine, on some personality traits and on our capacity for empathy towards other people, which seem to be out of the reach of scientific thinking's universality.

On the other hand, it is true that we can encounter implicit ideas in other types of arguments, such as faulty causal argumentation and hasty conclusions, but these problems are less frequent due to the expansion of scientific thinking. At least, they are more easily taught than analogical argument, since an appeal to a personal effort in imagination is predominantly required here, whereas in causal or symptomatic argumentation the appeal to scientific authority becomes the usual support of beliefs.

Therefore, we think that comparisons, analogies and fictional cases can help develop a sensibility to apprehend the hidden assumptions underlying standpoints opposite our own in a controversy. For instance, if someone has a very strong conviction concerning beliefs that lead him/her to hold his/her standpoint as highly convincing, he/she runs the risk of unwittingly ignoring important elements that would dissolve the comparison. In this case, objections consist in bringing to light the implicit elements and, in this way, undermine the proposed reasons.

Consider the following example provided by Johnson & Blair (1993, p. 111):

(1) Contrary to your article, the events that are taking place in South Vietnam's presidential election offer the best opportunity for the U.S. to make a "decent" exit from Southeast Asia. Under the existing circumstances, the U.S. should declare that South Vietnam is unable to sustain a political democracy, that there is no reason for us to remain there, and that we should withdraw our remaining forces. By doing this, we would leave the image of a patient who died despite the extraordinary efforts of a good doctor.

Implicit in this argument is the idea that the U.S. is comparable to a good doctor. But, is this so? As the authors point out:

A "good doctor" here would be one who sought to make democracy a workable form of government. In fact, U.S. foreign policy throughout the 1950s and 1960s can be interpreted as more anti-Communist than pro-democratic –witness the U.S. support of the undemocratic regime of Batista in Cuba, of the military dictatorship in Greece, and so on. (Johnson & Blair, 1993, p. 112)

If someone had the conviction that the U.S. was the great defender of democracy throughout the world, an idea that may be acquired early in life, he/she might forgo the criticism made by these authors.

Let us consider another example. In a case of marital infidelity, if the unfaithful member of the couple thinks that he/she should enjoy his/her sexuality on every possible occasion, this implicit idea may lead him/her to assume that infidelity does not cause harm to the other member, as long as he/she is not aware. An objection to this may involve an analogy:

(2) For the purpose of considering whether infidelity causes harm, it is irrelevant whether the spouse does or does not know about it, since the situation is similar to

that of someone who is being affected by a terrible disease, such as terminal cancer, without knowing it. Not knowing, and therefore not suffering, does not mean that the person affected is not harmed.

Some may insist, however, in defending their implicit idea, that the analogy is faulty because both situations are different: in one case the damage is physical and in the other not. If the other party counters by asking: what if it is your own spouse who is being unfaithful? They would probably answer that this is highly hypothetical and that it is not happening, but, if it was, they wouldn't mind. Although this doesn't seem a very reasonable position, many people may still hold it, because they cling to their beliefs.

This shows that, in the case of beliefs and implicit ideas, it is not enough to identify the implicit and to understand how it works in the argument; it is necessary to understand also the emotional aspects. The lack of empathy towards the deceived spouse becomes apparent in this kind of answer. In other words, the inability to put him/herself in his/her spouse's place shows a want of feeling indicative of a superficial and uncaring person, someone who treats others with disrespect.

Therefore, an analysis and discussion of analogical arguments and comparisons may help develop an ability to reflect about our prejudices and see things from a different perspective, including the emotional factors along with the intellectual.

In traditional stories like *Cinderella* and *The Ugly Duckling*, created by imagination and transmitted by folklore and children's literature, we see that, through comparison and empathy, they are not only entertaining but also transmit implicitly a moral sense and an education of emotions. The same could be said also of religious stories or Jesus' parables in the Bible, like the sower and the prodigal son.

An appeal to fictional situations can be employed also by philosophers and, in this sense, can show how analogy and comparison may help in fostering reflection. An example of this could be the story of Ixion in Greek mythology, an example we used in our philosophical novel (López, Tugendhat & Vicuña, 2001):

(3) Ixion has fallen in love with Zeus's wife, Hera, and wants to seduce her. Realizing this, Zeus transforms a cloud into a woman identical to Hera, to deceive Ixion and to find out how far he is willing to go. Ixion seduces the cloud and makes love to her thinking that he has conquered Hera. Zeus can then laugh because Ixion has made a fool of himself: believing that he has made love to Hera he has only made love to a cloud.

Considering this example may help us understand what it would be like to live under the illusion of a perfect love relationship while one's partner is being unfaithful without one's knowledge. A comparison with Ixion's situation may show that no one would like to live under that kind of delusion.

On the other hand, appealing to fictional situations may not satisfy the pragma dialectical critical rules (van Eemeren & Grootendorst, 1992) mentioned above, in the sense that a controversy ends when the other party withdraws his/her standpoint or doubts, which may not occur in these fictional cases.

Before going further it seems necessary to clarify what we understand by analogy. We think that a useful definition for our pedagogical purposes is given in Lipman's (1980) novel *Pixie*. Pixie asks her teacher what would be called a comparison of things that have the same relationships but different parts. He answers: "I suppose that this would be an analogy". He then asks the students to give examples.

The first example offered is that a wing is related to a bird in the same way as a flipper is related to a fish. This could be expressed as: "a wing is to a bird as a flipper is to a fish". This obviously doesn't mean that a bird and a fish are the same, but that both in a bird and in a fish these elements satisfy the same function: direct the movement. This makes it a good analogy. If we said instead that the game of chess is analogous to the game of checkers, this wouldn't be a good analogy, because the rules of these games are very different, and rules are essential game features.

Nevertheless, fictional situations involving analogies may help to look at things from a different perspective, moving away from our personal convictions. This is crucial in Philosophy for Children, where the most important goal is not to convince the interlocutor but to lead him/her to a point where he/she has to reflect and question previous beliefs and think further. If the difference of opinion is not resolved, the discussion stays open and can be resumed later.

Another example of a philosophical use of fictional situations can be found in Plato's myths. Let's consider the myth of the ring of Gyges told by Glaucon in Plato's *Republic* (*Rep.* II, 359d). (Extracted from the English translation by Jowett, no indication of year, p. 47-48):

> (4) Gyges was a shepherd in the service of the king of Lydia and, one day after an earthquake, he found a hollow brazen horse and, inside it, a dead body with nothing on but a gold ring. He took the ring from the finger of the dead and later, when the king's shepherds met, he came to the assembly having the ring on his finger, and as

he was sitting among them he realized that when he turned the collet of the ring inside his hand, he became invisible and when he turned it outwards he reappeared. He then contrived to be chosen one of the messengers who were sent to the court; where as soon as he arrived he seduced the queen, and with her help conspired against the king and slew him, and took the kingdom.

The purpose of this myth is to lend support to the sophists' standpoint that human behavior is not motivated by the idea of what is right, but by self interest and fear of punishment. According to this view, man is 'naturally' selfish and acts in his/her own convenience, except when he seeks to avoid punishment or to prevent becoming the victim of someone stronger than himself. The idea of a magic ring that turns the wearer invisible intends to show that no one with that power would choose to act against his/her own self interest.

This conception has been questioned by many other thinkers, for instance, MacIntyre (1966, p. 28) suggests that this is not a "natural" idea, but the sophists took it from Homer, more precisely from Homer's portrayal of Agamemnon as a selfish and authoritarian character. This idea's origin then would be in very ancient Greek culture. Our interest however is not in deciding about this matter, but to consider Plato's use of fictional situations. As mentioned, Plato seems to be asking for the reasons anyone would have for acting in a morally right way if he/she had a power like that granted by the ring of Gyges. The sophists' answer would be that everyone would act just as Gyges.

Plato, however, had already made Socrates object to Thrasymachos in the *Republic* (*Rep.* I, 351e-d) that all people need to collaborate with each other in order to obtain their goals; they cannot be totally selfish, even a band of thieves needs justice in order to reach its objectives. Rather than refuting the sophists, Plato seems to be raising questions that foster reflection about our personal mutual relationships and moral sense.

After all, the proposed analogy may not be altogether convincing, since it may seem obvious that there are many circumstances in which we are forced to act against our own

interests, although it may be rather difficult to establish whether we do it motivated by a moral sense or for other reasons.

In our view, Plato wants to induce the other party or the reader to place him/herself in a situation that leads him/ her to wonder what it means to act justly or, as we say now, morally. There is no resolution of the controversy, we cannot demand from people who would act like Gyges to withdraw their standpoint. However, in the *ring of Gyges* we encounter a tool that permits us to provoke reflection about human relationships, empathy and respect. In the end our interlocutor will decide, and his/her decision may not be the one expected by Plato, but this might change through time and reflection.

Another example of a philosopher who recurs to analogy is Descartes.

(5) Descartes' hypothesis of an *evil demon*:

> I shall suppose, therefore, that there is, not a true God, who is the sovereign source of truth, but some evil demon no less cunning and deceiving and powerful, who has used all his artifice to deceive me. (Descartes, 1968, p. 100).

Descartes had questioned all beliefs in order to find an unquestionable truth in which to found philosophical thinking. At some moment in his inquiry he comes to ask whether we should doubt our own consciousness, not only the things to which our consciousness refers to, the external world, but our consciousness itself. In Descartes' reasoning, even if we doubt that we are observing a real object, we cannot doubt that we who doubt exist, which leads to his célèbre *cogito ergo sum*. This seems unquestionable, evident. But Descartes wants to go farther and explore whether even this can be questioned.
To follow this inquiry he presents the hypothesis of an 'evil demon'.

Let's suppose that instead of having been created by a benevolent god we had been created by a deceitful one, someone who might have created us with a defective consciousness, so that each time that we believed something with certainty we would be mistaken. In this case, when we saw something that we believed to be so and we were conscious of experiencing this state of mind of being certain, we would have to doubt. For instance, concerning the fact that we are awake, no matter how strong our subjective certainty, we cannot trust it.

Although the analogy is not that clear, the appeal to the fictional image of an evil demon allows us to place ourselves in a position otherwise hard to maintain: that our internal consciousness might be wrong. By means of the analogy of this "great deceiver", the *evil demon*, Descartes gets us to move away from our everyday certainties.

Through this mechanism of considering fictional situations, although we do not achieve a definitive resolution of the controversy, we may stimulate reflection and the ability to consider different perspectives. The precedent examples intend to show how fictional cases may lead to wonder whether it is satisfactory to live deceived by an illusion, whether we would still act morally even if we had the power to avoid being caught and being punished, and finally whether we should doubt our own consciousness.

We turn now to a more actual case, the present controversy in Chile concerning a law proposal, now under discussion in parliament, to take away the penalty of abortion in three circumstances (danger to the woman's life, no viability of the fetus and rape). Until now, abortion is illegal in Chile and it is considered a crime in all circumstances. One of the most difficult issues that prevent the resolution of the controversy lies in the belief that many people hold that the fetus is a human being and therefore has a right to live, as granted by the constitution. This belief is based on the idea that the fetus, since its conception, has the genes that make a human being. Consequently, abortion is considered homicide.

An objection to this position is that it only displaces the problem, because it does not explain why only the human species should have such an absolute right to life. Why don't other species, for instance dolphins, have the same right? In our view, in this extreme position about abortion that leads to its absolute prohibition is implicit the catholic idea of the soul's *infusion* by God in the fertilized ovule. Since this is a religious idea, it is not made explicit in a philosophical or for that matter *layman's* parliamentary discussion.

In this context, the argument by Judith Jarvis Thomson seems relevant. Considering the impasse produced by the belief that the fetus is a human being, she proposes to defend abortion by conceding that the fetus is a person and cannot be aborted: "I propose, then that we accept as established that the fetus is a person, from the moment of its conception." (Thomson, 1983, p. 11).

Next, instead of questioning the opposite standpoint, she takes an alternative path that is similar to the fictional situations that we have been discussing and proposes the following analogy:

(6) Suppose you wake up one morning and find yourself in bed with an unconscious person. This turns out to be a renowned violinist who has been found to suffer from a terrible kidney disease and the Society of Musical Lovers, after having researched all medical records has found that you are the only one who has the matching blood type to help him. So, they had kidnapped you and during the night they had connected the violinist's circulatory system to yours, so that your kidneys could purify the violinist's blood along with your own. The hospital Director says to you: 'Listen, we are very sorry that the Society of Musical Lovers has done this to you. If we had known, we would never have allowed it, but they have. So, now the violinist is connected to you and to disconnect him would be to kill him. In any case, do not worry; it is only for nine months. By then, he would have recovered from his illness and he could be disconnected from you without risk.'

What is the meaning of this example? Later on, Thomson (1983, p. 12) makes the analogy explicit: a woman, who has been raped and, as a result of it, is pregnant, is in the same situation of the woman to whom the famous violinist has been connected without her knowledge and consent. Both situations are perfectly similar: both the fetus and the violinist depend on her to continue living.

What we should ask ourselves then is whether it is morally incumbent upon the woman to continue connected to the violinist (and, consequently, to the fetus). Of course, if this were a voluntary act, there wouldn't be a problem; it would be an act of generosity. But, if it were an act against her will, it wouldn't be morally incumbent upon her.

Since some people don't want to make this distinction between voluntary and non voluntary acts, Thomson (1983, p. 23) introduces another comparison:

(7) If a burglar enters a person's house, the owner has the right to prevent his remaining there; the burglar has no right to stay against the owner's will. The same would be true if the window bars had a minor defect that would make it possible for someone to enter. Even in this case, the intruder has no right to remain there. The situation would be even more serious if the woman's life was at stake.

Another consideration made by Thomson concerns the duration of the process. If the connection to the violinist required lasting only for an hour, the woman might reconsider her decision, and the same would happen in the case of pregnancy if it only lasted one hour, but even in this case she would be under no obligation to reconsider it.

In order to clarify this, Thomson (1983, p. 25) introduces another comparison:

(8) Suppose a child gets a chocolate box as a present and he/she is not willing to share it with his/her sibling. The child could be deemed selfish, cruel, egocentric or despicable, but he/she should not be considered unjust. Since the chocolate box is a present, it belongs to him/her and he/she is under no obligation to share it.

Next, she introduces yet another comparison, relating the pregnant woman's obligation to continue her pregnancy: the difference between a Good Samaritan and a minimally decent one.

(9) A Good Samaritan, as in the Bible's parable, is someone who does an extraordinarily generous act on behalf of others. It is something that is done out of love of God and, consequently, is a voluntary and gratuitous act. In fact, if it were done in view of a reward, such as eternal glory or to escape hell, it would lack moral value. We are under no obligation of being Good Samaritans. On the other hand, there are certain minimal obligations we have towards others which would be a serious moral offense not to comply with: these would be the minimally decent Samaritan's obligations.

In this connection, Thomson (1983, p. 28) mentions the case of Kitty Genovese who was assaulted and murdered while 38 other people were watching without doing anything to help her, not even call the police. These people did not even qualify as minimally decent Samaritans. Consequently, they acted in a morally incorrect way, failing to lend a very small service to someone who needed it badly. This conduct, although morally wrong, is not legally wrong, but some legal systems are considering changing this.

In relation to abortion, then, the comparisons seem to show that the fetus has no right to occupy the woman's body, since it belongs to her only, as the examples of the burglar and the chocolate box imply. Therefore, she would neither break the precept of a Good Samaritan nor a minimally decent one, because the first would require a voluntary act that she doesn't want to do and is under no obligation of doing, and the second would require her to be pregnant for nine months, which cannot be considered an obligation for a minimally decent Samaritan.

Thomson's position has been criticized by pointing out that a woman's relation to her fetus involves important emotions derived from mother child relationship, which would deny the comparison of the fetus with an intruder. This objection, however, seems to imply that maternal feeling is instinctive and disregards the fact that at least some women are disposed to abort, especially in rape derived pregnancy. To them, the fetus is an intruder living in their bodies. In this case, at least, Thomson's argument seems convincing and would support the Chilean proposal in the third causal.

4. CONCLUSION

To sum up, analogical argumentation provides a fresh look on the problem of a controversy's resolution. It may foster reflection about the interlocutors' personal convictions by helping them see things from different perspectives. This is the role of comparison and fictional situations in philosophical discussions and, more generally, in literary fiction.

The main purpose of argumentation is, of course, to find a reasonable solution of a controversy. Nevertheless, in many cases this is not possible, for instance, when we lack the information that could decide the situation in favor of the protagonist or the antagonist.

Reaching a solution is not so important in teaching argumentation and in Philosophy for Children, because the main purpose here is to encourage the student's personal reflection on the topics under discussion and, therefore, to solve the controversy is not the predominant aim.

We consider that teaching argumentation and Philosophy for Children are complementary tools for developing students' thinking. Philosophical dialogue must include argumentation; otherwise it would not be more than conversation and exchange of opinions without purpose, and without challenge of our and the others' prejudices.

On the other hand, if reaching a reasonable solution of a controversy becomes impossible, either because we touch upon principles or values that cannot be abandoned, or because there is no sufficient evidence to incline the result one way or another, philosophical dialogue as practiced in Philosophy for Children may help to invite the other party to stop and think out of his/her usual system of beliefs. This is not persuasion, but an invitation to reflect on difficult issues and eventually become aware and critical of our own presuppositions and prejudices. To propose a fictional situation analogous to the one that hinders the discussion may not contribute immediately to resolve the impasse, the other party may insist in the initial standpoint, but he/she is challenged to think harder and to reflect more about the assumptions involved. This is the main purpose of Philosophy for Children: to enable everyone to think for himself, which is the basis of critical thinking.

ABSTRACT: Around the middle of the twentieth century, some controversy about the genetic fallacy arouse. This paper intends to analyse and reconstruct such a controversy in order to throw light on some difficulties regarding the use of fallacies in philosophical dialogues. Moreover, it is argued that a suitable analysis of it must appeal to the concept of strategic maneuvering. To conclude, some remarks are made regarding the way in which such maneuvering could be derailed.

KEYWORDS: genetic fallacy, philosophical dialogues, strategic maneuvering

1. INTRODUCTION

> The future historian of "thought and expression" in the twentieth century will no doubt record with some amusement the ingenious trick, which some of the philosophical controversialists of the first quarter of our century had, of labelling their opponents' views 'fallacies'. He may even list some of these alleged fallacies for a certain sonority which their inventors embodied in their titles: the fallacy of initial predication, the fallacy of simple location, the fallacy of misplaced concreteness, the naturalistic fallacy. (W. K. Frankena, 1939)

This communication attempts to contribute to a deeper understanding of philosophical controversies as critical discussions. As it is commonly assumed within the pragma-dialectical theory of argumentation, the ideal model of critical discussion is based on a philosophy of reasonableness. According to van Eemeren, such philosophy "takes the fallibility of human reason as its starting point and elevates systematic critical testing to the guiding principle of problem solving by means of argumentation in all areas of human communication and interaction" (van Eeemeren, 2010, p. 32). This explains a striking feature of philosophical discussions: as the very idea of reasonableness is usually -if not always as Habermas claims (1992, p.1)- its subject-matter, or at least a point at issue, those discussions tend to be meta-discussions in van Eemeren's sense, that is to say, discussions about the procedural starting-points that should be accepted by the parties (2010, p.241-242). This meta-discursive character is brought to the fore in Frankena's words which focus on the use of fallacies within philosophical controversies. In describing such use as an ingenious *trick*, he draws attention to the fact that, as philosophical evaluative strategies, fallacies can be effective but misguided moves: if those alleged fallacies are indeed inventions one of the controversialists came up with, it may as well be that the charge of committing one is fallacious.

In order to gain a better understanding of the use of fallacies in philosophical critical discussions -and to illustrate some of its problems- this article addresses the case of the genetic fallacy. To begin with, a preliminary characterization of this fallacy is provided, noting some difficulties in distinguishing between correct and fallacious uses of what can be

considered genetic argumentation. In the second place, some historical evidence is presented in favor of this grasp by revisiting the controversy given rise to over the genetic fallacy around the nineteen fifties and sixties. Thirdly, an account of charging the other party of committing a genetic fallacy as strategic maneuvering is presented along with some ways in which such maneuver could derail. To conclude, some general remarks will be made regarding the use of (certain) fallacies in philosophical controversies.

2. A CHARACTERIZATION OF THE GENETIC FALLACY

The genetic fallacy could be described in several ways. One may, for instance, conceive it as a defective genetic *explanation* of the origin of a phenomenon (see Goudge, 1961). Nevertheless, since this paper is concerned with philosophical argumentation, the genetic fallacy is understood as a move aimed at supporting a *point of view*. Establishing such understanding, as observed with other fallacies, is no easy task. For instance, according to Douglas Walton, a genetic fallacy is:

> The tactic of attacking the origin or original context of some practice, concept or argument that is instrumental to an opponent's point of view, in an attempt to discredit that point of view unfairly. For example: "The wedding ring originated from the ankle chain used by men to confine their wives; therefore, wearing a wedding ring is a sexist (bad) practice (2010, p.393).

In this characterization, the fallacy is committed in a context in which a viewpoint is criticized. For that reason, and provided that people are at least an important factor in the original context of ideas, this fallacy is sometimes classified as a type of *ad Hominem* whereby a point of view is rejected on the basis of some negative trait of the person putting it forward (Cf. Copi, 1980 p. 84 and Walton 1998, p. 18). However, this kind of argumentation could be used not only to question a point of view but to support it. Indeed, in his *Logic* (1973), Wesley Salmon states that, "The error of treating points of the discovery context as if they belonged to the context of justification is called 'genetic fallacy.'" (1973, p.11) According to this definition, the genetic fallacy could be committed in criticizing as well as in justifying a point of view and it is an infringement of the Relevance rule: the origin of an idea, its discovery and its history, are irrelevant with respect to its truth or falsehood. However, as Salmon's definition makes use of Reichenbach's well-known but not always accepted distinction between contexts, it is preferable to present a more neutral characterization. Consequently, the genetic fallacy is understood here as the use of the genesis or history of a point of view as a reason to prove or disprove it, a seemingly *wrong* move due to lack of relevance.

This definition faces another difficulty: as Walton mentions, "arguments based on origins are not always fallacious." (ibid.) For instance, his own example can be modified to thereby lose its fallacious character:

> (1) The wedding ring originated from the ankle chain used by men to confine their wives; for that reason, wearing a wedding ring could be a sexist (bad) practice and should be revised.

Here, a practice is undermined or dismissed due to its origin. Still, it remains unclear why this should be understood as fallacious. The origin of a practice or an idea, its history and its function in specific contexts can be, and perhaps should be, something to be taken into account when being assessed. Otherwise, *a priori* principles or God's will would be the only resource.

This problem has been noticed and attempts have been made to formulate criteria for distinguishing the genetic fallacy from correct uses of genetic argumentation (Ward, 2010, Crouch, 1993). In a recent article, Boudry, Paglieri and Pigliucci (2015) address this problem in a general way and consider the genetic fallacy among others. In their opinion, even current pragmatic and dialectical approaches of fallacies fail in giving a proper account of the problem of the demarcation between fallacious and non-fallacious arguments. Furthermore, they maintain that those approaches either characterize fallacies in a simplistic, non-realistic and non-persuasive way or in a more sophisticated way which makes it almost impossible to distinguish between fallacious and non-fallacious arguments. As a consequence of this destructive dilemma, they argue in favor of "the intractable nature of fallacies" (p. 433). Although it is not clear whether this conclusion can be extended to all fallacies, it does seem to apply to the case analyzed here.

At this point, it is possible to wonder whether the very idea of genetic *fallacy* should be completely rejected. It is certainly a possibility. Nevertheless, the concept of fallacy and the genetic fallacy in particular, play an important part in philosophical controversies and sometimes lead to clearer argumentations. In this vein, Boudry, Paglieri and Pigliucci suggest that,

> instead of being wielded like the sword of judgment against opponents, [the concept of fallacy could be] employed for more amicable purposes, e.g., suggesting ways to clarify arguments that, without being necessarily flawed, stand in need of substantial elaboration (2015, p.452).

This is an interesting suggestion which points to the fact that, in general, fallacies are seen as logical or communicative *neutral* errors in argumentation and, consequently, when a fallacy is identified in someone's argumentation, it looks like the discussion has reached its end. Indeed, this could be the reason why, in a highly controversial field as philosophy, the charge of committing a fallacy is so common: it seems to provide a neutral departure point that must be shared by all the parties engaged in the argumentation. In other words, this charge has an important rhetorical function. For that reason, the concept of strategic maneuvering, which introduces a rhetorical dimension without neglecting the dialectical normative facet of argument evaluation, provides some fruitful conceptual tools for understanding the charge of committing a fallacy.

3. THE CHARGE OF COMMITTING A GENETIC FALLACY.

In order to better understand the charge of committing a genetic fallacy and its aftermath it is worth looking into what philosophers have written about it. Around the middle of the twentieth century, in the context of North American philosophy, controversy arouse on the topic and different authors analyzed it. Since then, most of the articles which address the issue are intended to defend a philosophical point of view against what is understood as an attempt to block some philosophical research, such as naturalist ethical stances (Kahane, 2011), feminist studies (Crouch, 1991, 1993), Freudian studies (Pashman, 1970; Kleiman, 1970) or genealogical nietzschean critiques (Kim, 1990), to mention a few examples. These replies share a similar strategy: instead of showing that their arguments cannot be considered as an instance of the genetic fallacy, they maintain that such form of argumentation need not be a fallacy and they question the assumptions upon which the charge of committing this fallacy is made (see Feuer, 1983; Crouch, 1991; Klement, 2002).

The expression "genetic fallacy" in the context of American philosophy traces back to the 1920s and 1930s. Its first occurrence in a logic textbook is in Cohen and Nagel's 1934 book -*An introduction to Logic and Scientific Method*- but it was probably a common

expression before that date. Indeed, John Dewey refers to the genetic fallacy in 1928, in a way that assumes that it was a well-known concept. The expression also appears in an article by Cohen, "History Versus Value", published in 1914. In that context, pragmatism and specially Dewey's version of it was an influential philosophy in the United States. This is an important fact, provided that Dewey had been insisting, since the beginning of the twentieth century (see Dewey, 1902, 1902a), on the need to use what he called the "genetic or historical method" in ethics and both Nagel and Cohen were familiar with, and critical of, Dewey's work. In fact, in Cohen's aforementioned article, the expression genetic fallacy is used in a footnote in which a position similar to Dewey's is vehemently objected. Consequently, it is no far-fetched to assume that pragmatist ethics was one of the first targets of the proponents or inventors of the genetic fallacy.

The partisan character of this fallacy is also suggested by the fact that the genetic fallacy is more commonly used by philosophers in argumentative exchanges than by logicians. Indeed, the idea of there being something like a genetic fallacy is frequent in the context of philosophy lectures in the United States and primarily in those contexts where analytical philosophy is the prevailing tradition. This is what can be inferred from the articles in which the fallacy is analyzed. For example, in an article by Thelma Lavine we read: "Detection and censure of the genetic fallacy is one of the most securely established of contemporary philosophic practices." (1962, p.321) In the same vein, in a 1959 article it is stated that "Frequent references to the genetic fallacy are encountered in philosophic literature" and that "naturalists, pragmatists and materialists are thought to be the chief offenders." (Handy, 1959, p. 25) More recently, Margaret Crouch (1993, p.227) and Kevin Klement (2002, p.383) refer to the importance of fallacies and the genetic fallacy in philosophy learning environments.

In these articles and others where this fallacy is addressed, different forms of genetic argumentation are defended against a seemingly unjustified attack trying to invalidate and block a whole philosophical approach. For example, Lavine (1962) criticizes how the genetic fallacy is used to invalidate contextual approaches within social sciences. Moreover, referring explicitly to Dewey, she states that the genesis of beliefs and valuations has a bearing on their validity. On his part, Handy suggests that

> It may be suspected that some writers are opposed to a scientific and developmental approach to ethics, and that this has led them to raise charges of the genetic fallacy in order to undermine such endeavors (1959, p. 32).

Finally, Norwood Russell Hanson, in a 1967 article entitled "The Genetic Fallacy Revisited" questions the use of the genetic fallacy aimed at keeping history and philosophy of science apart.

So far, three main conclusions can be established as regards this controversy. In the first place, it seems that the concept of genetic fallacy was and still remains an available resource for philosophers. Second, the genetic fallacy was mainly a criticism against specific philosophical stances, pragmatist ethics being one of the most important in the context analyzed. Finally, the strategy of some genetic argumentation advocates was to consider the genetic fallacy not as an objection to a specific argument or move but as an attack against the entire approach they adopt. In this sense, the fallacy was not understood as a logical or argumentative error, but as a *partisan* strategy which already assumed the invalidity of the opponent's view. This is particularly clear regarding philosophical ethics since those who use the fallacy as a criticism are committed to aprioristic and transcendentalist conceptions of moral values.

However, what has been said does not imply that there are no actual cases of arguments or argumentative moves which can be considered instances of the genetic fallacy but rather that such cases should be analyzed in view of the concept of strategic maneuvering.

4. THE CHARGE OF COMMITTING A FALLACY AS STRATEGIC MANEUVERING

In this section, the charge of committing a genetic fallacy is described as strategic maneuvering following the analytical model presented by van Eemeren (2010). In a general way, strategic maneuvering "refers to the continual efforts made in all moves that are carried out in argumentative discourse to keep the balance between reasonableness and effectiveness" (2010 p. 40). This means that arguers try to have their point of view accepted, that is to say, to be effective in convincing the other party,[1] but in a way that maintains their own image as "people who play the resolution game by the rules." (2010, p. 42) This characterization perfectly matches with the charge of committing a fallacy to the extent that it makes use of an alleged normative concept to point that the opponent's move disregards a reasonableness rule. If the charge is fair, then the move is also functional with respect to the rhetorical aims of its proponent.

Using the pragma-dialectical theoretical frame (see van Eemeren 2010), the maneuver can be described as follows:

1. It is a move typically performed by the *antagonist*, that is to say, by the participant who expresses critical doubts regarding the protagonist's point of view.

2. It is a move performed in the *argumentation stage*. According to van Eemeren the dialectical and rhetorical aims of this stage are, respectively, the following: "To achieve clarity concerning the protagonist's argumentation in defense of the standpoints at issue and the antagonist's doubts concerning these standpoints and the argumentation in their defense" and "To establish argumentation that constitute an optimal defense of the standpoints at issue (by the protagonist) or to establish critical doubts that constitutes an optimal attack on the standpoints and the argumentation (by the antagonist)" (2010, p.45). In this way, the charge of committing a fallacy would be dialectically useful to clarify the antagonist's doubts and rhetorically convenient to the extent that it is an optimal attack which reveals a logical or argumentative error.

3. Considering the three aspects of strategic maneuvering presented by van Eemeren, it can be said that the charge of committing a fallacy involves the following choices:

3.1.   As regards topical potential, it can be said that the different approaches and classifications of fallacies offer the antagonist a large range of counter-arguments that can be used to clear up doubts and to establish objections. It might even be said that the reason why fallacies have been so popular among philosophers and logicians rests on the great topical potential that they have.

3.2.   Regarding moves adaptation to meet the audience's demand, the idea of fallacy is particularly suitable. Indeed, the period characterized by Frankena as a moment of expansion of the practice of labelling the opponent's views as fallacies coincides with a moment of fruitful development of logic. Logical positivism and thereafter analytical philosophy were characterized by holding logic in high esteem, considering it as philosophically neutral and, what is more, as an unavoidable tool for overcoming metaphysical issues and improving philosophy. The importance of fallacies and of the genetic fallacy in particular in philosophy teaching environments makes the charge of committing one a very effective move in accordance with the audience's demand. On the other hand, the idea that genesis

---

[1] The idea of effectiveness is however broader than the idea of persuasiveness: "the term *effectiveness* is not exclusively applicable to argumentative moves made in the argumentation stage (as at least the term *persuasiveness* is), but also to argumentative moves made in the other dialectical discussion stages (which are not aimed directly at gaining acceptance of a standpoint)." van Eemeren, Garssen, & Meuffels, 2012, pp. 51-52)

and validity should stand as completely different issues, thoroughly extended in those contexts, further accounts for the importance of the genetic fallacy in particular.

3.3. Finally, the third aspect of strategic maneuvering is "the exploitation of 'presentational devices,' which involves a choice as to how the argumentative moves are to be presented in the way that is strategically best" (van Eemeren, 2010, p. 94). As said, the idea of logic as an impartial starting point and of fallacies as logical errors makes them very effective presentational devices. This neutral character is also reinforced by the fact that fallacies are usually understood as procedural mistakes and not as mistaken premises or departure points.

As a consequence of this description, the charge of committing a fallacy and its importance in the mentioned philosophical contexts can be understood as a profitable strategic maneuvering which offers already-made procedural and logical tools, as opposite to ad hoc stratagems, in a context in which logic was supposedly the keystone of philosophy.

Be that as it may, strategic maneuvering can derail. Following van Eemeren words:

> The conditions that need to be fulfilled in order to ensure effectiveness do not necessarily always agree with the conditions that have to be met to guarantee reasonableness. (…) The pursuit of effectiveness may in some cases get the better of the simultaneous pursuit of reasonableness. Then the combination of effectiveness and reasonableness is out of balance. Making use of a railway metaphor, it can be concluded that the strategic maneuvering has derailed. (2010, p. 41)

This derailment is produced after some rule for critical discussion is violated. When such a thing happens, the move must be considered fallacious despite its effectiveness. For genetic argumentation advocates, some problems arouse in relation with the charge of committing a genetic fallacy. In the first place, what is a seemingly argumentative maneuvering, that is, a maneuvering within the argumentation stage, is indeed a derailed confrontational maneuvering violating the Freedom Rule (Rule 1, "Discussants may not prevent each other from advancing standpoints or from calling standpoints into question") for it is an attempt to block an entire approach. In other words, in such case the genetic fallacy is wrongly applied since it is not used against a *particular advanced argument* in the argumentation stage, but against a stance presented in the confrontation stage. On the other hand, the charge of committing a genetic fallacy is derailed or fallacious when it violates the Starting Point Rule (Rule 6, "Discussants may not falsely present something as an accepted starting point or falsely deny that something is an accepted starting point"). As it is usually understood by most of the authors mentioned in section 3, the genetic fallacy depends on a previously assumed premise according to which genesis and validity are mutually irrelevant. However, the approaches they adopt try to show how the genesis and the history of a belief can throw light on its validity. Consequently, the genetic fallacy cannot be considered as a shared procedural tool. It is, from this point of view, a partisan move which presents a starting point as if it were already accepted by the other party.

Finally, it is worth mentioning another way in which the charge considered can derail. As mentioned before, the examples in which the genetic argumentation is held to be fallacious are usually cases of deductive argumentation which turn out to be defective. However, the genetic argumentation used in different contexts is usually a reasonable non-deductive move or argument based on symptomatic relations (see van Eemeren, & Henkemans, 2017, p. 84). In this way, the charge of committing a genetic fallacy can indeed be a case of the straw man fallacy (violation of Standpoint rule 3, "Attacks on standpoints may not bear on a standpoint that has not actually been put forward by the other party"). This is an important point because deductivism as an evaluative and interpretative strategy, is generally the ground on which the charge of committing a genetic fallacy and other similar fallacies is made.

5. CONCLUSION

In this paper the genetic fallacy has been characterized and its use as strategic maneuvering in philosophical discussions has been interpreted. Such grasp is indeed an attempt to understand the way in which genetic argumentation advocates have dealt with the charge of committing that fallacy. Besides, some ways in which said maneuver can derail have been stated. It is worth mentioning that similar interpretations concerning other *philosophical* fallacies could be offered (López, 2015; 2018). For instance, the naturalistic and the *ad consequentiam* fallacy have received similar treatments by philosophers. Strikingly, those fallacies have also been used against naturalistic and pragmatist stances on ethics in the same context that the genetic fallacy has, usually in derailed ways. Indeed, they can altogether be seen as a derailed discussion strategy, that is to say, as coordinated modes of strategic maneuvering "that are methodically designed to influence the result of a particular stage of the resolution process, or the discussion as a whole" (van Eemeren, 2010, p. 47). More specifically, it was and it continues being the discussion strategy, *par excellence*, of aprioristic and transcendentalist, in some cases even emotivist philosophers against non-transcendental fallibilistic and cognitivist stances on ethics.

To conclude, an interesting point to emphasize is the value of the concept of strategic maneuvering as a tool in the analysis of philosophical argumentation. It is a remarkable fact that philosophers and especially analytical philosophers tend to assume very strong criteria to decide if an argument is cogent or not: prove or perish seems to be their motto. In other words, deductivism is the prevailing theory of argument evaluation among them. This is clearly seen in the uses of fallacies outlined before. For instance, the naturalistic fallacy is often presented in a deductive jargon: an "ought" cannot be *derived* from an "is." However, since its revival in the twentieth century, argumentation theory has tried to broaden those criteria and with them, the very concept of rationality. The idea that charging someone of committing a fallacy is a strategic move that must combine effectiveness with reasonableness, and not a final word, could serve to enrich the philosophical practice of identifying and analyzing fallacies since it throws light on other functions of them.

Recognizing argument types and adding missing reasons

CHRISTOPH LUMER

Department of Social, Political and Cognitive Sciences (DISPOC)
University of Siena
Italy
lumer@unisi.it

ABSTRACT: The article develops and justifies, on the basis of epistemological argumentation theory, two central pieces of the theory of evaluative argumentation interpretation: 1. criteria for recognizing argument types and 2. rules for adding reasons to create ideal arguments. Ad 1: The criteria for identifying argument types are a selection of essential elements from the definitions of the respective argument types. Ad 2: After presenting the general principles for adding reasons (benevolence, authenticity, immanence, optimization), heuristics are proposed for finding missing reasons, for deductive arguments, e.g., semantic tableaux are suggested.

KEYWORDS: adding missing reasons, authenticity, charity, deductive minimum, definitions of argument types, enthymemes, immanence, indicators for argument types, recognizing argument types, semantic tableaux

1. TOPIC OF THE STUDY: RECOGNIZING ARGUMENT TYPES AND ADDING REASONS AS STEPS IN ARGUMENTATION EVALUATION

The aim of this paper is to develop a theory of recognizing argument types and supplementing missing reasons or premises. This theory, in turn, is part of a broader theory of argumentation interpretation for the purpose of evaluating arguments in terms of their validity and situational adequacy (Lumer, 2003). The basis for the theory to be developed here as well as the source of the criteria for argumentation assessment is epistemological argumentation theory, or more precisely: the version of this theory known as "Practical Argumentation Theory" (Lumer, 1990; 2005; 2011a).

2. PROBLEMS WITH THE RECOGNITION OF ARGUMENT TYPES AND THE APPROACH TO THEIR SOLUTION: LISTS OF CHARACTERISTIC FEATURES

The need to determine the argument type first in order to be able to evaluate the argumentation only exists because there are different argument types in the first place, which also differ as to their criteria for the validity of an argument. In order not to measure an argumentation against the wrong standards, the corresponding argument type and therefore, also the corresponding list of criteria must be determined beforehand.

Various argumentation theorists share the idea that for the epistemic assessment of an argumentation one must first identify the argument, then recognize the argument type, and add missing premises; only then one is able to assess the argumentation (e.g. Govier, 1999, p. 85). However, there are several major difficulties when it comes to implementing this idea, and in particular identifying the type of argument.
1. There is still no agreement on the types of non-deductive argument types; and the lists of argument types proposed by various theorists differ greatly. This paper is based on the classification of argument types developed in the epistemological approach to argumentation theory, which distinguishes argument types according to their respective underlying epistemological principles (Lumer, 2011a).

2. The problem of the previously required lists of argument types is exacerbated by the fact that many existing arguments are molecular, i.e. composed of several elementary arguments, usually in such a way that subordinate parts of the overall argument justify premises of the central argument. The elementary arguments can be of different types. In the literature, certain more frequently occurring types of molecules, such as arguments to the best explanation or justifications of actions, are often conceived as a separate, irreducible types of argument. This shows how poorly understood these molecules are. For the classification, the fact that these arguments can then fulfill the criteria of several argument types is particularly confusing.

3. The arguments themselves usually do not contain any explicit indication of which type they are or which type of argument the arguer intended to produce.4. Even recourse to the arguer's intention does not help any further, firstly, because this intention must usually first be inferred from the argument text – because often one cannot ask the arguer beyond the text of the argument – and, secondly, because the vast majority of arguers argues only intuitively and, therefore, does not entertain explicit thoughts about the type of argument, and does not have theoretical knowledge to indicate the type of argument.5. Most argumentation theories distinguish between ideal and non-ideal but still valid arguments. For example, the latter contain linguistic impurities or variations, which, however, can usually be corrected relatively easily. But, above all, valid non-ideal arguments are mostly enthymematically abridged; thus, along with the lack of reasons, central characteristics of ideal arguments on the basis of which one can relatively easily identify the argument type are often also missing. The problem is aggravated by the fact that non-ideal arguments account for the overwhelming majority – over 99% – of the available arguments.

6. In addition to valid non-ideal arguments, there are also invalid ones. And these deviate even further from the ideal, making it still more difficult on average to assign them to a particular type of argument. If one also wants to assess these arguments afterwards according to certain argumentation standards – in order to then find out or to show that they are not valid – then one must be able to assign them to a certain argument type beforehand. The sense of the whole enterprise of argument assessment presupposes that the vast majority of arguments can be assigned to a certain type of argument.

The real reason why Ennis' attempts to determine the argument type before the assessment (Ennis, 2001) fail is, I think, that he has no more or less complete list with precise validity criteria for the various argument types (see problem 1 above). Ennis is gradually compiling a list of argument types with their characteristics; and this list is excellent when compared to others in the literature. But this list is a bit ad hoc and therefore not complete and systematic enough, e.g. without attempts at reduction, thus without differentiating between elementary and molecular types or between general types and more specific variants thereof. Furthermore, the validity criteria for the individual argument types are incomplete, vague and often incorrect.If, instead, one has an independent and elaborated positive theory of argument types with precise and complete criteria for the validity of the individual types arguments, then it should be possible to compile lists of characteristics of the individual argument types, which in the vast majority of cases leads to a correct classification of the argumentation. The basic idea of such a list is then to take the structural characteristics of the respective argument type as the characteristic features and thus capture the essence of this type. The epistemological approach in argumentation theory comprises such a positive theory of argument types (Lumer, 2011a). It is the basis for the following list of characteristics of the individual argument types, which are then used to classify individual arguments. In order to do justice to the problem of non-ideal, especially invalid arguments (problem 6), this list of characteristic features, of course, cannot always contain all the conditions for the validity of arguments of a certain type. Rather, a selection of particularly conspicuous characteristics, which show either all or nevertheless most of the arguments of this type, has been made here.

In a certain sense, the characteristics that, according to this list, are fulfilled by all the arguments of the respective type define the argument type; if an argument does not have these defining characteristics, it cannot be assigned to this type.

3. A LIST OF CHARACTERISTICS FOR IDENTIFYING ARGUMENT TYPES

The starting point for creating a list with the characteristics for recognizing argument types are the criteria for valid – ideal and non-ideal – arguments of this type (Lumer, 2011a; 2011b; 2014). With regard to these criteria, in each case it is necessary to decide which of them should constitute defining or at least very characteristic features for the argument type, and which should not: Are they striking, conspicuous and central? Are they still sufficiently broad to leave many fallacies which can still be assigned to this type? Are they sufficiently narrow to define the different argument types without overlaps? etc. (see the discussion above). I made such an analysis in a working paper that I use in my courses. However, that paper is far too comprehensive to be presented here in full. Instead, I will only present the core of the result of this analysis, the summary list.

A few explanations are required beforehand. The practical theory of argumentation, i.e. the variant of the epistemological approach I created, develops argument types on the basis of so-called epistemological principles; these are general statements about when certain types of propositions are true. For example the deductive epistemological principle, says: 'A proposition is true if it is logically implied by true propositions'. These epistemological principles in turn originate from branches of epistemology in the broad sense: deductive logic, probability theory and rational decision theory. Accordingly, there are three basic argument types: deductive, probabilistic and practical. In addition to these three basic types, however, several derived argument types are dealt with below. Some of them are frequently occurring *specializations* of these basic types. For probabilistic arguments, for example, arguments from authority are such specializations. Another part of the derived arguments are frequently used *molecular arguments*, such as arguments to the best explanation or justifications of actions. The following list contains the characteristics for the basic forms and only those for the most important derived argument types. But following the principle recognizable from this list, the list can be readily extended by characteristics for the other argument types contained in the classification of valid arguments (Lumer, 2011a). – In addition to the characteristics necessary for a particular argument type, the list includes some, not necessary but characteristic, features that facilitate recognition. Therefore, the descriptions of the single indicators are always preceded by a qualification stating whether the indicated feature must necessarily be present or, if not, how often it is present: "necessary", "frequent", " fairly frequent", "occasionally".

D: DEDUCTIVE ARGUMENTS:

1. Occasionally: deductive argumentation indicator: Deductive argumentation indicators: 'from this follows'; 'by implication it holds'.

2. Necessary: Repeating terms: If the singular and general terms of the argument have been made uniform (which, according to the rules of argument interpretation, should happen in the step to be worked through beforehand (Lumer, 2003, pp. 717-718: steps 4 and 10)), then singular or general terms from the thesis are also repeated in the reasons and possibly also from one reason to another.

3. Necessary: deductive inference structure: The structure of the argument's judgments, constituted by the logical operators, 3.1. in the ideal case corresponds to one of the (known or also less known) deductive inference schemes or 3.2., with valid but not ideal deductive reasoning, corresponds to a shortened version thereof, or 3.3., with invalid deductive reasoning, the structure resembles at least one of these abridged versions.

L: PROBABILISTIC ARGUMENTS (IN GENERAL):

1. Necessary: probabilized thesis: The thesis is probabilized. This is a necessary and sufficient condition for probabilistic arguments.

2. Frequently: probabilistic or statistical reason: In ideal probabilistic arguments at least one of the reasons is a statistical or probabilistic judgment. Mostly – but not always – this reason is also contained in abridged but still valid probabilistic arguments.

Le: GENESIS OF KNOWLEDGE ARGUMENTS (arguments from authority, arguments from testimony, quotations from historical sources, ...):

1. Often: probabilized thesis: The thesis can have very different contents, but should actually be probabilized. If it is not probabilized, the argument is invalid.

2. Necessary: description of the genesis of knowledge: The reasons are, first, excerpts from a narrative of how and by whom the thesis was examined with a positive result and, second, how this thesis then progressed from examination to being uttered by the arguer. These excerpts can be extremely fragmentary, e.g. a reference to a historical source (descriptions of the verification as well as the tradition from the verification to the production of the source text are missing) or to a statement by an authority or a witness.

3. Frequently: reliability assessment of the genesis of knowledge: Ideally, the reasons also include probabilistic assessments of the correctness (truth conformity) of the verification and transfer of the thesis. However, these reasons can be missing even in valid genesis of knowledge arguments; and they are missing quite regularly in invalid ones.

Li: INTERPRETIVE ARGUMENT:

1. Necessary: thesis about past event(s): The thesis is a (probabilistic) judgment with a description of a (past) event or state or a set of such events or states. This description can also be concealed, for example as a statement about the meaning of an object, especially a text, in which case the associated event is the author's intention.

2. Necessary: explaining a fact with the thesis: The main reason is 2.1. a hypothetical explanation 2.2. of a known fact; in this explanation the event or state mentioned in the thesis occurs as a (partial) cause. This hypothetical explanation can be very short, containing only central elements.

3. Fairly common: alternative explanations: In more complex interpretive arguments there are several such explanations of the known fact as further reasons. 3.1 Then, for each of the additional explanations, these additional reasons state that this explanation is inconclusive (pseudo explanation which is incompatible with certain known facts) or 3.2. that it is less likely than the explanation by the event mentioned in the thesis.

P: PRACTICAL ARGUMENTS:

1. Necessary: value judgment as thesis: The thesis is a value judgment (but this alone is not enough to be a certainly distinguishing feature).

2. Necessary: implications of the value object and / or their valuation: The most important reasons are pairs of 2.1. judgments about the implications (mostly causal consequences) of the value object and 2.2. value judgments about these implications. One of these judgments is often omitted. There are often several such pairs.

Pa: JUSTIFICATION OF AN ACTION:

1. Necessary: the thesis is an optimality judgment about action: The thesis is an optimality judgment about an action *a* or – in impure forms, which are often not valid – a proposal for action: '*s* should do *a* / let's do *a*!'

2. Often: evaluation of the action(s): The main reasons are 2.1. evaluations of *a* and 2.2. – in valid justifications of action – of at least one alternative *b*. This comparative evaluation is often lacking in invalid justifications of action.

3. Necessary: practical argument for the evaluation: The evaluation or the evaluations from 2 is / are justified in a practical argument. Pairs from 3.1. judgments on the implications of action *a* (or alternatives b_1, ..., b_n) and 3.2. evaluations of these implications are given as further reasons.

4. A THEORY OF ADDING REASONS

Most normative theories of argumentation require that possibly missing reasons must be supplemented for the assessment of an argument (e.g. Ennis, 1982; Govier, 1999; Hitchcock, 1985; 1998; 2003); but not all require this. For example, Walton's argument schemes (e.g. Walton, Reed & Macagno, 2008; critique: Lumer, 2016), even if they are supplemented by the answers to the "critical questions", do not contain all the reasons that other argumentation theories would add. So why is it necessary to add reasons at all? 1. As explained at the beginning, the aim of supplementing reasons is generally to make it possible to assess the argumentative validity (and situational adequacy to convince) of the argument. And this assessment has the following sense: Argumentation theories, and the epistemological approach in particular, have set standards for ideal arguments. In the epistemological approach, these standards are constructed in such a way that they are based on underlying *epistemological principles*, i.e. very general epistemologically justified principles which specify conditions under which a thesis (perhaps of a specific type) is acceptable, i.e. true, truth-like or probably true. Therefore, if an argument fulfills these standards it is guaranteed that: *i.* the argument's thesis is acceptable, and *ii.* the thesis can be recognized as acceptable by an addressee on the basis of the reasons contained in the argument (Lumer, 2005, in particular pp. 215; 221-222; 225-228; 233). Hence, if the assessment of an argument can show that the argument meets these standards, then the thesis is also acceptable, and this acceptability of the thesis can be recognized by checking the reasons. 2. For various reasons, the arguments to be found in everyday life, science, politics etc. are generally not ideal in this way. Nevertheless, they often work quite well in these practices and fulfill their argumentative function. Therefore, the theory of argumentation should also acknowledge that they are good arguments, but at the same time not renounce its standards (*i* and *ii*). The usual way to do this, which also enables an argument assessment according to standards *i* and *ii*, is: to bring the found arguments into an ideal form, in particular to add missing reasons. Since prior to the assessment one cannot assume that the found argument is really good, more precisely, the aim of adding missing reasons is: to bring the argument found into an ideal form as far as possible – meaning that it is practically as close to ideal as fulfilling a number of conditional permissions permit.

What is my own proposal for adding missing reasons? I will set out the conditions for adding missing reasons in the form of '*principles for supplementing reasons*'. These principles in turn are specifications of the general principles of argument interpretation (Lumer, 2003, pp. 716-717) for the particular purpose of adding missing reasons.

In the theory of text interpretation, this basic way of finding out a somewhat bounded but still as ideal as possible reading of a text is generally called "*benevolence*" or "*charity*". This is then the name of the first principle of the theory of argument supplementation developed here. Further principles will limit the idealization to a certain extent.

P1. Benevolence, charity: The completed arguments should transform the argument into an ideal argument as far as possible, i.e. a complete argumentatively valid and situationally adequate argument, without violating the other principles of argument supplementation. To this end, the additional reasons should (i) be as true or acceptable as possible, (ii) be accepted by the addressee, and (iii) contribute to the argument's conclusiveness.

The aim of charity is, for one, to recognize the good core, the central idea of an argument in a cooperative manner. For another, charity is a concession of argumentation theorists who have introduced relatively formal criteria for the validity and adequacy of arguments that cannot be expected to be fulfilled in everyday life. (Lumer, 2003, pp. 716-717)

As the phrase "without violating the other principles of argument supplementation" already suggests, benevolence has its limits. One of these limits is that the idealized argument must still be that of the author, i.e. attributable to her. Unfortunately this idea cannot be specified as some standard approach to text interpretation does, namely by the requirement that the author must have intended the idealized version. This requirement would be mistaken, because authors of arguments usually think as they write or speak, they jump to conclusions; i.e. they did not first imagine the missing reasons and then omit them (perhaps for stylistic reasons). The requirement to allow only reasons intended by the author would therefore mean that almost no additional reasons should be added. A weaker operationalization of the idea that the supplemented arguments must be accepted by the author is:

P2. Authenticity: The reconstruction has still to be a reconstruction of the *original author's* argument. Therefore, impute only such implicit reasons, types of inferences, argument schemes and steps to the author which she accepts or for which holds that she plausibly would accept them when her attention were drawn to them!

Another restriction for the reasons to be added is that the idealized argument must still be an idealization of the initial argument. In extreme cases, a mathematical argument, for example, could simply contain the axioms of the mathematical theory and then the theorem, without any intermediate step. So the real proof would be missing. To ask the interpreter (and addressee) to construct this proof in the course of interpreting the argument would be an imposition for the interpreter and addressee; and an argument so incomplete could not guide the addressee in recognizing the thesis, which however is its main function. In short, to allow for additions of too many reasons would mean that an argument, which should actually contain the proof as a guidance for recognizing the truth of the thesis, would also be regarded as proof although it contains nothing of the proof. Therefore, the essential elements of the complete proof, of the complete argument must already be contained in the existing argument. For the missing reasons to be supplemented, this means that they must be accessible from the material contained in the found argument.

P3 Immanence: The given argument must already contain the most important contential elements of the additions in the sense that the reasons necessary for the ideal version must be constructible from the existing components by means of standard reconstruction procedures. (Such reconstruction procedures are presented below.) – The following concretizations are only a few examples: *All arguments:* The essential predicates and singular terms of the reasons to be supplemented must already be contained in the existing ones. *Practical arguments:* In any case, at least one element of the pairs from consequence assumptions and their evaluation must be contained in the argument found.

That the missing pieces must be extracted from the existing pieces does not mean that a layman can do this or that an expert can do it without much work. The completion of enthymematic *deductive* arguments together with the elimination of their ambiguities is often extremely laborious, because a multitude of different combinations of premises have to be tried out (Lumer, 1990, p. 83).

It is possible that no supplement to the arguments fulfills the conditions of the above principles. However, the opposite is also possible: several sets of additions may fulfill the conditions of the previous principles of argument supplementation. In this comfortable situation, the ideal version of the argument, in the spirit of benevolence, should be as good as possible beyond argumentative validity and adequacy – stronger, more elegant, simpler etc.

P4. Optimization: strength and simplicity: If several sets of additions meet the previous conditions, choose the one that makes the argument strongest and simplest!

5. HEURISTICS FOR FINDING FITTING REASONS

The principles just mentioned for adding premises only formulate conditions for the end product, i.e. criteria by which a proposal for adding reasons can be assessed. They do not say anything about which method can be used to construct the reasons to be added. Unfortunately, there is no real algorithm by which one can simply construct these missing reasons. The only fundamental method here is trial and assessment, i.e. a hypothesis as to which set of reasons could meet the above criteria is developed followed by a critical examination of whether the hypothesized set of reasons fulfills the conditions. If the assessment is negative, i.e. the hypothesis for a suitable supplement does not meet the above criteria, then the procedure must be repeated, possibly several times.

Although we do not have algorithms, there are some heuristics for finding fitting reasons; these heuristics change with the respective argument type. Because of the strong structural requirements of *practical arguments*, adding reasons with this type of argument is usually not very difficult. Especially if one of the elements of the pairs of consequence judgment and valuation is missing, the given element already contains a denotation for the event or state that occurs once in the *description* of the thesis' value object *o*'s consequence and the other time as the object of the *value judgment* on *o*'s consequence.

Because of the polymorphism of *deductive arguments*, finding the missing reasons for deductive arguments is often much more difficult. However, some methods proposed by argumentation theorists as *the* method of adding premises – even if this claim is far too strong – can at least be used as *heuristics* for finding missing premises of deductive arguments. With these methods, *hypotheses* can be created about which premise is missing. However, as already mentioned, these hypotheses must then be reassessed as to whether the proposed addition fulfills the above conditions. The simplest heuristics is the *deductive minimum*:
Deductive minimum: If the argument consists of the premises p_1, ..., p_n, and the thesis t, then the missing premise is the material implication connecting these two components: '$p_1 \& \ldots \& p_n \rightarrow t$'.

Adding the deductive minimum definitely makes the argument deductively conclusive; and the deductive minimum must also be true if the premises and the thesis are true; and because this premise is simply obtained mechanically, the immanence condition is also fulfilled. But the premise so constructed often does not fulfill the pragmatic subcondition of charity that the premise is also accepted by the addressee (P1.ii).

Hitchcock (1985; 1998; 2003) has proposed an alternative method for adding premises to deductive arguments, the "*covering generalization*": First, as with the deductive minimum, the premises are again linked with the conclusion to a material implication. A universal generalization is then formed from this: At least one contentual expression occurring in the premise and in the conclusion (i.e. not the logical particles) is replaced by a universal generalization; in addition, other contentual expressions occurring several times can also be replaced by universal generalizations. Also this method always leads purely mechanically to an addition, which makes the argument conclusive; but, unlike the deductive minimum, this covering generalization is not necessarily true if the premises and the thesis are true. Therefore, in each case it is necessary to check whether this premise is true. The heuristics of the covering generalization works quite well with arguments of the classical form of the Toulmin scheme (i.e. with the data expressed and the warrant missing). But yet it does not work with arguments reconstructible as Toulmin arguments but where instead of the data the

warrant is made explicit (e.g. 'All humans are mortal. Therefore, Socrates is mortal.'). And it fares still worse with deductive arguments of a completely different form (e.g. *chaining*: '$a{\rightarrow}b$; $c{\rightarrow}d \Rightarrow d$' with the missing premises: a and $b{\rightarrow}c$).

Semantic Tableaux or *Beth Calculi* (Beth, <1955> 1969; Smullyan, <1968> 1995; von Kutschera & Breitkopf, <1971> 1979, pp. 108-127) are better heuristics for determining the missing premises of deductive arguments.[1] The basic idea of semantic tableaux is to examine the logical conclusiveness of logical inference forms by systematically trying, by decomposing the formulas, to find possible cases/worlds where the premises are true but the conclusion is wrong. In the tabular form of these calculi (Beth, <1955> 1969; von Kutschera & Breitkopf, <1971> 1979, pp. 108-127) a panel is divided vertically into two colums, called "tables", one (left) with true and one (right) with false formulas. The premises are entered on the left (true), the conclusion on the right (false) to check under which conditions the conclusion perhaps is invalid, i.e. the premises are true but the conclusion is nonetheless false. The formulas are then decomposed step by step into elementary formulas according to the semantic rules of the logical operators. A subtable is called "closed" if it contains a contradiction, i.e. if it contains a formula in both the true and false halves of the subtable. A table is "closed" if all its subtables are closed; and this means that all attempts to construct a counterexample against the conclusion lead to contradictions; so the conclusion is valid. If at least one subtable cannot be closed despite all possible decompositions, then there are possibilities, possible worlds, in which the premises are true, but the conclusion is false; thus the conclusion is logically invalid.

Now the latter case is interesting for enthymemes and premise supplementation because enthymemes are logically inconclusive – due to missing premises. The special thing about the semantic tableaux is that the open subtables describe the possibilities by which the conclusion can be refuted. And this in turn means that the premises to be supplemented must be such that they exclude these possibilities. In this way, semantic tableaux provide valuable information as to which conditions the premises to be supplemented must fulfill from a logical standpoint. They thus help in the construction of the premises to be supplemented. But they are only a heuristic, not an algorithm for finding these premises: 1. The open subtables of the semantic tableaux only indicate those cases which must be excluded by the additional premises. However, this can happen in several ways (e.g. by a singular conditional (e.g. $Fa{\rightarrow}Ga$) or instead by a general conditional ($\forall$x($Fx{\rightarrow}Gx$))), whereby the existing premises can still simplify these possibilities of exclusion and, vice versa, in order not to beg the question the truth of the conclusion cannot simply be assumed. Thus the creation of interesting possibilities of exclusion sometimes requires creative intelligence. 2. The premise set (or perhaps various premise sets) constructed in this way, which hence would make the argument conclusive, must again be checked "manually" as to whether the other conditions of premise supplementation are also fulfilled.

Semantic tableaux provide very good hints for the construction of missing premises, they work very well as heuristics, where e.g. the heuristic of the covering generalization has problems (e.g. Socrates enthymeme of the second form, chaining). But they do not help much with the simplest deductive arguments with exclusively elementary formulas. Concerning the Socrates enthymeme in the first form (Socrates is a human, therefore he is mortal), for example, they essentially say only: Add a premise which excludes that 'Socrates is a human being' is true and at the same time 'Socrates is mortal' is false – thus hardly more than what one knew before.

Even with the principles set out above and the heuristics just discussed for finding good supplemental reasons, the supplementation often remains a laborious business. But at

---

[1] Erik Krabbe reminded me of this possibility.

least the principles provide clarity about what is a good addition, and the heuristics and structural hints help somewhat in finding suitable additions.

The old and the new: The case of the Chinese online debate show, *Qipashuo*

JUNYI LV

Annenberg School for Communication and Journalism
University of Southern California
United States of America
junyilv@usc.edu

ABSTRACT: This paper analyzes the popular online debate show in China called *Qipashuo*. *Qipashuo* is unique in many ways. It demonstrates typical Western debate features such as true debate and new rhetoric, but also resurrects Chinese debating tradition, breaks the rigid format of formal college debate competitions, and illustrates four kinds of entertainment: alea, agôn, mimicry, and ilinx. In neo-liberal China, *Qipashuo* is a window for public education, participation, and discussion.

KEYWORDS: China, debate, entertainment, game, *Ming Bian,* new rhetoric, Qipashuo, true debate

1. INTRODUCTION

The word *qipa* literally means "weird and beautiful flowers" in Chinese. Its meaning has changed over time. In contemporary China, *qipa* means "weird folks," with a negative connotation. However, the online debate program *Qipashuo* (奇葩说, literal translation: weird folks talking) has subverted people's perception of the word. Because the show has become the most popular online talk show in China, the concept of *qipa* is associated with the courage to express stereotype-breaking opinions.

Qipashuo has run for four seasons (Li, June 6, 2016), generating several million views (Sohu, April 1, 2017). The latest season of the show received ¥140 million (about US $20 million) from the cooperate sponsors (Koetse, April 26, 2017). On Weibo (the Chinese version of Twitter), *Qipashuo*'s topics and debaters frequently appear on the "Hot Search Topic List" (Koetse, April 26, 2017). The debaters have also become opinion leaders in online communities. China has the largest netizen population, 88% of which watch online video content. For young people born after the 1990s, the percentage is even higher—90.6% (Koetse, April 26, 2017). *Qipashuo* has a tremendous influence among young people. One of the show's slogans is "please watch the show in the company of people born after the 1990s," a satirical comment on the movie rating system, specifically its "PG-13" designation.

Academic articles and industry reports have analyzed *Qipashuo*'s success (Koetse, April 26, 2017; Sohu, April 1, 2017; Wu, 2017; Shao, 2015). Media express many tensions in China. One is between government control and the uncontrollable algorithms of online platforms. Another is between the media's market-orientation and the policy requirement to act as ideological tools. China's media, both mass and online, are more or less struggling with these dilemmas. Despite *Qipashuo* encountering friction with the official values advocated by the government, its commercial and social success serves as a roadmap for other online shows to follow.

Beyond the perspective of the media and industry, *Qipashuo* strives to improve Chinese society by debating relevant social issues and leading public discussions. Topics in this program are not necessarily political, but rather bottom-up. The debate topics cover a wide range including relationship, technology, education, career, gender discrimination, LGBTQ rights,

and so on (Koetse, April 26, 2017). In an authoritarian country, *Qipashuo* encourages the debaters to express their personal opinions, to form a professional community proficient in rhetorical practices, and to open opportunities for public participation. Therefore, the show has created loci that can be circulated among private, professional, and public spheres (Goodnight, 2012).

 Qipashuo mixes four features. As an entertainment show, it deformalizes the format of college debate competitions. As a mediated debate program, it provides a place for professional and amateur debaters using rhetorical skills to speak and persuade. As a debate competition, it demonstrates classic Western rhetorical theories and techniques. Finally, as a Chinese debating event, it resurrects the debating tradition from 2,000 years ago, making it accessible and admirable to the public. The synthesis of these four components has not only popularized the show with the public, but has also highlighted debate as a true art form in addition to a public and social practice. This paper analyzes the features and discusses the relevance and the significance of debate and the debate show format for Chinese audiences.

2. CHINESE AND WESTERN, DEBATING AND ENTERTAINING

For a long time, Chinese rhetoric has been understudied by mainstream rhetoric and argumentation studies (Lu, 1993; Lu, 1997; Lu & Frank, 1993). A simplistic logic held: since harmony is appreciated by Chinese people, debate is not valued (Lu & Frank, 1993). However, this position denies the possibility that conflict and harmony can exist together. As the title of Branham's book *The Harmony of Conflict* (1991) indicates, debate seems to be conflictual. Nevertheless, it creates not only a clash, but also a sense of harmony more profoundly—not competing for the victory and personal interests, but forming a balance of the two sides and collaborating on seeking truth.

 Branham (1991) instead uses a culturally sensitive approach to study debate. He introduces debate traditions in different cultures. In China, debate is an essential part of religion, theology, logic, and philosophy, appearing in many forms throughout different dynasties. For instance, in the Han Dynasty, debate was an ideological engine to protect Confucianism advocated by the government (Branham, 1991; Kroll, 1985). In the Wei and Jin Dynasties, debate was called *qing tan* (清谈 meaning pure talk) and primarily assumed an educational role.

 Some scholars misrepresent the nature and features of Chinese rhetoric. It is argued that logic and deductive reasoning are not appreciated in Chinese culture (Jensen, 1992). Even some Chinese scholarship supports the idea that Chinese rhetoric does not emphasize reason and logic, but "figures of speech" (Eemeren et al, 1996, p. 349). The purpose of Chinese rhetoric was believed to be not persuasion but "how to write beautiful phrases and sentences" (Eemeren et al, 1996, p. 349). This viewpoint denies the co-existence of aesthetics and function. As Perelman argues, figures and tropes are not only ornaments but also function substantially in argumentation (Eemeren et al, 1996). Mao (2003) also addresses that it is necessary to pay attention to the differences of Chinese and Western cultures, but, instead of simply paralleling the descriptions, scholars should conduct a comprehensive analysis.

 The misunderstanding springs from problematic research methods and a lack of awareness about Chinese rhetoric's features. First, rooted in European training, Western modes of inquiry emphasize disjunction and isolation (Lloyd, 1966; Moore, 1967). They lead to decontextualization when studying Chinese rhetoric. Second, some Western scholars cannot read Chinese and thus refer to inaccurate translations. For example, in *Tao Te Ching*, "*shan zhe bu bian, bian zhe bu shan*" (善者不辩, 辩者不善) is mistranslated as "a good person does not argue; he/she who argues is not a good person" (Lu & Frank, 1993, p. 4). The wrong translation prompted the belief that Chinese culture does not regard arguing as a good behaviour. But if

one pays close attention to the context, the sentence should be translated as "a good person does not speak with high-sounding words; one who speaks with high-sounding words is not a good person" (Lu & Frank, 1993, p. 4). Third, Chinese rhetoric is not an organized and systematic discipline. Theory and practice are often intertwined with "philosophy, religion, ethics, psychology, politics and social relations" (Lu, 1997; Lu & Frank, 1993, p. 4).

China's tradition of rhetoric, argumentation, and debate started 2,000 years ago. The time was called the era of "The Hundred Schools of Thought." Confucians, Taoists, Mohists, Legalists, *Ming Jia* (名家, meaning the school of *Ming*)*,* and other schools debated with one another to advocate their positions (Jensen, 1992; Kroll, 1985; Lu, 1993; Lu, 1997). Scholars, philosophers, artisans, and people in other professions argued their opinions (Kroll, 1985). *Youshui* (游说, meaning the activity of persuasion) was prevalent. *Bianshi* (辩士, meaning debaters) actively participated in events to persuade powerful elites. In the political realm, debating was central to officials solving problems and crafting policy. Debate in that era had an egalitarian nature in which rulers did not necessarily always come out on top (Kroll, 1985).

Among all schools, *Ming Jia* specially focuses on debate. *Ming Jia* is often interchangeably used with other descriptions such as *bian zhe* (辩者, debaters) in Chinese culture. The school was regarded as *gui bian zhe* (诡辩者, deceitful debater), the equivalent of sophists standing against the rhetorician and the wise man. Although *Ming Jia* was put down by other schools, it has its distinct philosophy: "*Ming* refers not only to argumentation, but to a theory of expressing thoughts and confirming truth. It is the method of setting up an argumentation" (Lu, 1997, p. 41). The school has three major contributors: Deng Xi, Hui Shi, and Gong-sun Long. Although they did not espouse systematic theories and left few writings, some of their thoughts have been recognized and studied. Deng Xi was engaged in *xing ming zhi bian* (形名之辩, argument over forms and names), and was known for *li kou zhi ci* (利口之辞, sharp-tongued speech). He distinguishes *da bian* (大辩, big arguments) from *xiao bian* (小辩, small arguments). Big arguments refer to arguments concerning social well-being while small arguments mean those about personal interests. Hui Shi was good at using analogies, which he calls *pi*, (譬, meaning using what people know to convey what people do not know) (Lu, 1997, p. 140). All of them believed a person should examine both ends of an arguable topic for their mutual influences, which is called *liang ke* (两可, dual possibility) and *liang shuo* (两说, dual interpretation). *Ming Jia* and *xing ming zhi bian* reflect their thoughts on "correspondence between names and actuality" (Lu, 1997, p. 145), similar with the semantic theory on linguistic entities, conceptual entities and real world entities (Eemeren et al., 1996).

Western scholars have developed a more organized discipline of debate. Branham (1991) defines debate as "the process by which opinions are advanced, supported, disputed and defended" (p. 1). He also points out that debate is not necessarily formal or arbitrary. The goal for debate is to test opinion. In many cultures and eras, debate symbolizes the advancement of individual intelligence and human civilization. Debate is an activity and an attitude. True debate reflects "personal growth and independence" (Branham, 1991, p. 21). True debate has four characteristics: development (to bolster and improve argument with reasonable evidence), clash (to refute argument appropriately), extension (to defend argument against disputes), and perspective (to move argument from personal to a larger landscape).

Under the frame of true debate, many techniques and theories have been introduced by Branham (1991). For instance, fact, value, and policy are the three types of propositions. The concepts such as definition, research and evidence, argument anticipation, refutation and hypothetical acceptance, and counterpositions and counterplans have been applied to debate competitions. He has also introduced a debate format comprised of four characteristics. First, debate should start and end with the affirmative side. Second, both sides should speak alternatively. Third, speeches should be either constructives or rebuttals, and constructives

should be given more time than rebuttals. Finally, debate should be constrained under a time limitation. Currently the format is widely used in college debate competitions in China. The techniques of debating and cross-examination and the style and delivery requirements such as clarity, emphasis, and organization are also employed formally by Chinese debaters.

Debate has a close relation with argumentation. Argumentation is "social, dialectical and pragmatic in nature" (Eemeren et al., 1996, p. 164). It opens opportunities for not only democratic but also public participation. As a test for validity, it reflects critical thinking and Dewey's idea of "reflective thought" (Eemeren et al., 1996, p. 165). A good argument should be relevant, acceptable and sufficient (Johnson & Blair 1977; Govier, 1985; Damer, 1987; Freeman, 1988; Little, Groarke & Tindale, 1989; Seech, 1993; Eemeren et al., 1996).

Argumentation is a social practice open to the public. The audience is an essential part of argumentation. Perelman and Olbrechts-Tyteca's new rhetoric theory places much importance on audiences (Eemeren et al, 1996). From their perspective, argumentation is oriented by different audiences. New rhetoric uses ordinary language that is more accessible to the general public. An argument does not have to be valid, but at least plausible. Perelman and Olbrechts-Tyteca develop the idea of "argumentation based on the structure of reality" to describe the relation between what has been accepted and what the arguers hope to be accepted (Eemeren et al, 1996, p. 111).

Rhetoric has three purposes: to inform, to persuade and to entertain. Debate, if viewed from an interdisciplinary perspective, relates to games. Like debate, playing is a social practice and a driving force that refines culture. In his book *Man, Play and Games*, Caillois (1961) introduces four types of games: agôn, alea, mimicry, and ilinx. Agôn means physical or cerebral competitions in which the opponents have equal chance to win such as football or chess. Alea, the Latin name of dice, describes games based on luck. In other words, the players do not have control over the result. Money often plays an important role in alea such as in gambling. Mimicry's best examples are the role-playing games which provide players with an alternative reality. The role-playing behaviour is for gaining the pleasure of having different lives and identities and escaping from reality. Finally, ilinx are games designed to break stability and pursue vertigo. A roller coaster is a typical example.

The four types do not simply exist independently. Caillois (1961) indicates they come in pairs. While agôn emphasizes responsibility, professional training, experience, and effort, alea negates human agency and "signifies the favor of destiny" (p. 17). If agôn involves playing games with a visible rival, alea wrestles with the invisible—fate. While mimicry is playing within rules, order, or scripts, ilinx is breaking principles, creating "spasm, seizure, or shock" (p. 23). The two pairs are not the only way the four types connect. For example, mimicry has relation with agôn in some conditions. For example, in sports, agôn incorporates the action of mimicry in that audiences imagine that they are the athletes on the field. Spectators lionize the players and imitate their behaviors (Caillois, 1961).

Besides the four different kinds, there are several universal features of games such as "free (not obligatory), separate (within limited space and time), uncertain (result-wise), unproductive, governed by rules, and make-believe (second reality against real life)" (Caillois, 1961, pp. 9-10). Caillois (1961) also addresses a game's social function. Playing is often done not as individuals but as a group; it is "not solitude but company" (Caillois, 1961, p. 40) and involves the formation of communities. The nature of games is corrupting and destroying in that they attack mundane life. "Above all, play is a parallel, independent activity, opposed to the acts and decisions of ordinary life by special characteristics appropriate to play" (Caillois, 1961, p. 63).

Caillois (1961) also measures play with two concepts: paidia and ludus. The former refers to unrestricted playfulness, while the latter means following a certain order. Human society tends to develop from paidia to ludus, but the construction of rules also faces the

tendency of collapse. By forming and reforming the order, a culture moves forward. Interestingly, the scholar cites *wan* (玩, meaning play), to further clarify paidia and ludus. The original meaning of wan is "the act of indefinitely caressing a piece of jade while polishing it in order to savor its smoothness or as an accompaniment to reverie" (Caillois, 1961, p. 33). That explains why antiques such as jade are called *gu wan* (古玩 literal translation: ancient play) in Chinese. From Caillois's perspective, play with jade is paidia in its nature due to its general idleness, but shares some features of ludus because of its patience and calm, which are often related with obeying rules.

Entertaining does not simply mean making people laugh; it is a way to create hospitality among audiences and circulate the argument more thoroughly. Western and Chinese debate theories as well as Caillois's analysis shed light on features shared by debate and games and the possibility to merge the two activities together. Undoubtedly, debate is an agôn following certain rules (O'Keefe, 1988). Although the goal of it is not to let individuals win, but to find the truth. Like games, debate is free, separate, uncertain, sometimes unproductive, and governed by rules. Debate is also make-believe, a persuasion against reality, i.e. the beliefs of audiences and adversaries. It is also a social activity between at least two groups of people. To some degree, to say debate is destroying and corrupting is not wrong. After all, it is a process of constructing certain opinions as well as undermining the opposite opinion.

3. A CASE ANALYSIS OF QIPASHUO

As a debate show, *Qipashuo* applies the basic competition format introduced by Branham (1991). Debaters are separated into two teams, those in favor and those opposed. In an episode, each team sends forth three debaters to speak individually. The time of their speech is limited, but not in a rigid way. Each team also has a coach. After the three debaters speak from different perspectives of a loci, other debaters on the team can also be given a chance to speak to provide additional perspectives. Coaches in the end summarize the team's arguments. The debate starts from the affirmative side and also concludes with it (the rebuttals are sandwiched between the constructives). Then the host and the invited guest (usually a celebrity) comment on the performance of the debaters and express their opinion on the topics. To test opinions, the show also allows the two sides to switch the positions occasionally, which demonstrates the true spirit of debate (Branham, 1991).

The true judge of this show is the audience, which applies new rhetoric theory. Every episode, 100 people are invited to the show. Before the debate starts, the host asks the audience to support either side with a red or blue button. Then, the debaters need to appeal to the logos, ethos, and pathos to make good arguments that are relevant, acceptable, and sufficient. Their arguments should demonstrate their critical thinking. After the debate ends, the host asks the spectators to vote again. The team that successfully changes more opinions in the audience wins.

Debaters of *Qipashuo* can be generally classified into two categories: professional and amateur. Professional debaters are former domestic and international college debate competition champions or previous Best Debater winners. For instance, Huang Zhizhong, the champion of the third season of the show, is the only person who won the Best Debater for International Varsity Chinese Debate Competition twice. The professionals often appeal to logos. They can accurately locate the fallacies in their rivals' speech and dispute it, leading the audience toward sound logic that generates empathy. Audiences trust the professionals and are attracted by their charismatic style and delivery, which is the appeal to ethos. But the professionals, in contrast to their performance in formal college debate competitions, often use

middle-register or low-register language and a conversational style to cater to the laypeople in the audience.

The other debaters are amateurs. Although they lack experience in formal debate competitions, they have advantages due to their various backgrounds such as journalist, writer, online program host, policeman, actress, teacher, female singing group member, student, fashion model, entrepreneur, etc. They often share their rich experiences and life stories, appealing to pathos, to find faults in the logic of the professionals. For example, former actress Fan Tiantian does not have strong logic. But she appealed to the audiences' empathy by sharing her rich experiences. When debating the topic "Should we stick to stable jobs or pursue our dreams when we are 30 years old?" she explained how she started acting at 16, then had a career failure and became a receptionist (*Qipashuo*, February 01, 2015). But she did not allow this setback to be permanent. She worked hard to rise to a director position in a company. Eventually, when she was 32 years old, she gave up her stable job and came back to the stage of *Qipashuo*. She said she had such a difficult time that she did not have time to fall in love with someone, get married, and raise children. Under immense stress, she attempted suicide. Now, however, she uses her struggles to ensure other girls do not suffer like her. When she divulged these intimate details, the audience felt sympathetic with her and some of them even cried. This is only one instance in which an amateur debater was able to win over the audience through personal experience alone.

As Branham (1991) said, debate is not only a process but also an attitude. The goal for *Qipashuo* is not only to decide which side's opinion is superior, but for the exhibition and clash of different opinions as well as one's will (even duty) to speak. The debaters in *Qipashuo* give voice to subcultures that often go unnoticed in general society. They debate over topics such as "Should I be with my wife when her income is three times mine?"; "Are parking spots that are reserved for women discriminatory?"; "Should women approach men for dates?"; "Should a woman with a higher education ever become a full-time housewife?". Such questions direct public attention to the demand of rights and the changing status of women in China. *Qipashuo* has also become a place for LGBTQ communities to find a voice for themselves. Since LGBTQ content is not welcome in China's mainstream legacy media, online media has become the major space for the content to be circulated. Several debaters on *Qipashuo* are lesbians or gays. For instance, Jiang Sida, a college student from the Communication University of China, came out publicly at the very beginning of joining *Qipashuo* (*Qipashuo*, July 11, 2015). He said he is *qipa* because of his different sexual orientation. He wants to be who he is. The senior coach, Cai Kangyong, is also a gay activist. In the show's second season, the topic of one episode was "Should LGBTQ children come out to their parents?". In that episode, Cai Kangyong argued, "We are not monsters" with tears in his eyes. His emotional plea generated a heated discussion on social media about the LGBTQ community's hardships. The episode was forced by censors off of the video platform, which generated even more attention to LGBTQ's marginal status in Chinese society (Shenzhenzhichuang, August 25, 2015).

Besides using Western debating techniques, *Qipashuo*'s debaters also apply traditional Chinese debating skills. They are good at "using what people know to convey what people do not know" (Lu, 1997, p. 140), which is the *pi* strategy used by *Ming Jia.* For instance, when debating "Does the person at the center of a scandal deserve to be abused orally by thousands of people?", Qiu Chen said, "Everyone has a tyrant inside his mind. If we tame the tyrant, we can be a compassionate human. If not, we are nothing different from animals." She compares the evil thoughts in people's mind to a tyrant, a specific figure to whom people know to demonstrate the importance of kindness (*Qipashuo*, September 05, 2015). In addition, when preparing for the debate, both sides examined the other end of the topics, applying *liang ke* and *liang shuo* of *Ming Jia.* By constantly participating in public debate activities, debaters formed their professional communities and resurrected debater community in ancient China.

The debaters have also developed their own styles based on historical styles. Huang Zhizhong represents *jian zong* (剑宗, the school of jian), which is the opposite school of *qi zong*, (气宗, the school of qi) in debating (Lianhecanmouxueyuan, February 15, 2014). *Jian zong* and *qi zong* are originally Chinese *wu xia* (武侠, swordsman) concepts. In the novels of Louis Cha Leung-yung, a renowned novelist, *jian zong* and *qi zong* are two different approaches in a famous swordsmanship school. *Jian zong* mainly practices sword techniques while *qi zong* mainly practices the inner strength to control swords (Cha, 1980). Chinese debaters borrow this dichotomy to describe different characters of the two debating styles. *Jian zong* focuses on language and interpretation while *qi zong* focuses on logic and evidence; *jian zong* starts with values, while *qi zong* emphasizes facts. Huang Zhizhong was the debaters' coach before joining the show in the second season. His style has been integrated into other debaters' delivery as well.

As an entertainment show, *Qipashuo* embeds the features of games in debate. Two sides debate on certain topics following rules and procedures, forming an agôn. But since audiences are not professionals, their vote may be subjective. Sometimes the result of the debate competition is due to chance. It happens when a debater demonstrates marvelous skill and eloquent speech, yet the audience feels more empathy towards the other side. Therefore, the debate can also be regarded as an alea. To enhance suspense and amusement, the show adds money, which often plays an important role in alea. The winning team can win ¥100,000 (about US $15,600) in each episode. Alea at this show may hurt the professionalism of debate built by agôn—the most professional performance does not always get rewarded. Nevertheless, to let amateur audiences decide is consistent with the show's tenor.

The show also features mimicry. Debaters are ordinary people coming from different professions. They have their daily routines and roles. But when gathering on the stage of *Qipashuo*, they have second lives. They assume a different role than who they are in their daily lives, away from the spotlight. Some debaters have completely different characteristics on the show. For instance, Yan Rujing, a shy girl from Malaysia, could barely speak when she was not debating. But, when the time came, eloquent speech erupted from her mouth, stunning the audience (Zhang, November 28, 2016). She was socially awkward, but debating changed her life. Debate provides a place for the participants to disregard their routine lives and even personalities, creating new identities of *qipa*—people who dare to talk differently in public. The costumes they wear also illustrate mimicry. Senior professional debaters often wear formal clothes. For example, Huang Zhizhong often wears dark suits. But young and amateur debaters wear colourful and even flamboyant clothes to distinguish themselves from the drab attire they wear in their ordinary lives.

The holistic setting and apparatus of *Qipashuo* illustrate ilinx. The colorful boards, floor, furniture on set, and flamboyant costumes mark major differences from traditional college debate competitions. The symbol of *Qipashuo*, a big mouth with thick red lips and tongue, is eye-catching. *Qipashuo* breaks people's expectation about debating activities, creating a spiral of visual attraction and intellectual stimulation. In addition, satire is often used in the show. Ma Dong, the host of the show, often knocks a *moktak* (a Chinese temple block), but not a judicial mallet to contrast the show with serious court debate. He often comments, ironically, that, "This is a serious debating program" (Kuang, February 11, 2015, p. 1).

Above all, *Qipashuo* builds a field with ludus, and then breaks some of the rules creating paidia. Occasionally when the debating procedure is interrupted by debaters' spontaneous inspiration and performance, Ma Dong allows them to continue, claiming that there are not rules in the show. The show demonstrates and integrates the common features of games and debate: free, separate, uncertain, sometimes unproductive, governed by rules, make-believe, corrupting and destroying. The entertainment features of *Qipashuo* are not special. Many other entertainment programs use at least some features in Caillois's game theory. But the innovation

of *Qipashuo* lies in its combination of game and debate. It bridges two seemingly incompatible activities and demonstrates the common characteristics of the two.

4. CONCLUSION

Debate, entertainment, Western debate skills, and Chinese rhetoric are the four aspects that have popularized *Qipashuo*. But identifying features is not enough. For Chinese society, the true contribution of *Qipashuo* lies in its call for people to become publicly engaged. The entertainment feature is just a "shell" used by the show, but the rational training and public education are the pearls inside.

With the high viewership, massive social media exposure, and heated online and offline discussions, the effects of *Qipashuo* are undoubtedly strong. But there are more profound changes *Qipashuo* brought in three spheres. First, in the personal sphere, *Qipashuo* has changed people's attitudes on certain issues such as women rights, the LGBTQ community, family communication relationships, technology, education, and so on. These value changes may not be temporary – Chinese societal attitudes may be permanently altered in terms of certain social issues. Second, in the technical sphere, more debate activities have been organized. Inspired by *Qipashuo*, multiple offline Chinese debate competitions have been held, such as the Monash University Debate in Australia and *Xing Bian* (星辩, literal translation: star debate) competition in Malaysia. Finally, in the public sphere, debate has been resurrected as a Chinese tradition. Debaters are increasingly respected and appreciated. Young people are more aware of the importance of critical thinking and different voices.

Why has *Qipashuo* emerged and succeeded in this specific period? In the personal sphere, globalization of communication inspires the young generation to join a cosmopolitan trend and express their own identities and opinions. In the professional sphere, college debate competitions have been honing the skills of debaters for *Qipashuo*. In the public sphere, the development of the Internet, especially video content platforms, has provided a space for advocacy and public discussion. The rising status of China internationally has improved its people's cultural confidence about their debate traditions. With the development of individualization, urbanization, and commercialization in society, *Qipashuo* affirms people's need to use information technology to express themselves in China's transition from modernization to neoliberalism (Wu & Yun, 2018).

ABSTRACT: The aim of this paper is to provide an analysis of communication in forensic situations. First, we will define style formulas and brocards as typical linguistic expressions of legal experience, then we will focus on forensic practice. Style formulas are, mostly, used as rhetorical and argumentative presentational means: in fact, their use is not neutral but deceiving for what they do not say.

KEYWORDS: legal argumentation, legal communication, style formulas, rhetoric, forensic cooperation

1. INTRODUCTION

The aim of this paper is to provide an analysis of communication in forensic situations, drawing on expertise from forensic linguistics. Most crucially, the authors will focus attention on linguistic forensic practice of law, which is characterized by the frequent use of style formulas and brocards. They are included in defensive speeches and even in judgments, consisting in terms or concise juridical maxims, often expressed in Latin words or phrases, which correspond to general principles and behavioural norms. Their meaning and their use is understandable only by experts of the field.

Doctrine and jurisprudence have mainly analysed the use of style formulas in contracts, for instance in order to limit parties' obligations; on the contrary, their use in forensic communication does not seem to be of particular interest.

The purpose of this paper will be to highlight the role played by these technical formulas in forensic practice, whose use seems functional to the progressive construction of a common argumentative ground, to which the parties cooperate in the complex dynamic of practical judgment.

Style formulas are, mainly, used as rhetorical presentational means: the authors will explore their use in the judicial context and they will show that their use is not neutral but deceiving for what they do not say.

---

[1] This is a multiple authored research article: F. Puppo wrote par. 1 -3; S. Tomasi wrote par. 4-5; M. Manzin wrote par. 6-7.

2. A DEFINITION OF STYLE FORMULA

First of all, it is necessary to give a definition of what we propose to call "style formulas": a type of legal practice's linguistic expressions used in different legal fields (in contracts, in notarial acts, and in trials) by different subjects (by notaries, lawyers, and judges). In the Italian legal order, they are a type of formulas mainly analysed and evaluated in contract law, where they play an important role for contracts' drafting: that is why, as a first insight, it is necessary to refer to the definition given by *Corte di Cassazione*, the Italian Supreme Court:

> Style formulas are generic phrases we usually find in contracts or notarial acts, with a mere function of completion for their excessive indefiniteness: for this reason, style formulas cannot be considered capable of expressing a concrete and given will in connection with the deal in discussion[2].

From this point of view, typical examples of style formulas in contracts, which can assume the form of binomials or trinomials, are formulas like:

... the terms and conditions set forth in this agreement ...
... the same may be amended, supplemented or modified in accordance with the terms hereof ...
...unless the contract provides otherwise...
... in the absence of a provision to the contrary...
... except when otherwise provided by the contract...

Legal scholars and jurisprudence are mainly devoted to discuss the legal value of this kind of expressions in order to understand if contracts (or parts of contracts) with that kind of formulas, considered to be excessive indefinite, could bind the contracting parties or not. This is a real legal topic, but we cannot deal with it now[3]: rather, we would like to underline the fact that, as we are going to see in the next sessions of this paper, we should find examples of style formulas not only in contracts or notarial acts, but also in litigations, lawsuits or processes, in civil, administrative and criminal trials, in speeches by the parties (in this case it is common to speak about the formulaic recitation of a cause of action's elements) or even by the judge.

In fact, in all these kind of legal speeches, jurists usually use expressions and linguistic formulas that we can recognize as style formulas' examples because of their main character: that is the fact that style formulas can be recognized as such for their, so to say, "settled stylistic practice". From this point of view, a linguistic formula can be defined as "style formula" if it faithfully repeats an established and common phrase, again and again repeated in legal speeches or acts (see Bonamini 2016, 5).

3. STYLE FORMULAS AND BROCARDS

From an historical point of view, it could be of some interest to remember that these formulas were used in Roman legal experience and in Medieval times, playing an important role in the development of legal knowledge: they were considered the expression of a sort of common legal wisdom (see Messineo 1961, 820ff.; Bonamini 2016, 15ff.).

---

[2] See for example Cass. Civ. nr. 1950/09.
[3] It is sufficent to remember that these kind of formulas are supposed to have stylistic and not legal function: in other words, they are usually considered to be legally invalid and ineffective.

As such, style formulas could be seen as part of a broader set of legal expressions, usually known with the name of "brocards" or "*brocardi*": a noun that

> «from an etymological point of view, […] comes from the French *brocard*, cognate with Medieval Latin *brocarda*, *Brocardicorum opus*, a collection of canonical laws written by the bishop Burchard of Worms (died 1025). A *brocard* is a legal principle expressed in Latin (and often derived from past legal authorities or Roman Law), which is traditionally used to express concisely a wider legal concept or rule»[4].

Examples of brocards are the following ones:

> *Iura novit curia* (The judge knows the law – technically, there is no need to "explain the law" or the legal system to a judge/justice in any given petition).
> *Ignorantia legis non excusat* (Ignorance of the law is no excuse – not knowing that one's actions are forbidden by the law is not a defense).
> *Nullum crimen, nulla poena sine praevia lege poenali* (There can be neither crime nor punishment unless there is a penal law first).

These kind of formulas could mainly have rhetorical function, since they are commonly used to give elegance and strength to judicial and legal speeches, since brocards are able to recall, so to say, a common legal knowledge which is time immemorial (see Velo Dalbrenta, 2007). But brocards could also play an argumentative role, since they can be used as legal discourses' premises, especially when the maxim they express is actually included in legal orders and expressed by legal norms: for example, that is the case of the brocard "*audiatur et altera pars*" (in English: "hear the other side") at first expressed by Aeschylus' *Oresteia* and now formally included in many State's Constitutions (for example in the art. 111 of the Italian Constitution).

At the same time, it is clear that someone could be recognized as a jurist also because she knows brocards and style formulas and she uses brocards and style formulas in a right way: from this point of view, brocards and style formulas can be considered to be the traditional and inner part of the technical legal language. At the same time, brocards and style formulas contribute, in the linguistic practice of law, to the development of homogeneous communities: who wants to be considered to be part of them is expected to speak and understand that kind of specialized language (and, by the way, a part of legal education consist of this kind of linguistic training).

But this is not the only specific character we could recognize in the use of brocards and style formulas in legal speeches. In fact, we should remember that a peculiarity of legal context is that law regulates the cases and forms of the enforcement of justice: so legal opinions follow always a regular template, which also implies recurring style formulas.

4. THE USE OF LEGAL LANGUAGE: GOING BEYOND THE JUDICIAL TEMPLATE

Court practice analysis is a source of information to identify the uses of arguments in judicial communication and to evaluate their effects.

In this section, the research topics arise from the legal reality in Italian jurisprudence: we will present the results of a document analysis, by selecting some case-study and drawing conclusions on how courts apply certain style formulas, shared in legal context, and how they finally manoeuvre their communication.

---

[4] «Brocard», availbale at: https://en.wiktionary.org/wiki/brocard.

The court practise analysis is a valuable instrument for legal practitioners: it allows to get information about the court management and to provide support in case of legal appeal. In the course of this analysis, it become evident that the use of recurring formulas, shared by legal practioners, as brocards or style formulas, is not neutral: despite the fact their use is undisputable and their content is steady and permanent, they turn to be strategic arguments to dress.

As known, judicial opinions are written decisions, authored by judges, developed according a legal template. Statute law provides the formal framework for writing the judicial opinion, labelling "frozen" parts and "free" parts. According to the Rule of Law, the legal opinions are subject to such certain constraints, both with respect to content and form.

As for the frozen components, it is possible to recognize the heading, the preliminary stuff, the body, and the disposition. The Heading recalls the constitutional principles concerning the Judiciary, so that Justice is administered in the name of the people and Judges are subject only to the law. In the preliminary stuff, the court, its components, the parties, their lawyers are identified. As for the body of the opinion, the first part is usually devoted to precise the concluding legal requests of the parties involved; then, in the following section, the judge clarifies the "facts" of a case, the events that occurred before the legal case was filed in court, and that led to the judicial the case. Most opinions also include a section on the procedural history of the case: that is, what happened in the case after the case was filed in court. After the opinion has presented the facts, it will then discuss the law. This section of the opinion describes the legal principles that the judge will use to decide the case and reach a particular outcome. Finally, the disposition usually appears at the end of the opinion and reveals what action the court is taking with the case.

The sections, mentioned above, are fixed by statutory provisions (i.e. art. 132 Italian Code of Civil Procedure; art. 118 disp att.) in order to secure the jurisdiction by law.

As for the free component, all judicial decisions shall also include a statement of reasons. Maurizio Manzin, representing the ideal scheme of a judicial opinion (Manzin, 2014, pp. 147-172), makes clear that the duty of motivation has two main function: on the one hand, it regards the internal structure of the text; on the other hand, it is connected to extra-processual and social elements. According to Manzin, the judge is required to check both the topical extent and the coherence among the arguments. The disposition and its grounds are mutual dependant: so, the disposition has to be based on reasonable grounds. Moreover, the duty of motivation is embodied by art. 111 Italian Constitutional Act, according to which all court trials are conducted with adversary proceedings and the parties are entitled to equal conditions before an impartial judge in third party position. That is to say, that all citizens have the right to check the social acceptability. The motivation is first functional to the parties to detect the points of the opinion on which appeal for revision. It is also functional to the appeal court to understand the grounds of the inferior court. It is functional to the Supreme Court in order to ensure the uniform interpretation of the law.

The concern of this research is to explore legal opinions and assess them, going beyond formal accreditation.

As a matter of facts, legal practice reveals many forms of deviation from rule of law formalities, especially in the use of style formulas.

Legal language consists in conservative expressions, established formulas or formulas shared by participants at legal communication. These formulas are generally considered as lexical items commonly recognized as hallmarks of legal discourse.

This study will show that what seems to be an undisputable stylistic, choice in compliance with the Rule of Law and with the common use of legal language, shared by legal practitioners, turns to be a complex argumentative interplay in the decision making process.

In the court practise analysis, the hint is to develop these research questions: are there any patterns in stylistics? What is the effect produced by the use of the style formulas?

5. CASE STUDY: EXAMPLES OF STYLE FORMULAS

Since then we have carried out over 50 analyses, we select three recurring examples of use of style formulas. The database consisted in legal opinions delivered by the Criminal Court of Trento, assessed by local companies of lawyers in the last decade.

More than one judges wrote these formulas, trusting them as knowledgeable as regards the court system and administration of justice. These formulas appear as a 'format' shared in the legal context. We argue that this is not only a stylistic choice but a mode of arguing that invoke implicit entities, that may be defined and conceptualized.

This issue builds on the tradition established by Informal Logic. Ralph Johnson and Anthony Blair characterize informal logic in part as "a focus on the actual natural language arguments used in public discourse, clothed in their native ambiguity, vagueness and incompleteness" (Blair and Johnson 1980, p. x).

Leo Groarke has argued that when we analyse real life arguments, our first task is the dressing an argument, that is the identification of its component parts. In the case of arguments, there is a distinction between "arguments on the hoof" and "dressed arguments": the former are arguments as they appear in their real life contexts, the latter are those arguments after having identified and isolated their key components, for argument evaluation.

We should investigate the use of these formulas and, specifically, the extension of these arguments in the legal opinion. The argument is always a propositional entity but, despite the fact some verbal arguments are common, their argumentative use implies that one would dress.

In order to have a comprehensive account of style formulas in legal opinion, let's consider some examples.

Example (1)
Considered art. 133 Criminal Code, the final punishment can not exceed 10 years of imprisonment.
The Italian Criminal Code provides for maximum and minimum of imprisonment. Art. 132 provides that judicial discretion must be exercised within the legally established penalty ranges. Art. 133 defines the criteria that should guide the judge in exercising the discretionary power under 132. These criteria concerns the type of offense but also the offender (the previous conduct, the criminal record, the family status).

The style formula mentioned above is a recurring expression which rests on the formal adherence of the opinion of the provision. No statement of reason is added. It delivers the final measure of the punishment.

We need to isolate the premises in order to evaluate the penal decision.

Example (2)
Even according to the most authoritative jurists interpretation,...
As known, in Italian legal system there are no general rules directly concerning precedents in the proper meaning of the word. In some rules of the code of civil procedure there are only indirect references to precedents. According to art. 118 disp. att. Code of Civil Procedure, which define the criteria for legal motivation, in deciding a case judge may make a reference to corresponding precedents in the opinion that justify the decision. About legal sources in deciding the case, the provision specifies that no direct authority can be cited from books.

This statutory provision in Italian Legislation forbids a judge to quote the opinions of jurist. But what appears in text is different.

The style formula reveals the awareness that a judge does not decide based exclusively on statutory law: the decisions do not automatically sprout from the statutes.

This formula is compatible with the statutory provision but covers a pattern of argument from authority. Who is the doctrine? Is that doctrine all about the issue? The questions regards the premises of the argument.

The formula respect the formal interplay of academics and judges in the decision making process as required, but conceal the real concurring source of judging.

Example (3)
Judicial costs will be balanced considering the originality of the issue at dispute.
In Italian legislation, the costs of a case depend on its final outcome. According the statutory provision, the party who has lost the case is supposed to pay the courts feed and the feed charged by the lawyers of the parties. The losing party will support the prevailing party's lawyers 'fees. The other costs (i.e., expert costs, fitness costs) must generally be borne by the losing party (according art. 92 Code of Civil Procedure)

If there are exceptional reasons, the costs may be compensated by the parties. But the judges may explain the reasons of exceptions.

In the final part of motivation, the Court often wrote the recurring formula of justification "*considering the novelty, originality of the issue*". It turns to be a presumptive argument to dress: what is new? new regarding what (facts/law)?

In all these cases, beside the adherence to statute law, these expressions, familiar to judges and lawyers, are arguments to dress. Legal practitioners have a feel for these formulas because they belong the their habits: their use could be deceiving as they hide implicit premises and conclusions.

6. DRESSED ARGUMENTS IN JUDICIAL CONTEXT

When speaking about things like style formulas, it should be taken into consideration the fact that all of these "arguments on the hoof"/"dressed arguments" are used in legal speeches and that these speeches are made in peculiar contexts. In this regard we could distinguish either between private, tort, penal, administrative, constitutional, international etc. legal domains or between the degrees of judgement (first degree, appeal, supreme court etc.) – and, actually, each of these contexts has its own specific standards. Nevertheless all different linguistic uses (and all possible implicatures) of "arguments on the hoof" dealing with such contexts are in the very end conditioned by the possibility of a legal controversy. In this sense we could say that, implicitly or explicitly, the target of "arguments on the hoof" is always the (occurring or eventual) judicial context.

Communication in the judicial context communication is characterized by some pragmatic features which can be sketched as follows:

a. the judicial communication is *controversial:* the dialogue between the parties is not aimed at an exchange of information, feelings etc. but it is a sort of match in which every party wants to win the case;

b. the judicial communication is *triadic*: none of the parties supposes to persuade the opposing one, but both aim at persuading the decision-maker (the judge or the jury) which is 'third' and stranger to the parties;

c. the judicial communication is *linguistically vague*: strict legal terms (which anyway are just a part of the terms used in legal speeches) are expressed in natural language and they are not formalized in the way scientific terms like "point" or "zero" are. They are at most technical terms, meaning that they are used by and within a linguistic community of experts who know what were things like "adverse possession" or "complicity" even though there are no axioms or demonstrations dealing with them;

d. the judicial communication is *institutionalized*: the procedural rules of the judgment are not established in advance by the parties but they simply exist as a part of the legal system in which the parties act. This fact implies the acknowledgment and effectiveness of a number of social phenomena like "rule following" (Hart 1994, Poscher 2015), pre-establishment of a scene (the trial) with its own actors (judges, lawyers etc.) and some precise expectations (acquittal, punishment etc.).

According to the Gricean "principle of cooperation" all participants in a communication should know the implicatures of the terms and utterances used in the conversation. In the contexts of common conversations, public discourses, media etc. this clarity about the meaning of the words is usually obtainable also when "dressed arguments" are used.

Let us think for instance to a very common expression like *all in all* and imagine a conversation like the following between John and Mary:

> – John: I've got a new smartphone!
> – Mary: All in all my mobile still works well

In this conversational exchange it should be sufficiently clear to John that her friend has considered some evaluation elements dealing with her smartphone (state of conservation of the hardware, battery life, updating of the software, things that can be still done with it etc.), and she has concluded that in the end positive elements are more numerous than the negative ones, so it is not the case to waste time and money to buy a new mobile.

All in all in this conversational context is a "argument on the hoof" which can be easily "dressed" by the participants, thus it is not necessary to provide further information in order to reach the communication goal – nothing has been hidden by anyone.

On the contrary in the judicial context style formulas and *similia* could stay "on the hoof" without revealing their hidden implicatures. Let us think for instance to an expression very familiar (in Italy) to administrative lawyers like: *all presupposed, consequent and connected acts*. It is obvious that *all* is a dramatically wide category and that there could be desirable as well as undesirable acts (for one or both parties) implicated by the established action(s) which is/are presupposing or producing or somehow connecting some others.

That is the reason why there have been (in Italy) many legal decisions by administrative courts of different degrees according to which "such style formulas are neither effective nor legally valid, not being able to specify". The ratio decidendi of all of these decisions[5] was that

> the style formula "all presupposed, consequent and connected acts" on the ground of which such acts have become objects of a legal controversy cannot be used to indicate acts that are not specifically declared in the appeal, for the fact that this formula is not appropriate to determine a specific object of appeal, whereas only a clear indication of petitum allows the counterpart to fully exercise her right of defence.

Thus, the question at this point is: given the fact that style formulas which are not (or cannot be) specified have been considered by the courts neither effective nor legally valid, is it the

---

[5] See Italian courts rulings: T.A.R. Piemonte Torino, Sez. II, 14 gennaio 2010, n. 200, T.A.R. Lazio Roma, Sez. III, 26 luglio 2007 n. 7013, Consiglio Stato Sez. V, 16 settembre 2004 n. 6018, Consiglio Stato Sez. VI 07 luglio 2003, n. 4037, T.A.R. Lombardia Milano, Sez. I, 6 ottobre 2010 n. 6879.

case to keep on using them in legal discourses? More roughly: are style formulas good or not for law?

Before answering this question it would be appropriate to deepen some aspects of the contemporary legal scene which could affect the use of style formulas. We must remember that formulaic expressions and brocardi have a long tradition – substantially uninterrupted – in legal speeches dating back to the age of Roman and medieval law. There is a number of reasons to justify such a long life: philosophical (as the capability to find the common in the different – Velo Dalbrenta, 2007), historical (the 're-descovering' of the *corpus iuris civilis* and the birth of the universities in the Middle Ages), sociological (their use distinguishes a social group of learned people), even psychological ones (it strengthens the sense of belonging). It is not our aim to analyse now all these reasons and the connected ones, but only to notice that, regardless of the effectivity degree in our day, style formulas operate in a context which has some remarkable peculiarities if compared to the previous one in the last decades. These peculiarities could be very generally summarized this way:

a. *legal system.* Today we have to take into serious account the phenomenon of the s.c. "fluidization" of the (once) system of legal sources as it is going on especially in the European Union, where the new paradigm of governance has modified the rigid hierarchy of legislation established by constitutional rules;

b. *new legal sources.* Then we must consider the connected occurrence of legal sources different from the national legislatures (s.c. "legal pluralism"): international and transnational treaties, declarations and charters on various specific rights, lex mercatoria, "soft law" by EU officials, legal opinions by foreign supreme courts – all of which have a certain strength over judicial decisions;

c. *principles and rules*. Besides that it should be stressed the influence of ideas coming from "constitutionalism" and "new constitutionalism" in contemporary jurisprudence. Meta legal values (or "principles") are acknowledged today as the benchmark for either general or individual legal norms, whereas in the past legal positivism had maintained a strict divide between *sola lex* and moral criteria;

d. *moral pluralism.* Finally, we face nowadays a growing 'axiological multiplicity' caused by epochal events like globalization, migrations and multiculturalism. Rapidity and pervasiveness of information, economic exchanges and social mobility, intertwined with expectations on individual rights and positive actions, make available a lot of moral criteria (or "values") not infrequently at odds with each other.

7. CONCLUSION

In conclusion, if we are planning to use "arguments on the hoof" like style formulas, we should pay attention to the possibility of very different implicatures coming from the kind of legal system, legal source, constitutional principles and moral criteria which are at stake. In other words, there could be various and even opposite ways to "dress" style formulas, with a consequent injury to the certainty of law.

Let us try to make an example for clarification.

When speaking about a *presupposed, consequent or connected act* dealing with the obligation to exhibit an identity document if requested by a policeman we could refer: to a legal system where such condition is peremptory (as in Portugal) or to another in which, for instance, it is sufficient to declare one's personal details (as in Italy); to a document that is valid or expired (validity of ID card, in Italy, is necessary to go abroad but not to go to vote); to an exhibition of personal data which could be intended as confidential (if connected to the right of privacy) or not confidential (if connected to public security). The simple presupposition of having a

valid ID document in our pocket is therefore depending upon the implicatures of the formula. This is why, as mentioned above, we should seriously wonder if using style formulas in legal discourses were appropriate or not.

In our opinion arguments like formulaic expressions and *brocardi* are typical rhetorical tools. As such they are so to say 'double-sided': they can be exploited in order to create a shadow area from which the party could take out favourable elements for her strategic manoeuvring, or otherwise they can be used as *topoi* in a critical discussion. In the former case the arguer would act against the principle of cooperation, and the formulas would be mere presentational devices. In the latter the arguer would be committed to "dress" the formulas, identify its elements and avoid trickery. So before getting rid of style formulas insofar as they are considered deceptive, it would be challenging to find a way to "dress" them – in other words, to work out a normative model for argumentative moves based on style formulas.

On the many logical ways to counter an argument

HUBERT MARRAUD

Literature and Comparative Literature
School of Arts
Universidad Autónoma de Madrid (Spain)
hubert.marraud@uam.es

ABSTRACT: My aim here is to give an adequate definition of counterargument, establishing a suitable typology
of counterarguments grounded on Toulmin's model. This typology is based on a double criteria: the target of
criticism and the force or strength of the attack as expressed by the appropriate argumentative connector. I thus
distinguish four main kinds of counterarguments: dismissals, objections, rebuttals and refutations.

KEYWORDS: argument strength, counter-analogy, counterargument, dialectics, dismissal, objection, rebuttal,
refutation, Toulmin's model

1. INTRODUCTION

Elsewhere (Marraud 2015) I have distinguished two conceptions of dialectic. Dialectic can be
conceived of as the art of controversy or debate, with confrontation of opinions and hence of
arguers. The focus of dialectics thus understood is the conventional rules and procedures
governing such confrontations. This is what I call *arguers' dialectic*. But dialectic can also
mean the study of the oppositions between arguments. This *arguments' dialectic* is historically
linked to the notion of argument strength, and can may even be defined as the study of argument
strength. Argumentative connectors are the main device for expressing relations among
arguments. These are words or phrases that link two or several statements, assigning them a
particular argumentative role.

The concept of counterargument lies at the heart of argument's dialectic. The
importance attached to the relations between arguments – especially those of opposition-
establishes a clear distinction between the theory of argument and formal logic. My purpose in
this paper is twofold. First to give a suitable definition of counterargument; second, to establish
a typology of counterarguments. I will confine myself to *logica*" counterarguments: arguments
criticizing another argument on account of its logical properties. Thus, ways of attacking an
argument for being ineffective for a given audience, or for procedural matters will not be taken
into account.

Let us begin with some preliminary definitions. To argue is to present to someone
something as a reason for or against something else. An argument is a reason for (Pro argument)
or against (Con argument) some claim. Hence a con argument is a reason to reject some claim.
These are more or less standard definitions, though many scholars define argument either in
terms of its purported aim (justify, persuade, etc.) or of its structure (premises and conclusion).

According to the *Merriam-Webster Dictionary* to counterargue is to give (reasons,
statements, or facts) in opposition to an argument or in support of an opposing argument. Hence
a counterargument is a reason to reject some argument.

Therefore there is a clear difference between a con argument, a reason against a claim,
and a counterargument, a reason against the cogency of an argument.

2. MAIN KINDS OF COUNTERARGUMENTS

To argue is to present something to somebody as a reason for (or against) another thing. Hence the minimal autonomous unit of argument is a compound of one or more premises, the "something" in the above definition, and a conclusion, the "another thing" in the same definition.

When a reason for a conclusion is presented to someone but she does not endorse it, there are four possible moves.

1. She might reject the argument as a whole, alleging that there must be something wrong on it.
2. She might challenge some of the premises: "Where do you get that from?".
3. She might also question that the reason offered is a good reason for that conclusion: "How do you get there?"
4. Finally she might try to show that the conclusion should still be rejected, offering an opposite reason: "Yes, but…".

Therefore there are four main strategies for attacking an argument: challenging the argument as a whole, challenging some of its premises, challenging its warrant, or challenging its conclusion. But counterarguing requires more than challenging some of the parts of an argument: one has to give reasons for rejection. Thus one can either meta-argue that the offered argument is not cogent, or one can argue some of the premises are not true or acceptable, that the warrant is not valid or cannot be applied to the case, or that the conclusion is nonetheless false. Accordingly I shall distinguish four main kinds of counterargument, which I term, respectively, dismissal, objection, rebuttal and refutation.

3. DISMISSAL

An argument can be rejected as a whole for a variety of reasons; for instance, it can be adduced that argument A has been rejected for most philosophers, that A it is not a scientific argument, that A it leads to an unreasonable conclusion, etc. The rationality of such holistic counterarguments has been advocated by Daniel Cohen (2001). Here is an example:

> […] as we saw before, states and corporations differ in one crucial respect. The shareholders of a corporation voluntarily take on the obligations of the corporation when they purchase shares; indeed, the corporation's obligations are reflected as a discount in the price of a share. People who are born into citizenship of a state do not consent in a similar manner to take on the obligations that others have acquired in the name of the state. Although Locke argued that people give implicit consent to their government by not emigrating, no one takes this argument seriously anymore. Consent requires more than the ability to choose an extremely disagreeable alternative." (Posner, 2003: 1906).

For our present purposes Locke`s argument can be summarized thus:
    A. People give implicit consent to their government by not emigrating, so people have an obligation to live up to the state's obligations.
The corresponding counterargument then runs as follows:
    CA. No one takes this argument seriously anymore
Thus a dismissal is an argument whose-conclusion is an assertion to the effect that a given argument is not cogent. Since a meta-argument is "an argument about one or more arguments or about argumentation in general" (Finocchiaro 2013:1), dismissals are meta-arguments.

4. OBJECTION

An argument A is an objection for an argument B when A's conclusion is incompatible with some of the premises of B'. This is obviously the case when they are mutually contrary or contradictory, but in argumentation there are also less stringent forms of incompatibility. A successful objection suspends the conclusion. Here is an example:

> A. This patient has a streptococcal infection, so presumably this patient needs penicillin treatment.
> CA. Infection diagnosis is only based on symptoms, no clinical tests have been performed.

5. REBUTTAL

I am using "rebuttal" in a sense close to Toulmin (2003). To prevent possible confusions, notice that Pollock (2007) uses "rebutting defeaters" and "undercutting defeaters" for something close to what I call refutations and rebuttals, respectively.

The question "How do you get there?" can be answered in either of two ways: (a) Resorting to analogy: step from P to C is like (is analogous to) the already accepted step from P' to C'; or (b) Providing a warrant, i.e. a general, hypothetical statement, which can act as a bridge, and authorises the sort of step to which our particular argument commits us (Toulmin 2003, p.91). *Mutatis mutandis*, the inference proposed by an argument can be rejected arguing either that that it is analogous to another already rejected inference (counteranalogy or rebuttal by comparison), or that the warrant is problematic (warrant rebuttal). Rebuttal is similar to objection in that a successful rebuttal suspends the conclusion.

Let us illustrate first counteranalogy or rebuttal by comparison (example retrieved from https://undark.org/article/assisted-suicide-physician-health/).

> A. As a physician and medical ethicist, I am opposed to any form of physician assistance with a patient's suicide. The Hippocratic Oath — arguably, the most important foundational document in medical ethics— clearly states: "I will neither give a deadly drug to anybody if asked for it, nor will I make a suggestion to this effect."
> CA. There was a time and place for the Hippocratic oath to work, it doesn't mean it's always appropriate for all situations far into the future. That would be like the idiots who argue that we should always be allowed to keep guns just because it's in the Constitution.

A warrant in turn can be held to be problematic by one of two reasons: either the warrant is in general invalid, so that C cannot be inferred from P through W (*Plain rebuttal*), or the warrant cannot be applied in the case at hand, so that C cannot be inferred from P through W (*Exception*). There are weaker forms *(disclaimers)* of these, since the validity or applicability of the warrant may be controversial, so that C can only be inferred with reservations from P, "at your own risk". Thus we have four kinds of rebuttals: plain rebuttal, exception, warrant disclaimer and disclaimer by possible exception.

> Plain rebuttal.
> A. Since you want to live comfortably, you must attend university, for university graduates usually have higher incomes.
> CA. The reason why university graduates usually have higher incomes is that they normally come from wealthier families and they are more cleaver than the average.
> Exception.
> A. Polls give small advantage to candidate White over candidate Brown, so probably White will win the election.

CA. The advantage of candidate White over Brown is under the margin for error for these polls.

Warrant disclaimer (retrieved from https://www.indiewire.com/2014/06/the-fall-festival-50-our-wishlist-for-the-venice-telluride-and-toronto-film-festivals-84321/).

A. Primed for a November 7th release and coming from British powerhouse stable Working Title, the new film from James Marsh is a likelihood for a fall festival bow. Its biopic structure and potential crowd pleaser appeal hints at Toronto rather than Venice.

CA. Well, perhaps. But that's a pretty unreliable rule of thumb, and changing all the time.

Disclaimer by possible exception.

A. With the falling of the pound, Germany, for instance, will be a more attractive place for Spanish, Portuguese, Polish and Greek emigrants than the UK.

CA. Unless British companies raise wages to prevent the loss of labor force.

6. REFUTATION

I distinguish three kinds of refutation, associated with the phrases *A but B*, *A but also B*, and *Although B, A*.

In many cases when someone utters *A but B* she means that (1) she accepts *A*, (2) she accepts *B*, (3) *A* is a reason for some conclusion *C*, (4) *B* is a reason for some conclusion *C'* incompatible with *C*, and (5) in the situation of utterance, *B* outweighs *A*. When *A but B* is used in this way, the addressee is invited to infer *C'* from the joint consideration of *A* and *B*. In these cases I will say that the argument *B, so C'* is a *contradicting refutation*.

A. This patient has a streptococcal infection, so presumably this patient needs penicillin treatment.

CA. But this patient is allergic to penicillin.

The utterance in the appropriate circumstances of *A but also B* carries commitments similar to those in the former two cases. Yet the implicature is now that *A* and *B* are similar in force, so that they cancel each other out. When *A but also B* is a reply to *A, so C*, it is an attempt to suspend the inference of C from A. I will speak then of *cancelling refutation*.

A. Biofuels bring a number of environmental benefits, so production of biofuels should be promoted.

CA. However, it is also true that their production can have some adverse effects on the environment.

The difference between *but* and *although* in their relevant uses has to do with the suggested weighing. While *but* presents the second term as a stronger reason, *although* flags the weaker term. When someone utters *Although B, A* in the appropriate circumstances, she conveys the indication that *B* is insufficient to defeat the argument *A, so C*, so that, after weighing up *A* and *B*, the conclusion still remains *C*. Some authors contend that even if *B* lacks the force to defeat *A*, it still lowers the strength of the argument *A, so C*. Borrowing the term from Pollock (2010:11-12), in such a case I will say that *B, so C'* acts as a *diminisher* for *A, so C*.

A. It is impossible not to refer briefly to the Brahimi report and some of its main recommendations. The report clearly contains guidelines that, even almost 10 years after they were developed, need to be taken into consideration.

CA. Although the Brahimi report does not answer all of our questions.

7. WEIGHING

Notice that any refutation involves the weighing of pros and cons, since the conclusion is reached from the joint examination of positive and negative considerations. This feature relates refutation to Wellman's third pattern of conduction (Wellman, 1971:57).

Weighing is characteristic of refutation as a distinctive kind of counterargument. While objection and rebuttal look for flaws or faults in arguments, refutation starts from the acceptance of the argument under examination, as the previous analysis of such argumentative connectors as "but" and "although" shows. There is nothing wrong on a refuted argument, except that there is a stronger argument to the contrary.

The distinction of different kinds of counterarguments is important to limit the scope of weighing. Some authors seem to consider weighing as an all pervasive phenomenon in argumentation. Thus Robert Pinto writes: "In short, we can identify ´exceptions' to a qualified generalization only if we are already able to compare the strength of arguments licensed by that generalization to certain other arguments." (2011:117). Although this issue deserves a more detailed discussion, the unbounded spreading of weighing promoted by such argumentation theorist as Pinto is the result of mixing together the degree of acceptability of the premises and the robustness or strength of the link between premises and conclusion. To borrow an example overused in AI, there is no point in comparing (if it is possible at all) the strength of the argument *Tweety is a bird therefore Tweety flies since birds typically fly* with the strength of the rebutting argument *Tweety was watched in Peninsula Valdés, where there are important colonies of penguins, so probably it is a penguin*. In order to asses the later the sensible thing is to compare its strength with that of *Tweety was watched in Punta Loma, so it is more likely a rock shag than a penguin*.

Of course the possibility exists that the force of two arguments with incompatible premises be incomparable. So far as arguments are concerned, force defines in the best case a partial order. My conjecture is that when two such arguments are conjoined the sensible thing is to suspend judgement on the issue at stake. This skeptical position can be contrasted with a credulous one, according to which both conclusions are tenable, and in order to decide which argument is in force in some particular argumentative situation one has to resort to procedural rules. I take the terms "skeptical" and credulous" from related discussions in IA (*Cfr*. Prakken & Vreeswijk 2002, § 4.1).

8. OTHER CLASSIFICATIONS

Blair y Johnson (1987) propose a classification of counterarguments based on the RSA (*Relevance*, *Sufficiency*, *Adequacy*) criteria of good argument: an argument is *cogent* if and only if it has acceptable premises, its premises are relevant to its conclusion, and the premises provide sufficient grounds for the conclusion. Hence it can be argued that an argument is not cogent for one of two reasons: either its premises are unacceptable, or the move from its premises to its conclusion is problematic. In turn, the step from premises to conclusion can be problematic either because the alleged reason is irrelevant (i.e., it is not really a reason at all), or because it is a weak reason. Thus Blair and Johnson make no room for refutation, even if this is a quite common strategy for attacking an argument.

An examination of counter-argumentative procedures in polemic dialogues leads Apothéloz, Brandt y Quiroz to propose a quadripartite classification.

1) Counterarguments concerning the plausibility of the reason: they challenge the plausibility of some of the premises of the argument at issue; these correspond to my objections.

2) Counterarguments concerning the completeness of the reason: they offer a stronger reason for a conclusion incompatible with the conclusion supported by the contested reason; these are what I have called "refutations".

3) Counterarguments concerning the relevance of the reason: they dispute the relevance of the premises to the conclusion; thus these counterarguments amount to plain rebuttals.

4) Counterarguments concerning the argumentative orientation of the reason: they contend that the reason given is really a reason for a different, opposite conclusion; these seem to be a special sort of refutations.

Douglas Walton (2013: 27-62) offers a more complex (though not necessarily more clarifying classification).

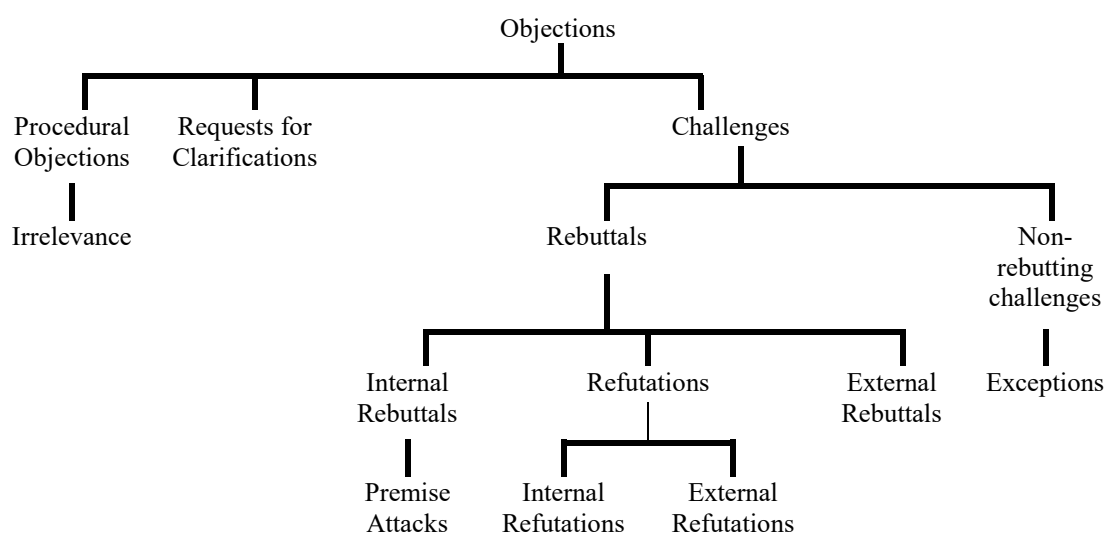

Table 1. Walton classification of counterarguments.

Walton defines an objection as any way of questioning the use of an argument on a given occasion. However, in fact, he only considers dialectical (procedural) and logical objections (challenges), letting aside rhetorical objections referred to audience reception (save perhaps requests for clarifications). A challenge is an expression of critical doubt about whether a reason supports the argument

Challenges are divided into rebuttals and exceptions. A rebuttal is an argument that is directed against other prior argument, in order to show that it is open to doubt or not acceptable. A refutation is a rebuttal that is successful in carrying out its aim. Now rebuttals are divided into external and internal ones.

Internal rebuttals aim at the premises of the argument under scrutiny. There are two kinds of external rebuttals. First, an external rebuttal can be an argument to the effect that the conclusion doesn't follow from the set of premises that were presented as supporting it. Second, an external rebuttal can be an argument that is stronger than the argument that is challenged and that provides a reason for rejecting its conclusion.

Walton defines an exception as a distinctive kind of premise, brought to light by means of critical questions, and classifies Pollock-style undercutter as an exception. Pollock (2007) makes a distinction between rebutting defeaters and undercutting defeaters. A rebutter of an argument gives a reason to show its conclusion is false, whereas an undercutter merely raises doubt whether the inference supporting the conclusion holds.

9. THE ORDER OF COUNTERARGUMENTATION

Argument criticism is developed following a procedure that seeks to get the maximum effectiveness at the lowest cognitive cost. For this reason priority is given to objection over rebuttal, and then to rebuttal over refutation. Refutation can result in a costly process of weighing pros and cons, the outcome of which is uncertain. Leibniz said that the possession of a balance of reasons would be an even more important achievement than the "fabulous science of producing gold".

To understand why rebuttal is a strategy more onerous than refutation, one just has to think about the different functions of premises and warrants. Premises are presented as data or facts while warrants are rules. Accordingly premises are appraised as true or false, acceptable or inacceptable, etc. and warrants as more or less reliable. Toulmin (2003:98) puts it as follow: a general statement like "Philosophers in their intellectual plenitude are unmarried" (according to Pierre Riffard, 70% of philosophers were unmarried when they published his masterpiece) can be used in two different ways:

- as a datum, and then it can be expressed in the form "It has been observed that philosophers were unmarried when they were in their intellectual plenitude";
- as a warrant, and then it can be paraphrased "If a philosopher is in his intellectual plenitude, he may be presumed to be unmarried".

To demonstrate the falsity of a universal statement is easier than to demonstrate that it is not a reliable guide to making inferences, if only because a false statement is false in any circumstance, while a guide to inference can be reliable in some circumstances and unreliable in others.

A pragmatic effect that confirms what has been said is that if someone attempts in the first place to rebut or to refute an argument, this can be taken as a sign of her acceptance of the premises.

## 10. FINAL PROPOSED CLASSIFICATION.

Table 2. Proposed classification of counterarguments.

A typology of Donald Trump's *Ad Hominem* in the 2016 presidential election

ABSTRACT: Many of the leading argumentation textbooks discount *ad hominem* attacks as a fallacy of relevance that should be avoided. It is surprising, therefore, that at American politician, Donald J. Trump, achieved considerable electoral success while delivering blistering personal attacks directed at the character, personality, or physical appearance of his rivals. This analysis, which develops a typology of Trump's *ad hominem* attacks, concludes that this form of political argument can serve as a powerful rhetorical strategy.

KEYWORDS: 2016 presidential election, *ad hominem*, campaigns, rhetoric, presidency, presidential rhetoric, Donald Trump

1. INTRODUCTION

Donald J. Trump's ascent to be president of the United States was extraordinary. An unlikely candidate, Trump had no political or military experience prior to his election to the presidency. His qualifications came instead from his experiences in business and media, including the successful NBC primetime television show "The Apprentice," which pitted would-be moguls against one another, vying for a position in one of Trump's businesses. Trump's campaign rhetoric was also unexpected, with free-wheeling campaign rallies and aggressive attacks on his opponents during both the Republican primary and the general election. His discourse violated many traditional campaign norms, as candidates typically will attack their opponents but still try to appear "presidential" in their demeanour. Trump showed no such concern, and instead used aggressive rhetoric to dismiss anyone or anything he viewed as a serious threat to his candidacy.

One of the most important strategies used by candidate Trump during the 2016 Republican primary and general election was the *ad hominem* attack. Commentators often referred to Trump's *ad hominem* as "giving nicknames," citing his ability to label his opponents with short, pithy attacks, including Lyin' Ted for Republican Senator Ted Cruz, Little Marco for Republican Senator Marco Rubio, and Crooked Hillary, referring to Democratic presidential candidate Hillary Clinton (CNN 2016). When asked about Trump's nicknames for her during an ABC "This Week" appearance, Clinton dismissively replied, "I don't respond to Donald Trump and his string of insults… He can say whatever he wants to say about it… I really could care less" (quoted in CNN, 2016). But despite Clinton's attempts to downplay Trump's rhetoric, the nicknames given by Trump were significant, and illustrate Trump's reliance on, and skill in using, argument *ad hominem*.

In this essay, we explore how Donald Trump was able to use argument *ad hominem* to effectively attack his opponents. We argue that Trump's use of *ad hominem* is better understood through rhetorical analysis that takes into account the broader context of the argument, rather than formal argumentation and logical proofs. In what follows, we briefly review the literature on argument *ad hominem*, then analyse Trump's *ad hominem* during the 2016 Republican primary and general U.S. presidential election. We propose a three-part typology to explain how Trump's *ad hominem* functioned in the campaign. Trump's *ad hominem* functioned to attack opponent's character, personality, and appearance, and in each case, drew attention to a significant critique present in the broader discursive field of the campaign. Finally, we suggest future pathways for argument scholars to further research the important role argument *ad hominem* plays in contemporary public discourse.

2. UNDERSTANDING *AD HOMINEM*

The standard treatment of the *ad hominem* fallacy, van Eemeren and Grootendorst (2015) observe, generally recognizes three distinct forms of the fallacy: (1) the abusive variant, (2) the circumstantial variant, and (3) the *tu quoque* variant. The most common variant, *abusive ad hominem*, can be characterized as an attack targeting a person rather than their ideas. van Eemeren and Grootendorst explain, "By portraying the opponent as stupid, dishonest, unreliable or indicate otherwise negative aspects, an attempt his made to undermine his credibility" (616). In contrast, the *circumstantial ad hominem* attempts to undermine an opponent's argument by asserting it is supported by self-interest, not by good evidence. Finally, the *tu quoque* variant attempts to expose an inconsistency in a position that an opponent has used on different occasions. "As a matter of fact," van Eemeren and Grootendorst conclude, "the difference between the three variants are so great that there might be some validity in regarding them not as different variants of the same fallacy but as separate categories" (617).

Of the three variants of *ad hominem*, the abusive form is generally regarded as the most questionable. Abusive *ad hominem*, Copi (1972) observes, "is clearly fallacious" (76). Echoing this sentiment, Rescher (1964) notes, "Any argument of this sort is of course highly improper and thoroughly fallacious" (81). According to the standard treatment, the abusive *ad hominem* can be discounted as a fallacy of relevance. While it may seem that there is a connection between the premises and the conclusion, under closer scrutiny, Rescher finds, the premises "fail to provide sufficiently relevant evidence for the conclusion" (70). "It is," Cliff (2017) continues, "an attempt to distract from the matter at hand by introducing irrelevant details aimed at discrediting the individual" (10).

Over time, however, a growing body of scholarship has emerged suggestion that *ad hominem* in public discourse is worth reconsideration, and even rehabilitation. For example, Hinman (1982) has argued, "there is a wide variety of situations in which *ad hominem* arguments are not fallacious" (p. 338). More recently, Johnson (2009) suggested that "intellectual virtues, moral virtues, and non-moral character traits can all be legitimate factors" when dealing with public argument and "deciding contentious public issues" (p. 252). He suggests, for example, that in the courtroom, *ad hominem* could be used to undermine a witness who is morally corrupt by suggesting they are a hypocrite. In political argument, *ad hominem* may serve similar functions: to reveal or highlight a relevant argument to voters about a particular candidate's character or past.

In the 2016 campaign, Donald Trump used all three types of *ad hominem* identified by scholars: abusive, circumstantial, and *tu quoque*. However, his most vicious and effective attacks were abusive *ad hominem*. Trump employed these arguments through multiple venues, including campaign rallies, presidential debates, and social media. We contend that Trump's

abusive *ad hominem* functioned as relevant evidence to his audience, suggesting a need for argumentation scholars to incorporate the rhetorical context into the evaluation of argument *ad hominem*.

3. STUDYING TRUMP'S *AD HOMINEM* IN THE 2016 ELECTION

To study the varied mediums of candidate Trump's *ad hominem*, we focused on the 2016 Republican primary and general election. Our goal was to identify and classify abusive *ad hominem* to understand more about candidate Trump's strategies. We began with a record-keeping website from the *New York Times* entitled "The 472 People, Places, and Things Donald Trump has insulted on Twitter," which as suggested, archives a list of links to Trump's tweets since Donald Trump declared his candidacy (Lee & Quealy, 2018). This website's focus is appropriate given that Trump himself has acknowledged that he used Twitter and Facebook to establish his message, convey information, and influence the public during his 2016 election campaign (Trump, 2016e), and early scholarly accounts of the 2016 campaign demonstrate the significance of social media to Trump's success (Ott, 2017; Azari, 2016).

Using the *New York Times* website, we first looked at Trump's attacks on the 16 Republican candidates and 5 Democratic candidates in the 2016 primary. We read all of the tweets for these 21 candidates listed on the website, noting the presence of *ad hominem*. This provided a sense of the field of campaign discourse as a whole, and also demonstrated the prevalence of abusive *ad hominem*. Since we wanted to expand beyond Twitter, we then used Trump's own words to guide our searches through the broader landscape of campaign discourse, expanding our scope to include rally speeches, debates, and media appearances. Analysing this discourse, we then developed a three-part typology of Trump's use of abusive *ad hominem*: (1) character; (2) personality; and (3) appearance.

4. *AD HOMINEM* OF CHARACTER ATTACKS

The abusive *ad hominem* often appears as an attack on a person's *ethos*, or character (Govier, 2013; Brinton, 1986). In this sort of attack, labels are used as the evidence for inferences being drawn. Character attacks can be effective because, as Zarefsky (2002) notes, "personal character is intrinsic to argument" and "one cannot simplistically dismiss it as a fallacy because it is a personal attack" (sect. 7). This is especially true for contemporary political campaigns, which often focus on the candidate's ethos as a part of the campaign platform. Trump's *ad hominem* character attacks were exemplified in arguments against Ted Cruz in the Republican primary and Hillary Clinton in the general election.

Trump's *ad hominem* against Cruz featured versions of Trump referring to his opponent as "Lyin' Ted." This attack functioned as an implied, ethotic argument against his opponent's character and credibility, since it attacked Cruz's platform that he was a moral, Christian candidate. Trump often deployed this *ad hominem* at rallies, with cries of "Don't want to vote for a liar. You have Lyin' Ted Cruz. I call him, I nicknamed him, Lyin'" (Los Angeles Times, 2018), sometimes even going so far as to spell it out: "How would ya spell that? L-Y-E-N— Lyin'!" (CNN, 2016). Trump often paired the nickname with the accusation that Cruz would "hold up the Bible," and then "put it down" and lie, further suggesting the duplicitous—or in Trump's words, "terrible"—nature of his opponent (Schwartz, 2016). He also used the *ad hominem* frequently to attack Cruz on Twitter, for example, tweeting on May 3, 2016, "Wow, Lyin' Ted Cruz really went wacko today. Made all sorts of crazy changes. Can't function under pressure – not very presidential. Sad!" (Trump, 2016f). This tweet extends the *ad hominem*,

suggesting that not only is Cruz a liar, but that this character flaw makes him impulsive and unpresidential.

In the case of Trump's *ad hominem* character attack on Democratic opponent Hillary Clinton, "Crooked Hillary" functioned as an enthymematic connector for voters to fill in pre-held biases and concerns about Clinton's past decisions and performance as a Senator, Secretary of State, and even former First Lady. Trump used "Crooked Hillary" as a character attack against her effectiveness in public office, tweeting on August 26, 2016 that "Crooked Hillary will NEVER be able to solve the problems of poverty, education and safety within the African-American & Hispanic communities" (Trump, 2016g). Trump turns Clinton's past experience as a government official against her, suggesting that her way of doing business in the government is "crooked," and that her actions would be more likely to be criminal or nefarious rather than helpful to marginalized communities. In another tweet, Trump cast her as "crooked" for her hidden intentions: "Crooked Hillary wants to take your 2nd Amendment rights away. Will guns be taken from her heavily armed Secret Service detail? Maybe not!" (Trump, 2016h). Both of these tweets suffer from flaws in factual misrepresentation; in the case of the first, no evidence is given and the "crooked" attack functions purely as an attack on her character, while in the second tweet, misleading evidence is given to suggest that Clinton is in favour of elimination (rather than restriction) of the right to bear arms. Additionally, the second tweet also ignores the potential difference in context between individual citizens and state security forces. But for Trump, the "crooked" *ad hominem* functions to amplify beliefs amongst some conservative voters that Democrats want to eliminate the 2nd Amendment of the United States Constitution, a belief that is at times, substantiated by members of the Democratic party or by liberals (Blake, 2018). All of this serves as evidence that Clinton's character is untrustworthy.

Trump's *ad hominem* character attacks took arguments against his opponents' *ethos* to the extreme. They functioned to destroy trust in the opposition, whether Trump's challenger was "Lyin' Ted" Cruz or "Crooked Hillary" Clinton. Arguing against such *ad hominem* was difficult because refutation, particularly when done by the opposing candidate who is being attacked, could then be used by Trump—and potentially by voters hearing the refutation—as further evidence of the lack of character in Cruz and Clinton.

5. AD HOMINEM OF PERSONALITY ATTACKS

A personality focused abusive *ad hominem* attacks the agency and demeanour of the opposing candidate and layers these attacks within the high expectations of the U.S. presidency. Trump's *ad hominem* personality attacks tended to take the form of criticizing someone's personal demeanour, suggesting that the way they behaved on the campaign trail was flawed. This is a classic *ad hominem* strategy, because it poses an argument that is accepted or rejected based on a characteristic, rather than on a rationale or more formal argumentation strategy. Trump's personality attacks centered around two candidates: "low energy" Jeb Bush and "crazy" Bernie Sanders.

Trump's personality attacks against Jeb Bush became an extended *ad hominem* about the tired, belaboured, and disconnected nature of the establishment Republican party. Given that Bush was related to *two* U.S. presidents—his father George H. W. Bush and his brother George W. Bush—he was able to be framed by Trump as the perfect example of why the Republican party was too traditional and unable to represent the people of the United States. Trump used the strategy of "parallipsis" to craft his *ad hominem* of personality against Bush; parallipsis being one of Trump's well documented rhetorical strategies when he would talk about something while saying he was *not* going to reference something (Merceica, 2016). For example, Trump proclaimed, "But I won't talk about Jeb Bush. I will not say—I will not say

he's low energy. I will not say it" (Los Angeles Times, 2016). In tweets, he referred to Bush as "weak and low energy," calling his campaign a subsequent "disaster" (Trump, 2015c), and suggested "@JebBush is a low energy 'stiff' who should focus his special interest money on the many people ahead of him in the polls. Has no chance!" (Trump, 2016a). While "low energy" was an attack on Jeb's delivery and performance, the *ad hominem* of personality functioned to call attention to the lack of coordination, enthusiasm, and dedication in the establishment Republican party when compared to Trump's own free-wheeling, energetic rallies and campaign.

Trump also used *ad hominem* against Democratic primary candidate Bernie Sanders, referring to him as "Crazy Bernie." However, in this case, while the *ad hominem* criticized Sanders's presidential capabilities, it did so in a way that was not as critical as some of Trump's other *ad hominem* against his opponents. Trump suggested that "wacko Bernie Sanders allies" would come "over to me because I'm lowering taxes, while he will double and triple them" (Trump, 2015b). He confessed on Twitter that "I don't want to hit Crazy Bernie Sanders too hard yet because I love watching what he is doing to Crooked Hillary. His time will come!" (Trump, 2016bb). Trump's *ad hominem* formation almost affords Sanders some respect—he uses Sanders' full name, not just an adjective and first name, and he suggests that Sanders is effective at attacking "Crooked Hillary." In some rallies, Trump even praised Sanders, saying he did not want to run against him and saying, "Crazy Bernie, he's a crazy man, but that's okay, we like crazy people" (Associated Press, 2016). However, in the end, Trump's *ad hominem* against "Crazy Bernie Sanders," as it played out in tweets and rallies, implied that Sanders is too unpredictable and illogical a candidate for the presidency.

The *ad hominem* of personality subtly reinforced Trump's own narrative that he would be the best leader for the president, and that he would be a president who would actively work to fix problems and make deals. Someone like Jeb Bush was too "low energy" and therefore unable to handle the high demands of the Oval Office, whereas someone like Bernie was just a little too unpredictable and inconsistent. Instead, these arguments subtly reinforced Trump's own narrative that he was high-energy and strategically unpredictable, able to best opponents, whether in his business dealings or, as Trump hoped, from the Oval Office.

6. *AD HOMINEM* OF APPEARANCE ATTACKS

Trump's *ad hominem* took its most brutal form in the third type, namely *ad hominem* of appearance attacks on his opponents. The *ad hominem* of appearance functioned in a gendered, sexist way to argue for strong masculinity in the Oval Office. The arguments emphasized Trump's appearance as a dominant male leader, and criticized his opponents—Republicans Carly Fiorina and Marco Rubio, as well as Democrat Hillary Clinton—for not being strong, masculine presidential candidates.

One of the most striking examples of Trump's *ad hominem* of appearance came in his hostile, biting comments to Fiorina's physical appearance. In the September 9, 2015 edition of *Rolling Stone* magazine, Trump was quoted making negative comments about Fiorina's "face":

> When the anchor throws to Carly Fiorina for her reaction to Trump's momentum, Trump's expression sours in schoolboy disgust as the camera bores in on Fiorina. "*Look* at that face!" he cries. "Would anyone *vote* for that? Can you imagine that, the face of our next *president*?!" The laughter grows halting and faint behind him. "I mean, she's a woman, and I'm not s'posedta say bad things, but really, folks, come on. Are we *serious*?" (Solotaroff, 2015; emphasis in original).

The quotation attributed to Trump suggested that a female face—and perhaps an unattractive female face—cannot be presidential. Trump eventually had to walk this comment back in a

Republican primary debate, but even then, he maintained that what he meant was her "persona, not [her] appearance," and only later when challenged in the Republican primary debate said that he thought she had "a beautiful face" (CNN Debate, 2015). Trump's fixation on Fiorina's face—whether critiquing it or praising it—as well as his discussion of her "persona" served as an attack and drew attention to her feminine demeanour as unfit for the presidency of the United States.

Trump also attacked Marco Rubio for his physical appearance, referring to him as "Little Marco." In this case, Trump's tweets through March 2016 are illustrative of how the abusive *ad hominem* of appearance developed. First, Trump (2016b) tweeted that "Lightweight choker Marco Rubio looks like a *little boy* on stage. Not presidential material!" The argument here is more explicit—Rubio's short stature suggests that his character is not fit to contend with the masculine work of being president. Then, his tweets evolved, referring to "little Marco Rubio" as a "lightweight" (Trump, 2016c; Trump, 2016e) and "Little Marco" was "set to be a puppet" (Trump, 2016d) for special interests. The use of the terms lightweight and puppet draw on a physical comparison that Trump is the strong boxer, or that Trump is his own master whereas other politicians are weak and controlled by special interests. As Trump reiterated "Little Marco, Little Marco" in his rally stump speech (CNN, 2016), the *ad hominem* functioned enthymetatically to reinforce that Trump's opponents represented a weak version of leadership as opposed to Trump's own masculine and dominant persona.

Trump's masculine dominance was further emphasized in the third example of *ad hominem* of appearance, which implied that Clinton did not have the right "look" for the presidency. Commenting on Clinton's campaign events, Trump (2015a) tweeted that "Black Lives Matter protesters totally disrupt Hillary Clinton event. She looked lost. This is not what we need with ISIS, CHINA, RUSSIA etc." This was a particularly cutting critique of appearance, because looking "lost" suggested a lack of willpower and force, even with groups who traditionally would be aligned with Democrats. It implied that Clinton was weak with her allies, and would be even weaker with foreign adversaries. A second tweet boldly laid out the underlying argument of Trump's *ad hominem* of appearance: "Hillary Clinton does not have the STRENGTH or STAMINA to be President. We need strong and super smart for our next leader – or trouble!" (Trump, 2015b). *Strong* is an attribute for Trump that becomes synonymous with good leadership, which in turn is about overpowering and controlling one's foes. Furthermore, Trump's *ad hominem* of appearance against Clinton continued in the first presidential debate. When asked by debate moderator Lester Holt what he meant by his statement that Clinton did not have the right look for the presidency, Trump replied:

> She doesn't have the look. She doesn't have the stamina. I said she doesn't have the stamina, and I don't believe she does have the stamina. To be president of this country, you need tremendous stamina (Politico, 2016).

When asked to clarify about his comment that Clinton "did not have a presidential look," Trump elaborated:

> Wait a minute, Lester. You asked me a question. Did you ask me a question? You have to be able to negotiate our trade deals. You have to be able to negotiate. … Wait, you have so many different things, you have to be able to do, and I don't believe that Hillary has the stamina (Politico, 2016).

In his response to the moderator's question about Trump connecting Clinton's "look" with the presidency, Trump connected to stamina. The "look" here suggested that Clinton is female, and stamina implied a robust masculinity—negotiation through force, through *strength*. Trump's implied argument underneath this *ad hominem* of appearance is that only men possess the brute force to be president of the United States.

Whether critiquing Republican challengers Fiorina and Rubio, or challenging Clinton in the campaign and presidential debate, Trump consistently used his *ad hominem* of appearance to attack candidates for weakness, femininity, and lack of strength. By criticizing female candidates' faces and looks, and nicknaming Rubio "Little Marco," Trump was able to advance his argument about masculine leadership without having to openly declare his preference for brute force.

7. CONCLUSION

Trump's example of argument *ad hominem* demonstrates the referential—and persuasive—power of so-called nicknames and the subsequent attacks on character, personality, and appearance. Scholarship on argument may be quick to dismiss this sort of argument due to the lack of logical evidence and warrants; *ad hominem* are seen as fallacies. However, we challenge that *ad hominem* can and must be taken seriously as political argument in our current public discourse. Trump's candidacy in 2016 demonstrated that *ad hominem* can be an important means of persuasion for audiences when the *ad hominem* connects to larger arguments through references, enthymemes, and other rhetorical forms. We advocate, therefore, for treating *ad hominem* as both fallacious reasoning and as a powerful rhetorical device.

Analyzing *ad hominem* rhetorically means adopting the framework of not judging logical/fallacious or right/wrong, but rather utilizing Chaim Perelman's conception of stronger or weaker arguments, that appeal as relevant or irrelevant to contingent rhetorical circumstances (see Minot, 1981). Understanding the impacts of *ad hominem* means examining "whether an *ad hominem* argument is relevant within its context" (Minot, 1981, p. 228), particularly considering the *ethos* of the speaker, the circumstances of the broader issues at hand, and the contingent nature of public discourse.

In reference to the context of contemporary campaign discourse, we advocate expanding Woods' (2007) notion of "slanging." Slanging, Woods explains, "is a rhetorical device, as old as the hills," and the objective is to "expose, embarrass, ridicule, mock, calumniate or humiliate one's opponent" (p. 109). Trump's *ad hominem*, when viewed as slanging, fulfilled a variety of functions, including entertainment for his base, diverting the audience away from evidence, and enhancing Trump's own *ethos* while embarrassing his opponents. In the case of Trump, slanging *ad hominem* became an effective way of undermining traditional politics and career politicians, critiquing an *ethos* that usually would be a strength in a campaign and instead promoting Trump's own brand of outsider committed to "#DrainTheSwamp" (Trump, 2016i). Slanging not only diminished Trump's opponents, it also challenged and undercut democratic institutions and norms.

This doesn't mean that *ad hominem* and slanging should be encouraged or accepted in public discourse. As argument scholars, we have a particular responsibility to call attention to the logical content, as well as the quality of discourse. Our task is to understand how *ad hominem* functions, and then use that knowledge to demonstrate the dangers "slanging" can pose to democracy. *Ad hominem*, even "slanging" or amusement, seems to drive out meaningful political discourse. As *ad hominem* becomes more common, politics becomes even more about attacking the character of one's opponents, drawing attention to the negative and fueling suspicion about political candidates, elected representatives, and the government itself.

The example of Trump demonstrates a particularly powerful three-part typology for *ad hominem* attacks during his 2016 presidential campaign, focusing on character, personality, and appearance arguments. These forms of abusive *ad hominem* must be seriously considered, and future research should expand our understanding of how *ad hominem* can function effectively from a rhetorical context. Argument scholars are well positioned to evaluate both the form—

the logical flaws and lack of evidence—as well as the rhetorical function—the significance and strategy—of *ad hominem* arguments. We would do well to seriously consider and expand our understanding of the intersections of form, function, and impact in the future.

Managing argumentative potential in the networked public sphere: The anti-#MeToo manifesto as a case in point

DIMA MOHAMMED

ARGLAB-IFILNOVA, FCSH
Universidade Nova de Lisboa
Portugal
d.mohammed@fcsh.unl.pt

ABSTRACT: The controversy around the Anti-#MeToo Manifesto is undoubtedly a reflection of 'a central rift within feminism' today. Nevertheless, a closer look reveals that the divide has also been deepened by a series of clumsy discursive choices and misunderstandings. This paper offers an argumentative analysis that highlights the controversy's unfortunate turns, sheds light on the divide, and shows how important and yet how arduous a task it is to manage the argumentative potential of one's discursive choices in today's networked public sphere.

KEYWORDS: agency argument, argumentative associate, argumentative potential, disagreement network, feminism, #MeToo, rape apology, standing standpoint, networked public sphere

1. INTRODUCTION

In October 2017, a tweet reignited a movement set to raise awareness of the pervasiveness of sexual abuse in society. In the tweet, actress and activist Alyssa Milano called on women who have been sexually harassed or assaulted, to tweet back 'me too' (Milano 2017). The phrase, which had been used by civil rights activist Tarana Burke already in 2006, was now becoming the viral hashtag #MeToo. By Monday morning, tens of thousands had already used it, many of which sharing stories too. Responses came from activists, celebrities and ordinary people alike: On Facebook, the hashtag was used by more than 4.7 million people in 12 million posts during the first 24 hours. Soon, the phrase spread beyond social media: Columnists in major news and media outlets all over the world were using and discussing it. The hashtag trended in at least 85 countries, with local alternative hashtags such as #أنا_كمان in Arab countries, #MoiAussi in French-speaking Canada, #我也是 and #WoYeShi in China, #QuellaVoltaChe in Italy, and #balanceTonPorc in France. A mass movement was reigniting to spread awareness of the magnitude of the problem and to empower women through empathy.

As the #MeToo movement was gaining momentum by the day, unsurprisingly, critical voices were mounting too. One of the strongest critical reactions came in the form of an open letter published in the French newspaper *Le Monde* in January 2018. The letter, signed by 100 French women, was presented as a statement in favour of the agency of women against "enslaving them to a status of eternal victim" and "reducing them to defenseless preys of male chauvinist demons".[1] What became known as the Anti-#MeToo Manifesto rejected the movement's 'naming and shaming' of men, defended the 'freedom to pester' and urged women to respond to it in "ways other than closing off in the role of the prey" (Le Monde 2018). The manifesto provoked outrage and was described as a clumsy and shocking rape apology. As criticism and counter-criticism were exchanged, it became clear that the charge, though obviously rejected by the signatories, could not be laid off as baseless. The resonance

---

[1] The letter was written by Abnousse Shalmani. Most famous among its 100 signatories are actress Catherine Deneuve, radio host Brigitte Lahaie, feminist activist Caroline De Haas, art critic and author Catherine Millet.

between (parts of) the manifesto and arguments that undermine the seriousness of sexual assault could not be dismissed. A few of the signatories, including actress Catherine Deneuve, felt compelled to clarify and apologise. In a new letter, published in *Liberation* a week after the manifesto appeared in *Le Monde*, Deneuve eventually apologised to rape victims who might have been offended by the manifesto (Liberation 2018).

Undoubtedly, the controversy around the manifesto is a reflection of a *central rift within feminism* today: a divide between "two distinct understandings of sexism, and two wildly different, often incompatible ideas of how that problem should be solved" (The Guardian 2018b).[2] Nevertheless, a closer look at how the controversy developed reveals that the divide, undeniably serious, has also been deepened by a series of clumsy discursive choices and misunderstandings. Through its unfortunate turns, the controversy indeed shows how important and yet how arduous a task it is to manage the argumentative potential of one's discursive choices in today's networked public sphere. In the web of entangled issue, arguers often fail to prevent their own arguments from being interpreted as support for positions other than the ones they wish to support. When this happens, they are compelled to clarify and apologise.

In this paper, I analyse the controversy aiming to explain how the manifesto ended up being interpreted as a rape apology. I examine the manifesto's arguments as well the reactions to it and the subsequent apology. The analysis will highlight the failure to curb the argumentative potential of manifesto's arguments, how it came about and its consequences. It will reveal how, in the manifesto's case, by dint of its maladroit craft as well as other clumsy statements made later by some of its signatories, the manifesto was (mis-)interpreted as defending a position that undermines the seriousness of alleged sexual assaults and excuses the assailant or blames the assaulted for it. It will also explain how, subsequently, the apology seeks to reinstate an understanding where the support the manifesto could give to these positions is denied.

The paper is divided into five sections. After this introduction, I present a brief exposé of the methods and theoretical tools used in the analysis (Section 2). Following that, I reconstruct the manifesto and present its main arguments (section 3). Then, I analyse the reactions and subsequent apology (Section 4). Finally, I discuss the implications of the analysis and further research.

2. THEORETICAL FRAMEWORK

In analysing the controversy unfolding, I reconstruct the arguments of the manifesto, following the reconstruction method developed by van Eemeren, Grootendorst, Jacobs and Jackson (1993), and analyse the reactions to it and the subsequent apology using the concepts of *standing standpoint* and *argumentative associates* (Mohammed, 2018b).

The reconstruction following van Eemeren, Grootendorst, Jacobs and Jackson (1993) highlights the role different premises play in support of the different claims made, while focusing on the disagreement that gives rise to argumentation. Accordingly, argumentation is understood as the exchange of reasons in the context of disagreement (Jackson & Jacobs 1980, Lewiński & Mohammed 2016). Applying dialectical transformations to the text will reveal the underlying argumentative structure maintaining a dual commitment to usefulness and adequacy in description (van Eemeren et al. 1993). The method is well suited for the

---

[2] As the analysis of Moira Donegan shows, the #MeToo movement represents an approach that is "expansive, communal, idealistic and premised on the ideals of mutual interest and solidarity", while the Manifesto represents one which is "individualist, hard-headed, grounded in ideals of pragmatism, realism and self-sufficiency".

analysis of argumentation occurring under less-than-ideal conditions and conducted by less-than-ideal participants (ibid), that is of naturally occurring argumentation (Jackson 2018).

Among the concepts used in the analsyis, two concepts are crucial for making sense of the way the controversy unfolds and the (mis-)understanding of the manifesto as a rape apology emerges. The concepts are tailored to the open-endedness typical of the networked public sphere (Benkler 2006, Kaiser et al. 2017, Pfitser 2014) and characteristic of the #MeToo controversy.

Firstly, the concept of *standing standpoint* (Mohammed 2018b) is used in order to highlight the argumentative potential that argumentative choices have in the networked public sphere. The concept refers to standpoints not expressed explicitly by arguers and yet justifiably attributable to them in virtue of premises that are have become publicly associated with them. Think of premises such as the second amendment to the US constitution, when invoked in the context of discussing gun policy. The premise has become associated with defending opposition to gun control that it suffices that one invokes the amendment for one to be attributed that position. As long as there is no evidence to the opposite, the position may be attributed as a *standing standpoint* to an arguer who asserts the premise. The standpoint is *standing* just as in a standing declaration (Searle, 1995): it takes effect only once a certain context is in place. The attribution of a *standing standpoint* is presumptive: it can be reversed if an arguer advances what may count as evidence that denies the arguer's commitment to the standpoint. For example, an arguer invoking the second amendment may make it clear that what they oppose is total ban of gun ownership rather than gun control in general.

Secondly, the concept of *argumentative associates* (Mohammed 2018b) is used in order to capture the collective and polylogical (Lewiński & Aakhus 2013) nature of arguing in the network public sphere. Roughly speaking, *argumentative associates* of an arguer A as those arguers who share with arguer A general positions. Argumentative association may be based in the membership of an institution (Government, committee, … etc), but may as well form on the basis of collective action. The signatories of the manifesto are good examples of *argumentative associates* emerging voluntarily out of collective action. An important consequence of the association is a defeasible transferability of commitments (Mohammed 2018a, b). An arguer may be attributed the position of her *argumentative associates*, in the area where they are *associates*, as long as she does not distance herself from these positions. As the analysis below will show, the concept provides a crucial tool to make sense of the controversy over the anti-#MeToo manifesto.

3. THE ANTI-#METOO MANIFESTO: THE ARGUMENTS

The manifesto makes three main claims.[3] Firstly, the manifesto argues that *The #MeToo movement has gone too far*. In support of this claim, three main lines of arguments are advanced. Each of the lines concerns an area harmed by the movement: women, men and the arts. The manifesto argues that the movement which had begun as an attempt to free women up to speak "has today turned into the opposite": "instead of helping women, this frenzy to send the male chauvinist 'pigs' to the abattoir actually helps the enemies of sexual liberty". Furthermore, the movement has 'named and shamed' men without giving them the chance to respond or defend themselves, the manifesto claims. Men are named and shamed, "while the only thing they did wrong was touching a knee, trying to steal a kiss, or speaking about 'intimate' things at a work dinner, or sending sexually-charged messages to women who did not share the attraction", the text reads. Finally, the movement has caused a 'purging wave' in

---

[3] The summary of the arguments is based on the analytic reconstruction on the manifesto following method of van Eemeren, Grootendorst, Jacobs and Jackson (1993).

the arts, the manifesto laments: #MeToo proponents have called for the removal of a Balthus painting from a museum, Cinémathèque Française is told not to hold a Roman Polanski retrospective … etc.

The second main point defended in the manifesto is a call for protecting 'the freedom to pester' (or to bother, in French *importuner*). *The freedom to pester needs to be protected* for it is *indispensable to sexual freedom*, the text argues. Protecting sexual freedom is a strong concern for the manifesto signatories. This isn't surprising considering that many of them come from a generation which fought for sexual liberation in the sixties and seventies. The text argues that "the freedom to say no to a sexual proposition cannot exist without the freedom to pester". In defending the freedom to pester, the manifesto seeks to distinguish between 'an awkward attempt to pick someone up' from 'sexual attack'. In a rather boastful manner, the signatories assert that they "are clear-eyed enough not to confuse" one with the other.

Finally, the manifesto expresses opposition to "a certain feminism that takes the face of a hatred of men and of sexuality". Here, the signatories seem to be defending a French version of feminism in opposition to an *Anglo-Saxon* one. The main argument here is that *there is no need for the (false Anglo-Saxon) dichotomy of feminism and femininity*. This is, as the manifesto explains, because:

> a woman can, in the same day, lead a professional team and enjoy being the sexual object of a man, without being a 'promiscuous woman,' nor a vile accomplice of patriarchy. She can make sure that her wages are equal to a man's but not be traumatised forever by a fondler on the metro, even if that is regarded as an offense. She can even consider this act as the expression of a great sexual deprivation, or even as a non-event.

Consequently, women are urged to respond to the freedom to pester "in ways other than by closing ourselves off in the role of the prey". In another attempt to distinguish themselves from the version of feminism they reject, they proclaim that it is 'wiser' to raise "daughters in a way that they may be sufficiently informed and aware to fully live their lives without being intimidated or blamed":

> Incidents that can affect a woman's body do not necessarily affect her dignity and must not, as difficult as they can be, necessarily make her a perpetual victim. Because we are not reducible to our bodies. Our inner freedom is inviolable. And this freedom that we cherish is not without risks and responsibilities.

With such rather moralising tone, the manifesto concludes.

4. THE MANIFESTO AS A RAPE APOLOGY: FAILURE TO CURB ARGUMENTATIVE POTENTIAL

In spite of a few fair points made, it was to be expected that the manifesto is described as provocative, clumsy and shocking. Paying attention to the way it was written, and considering the state of the public controversy, it isn't too surprising that the defence of 'the freedom to pester' was understood as 'standing with those making excuses to torch powerless women' (The Guardian 2018a), a position 'contemptuous of the victims of abuse and harassment' (Franceinfo 2018). In its most extreme version, the criticism called the signatories rape apologists, 'lobotomised' by 'interiorised misogyny' (Argento 2018).

As the name suggests, the rape apologist charge criticises the act of making excuses for rape. The charge is more generally used to include undermining the seriousness of alleged sexual assaults, excusing the assailant or blaming the assaulted for it. Premises typically associated with a rape apologist argument involve shifting the responsibility to the assaulted,

for example by saying that she wore a short skirt; had a reputation; flirted with the rapist beforehand; had previously had sex with the rapist; was friendly towards the rapist afterwards … etc. Other premises undermine the magnitude of sexual assault as a problem: it is infrequent, misreported, over-reported, not that big a deal ... etc.

Needless to say, the manifesto does not offer any such premise directly. Yet, that it has been (mis-)understood as such seems to be to some extent justified. In view of the disagreement space in which it occurs, the manifesto may be interpreted as part of a rape apologist argument. This may not be what its signatories wish to do, yet there seems to be something in the manifesto that has the potential to support such views. Otherwise, the signatories wouldn't be compelled to clarify and apologise.

In her clarification and apology, published in *Liberation* on the 15 of January 2018, Deneuve reaffirms commitments to "the spirit of the manifesto", but clarifies what she takes to be the misunderstanding: she stresses that she does believe sexual harassment and assault are real problems, and apologises to "all victims of unpleasant sexual acts who read the letter and felt hurt by it". Looking at what is it exactly that Deneuve clarifies and apologises for is a good first step for understanding how the (mis-)understanding of the manifesto came about. In what follows, I analyse three particular excerpts from the apology and trace them back to excerpts from the original manifesto.

4.1 Undermining the seriousness of sexual assault as a problem

In reference to the men 'named and shamed' by the #MeToo movement, Deneuve begins her clarification by saying "I'm not making excuses for these men. I pass no judgment on their guilt or innocence". Deneuve feels compelled to deny that she is making excuses for these men because a few passages in the manifesto may be understood just like that. For example, in lamenting the harm the #MeToo movement is inflicting on men, the manifesto text reads:

> This expedited justice already has its victims, men prevented from practicing their profession as punishment, forced to resign, etc., while the only thing they did wrong was touching a knee, trying to steal a kiss, or speaking about 'intimate' things at a work dinner, or sending sexually-charged messages to women who did not share the attraction.

While the manifesto may not be offering excuses for all men accused of sexual assault, the text is clearly excusing those who 'touch a knee', 'try to steal a kiss' … etc. When these are acts of unwanted sexual advances, it is hardly a straw man to take the passage above to be arguing that *men are excused for making some unwanted sexual advances.*

The passage plays into the view that *the problem of sexual assault is exaggerated*, too. Using 'while the only thing they did wrong' assumes considering what follows no big deal, when what follows are in fact acts of unwanted sexual advances. The assumption conveyed, namely that *making some unwanted sexual advances is no big deal*, has been typically associated with the rape apologist view that *the problem of sexual assault is exaggerated.* Furthermore, in another passage, the manifesto may be read as undermining the seriousness of even those which are 'aggressive' among sexual advances. In defending the view that *freedom to pester is indispensable to sexual freedom*, the manifesto argues that:

> […] the sexual urge is by its nature wild and aggressive. But we are also clear-eyed enough not to confuse an awkward attempt to pick someone up with a sexual attack.

Undermining the seriousness of aggressive advances is another position often advanced in support of the view that *sexual assault is over-reported.*

Deneuve may be right, the manifesto does not pass an explicit 'judgment on the guilt or innocence' of men accused of sexual assault. Nevertheless, the text has in it what undermines the seriousness of sexual assault as a problem. The discursive choices made convey premises which are typically associated with this view. The text assumes that *making some unwanted sexual advances is no big deal* which is typically used to defend the view that *men are excused for making some unwanted sexual advances*. Furthermore, the manifesto suggests that *aggressive sexual advances are not sexual attacks* which is a premise typically used to support the claim that *the problem of sexual assault is exaggerated*. In view of the public association between these premises and claims, the claims may be attributed to the manifesto as *standing standpoints*. That is, unless evidence to the opposite is offered, the premises assumed and suggested in the text justify an interpretation of the text as making these claims.

Eventually, the manifesto may be understood as a rape apology as a result of the argumentative potential of formulations that it has. While the intent of the signatories, Deneuve claims, was to defend sexual freedom, the choices made invoked claims related to the seriousness of the issue of sexual assault. An unwanted argumentative potential was not curbed – one way it could have been would have been to argue against the undesired claim. If, indeed, Deneuve et al. did not intend to argue that *men are excused for making some unwanted sexual advances*, nor that *the problem of sexual assault is exaggerated*, then not curbing the undesired potential is a case of maladroit craft. At best, the text was clumsy and failed to control the argumentative potential that its discursive choices have.

4.2 Anything good about harassment?

Another important 'clarification' Deneuve makes relates to whether or not there is anything good about harassment: "nowhere in the petition does it say that there is anything good about harassment, or I would not have signed it", she says. Here again, Deneuve denies commitment to an undesired claim that has been attributed to the manifesto. In this case, there are two bases for attributing to Deneuve et al. the position that she denies, namely that *women can get something good out of harassment*.

Firstly, similar to the position undermining the seriousness of sexual assault as a problem, the position that *women can get something good out of harassment* can be attributed to the manifesto on the basis of its discursive choices. In the vain of promoting *seduction a la Française*, the manifesto asserts that a "woman can […] enjoy being the sexual object of a man". While as such it may be benign, the assertion has been publicly associated with the view that *in spite of what they claim, women do enjoy sexual harassment*. Furthermore, the manifesto makes no effort to avoid association with this view. That could have been done for example by acknowledging the suffering of women who are sexually assaulted. Even to the opposite, as the third item in the apology shows, the manifesto exhibits a total lack of empathy with the women who undergo sexual assault. Here too, the view that *in spite of what they claim, women do enjoy sexual harassment* may be attributed to Deneuve et al as a *standing standpoint*. The attribution may be justified on the basis of discursive choices, public association and lack of evidence to the opposite, but not just that. The clumsy craft is combined with explicit claims made beyond the manifesto.

Indeed, another basis for interpreting the manifesto as claiming that *women can get something good out of harassment* is an explicit claim made by one the signatories, Brigitte Lahaie. In a TV debate a few days after the manifesto was published, the radio talk show host and film actress stated that "One can have pleasure during a rape". Deneuve's apology makes direct reference to this statement: "To state on national television that a woman can climax during rape is worse than spitting in the faces off all women who have had to endure such a

crime". Having signed the manifesto together, Deneuve and Lahaie may be considered *argumentative associates* (Mohammed 2018b), at least when it comes to issues related to sexual harassment and the #MeToo movement. The argumentative association entails a certain *transferability of commitments* between Lahaie and the other signatories. Deneuve et al. may be attributed their Lahaie's position as a *standing standpoint* that takes force in the absence of evidence to the opposite. The transferability is defeasible and can be annulled by dissociating oneself from the arguer assuming the undesired position, which is what Deneuve's apology seeks to achieve.

4.3 Offending the victims

A third position attributed to the manifesto and found undesirable by Deneuve is one of lacking empathy for and solidarity with the victims of sexual assault. To that, she writes: "Let me acknowledge those of my fellow women who have been the victims of abhorrent acts and felt offended by the article in Le Monde. I apologize to them, and to them alone". The lack of solidarity position too is attributed to Deneuve et al. on the basis of the manifesto's discursive choices as well as positions assumed by *argumentative associates*.

Not only does the manifesto lack explicit acknowledgment of the suffering of women who are sexually assaulted, but the text of the manifesto is rife with what may be described as an arrogant language that patronises the women involved in the #MeToo movement, including those who shared their experiences. In distancing themselves from the movement, the 100 women boast:

> We are clear-eyed enough not to confuse an awkward attempt to pick someone up with a sexual attack. Above all, we are aware that […] a woman can […] make sure that her wages are equal to a man's but not be traumatised forever by a fondler on the metro […]. She can even consider this act […] as a non-event.
> […] we consider that one must know how to respond to this freedom to bother in ways other than by closing ourselves off in the role of the prey…

The immodest language may have been well-intended, possibly to affirm the signatories' agency, strength and sovereignty over their bodies, or even better to assert the possibility of empowering other women too. Nevertheless, the contrast it emphasised let away that insolent contempt of the victims of abuse and harassment (Franceinfo 2018).

Here too, it didn't help the signatories that *argumentative associates* of the manifesto have been explicit in assuming an apathetic patronising position. A few days before the manifesto was published, New York Times columnist Daphne Merkin, for example, wrote addressing the women coming forward: "Grow up, this is real life" (NYTimes 2018). The manifesto was no doubt interpreted in view of such statements. The boastful language, a clumsy craft at best, invoked that position of tolerance to sexual harassment as 'real life' and of disdain to women who are 'traumatised forever' by it. The position is definitely not impertinent to the rape apologist inclination to undermine sexual harassment as a problem of vulnerable women who aren't fit for the challenges of modern life.

5. DISCUSSION: THE MANIFESTO IN THE COMPLEX DISAGREEMENT NETWORK

As the three examples above show, analysing the manifesto's argumentative potential is crucial for understanding how the interpretation of the manifesto as a rape apology emerges. The manifesto includes several discursive choices that convey premises typically associated with a relative tolerance of sexual harassment. The discursive choices and the association

between the premises and these views makes such views *standing standpoints* attributable in the absence of evidence to the opposite, i.e., given the lack of effort to curb this argumentative potential. Even more so in view of positions assumed by *argumentative associates* (e.g. fellow manifesto signatories, supporters of it … etc.). All in all, the *standing standpoints* tolerant of sexual assault are by no means baseless. The manifesto was (justifiably) misunderstood, hence the Deneuve apology.[4]

Furthermore, the analysis using the concepts of *standing standpoint* and *argumentative associates* highlights the complexity of the task of managing the argumentative potential of one's discursive choices in today's networked public sphere. Especially when argumentation involves multiple parties in multiple places (Aakhus & Lewiński 2017) pursuing multiple goals (Mohammed 2016a), multiple issues are intertwined and different disagreement lines crisscross and overlap (Mohammed 2016b, forth.). Eventually, arguers may and do fail to prevent their own arguments from being interpreted as supporting positions other than the ones they wish to support. In this controversy, a crucial disagreement overlap occurs around the question of agency - agency broadly understood as the ability to make choices and act accordingly. Ironically, in its general form, women agency is a premise shared between a trend of feminism and rape apologists. Feminists use the premise to empower women and give them back control over their bodies and destiny. Rape apologists use it to blame them for the assault, make excuses for men or to undermine the assault committed by them. That is to say that the agency premise is part of (at least) two already publicly established argumentative patterns which are considerably different, almost opposite: women are agents therefore women deserve more emancipation and women are agents therefore men cannot be blamed if women choose not to say no.

What we have here is clear case of disagreement within a network (Lewiński & Mohammed 2015) rather than disagreement between two consistently conflicting camps. The agency premise is one place where the disagreement lines crisscross and overlap. Looking at the disagreement as a network, it becomes also clear that central to the rift between the #MeToo movement and the manifesto supporters is what each considers crucial: while the #MeToo focuses on the abuse of power and solidarity with its victims, the manifesto cherishes agency and sexual freedom. The issues are entangled, and as the analysis in this paper shows, the manifesto was clumsily crafted, leading to a bumpy path within the complex network. A vigilant arguer who did not intend to excuse sexual assault would have made the effort to curb the undesired argumentative potential of the agency premise once she had used it (see Mohammed 2018b for examples of arguers' attempts to control the argumentative potential of their choices). As the manifesto case shows, arguers may be held responsible for the uncurbed potential of their arguments: when one fails to anticipate and curb the undesired argumentative potential of one's assertions, one ought to clarify and apologise.

Needless to say that by highlighting the clumsiness of the manifesto and the failure of its signatories to manage the argumentative potential of their text, I am not undermining their case nor favouring the cases of their opponents. Not to fall into the same trap myself, let me end with a disclaimer: The analysis in this paper is not intended to compare the

---

[4] Needless to say, the analysis makes no assumption of sincerity on behalf of Deneuve. The apology may be genuine: the *standing standpoints* were not intended, and not distancing the manifesto from them was a *faux pas*, a clumsy move. Keeping under control the contribution one's arguments make to the different interrelated issues requires careful craft and is subject to failure. But the analysis holds even in the case of Deneuve's being a fauxpology: the *standing standpoints* were in fact intended but Deneuve could not bear the consequences of assuming them so she makes the effort to deny assuming them. This is a plausible interpretation given that Deneuve's controversial stance on sexual assault is not new. In March 2017, while discussing her support for filmmaker Roman Polanski, who is wanted in the US for the statutory rape of a 13-year-old girl in 1977, she said that she "always found the word 'rape' excessive."

communicative competence of the opponents. The author believes that the #MeToo movement has also had its clumsiness and failures to curb argumentative potential. But, that will have to be dealt with in works to follow.

ABSTRACT: To reclaim the social relevance of student oratory in post-war Japan, a group of students tried to promote debate as a new mode of oratory in the 1950s and 60s. By analyzing the format and rules as well as excerpts from an actual round, the paper seeks to identify their characteristics as argumentative discourse. It also explores how the idea of debate as a new mode of oratory was received in the college oratorical community.

KEYWORDS: argumentation in debate, citizenship education, civic education, controversy analysis, Japan, post-World War II

1. INTRODUCTION

This paper examines the controversy surrounding the value of student oratory in Japan during the 1950s and 60s. Student oratory (*gakusei benron*), once a vigorous educational practice and a major medium of political engagement among college students, was rapidly losing its social relevance in post-World War II Japan. Not only did it reflect the decline of platform oratory (*danjyō benron*) with the rise of broadcast media and microphone technology, but the elocutionary style of oratory was also deemed outmoded in an age of democracy. Faced with declining membership and public interest, a group of students set out to transform oratory as a more egalitarian form of communication by introducing debate (*tōron*). Interestingly, just as teachers of public speaking in the United States turned to debate in attempts to revive "the tradition of rhetoric-as-argumentation" at the turn of the 20th century (Keith, 2007, p. 59), the group tried to rejuvenate student oratory by tying argument instruction to oratorical training.

The group's revitalization effort, however, drew mixed reactions and stirred up a debate about debating and, more broadly, the value of student oratory. Proponents of debate argued that student oratory should be primarily a training ground where students developed their thinking and speaking skills. On the other hand, its opponents, especially those who considered student oratory a tool for political engagement, rejected the idea of debate as a new mode of oratory lest it foster spectator attitudes to the world. In the end debate did not

help to improve the status of student oratory in society and on campus. It was not until the early 1990s that debate education began to take hold in Japan.

The goal of this paper is two-fold. First, by analyzing the debate format and rules as well as excerpts from an actual round, the paper seeks to identify their characteristics as argumentative discourse. It then explores how the idea of debate as a new mode of oratory was received in the college oratorical community by perusing archival materials on the debate about debating. All in all, through an analysis of the largely neglected controversy this paper hopes to provide new insights into debate pedagogy, especially a potential tension between political education and political action.

2. STUDENT ORATORY AT THE CROSSROADS (*Benron no Magarikado*)

Although Western-style speech and debate were introduced to Japan in the 1870s, it was only in the 1900s that oratory clubs typically named *benronbu* or *yūbenkai* began to be founded in many schools. Among the oldest college oratory clubs were Jitatsu Gakkai at Chuo University (est. 1901) and Yūbenkai at Waseda University (est. 1902). Their activities included oratorical speech contests (*yūben taikai*), provincial speaking tours or lecture circuits (*chihō yūzei* or *junkai kōen*), soapbox (or street-corner) speeches (*gaitō enzetsu*), campaign speeches for candidates (*ōen enzetsu*), and mock parliaments (*gikokkai*). Many oratory clubs had close connections to the political world. The most notable example was Waseda University's Yūbenkai. The former prime minister Shigenobu Ōkubo became the founding president of the club; Sanae Takada, who would later become an education minister, served as the first faculty advisor. The club has also produced five prime ministers to date. "In prewar Japan, graduates of higher education comprised fewer than 7 percent of the age cohort" (Nakayama, 1991, p. 11). Naturally, they enjoyed privileged status and were expected to lead the society after graduation. Oratory clubs were among the most popular extra-curricular activities until around 1935 (Aizawa, 1989, p. 72) because they not only helped students prepare for future leadership roles but also provided them with ample opportunities to voice their opinions on important political issues of the day. Students in oratory clubs also regularly went on provincial speaking tours, delivered speeches to local audiences, and thereby disseminated new information and ideas across the nation. As written in the mission statement of Waseda University's Yūbenkai, student orators prided themselves on their ability to lead public opinion and move people with their words (Waseda Daigaku Yūbenkai, n.d.). Student oratory functioned as a medium of enlightenment especially prior to the advent of radio broadcasting in 1925. Conversely, the development of radio broadcasting, coupled with the rise of totalitarianism, had eroded the value of student oratory. In a way student oratory had already come to a crossroads by the late 1920s (Inoue, 2010). But as Japan became more militaristic and totalitarian, many student oratory clubs were suspended or terminated before they were compelled to grapple with the impasse.

After World War II, oratory clubs were revived in many universities. In December 1946 the All Kantō Association of Oratory Clubs (Zen Kantō Gakusei Yūben Renmei, henceforth referred to as the All Kantō Association) was established with the goals of realizing social justice and protecting freedom of speech (*Benronbu*, n.d.). As the name suggests, the All Kantō Association was an umbrella organization for college oratory clubs in the Kantō region which consisted of Tokyo and six other prefectures. However, the situation surrounding student oratory had substantially changed from the pre-war era and the traditional style of oratory had become obsolete. Student orators themselves were well aware that platform oration and soapbox speeches had lost much of their social significance due to the development of mass media and the rise in the education level of the population (Keiō Gijuku

Daigaku Benronbu, 1965, pp. 255-256). It was widely recognized by the early 1950s that university students' oratory had reached "a crossroads" (*magarikado*) (Sakai, 1966, p.48).

Among others, oratorical speech contests were subjected to particularly harsh criticism. To begin, most oratorical contests were poorly attended and the audiences were limited mostly to students in oratory clubs, which reflected the lack of public interest in student oratory. To make matters worse, many student orators cared only about winning a contest and practiced oratory for the sake of it. Further, the literary and elocutionary style of oratory was seen as antiquated and not suitable in an age of democracy. The growing concern about the future of student oratory led many oratory clubs to experiment with new approaches and find a way out of the crossroads. One such attempt was to put more emphasis on *inventio*—or the construction of ideas—akin to Guy Carleton Lee's call for content-delivery amalgamation (Sproule, 2012, p. 586). For instance, Yasuhiro Arai (1966), who was an active member of the oratory club at Keio University in the mid-1950s, proposed that oratory should be practiced first and foremost as a "thinking method" (p. 16). Another attempt was to make oratory more interactive. Keio University's oratory club resumed a provincial speaking tour in 1948. For the first two years its primary goal was to enlighten local audiences. But the oratory club began to shift the emphasis in 1950 from speaking *to* local audiences to thinking *with* them and learning from each other (Keiō Gijuku Daigaku Benronbu, 1965, pp. 197). Along this line it incorporated a round table discussion into the 1959 speaking tour and engaged in dialogue with local youths in farm villages (Keiō Gijuku Daigaku Benronbu, 1965, p. 203). By the same token, the oratory clubs at Rikkyo University and Hosei University added question & answer sessions to their respective oratorical speech contests and opened the floor for questions and comments after the speeches (Sakai, 1966, p. 50). Yet another attempt was to transform the traditional style of oratory into a more conversational one. To this end, extemporaneous speech events were held by some oratory clubs. According to Sproule (2012), public speaking instruction in the United States broke with "a long tradition of basing speech on delivery" and came to prioritize "matters of invention and organization" over voice and action by the early 20th century (p. 587). In many ways the college oratorical community in mid-20th century Japan was faced with a similar pedagogical quandary.

3. DEBATE AS A NEW MODE OF ORATORY

Although the history of college oratory clubs dates back to the early 1900s, academic debate was not a popular campus activity prior to World War II. When students at the University of Oregon visited Japan as part of the world debate tour in 1927, they initially challenged Japanese students to debate. However, it turned out that they did not engage in any debates during their five-day stay (Harper, 2003, p. 90) because Japanese students were reluctant to debate in English and proposed an oratorical contest instead (Kiyosawa, 1928). This anecdote illustrates that debate was not widely practiced among college students in the pre-war era.

Japan's first intercollegiate debate tournament was held in 1946 under the auspices of the Asahi Shimbun (Newspaper). Instrumental in organizing this so-called Asahi Debating Contest (*Asahi Tōronkai*) was Toshio Kanchi, a reporter for the Asahi Shimbun and a former member of Waseda University's Yūbenkai. He got acquainted with speech and debate education in the United States while studying political science and journalism at the University of Southern California in the 1930s (Kanchi, 1952; Waida, 2001). It is not clear whether or not Kanchi was aware of the "broad paradigm shift from elocution and oratory to public speaking" that came to fruition in the 1930s (Sproule, 2012, p. 591). But he held a similar view and put forward a communication-centered, rather than an expression-focused,

approach to public speaking, to borrow Sproule's terminology. For example, Kanchi (1952) argued:

> the goal of public speaking in a new democratic society is not to hypnotize, intoxicate, or manipulate the audience; on the contrary, it should aim at calming down the excited audience and persuading them with reason. (p. 152)[1]

He went as far as to say that debate as reasoned discourse was a new mode of oratory suitable in an age of electronic media and essential to effective democratic politics (Kanchi, 1952, pp. 29-31). Although the Asahi Debating Contest ended only in four years, it exerted much influence on the college oratorical community and paved the way for the launching of another intercollegiate debate tournament in 1953 (Sakai, 1966, p. 58). This annual tournament was organized by the All Kantō Association under the sponsorship of the Asahi Shimbun. The All Japan Association of Oratory Clubs (Zen Nihon Gakusei Yūben Renmei) became the official tournament host in 1961, but as the biggest member organization the All Kantō Association continued to play a leading role in administering the tournament.

Since its foundation in 1946 the All Kantō Association had held oratorical speech contests. However, many speeches delivered in the oratorical contests were full of rhetorical flourishes but empty of substance. They were also frequently interrupted with crude jeering and heckling from the floor. A group of students within the All Kantō Association was concerned that participation in the existing oratorical contests was not a worthwhile activity for university students and set out to hold a debate tournament as part of its efforts to revitalize student oratory. The first debate tournament was held in 1953 and apparently ended in success. The following year, the All Kantō Association decided to abolish the Prime Minister Cup Oratorical Speech Contest and to replace it with a debate tournament on the ground that primary emphasis in oratorical training should be placed on critical thinking and judgment skills (Zen Kantō Gakusei Yūben Renmei, 1981, p. 18). The replacement of an oratorical speech contest with a debate tournament can be understood as a shift in emphasis from "emotional oratory" (*kanjyō benron*) to "logical oratory" (*riron benron*). In the inaugural issue of the All Kantō Association's newsletter (1954), Toyonori Tamada, the chair of the All Kantō Association's Debate Tournament Organizing Committee, wrote an article entitled *Dibēto no Honshitsu* ("the Essence of Debate"). In this article Tamada argued that "we, who are committed to the way of eloquence [*yūbendō*]" must "adapt to the new times" by being self-critical of grandiloquent but empty speeches and putting more efforts into making a logical appeal based on facts and reason (Tamada, 1989, pp. 96-97). The All Kantō Association continued to promote academic debate for the next few years as nicely encapsulated in the slogan for 1958: "Debate is a solution to individual oratory which has reached an impasse" (Zen Kantō Gakusei Yūben Renmei, 1981, p. 20).

While academic debate became subjected to more criticism in the 1960s, the intercollegiate debate tournament continued to be held until 1967. The All Kantō Association even held a separate debate tournament in 1964 in order to broadcast its final round on national television. After nearly a year of preparation, elimination rounds were held in November and the final round took place on December 19th, 1964. The debate over revision to Japan's constitution was aired nationally on Nippon Television Network (NTV) two days later. Yomiuri Shimbun, Japan's largest newspaper affiliated with NTV, carried an article the next day, reporting on the changing trend in student oratory from the *sōshi* style (literally, "manly warrior style") to *tōronkai* style (debating contest style) (*Kawaru,* 1964, p. 3). It is not certain if the debate tournament was held in 1968 and beyond. The paucity of remaining

---

[1] The translation of all Japanese texts in this paper is the authors'.

documents implies that the All Kantō Association had difficulty conducting its regular events in the late 1960s and 70s.

4. CHARACTERISTICS OF ARGUMENTS AT THE INTERCOLLEGIATE DEBATE TOURNAMENT

This section seeks to delineate the characteristics of argumentative discourse at the intercollegiate debate tournaments hosted by the All Kantō Association. First, each team was made up of 3 persons and represented a different university. The format was based on the so-called revised Asahi debate format. That is, both the Affirmative and the Negative gave two 8-minute constructive speeches and two 4-minute rebuttal speeches. Each constructive speech was followed by a 3-minute cross examination. One distinct feature of the format was the addition of question time at the end in which the audience had the chance to ask each side questions for five minutes. The question time was intended to facilitate dialogue between the speakers and the audience, which was perceived as lacking in oratorical speech contests.

The debate tournament lasted for nearly a month. To take the 1954 tournament as an example, 13 universities entered the competition (Murase, 1966, p. 60). As Table 1 shows, the first rounds were scheduled in the first two weeks, two debates in the first week and three debates in the second (including two forfeit rounds). The second rounds took place the following week and semi-final and final debates were held on the same day two weeks later. Three types of resolution—policy, value, and fact—were used throughout the tournament. While resolutions differed from round to round, they were all announced in advance so that participants had plenty of time to prepare their arguments. Sides of debate were randomly attributed by lot (Tamada, 1989, pp. 97-98). In other words, although debaters did not defend both sides of a resolution, there was no room for their personal convictions to affect in-round arguments (for details about the tournament schedule, resolutions, and participating schools, see Table 1).

Rounds	Dates	Resolutions	Winners	
Round 1	May 21	Bye	Gakushuin University	Kokugakin University
		The tight fiscal policy would destroy the Japanese economy.	Kanto Gakuin University	Senshu University
Round 1	May 29	The present labor movement is illegitimate.	Tokyo Keizai University	Meiji University
		Japan should abolish the death penalty.	Chuo University	Nihon University
		Bye	Toyo University	Waseda Univesrsity
Round 2	June 5	The currency exchange rate should be lowered.	Keio University	Gakushuin University
		Communism deprives individuals of their freedom.	Chuo University	Rikkyo University
		The Chinese market is indispensable to the Japanese economy.	Kanto Gakuin University	Nihon Women's Junior College of Economics
		The House of Representatives should adopt a single-seat district electoral system.	Tokyo Keizai University	Toyo University

Semi-Finals	June 19	International management of nuclear power is possible.	Kanto Gakuin University	Keio University
		Shifting to a communist society is inevitable.	Tokyo Keizai University	Chuo University
Final	June 19	The Japanese family system should be maintained.	Tokyo Keizai University	Kanto Gakuin University

Table 1: The 1954 Prime Minister Cup & Asahi Cup Intercollegiate Debate Tournament（adapted from Murase, 1966, p. 60）

As for judges, three professors from participating schools—one judge from the Affirmative side, another judge from the Negative side, and a third judge from a different school—judged the first two rounds. As far as semi-final and final rounds are concerned, several "experts" served on the judge panel along with professors from participating schools. To take the 1953 debate tournament as an example, five professors, Kanchi and Mitsuru Suematsu from the Asahi Shimbun, and Tadatoshi Ōkubo (the founder of the Japan Language Society) judged the final debate (Sakai, 1966, p. 56). Few of the professors probably had prior debating experience. Nevertheless, the All Kantō Association invited them as judges in order to lend authority to the tournament (Kobayashi, 1975, p. 406). The judge was required to render an objective, impartial, and evidence-based decision (Tamada, 1989, p. 97). This was in contrast with judging criteria used in oratorical speech contests at the time which allocated different points to content, voice, and non-verbal expression (Kobayashi, 1975, p. 404).

To further elucidate the features of argumentative discourse at the All Kantō Association's debate tournament, the paper analyses the first Affirmative constructive speech in the final round of the 1958 tournament. The speech was given by a student representing Chuo University in support of the introduction of a wide-area regional government system called *dōshūsei*. To begin, the speech followed a coherent structure beginning with a short overview and a definition of *dōshūsei*. It then moved on to propose a detailed course of action and articulate six points of contention for demonstrating the benefits of the proposal from multiple standpoints. In addition, first-person pronouns such as "I" or "We" were nowhere used in the speech, suggesting that the speaker was well aware that his personal opinion had nothing to do with the outcome of the debate. Further, the speaker made logical appeals rather than ethical and emotional ones and relied heavily on numerical data. Although the sources of evidence were not cited, it is evident that the team conducted intensive research on the topic. In fact, according to the commentary following the transcript, the speech was "written with our feet" (*Dōshūsei,*1958, p.62), meaning that members of the oratory club divvied up their responsibilities and went everywhere they could to gather supporting materials.

For the purpose of comparison, the paper also looks into the champion speech at the 4th Prime Minister Cup Oratorical Speech Contest in 1951. The speech on the restoration of Japan's independence was delivered by Kaoru Ishiwari, then a student at Chuo University. First of all, in contrast to the speech at the debate tournament, the speaker used "I" or "my" 7 times and "we" or "our" 13 times. This suggests that the speaker's personal opinion came to the fore at the oratorical speech contest. Second, the speech was replete with rhetorical figures and devices such as hyperbole and metaphors. For instance, the speaker chastised the callousness of the dominant class who would not "shed even a single tear on the misery of the people" (Ishiwari, 2001, p. 282). Moreover, Ishiwari (2001) made frequent attempts to evoke emotion in the audience, for instance, by arguing that unless Japan restored independence immediately, its future could be as miserable as "a blindly obedient slave" (p. 280). Lastly, Ishiwari addressed the audience as *shokun* (literally, "everyone" or "gentlemen") and asked a couple of rhetorical questions to engage the audience. On the whole, as Ishiwari (1966) himself later wrote, his speech marked by overblown rhetoric was typical of speeches in

oratorical speech contests at the time (p. 47).

5. THE CONTROVERSY OVER THE VALUE OF STUDENT ORATORY REVISITED

This section revisits the controversy over the value of student oratory in the 1950s and 60s. In a nutshell, student orators were sharply divided over the pros and cons of academic debate. While both proponents and opponents shared the view that student oratory was fraught with problems, they disagreed on how to rejuvenate it. Proponents of debate argued that student orators must appreciate content over style and delivery and therefore learn how to form a rigorous opinion before expressing it in public. Moreover, oratory was considered a one-way street and thus not a suitable form of communication in an age of democracy. As proponents of debate saw it, what was required of student oratory in post-war Japan was not to *speak to* the audience but to *talk with* them. In view of this, debate was superior to oratory as it forced the speaker to listen to opposing viewpoints and engage in rational dialogue with others. Lastly, proponents of debate sought to refigure the role of student orators as "public opinion leaders" (*yoron no kankisha*) by claiming that they could "inform," rather than "enlighten," audiences by articulating both sides of an issue and helping them to form their own opinions (Arai, 1966, pp. 15-16).

On the other hand, opponents of debate, especially those who considered student oratory a tool for political engagement, criticized debate for fostering spectator attitudes to the world. Granted that platform oration was no longer any match for print and electronic media in influencing public opinion. But replacing platform oratory with debate would not make things any better because debate precluded students from advocating their own views. Instead, debate encouraged students to discuss social issues as detached observers. This was antithetical to the founding principle of student oratory, namely leading public opinion and moving people with their words. Student orators should not be content with debating social problems in a tournament setting; rather they should take to the streets, appear in the media, or seize any other opportunities to speak up and intervene in social problems. Further, opponents of debate charged that the argument in favor of debate, taken to its logical conclusion, would lead to the wholesale rejection of oratory; for it idealized a plain, idea-centered, conversational form of communication with little regard for style and delivery. Ideally, student orators should develop both critical thinking and advocacy skills, but debate, opponents contended, was not well equipped to teach them to become forceful advocates.

All in all, the debate over debating did not help to improve the status of student oratory. Membership in oratory clubs continued to decline and many college oratory clubs became defunct in the early 1970s (Okaichi, 1981, p. 138). The debate about debating did not help academic debate to take root in Japan either. Criticism against the idea of debate as a new mode of oratory grew in the early 1960s. Among others, the student movement against the Japan-US Security Treaty and the assassination of Inejiro Asanuma (the then chair of the Socialist Party and a former member of Waseda University's Yūbenkai) in 1960 led many oratory clubs to reconsider the goals of their activities. In 1963 the All Kantō Association pledged to get more actively involved in pressing social issues by adopting the slogan "the Fighting All Kantō Association" (*Tatakau Zenkan*). The following year the All Kantō Association made it a goal to reinvigorate the role of student orators as "public opinion leaders" In fact, the project to broadcast the final round of the debate tournament was one of its attempts to reach a wider audience and influence public opinion. But the college oratorical community continued to struggle. As student protests against oppressive campus policies gained momentum in the mid-1960s, members of oratory clubs were often accused by student radicals of having a lukewarm attitude toward the campus disputes. Confronted with such

attacks, the All Kantō Association had to defend its *raison d'être* by insisting that the association was an academic group not committed to any particular ideology but to learning how to communicate ideas (Murase, 1981, p. 127). However, this argument was hardly convincing to those who confronted political authorities head-on and resorted to direct action. In their view, engaging in a political debate was fundamentally different from engaging in politics. A political speech, regardless of its form and style, was futile unless it was followed up with concrete action. According to the newspaper *Yomiuri Shimbun*, students in oratory clubs were generally seen as too conservative by other college students (*Kawaru,* 1964, p. 3). Ironically, they, the article continued, often had a hard time finding a job because they tended to be perceived as too progressive. On the whole, the article was illustrative of the popular image of student orators at the time.

6. DISCUSSION AND CONCLUSION

The attempt to spread debate as a new mode of oratory in the 1950 and 60s has been largely forgotten. Oratory and debate are now understood as distinct forms of communication both inside and outside the college oratorical community. Although debating events are still held by some oratory clubs, they are not the mainstay of debate education. Nor did academic debate help student orators to regain the status they once enjoyed in the pre-war era. The failure to promote academic debate could be attributed in part to a dichotomous view between social practice and education. By defining oratory as a training ground for developing thinking and speaking skills, proponents of debate failed to see that debate itself could be a form of social engagement. On the other hand, opponents of debate had a narrow view of social practice, equating it with political action and pitting it against education. After all, what was missing from the controversy over the value of student oratory was the notion of debate as civic education. That is, unlike the controversy over competitive debate in the early 20th century United States (Keith, 2007, p. 71), student orators in mid-20th century Japan did not appreciate the civic implications of academic debate. Both proponents and opponents of debate strove to "charg[e] academic work with democratic energy," but not "by linking teachers and students with civic organizations, social movements, citizens and other actors engaged in live public controversies beyond the schoolyard walls" (Mitchell, 1998, p. 45). As noted earlier, oratory clubs historically functioned as a breeding ground for future politicians. Student orators were even paid to give speeches in support of candidates in election campaigns. This indicates that student orators were more inclined to align themselves with established political powers than civic organizations, social movements, and citizens. This may partly explain why both proponents and opponents failed to link debate (or oratory for that matter) to social or civic engagement.

Seen in this light, the controversy over the value of student oratory in the 1950s and 60s has important pedagogical implications for debate education today. Unlike the policy debate circuit in the United States where "civic engagement through policy debate is becoming a community norm" (Vats, 2010, p. 242), the idea of debate as civic education remains neglected in Japan. Debate education—more broadly, speech communication education—operates mostly on skill-based curricula whose goals are to create a positive, agentive self rather than to enact a social change. At the same time, as many universities now offer service learning courses and community outreach programs, the notion of debate as civic engagement or "sit[e] of community change" (Atchison & Panetta, 2009, p. 326) could resonate with university administrators and faculty who try to forge closer links between research, teaching, and social practice. Specifically, we suggest that the civic potential of debate education could be better achieved by tying it to citizenship education

(*shichizunshippu kyōiku*), which has been an educational fad in recent years (Ikeno, 2011). One caveat is that citizenship education in Japan has been largely stripped of its political possibilities. To borrow Bernard Crick's terms, it is primarily intended to teach students to become "good citizens," not "active citizens." In a broader historical context, educational space has been kept largely apolitical in the post-war period (Kodama, 2016, p. 71). This presents both challenges and possibilities for debate education in Japan. First, the concept of "active citizens" could be fruitfully integrated into academic debate as one of its components is to acquire political literacy, i.e. "the knowledge, skills, and values to be effective in public life" (Crick, 2007, p. 245). Second, the idea of active citizens illuminates a tension between "the political literary necessary for sensible citizenship" and "political education in favor or against any specific political party" as stipulated in Article 14 of the Basic Act on Education in Japan:

> Article 14 The political literacy necessary for sensible citizenship must be valued in education. (2) The schools prescribed by law shall refrain from political education in favor of or against any specific political party, and from other political activities. (*Basic Act on Education*, n.d.)

We argue that this tension between political education and political activities is inherent to debate education, especially policy debate. Of course, this does not mean that political education and political activities are mutually exclusive. On the contrary, one pedagogical possibility of debate education lies in challenging such a binary view that has permeated the field of education in post-war Japan. As this paper has demonstrated, the controversy over the value of student oratory in the 1950s and 60s pivoted around the relationship between talking about politics and engaging in politics. As such it provides a useful lens for ruminating over the challenges entailed by the (sometimes) competing interests between the two.

ABSTRACT: The preference for ambiguity might be one reason why equivocation works as a highly effective instrument of political communication in Japan. Politicians equivocate as a strategy for turning difficult situations to their advantage, for advancing their agendas, and for influencing their constituencies. By focusing specifically on the use of political slogans, this study shows the way in which Prime Minister Shinzo Abe makes effective use of slogans in keeping him in power.

KEYWORDS: Abenomics, ambiguity, campaign style, equivocation, political communication, political slogans, strategy

1. INTRODUCTION

Japanese people tend to view equivocation as a sophisticated way of deflecting the threats to one's face in communicative conflicts. In order not to blunder into these threats, they have long preferred to go along with ambiguous expressions rather than engaging in direct public deliberation. From the results of the five recent consecutive elections, it appears that they still do. This preference for ambiguity might be one reason why equivocation works as a highly effective instrument of political communication in Japan. Politicians equivocate, using ambiguous or even evasive language, as a strategy for turning difficult situations to their advantage, for advancing their agendas, and for influencing their constituencies. By focusing specifically on the use of political slogans, this essay shows the way in which Shinzo Abe makes effective use of slogans in keeping the Liberal Democratic Party (LDP) and Abe himself in power.

Skillful politicians win over their oppositions by using popular phrases that convince the people to vote for them but does not commit themselves to taking action. For example, Junichiro Koizumi took office—the President of the LDP and Prime Minister of Japan—in 2001 by making use of evasiveness and vague statements capable of various interpretations. Rather than implementing specific reform programs and explaining them by using plain language, Koizumi continued to restate his reform platform *no reform, no growth* and called for structural reform of the nation's political, administrative, financial, and social systems *without being constrained by sacred cows*. Like such a synecdochic style of speaking represents a complex

issue in a single memorable phrase, Prime Minister Abe successfully focuses the minds of the nation to a dysfunctional legislature by calling for the Abenomics economic package to overcome deflation (See Uchida, 2017, p. 17).

For Japan, it appears to be an ideal to take the deliberative democratic approach to "collective decision-making for the public good" that even in the past was not kept very well (Zarefsky, 2009, p. 115). On the one hand, present instant communication disturbs the voters from promoting "commitment to citizenship" that sustains democratic life (Christians et al., 2009, p. 102). On the other hand, without critical information on social issues, public deliberation fails to influence policy and public issues, resulting only in a loud cacophony of politics. Democracy requires deliberation, and deliberation requires honesty (See van Eemeren, 2010). Since the idea of compromise is excluded from the choice of Japanese political decision-making, the government can function only when one party has the majority control. Then, the losing party is reduced to opposing only, and not working constructively. This lack of attitude toward working together for a best decision-making is the current situation in Japan and the United States. In what follows, we will first of all discuss the effectiveness of evasive language in political slogans to gain agreement from the public and next explore the way in which Prime Minister Abe's slogan style is quite successful in maintaining his second premiership.

2. EVASIVE LANGUAGE IN POLITICAL SLOGANS

One interesting aspect of Japanese political language is the deliberative use of words to influence the attitudes of other people surrounding individuals since Japanese are more sensitive to *kūki*, or atmosphere requiring compliance than messages such as clear and logical ideologies and principles (See Yamamoto, 1977). It often seeks to create a particular feeling like optimism, loyalty, cooperation, encouragement, or empathy to spur or guide public action related to specific public issues or policy programs. Rather than speaking up for the sake of the country, the Prime Minister or members of his cabinet perceive strategic advantage in using their clichés as masks, instead of as signs. These sound-bite slogans are collective headings for generating an atmosphere that is positive, sympathetic, and supportive of the cabinet (Macagno & Walton, 2014, pp. 16-18). In other words, the effective use of euphemisms, instead of direct expressions, enables the bureaucracy and the mass media to lead the national psyche toward their favorable policy directions. Omitting all details and specific features, these rallying phrases reflect the tone of the times as well as the administration's hopes and concerns.

Against such a traditional Japanese campaign rhetoric to repeat political slogans and avoid making concrete promises, the Democratic Party of Japan (DPJ) brought a new campaign tool modeled on the British-style *manifesto* concept of promises backed by clear financial resources and specific timetables. As a result, in the 2009 general election, the DPJ won a sweeping victory against the LDP-Kōmeitō ruling coalition. After the regime change, however, the DPJ administration could not keep a number of its key election promises because it needed a help from other parties to pass the measures they thought were necessary, thereby deeply disillusioning the country. The situation brought about an unfortunate outcome in which both voters and political parties lost their enthusiasm in the manifesto-based campaigns. This became apparent on 25th September 2017 when Abe abruptly dissolved the House of Representatives. Being criticized as an attempt at his own self-preservation, nevertheless, he restated a fresh mandate on his administration's North Korea policy along with its proposal to change the use of tax revenue.

In his second premiership, Abe maintains his leadership through the skillful use of political slogans. Nevertheless, this effectiveness is harmful for the country. In particular, the series of his slogans played a crucial role in turning the landslide wins in five key elections into

momentum not for the resurgence of Japan's 30-year stagnant economy, but for the adoption of his preferred nationalistic policies (See Osaki, 2017). In spite of affirming and reaffirming a national consensus that what Abe named *kaikaku* (reform) and *kakumei* (revolution) was needed for the economic recovery, Abe failed to ascertain the real issues in informing the country of what the consequences would be of such implementations for them. The administration indeed failed to disclose facts about the rapid graying and shrinking of Japan's population and its snowballing debt. When it came to policy decision-making, Abe took advantage of the election victories to heighten the level of surveillance and to take steps toward revising the Constitution. What follows offers three consequences of Abe's successful use of political slogans in calling a referendum for constitutional amendments.

At a critical time in both Japanese politics and economy, the 2017 election marked a fundamental departure from the postwar order in which the United States was the indispensable pillar of Asia-Pacific security. The collapse of the Democratic Party of Japan, disillusionment with a heroine Yuriko Koike, and dissatisfaction with Abe left many voters wondering for whom they should vote in the election. Trying to win the hearts of these voters just 24 days after the snap election, parties sought the simply-worded slogans displayed on campaign pledge brochures and other election materials—as if there were a fire sale on political slogans. The ruling LDP adopted the slogan *Kono-kuni o mamorinuku* (Resolutely defending this country). To promote the stability of the ruling coalition to convince voters, as the LDP's junior partner, Kōmeitō chose the tangible campaign slogan, *Kyōiku futan no keigen e* (Reducing the burden for education). Along with the catch-phrase *a reset for Japan*, the Party of Hope pushed the slogan *Nippon no kibō* (Hope for Japan) to stress the need for another regime change. The slogan of the Constitutional Democratic Party (CDP) was *Mattō-na seiji* (Honest politics), which sought to reflect public sentiments on two scandals concerning favoritism that involved Abe ("Editorial: Reactive debate," 2017, p. 4). In fact, those cronyism allegations put Abe on the defensive to dissolve the lower house in the guise of getting a fresh mandate on his administration's North Korea policy along with its proposal to change the use of tax revenue.

3. PRIME MINISTER SHINZO ABE'S CAMPAIGN STYLE IN THE 2012, 2013, 2014, 2016 AND 2017 ELECTIONS

Chosen to lead the conservative opposition LDP in early 2012, Shinzo Abe made its and his dramatic comeback by securing a two-thirds majority in the 480-seat lower house with its partner Kōmeitō on December 16, 2012. He said:

> Our victory this time does not mean trust in the LDP has been completely restored. . . . Rather, it was a decision by the public that they should put an end to the political stagnation and confusion over the past three years, caused by the DPJ's misguided political leadership (McCurry, 2012b).

Underlying his determination to reclaim the power the LDP had lost three years before, Abe reiterated the LDP's campaign slogan, *Nippon o torimodosu* (Take Japan back). During the two-week campaign, he advocated that "This is not just about winning Japan back from the DPJ-led government. If I dare say, it is a war to return Japan to the hands of its people" (Ito, 2012). Here was the critical question raised—which version of Japan was the LDP planning to restore.

Given that this political slogan sounded nostalgic for *Showa* era Japan (1926-1989), the victory brought to Abe, who was elected as the Prime Minister, a mandate to pursue a hawkish security agenda, i.e., a revision of the pacifist Constitution, and a revival of the party's traditional economic remedy, i.e., huge public works spending (Gelernter, 2016). In other words, the election result allowed him to dismiss Japan's looming fiscal crisis and swelling social security expenditures. Moreover, the public's unease over Chinese aggression and the

North Korean crisis allowed him to justify the increasing defense budget far beyond the conventional benchmark of one percent of Japan's GDP for strengthening Japan's sea-lane security. While heightening his nationalist credentials, however, he made it a priority to recover Japan's economy which had been stagnant for almost three decades: "First and foremost we have to bring about an economic recovery and pull Japan out of deflation" (McCurry, 2012a).

As a result of the LDP's victory in the 21st July 2013 election, the governing coalition came to secure the majorities in the both houses and thus raised hopes to end the political deadlock, namely, what came to be known as *nejire kokkai* (a twisted parliament) among Japanese people. On the news coverage at home and abroad, this comfortable victory was presented as a mandate for Abe to advance the third stage of his Abenomics policy programs, i.e., pushing deregulation following monetary easing and massive fiscal stimulus. In fact, he insisted "deregulation" as "the first and foremost core of the growth strategies," saying that "The extraordinary Diet session will be an occasion to push forward strategies on Japan's revival" (Hongo, 2013). While highlighting economic issues, he never hesitated to bring about his nationalist values. His administration was taking steps to pass the bill to enable Japan to engage in collective self-defense and to enact the state secret law, neither of which had been realized under the preceding cabinets. The region carefully watched these political moves to see when Abe would start his campaign to amend the postwar Constitution in order to turn the Japanese-called self-defense forces into a regular army. Against his remarks on China's "dangerous" maritime activities as an "extreme challenge" to Japan's territorial security and Japan's "no compromise, not even a step" on the territorial issue, Beijing accused Tokyo of playing the China threat card in an attempt to change Japan's pacifist foreign policy (McCurry, 2013).

In the name of seeking the voters' verdict on his economic policy programs, Prime Minister Abe called a snap election on 14th December 2014. The elections was expected to judge his growth-focused economic programs as he sought public support for his decision to postpone a raise in the consumption tax from 8 to 10 percent originally planned for October 2015 until April 2017. By doing so, he sought to focus the minds of the nation on the success or failure of his Abenomics policy to raise Japan's growth potential. Due to the lack of viable alternatives presented from powerful opposition parties, the LDP's campaign slogan, *Kono michi shikanai* (This is the only way), presented its economic package as the only choice to restore the country's economy. By winning the general election, he could also turn the tables on fiscal hawks in his own party who prioritized raising revenue to meet growing social welfare costs and start paying off Japan's huge public debt. To live up to the promises of making economics, Abe emphasized a rise in employment and growth in corporate revenues as proof that the Abenomics economic programs were succeeding. Nevertheless, no improvement was seen in the two key areas—neither in wages nor in domestic consumption—and not even in any positive impact on people's life.

In an election debate, Abe said that "I don't think there is a growing desire for constitutional change among the public," but added, "We have finally built a bridge that we can cross toward constitutional revision" (McCurry, 2014). Instead of calling for a constitutional amendment, which would be still controversial enough to risk losing public support, on 1st July 2014, he issued a cabinet resolution that would end a ban on collective self-defense by reinterpreting the Constitution, then making the best of the supermajority to vindicate it in the Diet (Okuda & Suzuki, 2018).

This cabinet decision to change the present interpretation of the Constitution was not only unconventional but also unusual because cabinet decisions had been associated with a law, not the Constitution. While legal experts raised severe criticism of the unconstitutionality of collective self-defense, Abe called for ambivalent popular sentiment on the ever-unchanged Constitution by emphasizing the "fact that he has been elected by the nation enables him to

change the interpretation of the Constitution by himself" ("Lawyer group," 2014). Here he transferred the issue of constitutionality from the legal context monopolized by professionals to the public sphere, which should function as a bridge of arguments among diverse groups of people (Goodnight, 1982). By infusing the public sphere with evasive discourse to simplify his standpoint concerning the national security, however, Abe failed to make the argumentative point to start discussing merits and demerits of constitutional revisions as a preliminary step from the dialectical point of view (van Eemeren, 2010).

By bypassing the process of forming public opinion and a national consensus, he pushed against the constitutional limits to lift the postwar ban on collective self-defense. While justifying this move by referring to potential military threats from China and North Korea and a relative decline in the U.S. presence in the region, he made deliberative use of political slogans in dismissing the due process to examine the constitutional reinterpretation in parliamentary debate. By the end of 2013, in the name of his *proactive pacifism* diplomacy, Abe had already justified for Japan to engage more actively in overseas conflicts. These defining actions in the areas of defense and freedom of information had not been mentioned either in the LDP's campaign promise in the 2012 election or in the 2013 election. Without seeking the voters' verdict on legislation, the Abe administration merely reiterated that Japan needs tighter control of its security information. Its dominant grip on the Diet played into the hands of Prime Minister Abe to legally implement these policy programs and to pursue closer defense cooperation with its foremost ally, the United States. On the whole, he focused and refocused on the economy as a smoke screen to deflect public criticism of the way in which his cabinet railroaded the controversial legislation through the Diet.

During the 2016 election campaign, Abe made a posture of setting the policy focus back to the bread and butter issues of the economy. Nevertheless, on 10th July 2016, he claimed that its election result opened the door for his administration to revise the Constitution. He even stated: "This is the people's voice letting us firmly move forward" (Blair, 2016). Just like the preceding three elections, he made economy the center of his campaigning, asking voters for a mandate to continue his attempts to pull Japan out of decades of stagnation, deliberately downplaying talk of constitutional revision. For many conservatives in the LDP, the Constitution is a symbol of a defeated nation, and the fact that it was drafted by the occupying U.S. administration was a source of shame. Just around this time, the Abe cabinet's arrogance and laxity came to the fore through the emergence of scandals concerning the government's alleged connections with two educational foundations. Abe and the relevant cabinet ministers gave sloppy explanations, thereby raising strong criticism that they were conceited ("Editorial: Govt Must Respond," 2017, p. 4). While emphasizing he would accept critical comments with sincerity, Abe began to seek a way to break the stalemate and to regain power for implementing his policies.

As a result of the latest 2017 general election victory, Abe sought to consolidate his grip on power so as to revise the charter, which had remained untouched for 70 years. At a news conference accepting the landslide victory, he announced that "I am very grateful that the Japanese public has powerfully encouraged us to move forward with our politics based on the solid foundation of our leadership" (Osaki, 2017). What was the rational for Abe to hold this election fourteen months earlier than necessary? On 25th September 2017, when the Diet convened for an extraordinary session, he announced that he dissolved the lower house for a snap election: "We are indeed facing a national crisis and we need strong leadership to face the national challenges. … It is my responsibility as prime minister of Japan to overcome this, no matter how tough this election will be" (Lloyd, 2017, p. 35). At a news conference that evening, he specified the "national crises" as the rapid demographic shrinkage and the North Korean provocations, saying: "It is my mission as prime minister to exert strong leadership abilities at a time when Japan faces national crises stemming from the shrinking demographic and North

Korea's escalating tensions" (Osaki & Yoshida, 2017). In terms of crisis management for the country, his rhetoric of confrontation strengthened the impression that he would be the only man who could deal with *kokunan* (national crisis). In the meantime, Abe could distract voters from the two scandals over alleged government favoritism ("Abe's partisan quest," 2017).

In associating the proposal to divert revenue from the planned 2019 consumption tax increase with the menace of North Korea, Abe's new spending announcement left the root problems untouched—a huge debt burden of one quadrillion yen as well as ballooning social security costs for pensions, health care, and nursing care. In addition, this was likely to increase public concern over the country's long-term fiscal sustainability. To appease the public, instead of indicating Japan's fundamental issues, Abe brought back his Abenomics policy whose original goal was to end the deflation by generating the hoped-for virtuous cycle of rising incomes. By dissolving the lower house while the opposition parties remained unprepared, he attempted to derail the accusations of his involvement in the political scandals. In other words, the general election on the national crisis created by the looming missile threat was driven by the political calculation to maximize the wins for the ruling coalition, i.e., a high-stakes political gamble to determine whether or not Abe would survive as the national leader. During the election campaign, the opposition DPJ collapsed, and the spin-off Party of Hope led by Tokyo Governor Yuriko Koike failed to gain momentum. Abe's decision to gamble on an election paid off handsomely.

Making use of the North Korea crisis as an opportunity to rewrite the pacifist Constitution in hopes to spell out the military role of the country's SDF, Abe turned a blind eye to serious policy matters that would require the public to shoulder a greater burden by promising to spend around two trillion yen of the extra revenue on his new education and social security programs. Whenever North Korea launched a ballistic missile and carried out a nuclear test, he addressed a frightened nation on national television that he "was prepared to take all measures to protect people's life" (Holtz, 2017). The more threatening North Korea became, the more his hawkish worldview, including his move toward Japan's militarization, seemed to make sense to the country. Requesting an urgent meeting of the United Nations (UN) Security Council, Abe "lodged a firm protest" to Pyongyang (Holtz, 2017). In the *New York Times* op-ed prior to the snap election, as the Prime Minister of Japan, he also promoted Japan's diplomatic policy in asking "the entire international community" to hold out "concerted pressure" against "an unprecedented, grave and imminent threat from North Korea" (Abe, 2017, p. 23). Furthermore, Abe stressed the shared strategy with the U.S. President Donald Trump of maximizing international pressures on North Korea: "prioritizing diplomacy and emphasizing the importance of dialogue will not work with North Korea" (Abe, 2017, p. 23). Later, calling for the country to endorse his leadership, he restated that "Dialogue for dialogue's sake is meaningless. Attempts at engagement have been used by North Korea to buy time. Having secured the trust of the people, I will push for more strong diplomacy" (Lloyd 2017, p. 35). While public support for his uncompromising stance on North Korea rose, his popularity remained low.

As the election result suggested, the North Korea threat helped set the stage for Abe's political rebound. His hawkishness apparently became vindicated by North Korea's belligerence. In addition to North Korea crisis, chaos in the opposition camp brought about Abe's huge election victory. The opposition vote split helped Abe's ruling bloc and its allies win the critical two-thirds supermajority needed to call the referendum. Moreover, with only 53% voter participation (the second-lowest turnout in history) it is questionable whether the result can be considered a real endorsement of the ruling coalition. The low voter turnout suggested not the approval of Abe's leadership, but the lack of a credible opposition offering an alternative to his nationalistic policies, and even deepening a sense of political apathy. Nonetheless, as calls for changes to the Constitution gained ground at the House of

Representatives, nearly 80% of lawmakers newly elected in this election were in favor of revising the Constitution. This contrast between the representatives and the lower turnout showed that the gap kept widening between the country's politics and the people's preferences. On the whole, the current Japanese political system failed to show what was at stake in the 2017 general election but led to raising a more muscular Japanese foreign policy at home and abroad.

4. CONSEQUENCIES

Japanese cabinets have a long history of using catch-phrases to spread specific ideas among the public, which reflect the concerns that dominated the nation's thoughts at a given time. Whether or not each cabinet indeed delivered the virtues expressed in its political slogan is another question. The important point is that Prime Ministers and other senior politicians use words as a means of giving rise to public support for their policies. Since his comeback in office, Shinzo Abe has put forth slogans like *chihō-saisei* (regional vitalization), *ichi-oku sō-katsuyaku shakai* (creation of a society involving dynamic engagement by all citizens), *hataraki-kata kaikaku* (work style reforms), and *jinzai kaihatsu kakumei* (a revolution in human resources development) without any specific policy programs. As if his deeds were done in words, he has never provided any substantial measures to improve the quality of people's lives, but merely reiterated these catch-phrases. Thus, whenever his policy labels changed, public opinion surveys demonstrated that a few respondents answered that "the prime minister cannot be trusted" ("Editorial: Can the long-running," 2017, p. 4).

First, the Abe administration shifted its emphasis to one new political catch-phrase after another without implementing any of its political agendas. In a political landscape in which the LDP reigned as the predominant force confronted by many weak opposition parties, the opposition lawmakers pointed only to the Abe cabinet's failure to explicate its plans. In a 22nd January 2016 policy speech, the Prime Minister called for *dōitsu-chingin dōitsu-rōdō* (equal pay for equal work) as if he pledged to correct the wage gap between regular and non-regular workers including part-timers, contract workers and temporary staff dispatched by personnel agencies. Raising questions on his definition of equal pay for jobs with identical conditions, Akira Nagatsuma, at that time a member of the DPJ, asked Abe to "submit a bill. Otherwise, it's only a slogan, which is very bad" (Yoshida, 2016). Nagatsuma pointed out that the cabinet overlooked a work value assessment system for different categories to implement the appealing policy. Moreover, after two years had passed, the *regional revitalization* policy appeared to be sidelined from the cabinet's main political agenda. By taking into consideration the population flow from rural parts of the country to big cities, in particular to the Tokyo area, the cabinet should have designed comprehensive strategies to reverse the population exodus by promoting local industries and tourism. Without keeping any of his campaign promises, at the news conference in June 2017, Abe announced another new policy, *jinzai kaihatsu kakumei* (human resources development revolution), in order "to change Japan into a country full of chances" ("Abe's HR," 2017). Despite the new agenda pillar which highlights the crucial role of education in creating a community spirit, the phrase *human resources* uncovers that the administration viewed people as mere resources to be useful in the business-minded perspective. Instead of spelling out new policy slogans, Abe should have secured the measures needed to carry out his policy programs.

Second, in 2017, compared to the histrionic elections in several Western democracies where anti-establishment forces gained momentum with the support of disillusioned voters, the result of Japan's snap election turned out to be inconsequential, except for the prospect of a militarized Japan (Osaki, 2017a). By saying that it is "imperative to alter the situation in which the Self-Defense Forces are dismissed as unconstitutional in my generation" ("Inside," 2017),

Abe sought to end the balancing act by adding language to Article 9 to clarify the legal standing of the SDF. On the seventieth anniversary of the pacifist Constitution, he made a surprise announcement that he had set a 2020 deadline for constitutional reform. Since then, nonetheless, he has emphasized the controversial timeline is not schedule-oriented (Osaki, 2017b). Instead of curing Japan's 30-year stagnant economy, he openly pushed a path toward revising the Constitution. It is difficult to predict what the consequences would be at the moment. Concerning the North Korea issue, however, any constitutional amendment would give a major shock to the region's military and political system.

Finally, Tokyo's move to *reinterpret* Japan's postwar pacifism will end up inflaming nationalist sentiment and even spark an arms race in the region. Any weakening of Japan's pacifist principle is expected to anger China and South Korea, where many Asian people still retain bitter memories of Japan's militarism in the first half of the twentieth century (Fifield, 2017, p. A11). At home, some Japanese began expressing fear that *normalizing* the country's armed forces will lead to their direct involvement in the U.S.-led war on terrorism. Despite the LDP's decisive victory in holding on to 313 out of 465 seats in the House of Representatives, a huge gap exists between public opinion on key issues and the distribution of seats in the Diet (Yoshida, 2017). With a low turnout, a non-critical performance assessment of the ruling coalition does not mean that the premier has a real mandate for constitutional amendments. The weakness of the opposition, especially the unexpected demise of the major opposition DPJ, might mask discontent with Abe and a lack of support for many of his nationalistic political agendas. Therefore, a loss of counterbalance might entail the critical question of what is indeed needed for public deliberation to pursue a broader agreement and to build a national consensus.

Every campaign, Abe reiterated his pledge to reviving Japan's stagnant economy by centering on the Abenomics economic package. Over five years, however, the country has fallen short of the defeat of deflation and the fulfillment of a new inflation target of 2%. In spite of upholding the banner of fiscal reconstruction, the Prime Minister addressed neither Japan's economic problems derived from his government's stimulus policy programs nor critical but unpopular reforms intended to recover the country's economy. Instead, by making political use of populist factors, he succeeded in making up for the plunge of his approval ratings. As a result, while mainstream political parties fell because of populist revolt in Western countries, Japan's political stability stands out. The voters under twenty seemed to have chosen to carry on with business as usual, perceiving Prime Minister Abe as continuity and stability since he was in power close to the longest premiership in the postwar era. Indeed, a higher proportion of those younger electorates, 47. 2% in the teens (and 42.1% in the twenties), turned out to be supportive for the LDP than their elder counterparts, e.g., 28.3% in the sixties ("Tokushu waido," 2017, p. 2). Confounding conventional wisdom that younger voters lean liberal, Japan under the Abe administration was an exception in a tide of Trumpian-inspired global populism against the establishment (Blair, 2017, p. A3). It seemed to be apparent that the LDP could capitalize on these voters' desire for sustainability. On the one hand, turning that into support for revising the pacifist Constitution would be a considerable leap (Holtz, 2017). On the other hand, as the Western media noted, the result of this Japanese election was a first, big step to erode Japan's post-World War II commitment to pacifism. As lower turnout in elections demonstrates growing apathy, the rise of populism might be having a dramatic impact on Japan's policy making as well as Europe and the United States.

A meta-argumentative approach to abduction and IBE

PAULA OLMOS

paula.olmos@uam.es

ABSTRACT: Abductive arguments support a statement as offering some conceivable explanation to shared data, what reveals their meta-explanatory nature. When the context allows for the advancement of different explanatory hypothesis and the agents assume the necessity to choose one among them as the "best available explanation", a complex argumentative process starts, involving the comparative assessment and weighing of the first arguments and requiring further arguments and meta-arguments in support of the favoured hypothesis.

KEYWORDS: abduction, explanation, inference to the best explanation, meta-argument, Toulmin's model

1. INTRODUCTION

Abductive arguments, in which a factual or theoretical statement –typically mentioning either unobservable or merely unobserved entities, properties and processes– is defended as offering some conceivable explanation to shared data, are common in everyday life and, in a particularly intriguing way, also in scientific practice. These are arguments that support an "explanatory hypothesis" precisely on the basis of its *explanatory power* as related to certain data. When advanced, they might be critically assessed by the arguer's interlocutors and this usually brings to light their complex nature as meta-explanatory arguments; explaining being a practice of "giving reasons" with pragmatic properties that differ from those of arguing. In this paper, I will present and defend a meta-explanatory scheme for abduction according to this approach.

Moreover, when the context of inquiry allows for the advancement of different and alternative explanatory hypothesis and the agents involved in the particular situation assume the necessity (or the institutional requirement) to choose one among them as the "best *available* explanation", a rather more complex justificatory process starts. This typically involves the comparative assessment of the first arguments advanced and usually requires further arguments and meta-arguments in support of the favored hypothesis, not necessarily of an abductive character.

The rather abstract, monological and zealously formal version of such processes that is common in epistemological al discussions has been labelled "inference to the best explanation" (IBE). Logical schemes for IBE usually include premises of the kind: "no other hypothesis explains evidence e as well as H does", "H satisfies conditions $s_1 \ldots s_n$ that other hypothesis don't", "there are no other explanatory hypothesis", but no clue is offered as to where those premises come from or how they might be supported. Here, a more organic and dialogical argumentative version of such processes will be offered describing tools grounded in argumentation theory to clarify their rather varied nature.

Argumentative accounts of abduction have not been so far as frequent as could be expected. This much is admitted by J. Wagemans, who has recently published some papers on abduction using a pragma-dialectical framework (2016, 98). Probably the most extensive treatment from the ranks of argumentation scholars is due to D. Walton who, in 2004,

published the monographic work *Abductive reasoning*. The book contributed with some interesting ideas, as a proposed *dialogical model of explanation* (2004, 79ss, Cf. Paglieri 2004), but builds on somewhat confusing starting points.

In particular, I would say that Walton's account does not clearly trace or at least clearly exploit three distinctions that are the basis of my own argumentative proposal:

a) the discrimination between *mental* processes of reasoning and *communicative* processes of arguing;
b) a more careful distinction between the communicative acts of *explaining* and *arguing* and
c) an analysis of simple abduction as a *distinctive* argumentation scheme based on a characteristic kind of reason-for-a-conclusion –and, thus, a characteristic kind of *warrant* in S. Toulmin's (1958) sense– as opposed to the more complex argumentative process that's usually dubbed IBE and which, according to this framework, purports the use of varied *argumentative* and *counterargumentative* both *schemes* and *structures*.

I will develop and support separately the two first distinctions (sections 2 and 3) and use them in construing a meta-explanatory scheme for abduction (section 4) that will allow me to differentiate my *organic* and *meta-argumentative* account of IBE in terms of a variety of tools for argument analysis (section 5).

2. ABDUCTIVE REASONING VS. ABDUCTIVE ARGUMENT

Regarding distinction a), although there are in fact communicative uses of the term *reasoning* (e.g. "interpersonal reasoning"), the distinction is widely admitted and advocated as significant in philosophical literature, especially within the field of argumentation studies. However, at least in my opinion, it has not been so far conveniently and fruitfully explored in the explication of concrete problems.

I take the distinction between *mental* reasoning and *communicative* arguing to constitute a step further along the line of J. Woods' (2016a) discrimination between:

i) the consequences a group of premises may *have* within a *logical space*, for whose delimitation, there is no need to count on the involvement of any agent: "There are no heads in logical space" (Woods 2016a);
ii) the consequences that *someone* may, within her own *psychological space*, first *identify* or *spot* (in a *recognition subspace*) and then *draw* or *infer* (in an *inference subspace*).[1]

Psychological space is not only different from logical space but Woods claims that the latter does not provide the normative counterpart for the former. But, unlike Woods, who explicitly dismisses this possibility, here it is claimed that an exploration and better understanding of the distinctively *public space* of *arguing* has much to offer both from a descriptive and a normative point of view. In such public, communicative and interactive space we may talk about:

---

[1] Because of the essential connection between this kind of recognised and inferred consequences and the *agents* that actually *perform* the recognition and inference, the relations on which they are based are called "*epistemic relations*".

iii)   the (also epistemic and agent-related) consequences that *someone* may *present to others* as justified by considerations adduced in the same communicative context as reasons in its favour.

In the case of abduction, the idea of this move is basically switching the current emphasis on accounting for how *individuals* mentally make use of more or less *intuitive* constrictions when suggesting *plausible* –and more or less *creative*– explanatory hypotheses to the interactive *interpersonal* space of collective discussion from which (I claim) such internalized constrictions really emerge.

This idea agrees with recent cognitive approaches of a pragmatist descent like Mercier and Sperber's "argumentative theory of reasoning" (2011, 2017). Focusing on communicative argument over mental reasoning favours attention to the socialized processes through which we learn to recognise and use conventional argumentative patterns and emphasizes the intrinsic normative nature (from an insider's point of view) of the practices of asking for, giving and assessing reason(s).

If we approach abduction starting from its communicative counterpart, offered in a dialogical justificatory exchange, instead of referring to its mental model, we may transfer *all* additional requirements made to our justificatory claims to the *continuity* of argumentation and argumentative interactive assessment, i.e. to the "continuum between argument and argument criticism", mentioned by R. Pinto (2001). Thus, we may avoid somewhat obscure notions as C.S. Peirce's "intuitive flash", "insight" (*CP* 5.173), "power of guessing right" (*CP* 6.530) as sources for abductive conclusions and examine, instead the *substantive* (as oppose to *formal*) criteria for argument assessment that the context and particular argumentative practice involved would have construed.

Finally –although Woods' account of defeasible and *nonmonotonic* relations of consequence and their virtuous *fragility* (Woods 2016a) does, in my opinion, already do the job pretty well– I think it is still important to emphasize the *substantive* and *ampliative* character of *any argument* worth discussing, as based on reasons and warrants and not on *formal* relations of implication, which only hold when the conclusion's contents are already *included* in the premises. In the case of abduction, which has been considered by many as *the* paradigm of *creative* and *ampliative* reasoning –something that puzzles and bewilders logicians and becomes a source of *fascination* for many in philosophy and cognitive science– the move towards the *public exposure* of the rational[2] criteria used for its acceptance, rejection, discussion or limitation might be especially beneficial.

Therefore, our focus will be on abductive argument and not on abductive reasoning, acknowledging nevertheless that the link between both might worth examining in further research. Presenting an abductive argument is to support an in principle theoretical or factual claim (typically mentioning either unobservable or merely unobserved entities, properties and processes) on the basis of shared data (observable, well-known, taken for granted or assumed) because it provides some conceivable explanation to them. The basic elements of an abductive argument, using Toulmin's model are:

---

[2] J. Searle (2001, chap. 3) characterizes *rationality* as the conscious exercise of giving and conceding reasons that precisely takes place in the presence of *gaps* and the absence of *algorithms* or necessary links between contents. The defeasible and nonmotnotonic character of the relations of consequence exploited in argument (i.e. their *fragility*, in Woods' terms), the possibility of keeping asking for reasons that may reinforce or clarify proposed links or even show alternative ways of supporting discussed claims, the lack of compulsion to *accept* or *enact* argumentatively supported conclusions (i.e. *akrasia*) constitute the kinds of *gaps* that, for Searle, are rather *possibility conditions* of *rationality* instead of philosophical problems for its explication.

1. Conclusion/Claim: constitutes an "explanatory hypothesis" H, usually presented as a factual statement, although, depending on the requirements of the context it may be easily reinterpreted as a practical or even evaluative conclusion of the kind: "we should explore hypothesis H", "Hypothesis H is worth exploring".

2. Reasons/Data: usually empirical observable but in any case *shared* or *agreed upon* data, and nevertheless surprising data, data *requiring explanation* (what makes of them a potential *explanandum*). However this preparatory condition might be contested.

3. Warrant: what makes of the data a justificatory reason for the conclusion (the hypothesis) is that such hypothesis could *explain* them.

I will use the following kind of diagram tipo (based on Toulmin and developed by Marraud 2017a) to represent such an argument type:

	Data: Shared (usually empirical) data
Warrant: Hypothesis could explain data	**So**
	Claim: Hypothesis
Taking in account that abductive arguing is (as is abductive *reasoning* and *inferring*, precisely for that matter) firmly and extensively incorporated in our daily cognitive life, the move from data (D) to hypothesis (H) is in most occasions rather *directly* expressed and communicated, as in the following example:

- *There is no yoghourt left in the fridge, so you finally had the last one for dinner*

If the interlocutor would ask "why do you say so?" or "where do you get that from?" we could in principle think that she has not understood the proposed connection and answer by making the warrant explicit:

- *Well, that would surely explain it…*

In the case of abductive arguments (and this does not necessarily happen with any kind of argument) this seems somewhat artificial, *precisely* because of their pervasiveness and basic nature. The usual thing is to automatically *recognize* the proposed link (the way the data may constitute a reason for the conclusion) and go directly to critical assessment in the form of objections, rebuttals or refutations (Marraud 2017b):

[Objection]: - *Look again, I think there's one left…* (data were not shared, after all).
[Rebuttal]: - *But there were 10 yoghourts yesterday…* (that I took one for dinner does not explain that there's none left).
[Refutation]: - *I can think of other possible explanations…* (we'll have to compare them, look for the best (available) one).

3. ARGUING VS. EXPLAINING

Regarding distinction b) between acts of arguing and acts of explaining, I admit that it is, in principle, better established and widely recognized in argumentation theory.

a) *Acts of arguing* involve offering reasons in order to *justify* a doubtful (in the sense of *yet unjustified*) content, i.e. its conclusion, seeking the interlocutor's (or wider audience's) *persuasion* about its correctness.

b) *Acts of explaining* also involve offering reasons but this time in order to make an *already accepted* content, the *explanandum*, comprehensible, seeking the interlocutor's *understanding* about its (causal) origin, its relation with other phenomena, or its overall congruity and dispelling wonder or surprise regarding it.

According to this characterization, explaining and arguing would be structurally similar –in both cases reasons are given as related to a content– and pragmatically different –the status of that content and the pragmatic aims of the two activities are different (Cf. Marraud 2013, p. 24-26). This structural similarity allows us to build a *model of explanation* that mirrors Toulmin's *model of argument* (Toulmin 1958). As we have already expressed and exploited, in Toulmin's model of argument the reasons for a *claim* (identified as the particular case's *data*) are presented as reasons precisely *since* complying with the requirements of a certain inference license or principle –the argument's *warrant*. Likewise, in our proposed *Toulminian model of explanation*, the explanatory power of the reasons offered in the *explanans* is grounded upon certain idea or principle of what counts as explanatory in the context in which the explanation is presented. The kind of diagram used to represent explanations will be:

|	*Explanans*
Explanatory principle:	**That's why**
	Explanandum
In the case of abduction, Walton (2004, chap. 3, pp. 97-121), does indeed acknowledge this distinction offering first a dialogical model of explanation (pp. 79ss) and then a second dialogue model (pp. 240-243) that portrays an interactive justificatory process of the best explanatory hypothesis which he considers as equivalent to abduction. The distinction is also present in the work of philosophers who discuss kinds of reasons (Álvarez 2010).

However, the intrinsic connection of this two different acts that is characteristic of abduction, a kind of justificatory argument in which what's justified is precisely an explanatory hypothesis and more precisely for its explanatory power, forces us to be extra careful in this case, when modelling and understanding abduction. The analysis offered in this paper of abduction (of simple abduction) as an argumentative meta-explanatory scheme tries to cope with this difficulty.

4. A META-EXPLANATORY MODEL OF ABDUCTION

Our Toulminian scheme for abduction identifies as the abductive arguments' warrant the possibility of construing an explanation of the data taken as *explanandum* based on the hypothesis used as *explanans*. So, if the basic diagram for an abductive argument is:

	Data: Shared (usually empirical) data
Warrant: Hypothesis could explain data	**So**
	Claim: Hypothesis

we may construe an "expanded diagram" including the details of the related explanation –an explanation that is not exactly *given* in the argumentative act but just, *mentioned* or *alluded to* as what makes of the empirical data a justificatory reason for the (theoretical) hypothesis– thus:

		Empirical data	
	Hypothesis		
In virtue of explanatory principle/ideal X:	**That's why**	**So**	
	Data		
		Explanatory hypothesis	

Notice that this does not constitute an *act of explaining* but an *act of arguing* that urges the discussion of its conclusion. In any case, this expanded, explicitly *meta-explanatory* diagram may help us locate and identify different possible targets of the issuing assessing discussion urged by an abductive proposal.

Presenting an abductive argument means, thus, to offer a justifying reason for a hypothesis (which is a doubtful content, what is at stake) adducing the *factive* quality of the data, for which the hypothesis is deemed to be *explanatory*. This means that it is suggested that the hypothesis could be used (in a different act and setting, allegedly once accepted) as an *explanans* or *explanatory reason* for the acknowledged data.

5. ABDUCTION VS. IBE

A *simple abductive argument* is completely described as such. It constitutes a characteristic type of argument, using a characteristic kind of reason (what means a characteristic kind of warrant). However, *as any other argument*, it is liable to a subsequent discussion in which further clarifications, further justificatory reasons and requirements may be demanded (…or not, depending on the context) to improve the epistemic status or acceptability of its conclusion, *if and only to the extent that this is our goal* (characteristically in Science, for example).

Typically, when the context allows for the proposal of *different* explanatory hypothesis and the agents involved in the particular situation assume the necessity or the institutional requirement to choose one among them as the "best (available) explanation", a complex justificatory process starts. This usually involves the comparative assessment of the first arguments advanced in favor of each hypothesis (some of them, although this is not a necessary condition, possibly abductive) and usually requiring further arguments and meta-arguments in support of the final conclusion (i.e. the chosen hypothesis).

This brings us back to distinction c) of the three mentioned in the Introduction. It is easy to see how the also argumentative but much more complex process of comparison, weighing and selection of the best available one among several explanatory hypothesis departs from and cannot be squeezed into our proposed model. In the divide established in philosophical literature between those who assimilate abduction to IBE (Walton 2004, Douven 2017) and those who maintain the distinction (Magnani 2001, Iranzo 2007, Yu & Zenker 2017), I definitely side with the latter, although I contend that universal and formal models of IBE say really not much about the way *IBE-type* discussions are conducted.

I further claim that at least certain strands in argumentation theory offer us, instead, a number of analytic tools that may help us model (and better understand) such concrete *IBE-type* discussions: i.e. argumentative processes of justification of the best available explanation. The idea is to reconstruct the (*very varied*) ways some typical clauses appearing in certain (*allegedly universal*) models of the kind "H1 explains data better that the other available hypotheses" or "H1 complies with criteria S1…Sn" in turn come to be justified. These tools include the modelling of argumentative structures that reflect interargumentative

and meta-argumentative relations, of which the most complex and sophisticated account for the comparative weighing or hefting of reasons, which is typical of such kind of discussions.[3]

6. ARGUMENTATIVE ANALYSIS OF AN EXAMPLE OF IBE

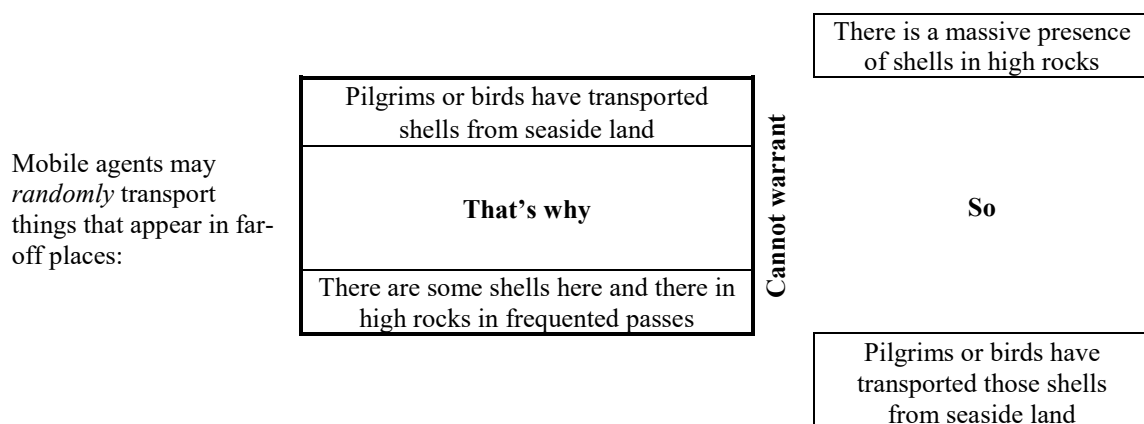
The following paragraph appears in John Herschel's *Preliminary discourse on the study of natural philosophy* (1831: 144-145). It is a discussion, presented by a single author, regarding the reasons that favor one of the explanations given for a certain phenomenon as the best among them, in scientific terms. It is easy to see that the presentation reconstructs a discussion that has taken place for many years among natural philosophers and (*lately*) geologists.

I have divided it into five parts in order to refer to them in the subsequent (just outlined) analysis.[4]

> **[Part 1.]** The phenomenon of shells found in rocks, at a great height above the sea, has been attributed to several causes. **[Part 2.]** By some it has been ascribed to a plastic virtue in the soil; by some, to fermentation; by some, to the influence of the celestial bodies; by some, to the casual passage of pilgrims with their scallops; by some, to birds feeding on shell-fish; and by all modern geologists, with one consent, to the life and death of real mollusca at the bottom of the sea, and a subsequent alteration of the relative level of the land and sea. **[Part 3.]** Of these, the plastic virtue and celestial influence belong to the class of figments of fancy. **[Part 4.]** Causal transport by pilgrims is a real cause, and might count for a few shells here and there dropped on frequented passes, but is not extensive enough for the purpose of explanation. **[Part 5.]** Fermentation, generally, is a real cause, so far as that there *is such a thing*; but it is not a real cause of the production of a shell in a rock, since no such thing was ever witnessed as one of its effects, and rocks and stones do not ferment. On the other hand, for a shell-fish dying at the bottom of the sea to leave his shell in the mud, where it becomes silted over and imbedded, happens daily; and the elevation of the bottom of the sea to become dry land has really been witnessed so often, and on such a scale, as to qualify it for a *vera causa* available in sound philosophy.

In Part 1 we have the opening of the discussion, identifying the phenomenon as an *explanandum*, that is, something that has been considered for long a puzzling fact in need of explanation and for whose understanding a variety of *explanantia* have been considered. Part 2 includes the list of available explanations:
H1: soil's plastic virtue;
H2: fermentation of soil;
H3: celestial influence;
H4: pilgrims passage and dropping;
H5: birds transport;
H6: life and death of real *mollusca* plus sea bottom alteration.

Part 2 also offers the first comparative weighing of them based on authority.

Part 3 expresses an argument against H1 and H3. We may consider that both hypothesis have been offered and supported on the basis of their explanatory power, that is, through their presentation as conclusions of abductive arguments, thus:


---

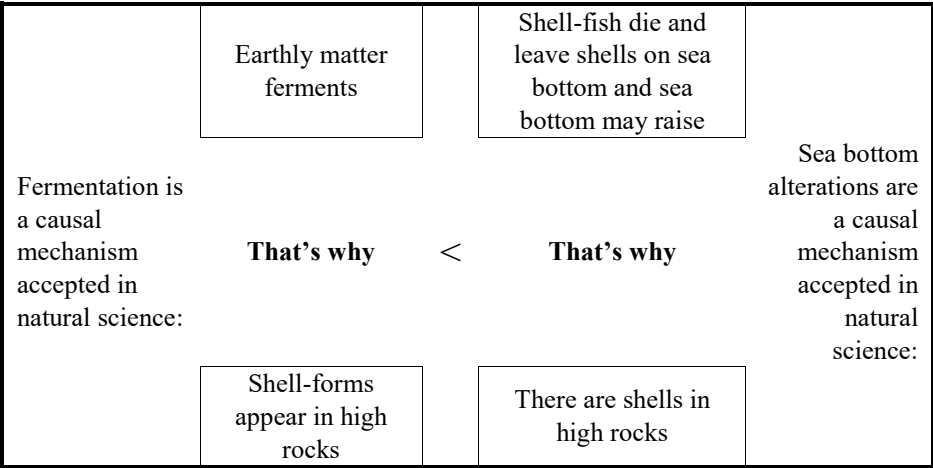
[3] A corollary of my approach is that IBE is neither a *characteristic* type of inference, nor a stereotyped argumentative sequence, so the label IBE should be rejected.

[4] A rather more complete analysis of this same example will shortly appear in Spanish (Olmos, forthcoming).

The first diagram (argument structure):

	Soil has acquired such forms due to its plastic virtue / Heavenly bodies have produced such forms	There are shells in high rocks
Plastic *virtue* may mold matter / Heavenly bodies have a direct *designing* influence in the sublunary world:	**That's why**	**So**
	There are shells in high rocks	Soil has acquired such forms by its plastic virtue / Heavenly bodies have produced such forms

Then, what we have here in a counter-argument in the form of a rebuttal of their associated explanations, that is, an attack to the "explanatory principles" warranting them. The counterargument is not very developed but characterizes such principles as "figments of fancy" and so *unacceptable* in scientific explanations.[5]

Part 4 contains an attack against H4 that also applies to H5. However, this time the problem is not the unacceptable character of the explanatory principles that indirectly support them, explicitly designated as "real causes" or *verae causae*. It is rather the random, unsystematic, character of the mechanism invoked that makes of it unsuitable for the explanation of persistent and extensive phenomena. Such mechanisms could explain the apparition of "some shells here and there in high rocks in frequented passes" but not the massive and widespread presence of shells in high places. We have, thus, a plausible, even scientifically acceptable, explanation that cannot warrant a proposed abductive argument:


The second diagram (argument structure):

	Pilgrims or birds have transported shells from seaside land		There is a massive presence of shells in high rocks
Mobile agents may *randomly* transport things that appear in far-off places:	**That's why**	**Cannot warrant**	**So**
	There are some shells here and there in high rocks in frequented passes		Pilgrims or birds have transported those shells from seaside land

Finally, Part 5 contains the comparative and reasoned weighing −i.e. a reason is offered for the comparative judgment whose warrant might be easily reconstructed− of the abductive arguments supporting H2 and H6. This kind of evaluative comparison of two abductive arguments is equivalent to the weighing of their associated explanations, thus:

---

[5] Contemporary philosophical discussions on the notion of "mechanism" as what may be the basis of a scientific explanation (Glennan & Illari, eds. 2016; Ioannidis & Psillos, 2017) are the updated version of Herschel's discussion of what constitutes a *vera causa*. These discussions look for criteria for (and so reasons to support) scientifically acceptable explanatory principles.

A *vera causa* with independent empirical support should be preferred:

> Fermentation has never been observed to produce such kind of forms. Sea bottom alterations and shell deposits on sea bottoms have been extensively observed

So

	Earthly matter ferments	Shell-fish die and leave shells on sea bottom and sea bottom may raise	
Fermentation is a causal mechanism accepted in natural science:	**That's why** $<$ **That's why**		Sea bottom alterations are a causal mechanism accepted in natural science:
	Shell-forms appear in high rocks	There are shells in high rocks	

As we have seen, not all advanced hypotheses are weighed against each other in this manner, for this is an argumentatively (and cognitively) costly procedure. Some are rejected by means of direct couterarguments that only affect them. Argumentative weighing is reserved for those that initially pass muster. In this case, just two of the available ones, although it could be much more complicated.

6. CONCLUSION

This is only a rather simple example and it has nevertheless showed a certain argumentative complexity, requiring form us the use of a complete toolbox of flexible notions for argument analysis. The moral we want to draw is that the argumentatively interesting part of *IBE-type* discussions –that is, the way typical clauses as "H1 explains data better that the other available hypotheses" or "H1 complies with criteria S1…Sn" are made acceptable– cannot be abstractly and universally sequenced. The comparative selection and defence of the *best available explanation* in a particular epistemic context and within a particular justificatory practice is a *dialectical* process, not necessarily in the sense that it involves two or more parties but in the sense that it involves the opposition of arguments and the comparative weighing of their relative strength (Cf. Marraud 2010).

Even in a case where this process is summarized and presented by a single author (as in the example above), it is representing and accounting for a long diachronic and usually collective discussion in which very different kinds of reasons and very different combinations of arguments and argument balance may appear. In order to understand such varied processes, the best strategy is not, I claim, to keep adding summary premises to a basic abductive scheme until it is deemed sufficiently *invulnerable*, but, on the contrary, to account for the way counter-argumentative structures and comparative assessment work, making explicit the intersubjective basis of justification.

Student responses to the immigration stalemate in the USA

EDWARD PANETTA

University of Georgia
United States of America
epanetta@uga.edu

ABSTRACT: For two decades, Americans have debated whether to liberalize laws that drive undocumented students underground. In 2014, President Obama signed the Deferred Action for Childhood Arrivals Act. This temporary Executive Order confirmed that students should be afforded the opportunity to an education. This paper describes the ways in which undocumented students network with Civil Rights movement veterans to nurture a political movement to permanently secure a right to higher education in the United States.

KEYWORDS: argument networks, civil rights, immigration policy, postsecondary education, public argument

1. INTRODUCTION

Laws and regulations enacted in a number of states in the US have restricted the access of undocumented students to public college admission, reduced in-state tuition rates, and scholarship opportunities. The old segregated South is home to the harshest educational restrictions, which are often part of larger legislative packages of laws to control the behaviors of the entire undocumented population. Dating back to the implementation of the first restrictions, human rights advocates have drawn the comparison between the pre-Civil Rights Act South and the contemporary Anti-Immigration South. As an example, in 2010 the Georgia prohibited students from attending the most competitive public colleges and stripped undocumented students of the right to pay in-state tuition at any of the thirty-four public colleges in the state. A 2017 Georgia law denies state-funded scholarship and research support to any private college that declares itself a sanctuary campus and enrolled undocumented students.

While many immigrants have fled their communities due to restrictive legislation and an increasingly hostile political climate, immigrant youth in Georgia and other southern states have stayed to fight for their rights. They engage in effective public protests and stand in public to stake their claim to a college education.

When pressing their case, undocumented students have networked with affiliate groups in Georgia and beyond. The rhetoric of the students highlights ties to leaders of the 1960s Civil Rights movement, including US Representative John Lewis. Today's undocumented students have benefitted greatly from their relationships with the 1960s Civil Rights student leaders who now serve as elders of the contemporary human rights movement. The modern students draw both inspiration and personal strength from the icons of the past. And, those Civil Rights leaders have been drawn into the current struggle for student rights serving as both teachers and protesters. The undocumented students have also reached out to student groups in other states to share stories and communicative strategies. They have partnered with interested college faculty to organize an educational program, Freedom University (FU), which provides college-level classes to disenfranchised students. Classes for students have been offered in both the cities of Athens and Atlanta. Some of the students have received debate training and participated in public debates with students from Emory and the University of Georgia.

Freedom University is modeled after the Freedom Schools movement of the 1950s and 1960s. During the Civil Rights era, movement leaders established elementary and secondary schools in the South for African American students. The public school systems in the South were segregated and African Americans were denied a quality basic education by the local (white) governments. The Freedom Schools achieved an important objective in educating students. They were a safe space for the young students in which they could both express their view and learn. For the undocumented college aged students in the 21st Century, Freedom University is a place that students come together to learn a variety of educational skills and learn about themselves and what it means to be undocumented in the United States. For some of the students, Freedom University affords them a first opportunity to discuss and debate what it means to be undocumented (Soltis, 2015, p. 20).

The laws of the United States provide both documented and undocumented students with the right to a secondary education. The undocumented students often avoid discussions about their status during their high school years. In many cases their parents instruct them not to disclose their status to their friends. Many of the students navigate their high school years and find themselves without driving privileges and the ability to connect socially with classmates beyond the day-to-day interaction at school. Freedom University plays an important role in their transition to adulthood and provides them with skills to live as undocumented residents in the United States. The Freedom University space allows students to talk through both the legal and relational problems that they confront in a secure setting and develop a shared sense of purpose with other undocumented youth.

This essay reviews the tactics used and protest actions taken by undocumented youth to reestablish access to public universities. Advocates have formulated a set of responses that shift focus of the public immigration debate to better protect the interests of the undocumented. First, by moving the focus of the immigration debate from border security to educational access, immigration advocates tilt the point of argument stasis in their favor. The move to focus on educational access had the benefit of allowing the current protesters to consult with the 1960s students who fought a similar struggle for access to educational opportunities in the old South. Second, in response to requests from students, professors play a role in this controversy by facilitating educational opportunities legitimating the claim that undocumented students should be participants in the American Dream. Third, student activists have organized a series of visible political actions to highlight the fight for educational opportunity.

The next section of this essay traces the development of the debate surrounding the educational rights of undocumented students. The third section describes the strategies deployed by students to push their position with the public. The brief final section suggests lessons that other groups might take from the strategies deployed by the students in Georgia.

2. IMMIGRATION RESTRICTIONS AND ACCESS TO EDUCATION

Since the 1980s, both Democrats and Republicans have lobbied on behalf of legislation that would secure the border and liberalize laws that drive the undocumented underground. The extension of rights for the undocumented is justified with claims of how immigrants would improve the performance of the US economy. A legacy of the Reagan revolution and the 1986 immigration debate, this rhetorical appeal continues to permeate the discourse of policy advocates (Aguirre & Simmers, 2011, p. 15).

The public debates surrounding the Development, Relief, and Education for Alien Minors (DREAM) Act deployed this line of argumentation. The DREAM Act, which first surfaced in the late 1990s, was intended to provide resident status to undocumented high-

school graduates. Unfortunately, following September 11 attacks, immigration policy was transferred to the jurisdiction of the Department of Homeland Security and support for policies intended to improve the economy lost domestic political momentum. The Mexican/US border was redefined as a site susceptible to terrorist crossings and was militarized. The politics that subordinated immigration policy reform to national security interests were followed by intense anti-immigrant hostility. By 2007, legislators lost their appetite for immigration reforms including the DREAM ACT.

While the DREAM Act was never enacted as legislative policy, it framed much of the rhetorical ground used in the contemporary struggle for student rights. The Act constituted the largely Hispanic undocumented youth in the United States into a defined community and established the undocumented youth as a political force. Commonly referred to as the "Dreamers", these individuals were portrayed as "the best and the brightest", embodying the cultural values that make America great. Many of them served in the US military. By joining the US Armed Forces, the undocumented youth were portrayed as protecting the national security of their adopted homeland. The youth were differentiated from other immigrants in an effort to move political moderates to support the DREAM Act. The undocumented residents were young, intelligent, and hardworking. And, importantly, they were in the country illegally by no fault of their own.

In the period immediately following the constitution of the Dreamers, students rhetorically distinguished themselves from other undocumented residents. By narrowing the scope of the controversy to providing educational opportunities for students, the appeals were more likely to be considered by moderates and conservatives. The students were motivated and smart and could make positive contributions to society. However, the narrowing of the issue to education had the unintended negative effect of providing a marker to distinguish deserving from undeserving immigrants. The deserving population aspired to improve themselves through education. The undeserving worked as agricultural and domestic laborers.

By 2012, President Obama responded to the lack of any legislative progress on legislation including the DREAM Act and an outcry from Dreamers and others in his political base by signing the Deferred Action for Childhood Arrivals Act (DACA). This Executive Order extended modest legal protections to the undocumented youth. President Obama's decision further cemented the notion that young students should be afforded the opportunity to pursue the American Dream. While the rationale for protecting the undocumented youth was celebrated, the fact that DACA was not a legislative act meant that the protection was dependent on the good will of the sitting President. Following DACA the undocumented youth continue to build upon the DREAM framework and push the Obama administration and legislative bodies across the country for rights including that of higher education.

The failure of Federal legislation to resolve the immigration controversy did not encourage only President Obama to act: conservative state legislatures across the country implemented immigration policy. While some states across the country have provided educational opportunities for undocumented college aged students that has not been the case in the South. As was the case in the 1950s and 1960s, states in the Deep South have passed laws in the last 15 years that are intended to erase people of color from the community. In this case, it is largely Latino/a bodies that are being denied the opportunity to sit in the classrooms of public colleges. In Georgia, a cornerstone of this response was a policy enacted by the Board of Regents (BOR) to prohibit undocumented students from attending the most selective colleges in the state. Rule 4.1.6 of the Board of Regents addressed a concern that undocumented students were taking college slots from deserving Georgians. Adopted in 2010, the rule prohibits undocumented students from attending colleges that have rejected qualified citizens in the preceding two years. The Georgia legislature followed implementation of 4.1.6 with a broader set of restrictions targeting employers who hired undocumented workers.

Student activists have responded in a more assertive fashion than others in their community. They speak in the public sphere, risking arrest and deportation. The risk is magnified by repeated stories found on social network sites reporting deportation checkpoints in and around Atlanta. The undocumented students organized into a number of groups, including the Georgia Undocumented Youth Alliance (GUYA), which uses both traditional local networking techniques and social networking sites to communicate. Beginning in 2011, GUYA had exhibited an active Facebook presence of immigrant group in Georgia. GUYA members organize and participate in marches and protests and delivered public speeches. The youth protest their political dislocation by occupying space reserved for citizens. Digital platforms have played a role in sharing stories with undocumented students from across the country and particularly those in other southern states.

The argument strategy of the students is more sophisticated than it was when the Dream Act was formulated in 2001. As the rhetoric of activists in Georgia indicates, early representations have been replaced by a more nuanced approach celebrating the entire immigrant community. The students redefined the controversy to include more than a narrow set of legal definitions of citizenship and suggested that the youth play a critical role in empowering the collective subjugated community. The undocumented students are a distinctive population, defined as having no legal rights, a situation which traditionally eviscerates a group's opportunity to mobilize support for political reform (Anguiano & Chavez, 2011, p. 82). Yet, today they are an influential political force in Georgia, due in part to their association with the Civil Rights advocates of the 1960s. The contemporary public advocacy strategies used by the undocumented students in the South reflect the influence of veterans of the Civil Rights movement. The elders provided guidance on language choice, protest locations as well as an appreciation that others has suffered through efforts to remove their bodies from public spaces. In retelling their stories, the elders effectively shared their history with a generation of undocumented students, which added to their own legacy (Cross).

3. RHETORICAL RESPONSES TO IMMIGRATION RESTRICTIONS IN GEORGIA

The students of Freedom University, many of whom are GUYA members, use a variety of communicative tactics in the fight to re-establish their right to education. Their tactics merge 1960s protest strategies, the use of social media, and a commitment to presenting their own cases in restricted public space. The group embraces the people, places and phrases of the 1960s movement to emphasize their loss of basic civil rights. In historically segregated Georgia, the Freedom University students easily draw from the Civil Rights tradition when crafting public argumentation.

The GUYA Facebook page displays several pictures of FU students meeting with the Civil Rights icon John Lewis, drawing the comparison to the 1960s movement. Lewis remains a force in American politics, and those with even a cursory awareness of our history have seen the iconic 1965 photo of a bloodied John Lewis. Since the initial Lewis-GUYA meeting, the Congressman has publicly called for reversal of the educational restrictions on undocumented students. His support reminds the public that the struggle of the undocumented shares characteristics with the Civil Rights battle. Additionally, this relationship benefits the curators of the Civil Rights legacy by reminding us that their long-fought struggle is part of a larger human rights struggle that includes the student movement in Georgia.

The similarities between the current exclusion of undocumented Latino students and the exclusion of African Americans in the 1960s are striking. In the 1960s there were more than 15 million African Americans who were victimized by exclusionary laws and were subjected to acts of violence. Today there are millions of undocumented residents and their

children, many of who are US citizens, who suffer a number of personal traumas. They are subject to deportation, financial exploited by employers, physically victimized by bigots, and denied the right to financial aid by some colleges and the right to higher education in some southern states (Perez). The stories of a few Civil Rights elders highlight the ways in which intergenerational networking advanced the shared interest in Civil Rights protection in the South.

Student protests have taken the form of the marches to sites important in the 1960s. Freedom University protested at the University of Georgia Arch. The Arch is a local symbol dating back to the 1850s. Originally, it was part of a fence and gate built to secure the campus from the town, but it lost its gate shortly after being built, leaving the border between the town and the campus open to all. The march on the Arch is an important case study in how the undocumented population cross a border in the struggle to craft their identity (Cisneros, 2014, p. 20).

Posts on networking sites called for graduates of Freedom University to march to the Arch in their academic robes. The students celebrating their academic success and their march reminded viewers of a traditional graduation ceremony. Additionally, the use of the Arch by graduates recalls the protests of the early 1960s in Athens. In 1961, some in the UGA community protested the admission of the first African-American students at the Arch, playing out the struggle between the Jim Crow South and an integrated University. The symbolism of that moment echoed as the students who are victims of Georgia's modern segregationist laws paraded through the Arch. They appropriated a symbol that had been exploited by 1960s era segregationists and used the location to celebrate their educational success. In a reference to the Jim Crow laws of the 20th century, the students describe educational restrictions in the South as "Juan Crow" laws (Lovato). In 2010 the GUYA page highlighted a panel the group co-hosted with the Georgia Latino Alliance to describe the Juan Crow laws and the resegregation of the South. The use of the phrase "Juan Crow" is a powerful trope in the effort to decriminalize the status of being "undocumented." Both the African-Americans of the 1960s and today's undocumented students have been made to feel like criminals by laws and statutes.

Freedom University provided the students with a safe space for the development of leadership skills. This informal educational program was established in 2011 to provide undocumented students with a place to continue their education while they identify out-of-state colleges to enroll in at a later date. The students receive a quality education while developing relationships with other undocumented students and local community leaders. They are provided with communicative skills including both public speaking and media relations training (Soltis p. 20). Some of the students received formal debate training as well. In the fall of 2015, a faculty member provided the Freedom University cohort with fundamental argumentation and debate training. By the end of the semester the students were prepared to engage in a policy debate on the status of undocumented students in Georgia. The Freedom University team was invited to visit the University of Georgia to participate in a debate over the legitimacy of the admissions restriction at the University. To ensure the security of the FU students, the advertisement and publicity for the debate did not mention that they were participating in the event. Rather, a large audience gathered expecting to hear only UGA students debate the issue. The Freedom University students were forceful advocates and the significance of their debating at a university that denied them applicant status was not lost on the audience. It was a moving experience for those, including this author, who witnessed their debate skills on display in restricted space. The hope is that the curriculum of Freedom University, including debate training, prepares students for acts of protest, the process finding a college outside of the South, and long-term personal development (English & Trivette, p.865).

A recurrent theme for some political conservatives is that undocumented residents have violated the law and should be labelled criminals. This illegal/legal dualism focuses the debate on the question of whether the undocumented have broken the law. This framework obscures racial undercurrents of policies and limits civic dialogue about immigration. Proponents of a secure border do not discuss the reasons why someone might flee their home country. The dominant rhetoric works to perpetuate a society in which nonwhites are "controlled, marginalized and disciplined" (Lawston & Murillo, 2009, p. 50). The existence of Freedom University pushes back against this rhetorical construction. For many observers, the FU students are bright young people attempting to advance themselves and contribute to their local community. Students in the 21st century, like their predecessors from the 1950s and 1960s inspire those who learn of their efforts to become full contributing members of society.

Drawing a parallel to the civil rights movement, student activists have regularly promoted the use of non-violent protest techniques. In 2011 they participated in a panel on non-violent protest techniques by contemporary protest movements at the Martin Luther King Center. The students pushed the boundaries of citizenship by embracing the notion of educational citizenship as defined by classroom performance, a tactic first espoused at the King Center meeting. The gathering was held in the MLK Freedom Hall, a location, which is both a monument to the bravery of the 1960s Civil Rights movement and a National Park, policed by the Federal National Park Service. The students navigated this conflicted space in their effort to craft better messages. Another meeting at the King Center included a gathering with Civil Rights veterans Constance (Connie) Curry and Charles Black. Curry was the first white woman who served on the SNCC Executive Board and has chronicled the role that women played in the 1960s movement. Charles Black was the SNCC Atlanta Student Movement leader in 1961-1962 and authored an important human rights document during that period. Curry and Black shared the document "An Appeal for Human Rights," with the Freedom University student and the collective group drew connections between the struggles of two seemingly different eras. The struggle to protect the human right to education in the 21st century uses digital communication platforms and contemporary language but relies on the tactics of the 1960s to demand social change.

The activist training for the students was not limited to the classroom setting in Atlanta. Dr. Laura Emiko Soltis, Director of Freedom University, is committed to an activist agenda and embraced sharing a wide range of experiences with students. For example, several of the students attended the fiftieth anniversary of the Freedom Summer in Jackson Mississippi. On that trip the students met Rita Bender a community activist who's spouse was killed by the Ku Klux Klan in 1964. The FU students and Ms. Bender both found the exchange of ideas to be inspiring (Blitzer). On another occasion, the FU students met with Dr. Bernard LaFayette, the architect of the historic Nashville lunch counter protest and the lead organizer of the SNCC Selma campaign. Again, both parties in the dialogue were enthused and left with a rich appreciation of the relationship between the student struggles in the 1960s and today (Soltis).

By 2015 the undocumented students regularly staged protests at the public meeting of the Board of Regents (BOR). While Rule 4.1.6 was not regularly on the Regents' agenda, the students demanded that the Board of Regents rescind the policy. The result of these recurrent protests is that students are arrested and the story is circulated on social media sites and covered in the local press (Davis, 2015). The 2016 fall meeting of the BOR took place the day after the US Presidential Election. In the face of Donald Trump's surprise victory, the students and their supporters again disrupted the BOR meeting and expressed their demand for access to a public college education (Maxouris, 2016, p. 1).

This pattern of protesting at the BOR meetings followed the one time that a Freedom University student was invited to address the BOR on the impact of 4.1.6. In 2011, Keish Kim

spoke against 4.1.6 before the BOR. She affirmed that the undocumented were hardworking students from tax-paying families who made great sacrifices to come to the United States (Georgia Undocumented Youth Alliance, 2011). She attended the meeting wearing a scarlet U to signify her compromised legal position. Her speech contained many of the arguments found in the rhetoric of other undocumented students. Having a student speak before the BOR was an important early moment for the movement. Since that time, the students have availed themselves of the opportunity to speak at meetings and in public locations, sometimes at personal risk. At that meeting, Ms. Kim told the group that at a time in life when students should aspire to great things, 4.1.6 made the students feel naive for believing in the American Dream. In her speech, the position of the opposition was reduced to nothing more than a set of numbers. The technicality of the rule and the lack of a nine-digit social security number were all that prevented these worthy students from attending the college of their choice.

While the students adapt tactics used by others, an important characteristic of their campaign is the willingness to speak on their own behalf. While policy advocates constituted the undocumented students as a political force with the drafting of the DREAM Act, it is the students themselves who serve as their most effective advocates. The students deliver speeches in hostile situations and exhibit a willingness to put themselves at risk. With the election of Donald Trump, supporters and advocates have stepped in to shield the students from some unnecessary risks. For example, Charles Black returned to his role of protestor and was removed from a Board of Regents meeting in 2017 (Aslanian, 2017).

A recurrent element of the rhetorical campaign is the repeated use of the phrase "undocumented and unafraid." In a number of blog posts, leaflets, posters, and YouTube videos in which students declare they will no longer be found in the shadows, but are undocumented and unafraid. This is an important statement in light of the risk of deportation, especially in 2011, 2012 and in 2017. The phrase plays a role in the rhetorical redefinition of citizenship from simply a legal construct that excludes undocumented residents to a cultural one in which students fight for their educational rights. The students are unafraid because they are citizens of an intellectual community and are demanding the state recognize their status.

The early actions by the Trump Administration to restrict immigration impacted the tactics the students and supporters have used. For example, while objections to Rule 4.1.6 were raised at the most recent BOR meeting, most of the protesters arrested were policy advocates rather than students themselves. Moving forward, it will be important to track the ways in which the emerging political environment will impact the Georgia student movement.

The students are aware of the risks involved in the strategy of public protest and the necessity of inhabiting public space. The social networking sites that post upcoming marches and protests also post stories about police roadblocks and of college age residents being deported. The students demand a place at the table at the annual BOR meeting while simultaneously engaging in protests outside the meeting. They also protest on the campuses to which the law denies them access. Students engage in self-risk in ways that recall the protests of the 1960s when the youth protested while risking being drafted into the Vietnam War.

4. CONCLUSION

The locally based undocumented student movement in Georgia is a response to the restrictions imposed by policymakers. With national action on a variety of public policy issues seems unlikely, local responses may be the best path forward for advocates of progressive politics. As we enter this new political moment, local grassroots movements will have more of a role to play in highlighting the need for social change. Groups like the students of Freedom University will continue to push state policymakers to enact progressive

reforms. And, with a focus on local based advocacy and protests, the intergenerational connections that today's students make with 1960s protesters play a critical role in any path forward. The undocumented students can identify with the Civil Rights protesters, which reduces their sense of isolation. They are made aware that this is not the first moment in history that bodies of color have been punished by a set of exclusionary regulations and laws.

The protesters make claims that traditional media outlets have been ineffective in sharing the stories of the undocumented. When coupled with the inability of the national government to act, this condition has moved the students to engage in a targeted local approach. The tactics used have provided a potential pathway forward for undocumented people struggling for their rights in the US. And it is important to note that young immigrants around the world are confronting problems not unlike those described in this paper (Tufecki, 2017). As Nicholls (2013) has observed, "in countries as diverse as France, the Netherlands, the United Kingdom, Belgium, Spain, and the United States, undocumented immigrants have launched high-profile campaigns for greater rights, less repression, and the legalization of their status" (p. 176). In each case, the undocumented are stepping into the public sphere to assert their human rights.

Gender and enthymematic identification: Trump's argument for masculinity in the 2016 presidential debates

SARAH T. PARTLOW LEFEVRE

Communication, Media, and Persuasion; James M. & Sharon E. Rupp Debate Society
Idaho State University
United States of America
partsara@isu.edu.

ABSTRACT: In the 2016 U.S. presidential debates, much of Donald Trump's gendered argument was enthymematic, appealing to audiences' sexism and constructing masculinity as inherent to the presidential office. I incorporate Burke's (1969) definition of identification as a key component of persuasion to theorize a better understanding of enthymematic argument. Verbal and nonverbal enthymemes about gender created identification with some voters and sharpened division with others.

KEYWORDS: debate, division, Donald Trump, enthymeme, Hillary Clinton, identification, Kenneth Burke, masculinity, presidential debates, ISSA

1. INTRODUCTION

Argumentation scholars often argue that the classical definition of enthymeme is an incomplete or truncated syllogism (Aden, 1994; Bitzer, 1959; Burnyeat, 2015; Copi, Cohen, & McMahon, 2016; Madden, 1952; McBurney, 1936). However, Smith (2007) noted, "truncation is not a requirement" (p.16), quoting Madden to suggest that "Aristotle does not define the enthymeme as a truncated syllogism. He only indicates that frequently arguments ought to be truncated" (Quoted in Smith, p. 116). Smith argued that such definitions reduce the enthymeme to a "procedural matter" in a move that neglects "several significant attributes" of enthymemes (p. 115). Instead, Smith drew on the Prior Analytics and Madden (1952) to examine enthymeme as a probable syllogism with three distinguishing aspects: it "involves probable premises and conclusions" (p. 116); it includes emotion and ethics as part of argument (p. 117); and, some point of agreement between the audience and the speaker is necessary (p. 117).

As scholars have incorporated enthymeme into explorations of visual argument (Barbatsis, 1996; Birdsell & Groarke, 2007; Blair, 1996; Finnegan, 2001; Medhurst & Desousa, 1981), many have defined it in the popular sense of an incomplete syllogism (e.g. Finnegan, 2001). Smith argued that returning to Aristotle's concept of enthymeme can provide a more fruitful understanding of enthymemes in visual argument. She noted that multiple enthymematic interpretations are possible which makes visual enthymeme "consistent with Aristotle's assertion that enthymemes employ probable premises and conclusions" (p. 119). She argued,

> Probabilistic visual enthymemes consisting of probable premises comport well with our everyday experience. Within cultural frameworks, we understand visual aspects of nonverbal communication to carry a limited and likely range of meanings. (p. 120)

This definition allows for enthymematic consideration of ethics and emotions and consideration of the relationship between the speaker and the audience or audiences. Smith argued that visual enthymemes may address ethical and emotional concepts, "Enthymemes consist not only of logical propositions, expressed or implied, but also appeals to emotion and character. For

Aristotle . . . even an emotional response requires reasoned judgement" (p. 120). Additionally, visual enthymemes promote identification between arguer and audience. She wrote, "To be persuasive, enthymemes must identify with common opinions of their intended audiences. Creators of visual enthymemes discover these common opinions in context and culture" (p. 120). Because common opinions "are not homogenous," different audiences will understand and incorporate arguments in vastly different ways. Thus, Smith's return to Aristotle's enthymeme opens the concept of arguing to a "rhetor who creates images that identify with an audience's common opinion" (p. 121).

Smith rightly pointed out that viewing visual enthymeme in an Aristotelian sense . . . draws attention to the process of forging agreement, when persuasion succeeds, and to the possibility of dissension, whether spoken or unspoken, when it fails" (p. 122). In this essay, I rely on Smith's definition of visual enthymeme to examine verbal and nonverbal enthymemes in the debates between then Presidential Candidates Hillary Clinton and Donald Trump. In particular, I incorporate Burke's notion of identification to suggest that an audience's failure to identify with an enthymeme may not be failure as Smith suggests. Rather, it may be intentional and strategic on the part of the arguer to fail with one audience in order to succeed with another. First, I examine Burke's concept of identification. I then discuss Trump's intended audience and examine key moments in the Trump v. Clinton debates, arguing that Trump made a deliberate argument for masculinity as a precondition to holding a presidential office.

2. BURKEAN IDENTIFICATION AND ENTHYMEME

Kenneth Burke's explication of identification included the three elements Smith cited as crucial to enthymemes: a probabilistic premise, agreed interests between the arguer and the audience, and the inclusion of ethical implications in regards to "emotions and character" (Smith, 2007. p. 120). First, identification is neutral on face and can be used to promote "love" (Burke, 1969, p. 20) or "malice and the lie" (p. 45) and any range of ideas in between. Indeed, identification can promote a thesis that is more or less probable.

Second, identification relies on some shared idea between the arguer and audience. Burke defined identification as the pointing to areas of joined interest or established similarities between arguer and audience. He wrote, "A is not identical with his colleague, B. But, insofar as their interests are joined, A is identified with B" (Burke, 1969, p. 20). In this process of establishing shared interests, the audience and arguer are both one entity and separate individuals at the same time. In other words, their motives are not entirely aligned even though they share some common trait. Burke wrote, "In being identified with B, A is "substantially one" with a person other than himself. Yet, at the same time, he remains unique, an individual locus of motives" (Burke, 1969, p. 21). Thus, arguer and audience become consubstantial, sharing some understandings, emotions, ideas, or attitudes for common gain (Burke, 1969, p. 21). Burke explained,

> A doctrine of consubstantiality, either explicit or implicit, may be necessary to any way of life. For substance, in the old philosophies was an act; and a way of life is an acting-together; and in acting together, men have common sensations, concepts, images, ideas, and attitudes that make them consubstantial. (Burke, 1969, p. 21)

Consubstantiality may exist in material or entirely symbolic realms. It may be the common need for food or water or a shared abstract desire for something beyond reach. Burke explained,

> The resources of identification whereby a sense of consubstantiality is symbolically established between beings of unique status may extend far in to the realm of the idealistic. And . . . out of this

Note that the counterpart of identification is division. Identification cannot exist with one audience without dividing the arguer from another audience.

Third, the ethical implications of identification as a strategy range from those of virtue to those of vice, depending on who uses that strategy, for what purpose, and what audiences are implicated. Burke called division the "ironic counterpart" of identification and noted that inherent the inability to "know for certain just where" identification "ends and" division "begins, and you have the characteristic invitation to rhetoric" (Burke, 1969, p. 25). When mixed states of identification are extant, messages may become confusing or jumbled. What may be persuasive for one audience may alienate another, allowing for manipulation. Burke wrote, "Rhetoric is concerned with the state of Babel after the fall . . . [and] . . . must often carry us far into the lugubrious regions of malice and lie" (Burke, 1969, p. 22). Burke's warning went further to warn against deception. He wrote,

> If an identification favorable to the speaker or his cause is made to seem favorable to the audience, there enters the possibility of malice and the lie; for if an identification favorable to the speaker is made to seem favorable to the audience, there enters the possibility of such "heightened consciousness" as goes with deliberate cunning. (Burke, 1969, p. 45)

Thus, identification as an argumentative tool may be risky for the audience because the end pursued by the arguer may not be partially or wholly in the interest of the audience. Burke explained,

> When two men collaborate in an enterprise to which they contribute different kinds of services and from which they derive different kinds and amounts of profit, who is to say, once and for all, just where "cooperation" ends and one partner's "exploitation" of the other begins?" (Burke, 1969. p. 25)

Burke used that example of a shepherd who appears to promote the "good of the sheep" but is actually "raising the sheep for market" (Burke, 1969, p. 27). This danger makes the moral status of the arguer particularly important. Burke wrote,

> The rhetorical concept of "identification" does not justify the excess to which such doctrinaire tendencies can be carried. But, it does make clear that one's morality as a specialist cannot be allowed to do duty for one's morality as a citizen. Insofar as the two roles are at odds, a specialty in the service of sinister interests will itself become sinister. (Burke, 1969, p. 31)

Such "temptations to strife are implicit in the institutions that condition human relationships" but do not foreclose the possibility for "identifications in the order of love" (Burke, 1969, p. 20). Identification in and of itself, remains neutral, allowing for moral implications in practice.

3. IDENTIFYING TRUMP'S AUDIENCE

Burke's explanation of identification in concert with Smith's concept of enthymeme may produce productive results as critical tools. Because enthymematic identification is probabilistic, it need not rely on verifiable facts to be effective for its intended audience. Instead, it is an argument forged on some agreement between rhetor and audience, one that need not be true. It need only rely on some emotional bond between arguer and audience. Its moral implications may cut against both included and exclude audiences. In the 2016 Presidential debates, Trump made an argument for a certain brand of masculinity as a precondition to

presidential office. His argument was enthymematic and relied on identification with a particular segment of the United States public. Rather than appealing to all citizens, Trump made a deliberate choice to forge extreme identification and division. He enacted an appeal to a particular audience that felt left behind by social change. First, I describe the audience and then I give examples to examine how Trump's argument for white masculinity in the presidency functioned.

Trump was functioning in what the *Economist* called, "post-truth politics," and environment where "truth is of secondary importance" shifting political lies from an effort to promote a "false view of the world" to lies that are "not intended to convince elites, whom their target voters neither trust nor like, but to reinforce prejudices" (*The Economist*, 2016, p. 9). Educated, progressive elites were not only shocked and offended by Trump's use of identification, they decried it every turn. For example, *The Nation's* editorial endorsing Clinton, stated that Trump engaged in a "daily torrent of ignorant, offensive, and alarming views" (p. 3). *The Nation* continued,

> The perils of Trumpism go beyond one man. Trump leads a party that has sought to normalize a cruel and unusual politics . . . Throughout the election, Trump has insulted women, questioned the patriotism of Mexican and Muslim Americans, incited hatred of refugees, mocked a disabled journalist, and depicted the lives of African Americans as a "total catastrophe" (Nation, 2016, p. 4)

The previous quote demonstrates progressives' shock at Trump's choice to exclude them as an audience. Trump used division not as an ironic counterpart of identification but as an overt strategy designed to shock and appal some while empowering others. Trump did not seem see division as an unfortunate side effect. Rather, he delighted in dramatically upsetting progressive audiences while serving as the charismatic, morally challenged leader of a new underclass.

Trump used both identification and division strategically. His unapologetic alienation of particular groups curried favor with a particular segment of the electorate and his appeals deceived as he shirked his "morality as a citizen" by promoting problematic arguments for identification with the purpose of self-promotion. To understand how Trump manipulated identification and division in the debates, one must interrogate the motives of his audience. Hochschild (2016) interviewed many Trump supporters and Tea Partiers seeking their perspectives. She found a common deep story. Based on emotional responses to how they experienced cultural change, many Trump supporters embraced this "feel-as-if-it's-true story, stripped of facts and judgements that reflected feelings underpinning opinions and votes. It was a story of unfairness and anxiety, stagnation and slippage—a story in which shame was the companion to need" (Hochschild, 2016, p. 22). The story itself was simple narrative. Hochschild wrote,

> The deep story of the right goes like this:
> You are patiently standing in the middle of a long line stretching toward the horizon, where the American Dream awaits. But, as you wait, you see people cutting the line ahead of you. Many of these line cutters are black . . . some are career driven women pushing into jobs they never had before" (Hochschild, 2016).

Not only were others cutting in line, but "the line for advancement toward the American dream of secure prosperity has grown very long. Sometimes it seems to have stopped moving" (Purdy, 2016, p. 50). Trump's audience felt that these line cutters were "newcomers . . . playing by their own rules to get ahead" (Purdy, 2016, p. 50). Essentially, they were changing the rules and "moving the goal posts, undercutting . . . lives of working hard, waiting patiently, and playing by the rules" (Purdy, 2016, p. 50). Combine this with feeling "disrespect for holding their values" and being insulted by progressive media outlets who labelled them "backward," "ignorant," or "rednecks" and they emerged as a motivated audience (Hochschild, 2016, p. 26).

As Purdy (2016) noted, in this context, "the meaning of identity politics has changed . . . Now there is a white, Christian, nativist identity politics espoused by people who . . . regard themselves as members of an aggrieved minority" (Purdy, p. 53). Before the 2016 election, Goldhammer identified the danger that Trump might energize this group, he wrote,

> Accurate or not, what fuels the anger of those who see themselves as displaced an despised is the belief that, while they are prepared to sacrifice self interest to honor and country and receive nearly nothing in return, newly included groups—blacks, women, gays and lesbians, immigrants—are welcomed with open arms by elite institutions and given a leg up in competition for high status jobs . . . .Revolutionary social changes that have brought a black man . . . to the White House have conspired to make the 2016 election a moment of real danger, unleashing anger of such astonishing intensity that the election of a man with evident authoritarian instincts by a relatively prosperous and flourishing democracy is not . . . unthinkable. (Goldhammer, 2016, p. 14)

Trump forged identification with this audience, emerging as their charismatic, self-interested leader. Hochschild quoted Sharon Galicia, a Trump supporter, explaining Trump's appeal to this group, "They see him as very strong. A blue-collar billionaire. Honest and refreshing, not having to be politically correct. They want someone that's macho, that can chew tobacco and shoot guns—that type of manly man" (Quoted in Hochschild, 2016, p. 28). Trump's brand of masculinity combined with his ability to shame "virtually every line cutting group in the Deep Story—women, people of color, the disabled, immigrants, refugees" (Hochschild, 2016, p. 29). Because the deep story that Hochschild identified involved losing status and power, Trump's ability to weaponize shame as a mechanism of division resulted in a "national theater of shame" where Trump saved his followers from having to admit their "pain by publically shaming others instead" in a public spectacle of the "pleasure of public humiliation" (Haslett, 2016, pp. 16-17). This audience may have been hungry for others' pain as a way of denying their own.

Statistics support some of these claims about Trump supporters. "A Public Religion Research Institute (PRRI) poll released in the spring of 2016 found that 50% of Trump supporters said that it benefits society for men and women to stick to roles for which they are naturally suited. By the fall of 2016, 64% of Republican respondents to another PRRI poll said that society as a whole had become too soft and feminine" (Dittmar, 2016, p. 6). Additionally, according to *Presidential Gender Watch*,

> A PerryUndem study from early 2017 found that men also underestimate the frequency of sexist treatment experienced by women. In fact, the majority of Trump's male supporters in the fall of 2016 felt that they were the victims of gender discrimination, according to PRRI; 58% of Trump supporters surveyed in fall 2016 agreed that "these days society seems to punish men just for acting like men. (Dittmar, 2016, p. 7)

Enter Hillary Clinton and the general election debates. In his public statements, Trump used her gender to humiliate her and to enact a form of toxic masculine power that, for his followers, promised to make America great again. In this essay, I focus on Trump's use of verbal and visual enthymeme in the debates that forged identification with his intended audience and capitalized on the division it created. From this perspective, calls of sexism and unfairness, not only failed, but they played into Trump's hand. Clinton's callouts of Trump's sexism and her calls for respect bolstered Trump's masculine power in the eyes of his intended audience. James Fallows described the situation thus, "The potential first woman president of the United States who is often lectured about being too "strident" or "shrill," is up against a caricature of the alpha male, for whom stridency is one more mark of strength" (Fallows, 2016, p. 78).

4. TRUMP'S MASCULINIST ENTHYMEME

To explore masculinity as enthymeme in the debates, I focus on three broad examples of masculinist enthymemes from the 2016 general election. These examples evidenced Trump's argument for masculinity as a requirement for office. First, Trump used aggressive nonverbal behaviour through pointing, facial expressions, and lurking during the Town Hall debate. Second, he cast Clinton in the role of the stereotypical woman who is a liar, is ineffective, never stops talking, and is subject to the power of and responsible for the actions of her husband. Finally, he used pacing, interruption and interjection, direct and indirect insults to control the pacing and tone of the debates.

Three images, one from each debate, illustrate Trump's visual depiction of masculine power in the debates. In the image from the first debate, Trump and Clinton shake hands as he pulls her arm toward him in his signature move. His position shows control of the handshake. He also stands slightly behind Clinton who smiles widely while Trump clenches his mouth in a dominant way. Standing behind her suggests a posture of control (Segar, 2016).

In the second debate, Trump was widely criticized for lurking behind Clinton in a menacing way. Both pro and anti-Trump audiences might have read this as an exertion of masculinity in which Trump played on greater physical size and power commonly attributed to men. Additionally, the second image shows Trump grabbing his belt buckle while standing behind Clinton, an apparent reminder that he is masculine while she is not (Wilking, 2016).

The image from the third debate is a composite side-by-side depiction of both candidates pointing. The difference is stark, Clinton's elbow is pointed down and forearm is turned slightly up. Her finger is only partially extended. Trump is pointing from the shoulder with his forearm turned out to point away from him in a poking motion. His posture demonstrates power and dominance associated with his brand of masculinity (AP, 2016). For those who feel their masculinity is threatened, these images provide strong emotional reassurance that Trump would exert masculine power in office.

A second way that Trump pushed a masculine enthymeme was by casting Clinton as a stereotyped woman who is a liar, is not only ineffective but has bad motives, never stops talking, is subject to her husband while also being responsible for his actions, and relies on her emotions. First, He repeatedly called her a liar in a variety of contexts, expressing outrage and a desire to protect the American public from her lies. For example, in the second debate, he said,

> If I win, I am going to instruct my attorney general to get a special prosecutor to look into your situation. Because there has never been so many lies, so much deception. There has never been anything like it. And we're gonna have a special prosecutor. When I speak, I go out and speak, the people of this country are furious. (Clinton & Trump, 2016b)

The claim that never have so many lies been forwarded relies on negative feminine stereotypes and suggests Clinton's candidacy is unique, subtly reminding audience of the other unique feature of her campaign—being the first female candidate for president to represent a major party in the United States.

In another example from the third debate, Trump accused Clinton of inciting women to lie about him and generating false charges against him. He said,

> I didn't even apologize to my wife . . . because I didn't do anything. I didn't know any of these women. I didn't see these women . . . . And I think it's her campaign because what I saw what they did, which is a criminal act, by the way . . . I believe, Chris, she got these people to step forward . . . . it was all fiction. It was lies and it was fiction. (Clinton & Trump, 2016c)

This passage is notable not only because it accuses Clinton of promoting falsehoods, it more generally accuses all of his accusers of lying for attention, in order to "get their ten minutes of

fame." Note that Trump used the phrases "these women" and "these people" in a move that verbally constructed them as the other.

Trump repeatedly cast Clinton as ineffective, another common feminine stereotype. He said, of international trade agreements, "She's been doing this for 30 years. And why hasn't she made the agreements better?" (Clinton & Trump, 2016a). He repeated claims to her ineffective 30 year tenure. He said,

> And all you have to do is look at Michigan and look at Ohio and look at all of these places where so many of their jobs and their companies are just leaving, they're gone.
>
> And, Hillary, I'd just ask you this. You've been doing this for 30 years. Why are you just thinking about these solutions right now? For 30 years, you've been doing it, and now you're just starting to think of solutions.
>
> . . . I will bring back jobs. You can't bring back jobs. (Clinton & Trump, 2016a)

In another example, Trump accused Clinton of lying about past policy positions and being ineffectual. He said, "Hillary Clinton wanted the wall. Hillary Clinton fought for the wall in 2006 or there abouts. Now, she never gets anything done, so naturally the wall wasn't built. But Hillary Clinton wanted the wall" (Clinton & Trump, 2016c).

Trump accused Clinton of talking too much about international issues she knew nothing about. For example, he said,

> Now, with that being said, she talks tough against Russia, but our nuclear program has fallen way behind . . . . Now, she talks tough. She talks really tough against Putin and against Assad. She talks in favor of the rebels. She doesn't even know who the rebels are. (Clinton & Trump, 2016b)

The idea that women talk too much and know little is commonly used to discredit women by encouraging others not to listen to "feminine chatter" which lacks valid content.

Trump blamed Clinton for her husband's actions while in office, undermining her status as an individual candidate. In the first debate he said, "Your husband signed NAFTA, which was one of the worst things that ever happened to the manufacturing industry" (Clinton & Trump, 2016a). For example, he said that if he was elected, "We will be doing very much better with Mexico on trade deals. Believe me. The NAFTA deal signed by her husband is one of the worst deals ever made of any kind signed by anybody. It's a disaster" (Clinton & Trump, 2016c). He repeated the same claim later in the debate, stating, "We have horrible deals. Our jobs are being taken out by the deal that her husband signed. NAFTA. One of the worst deals ever. The jobs are being sucked out of our economy" (Clinton & Trump, 2016c).

He blamed her for Bill Clinton's infidelity and other offenses against women, accusing her of attacking Bill Clinton's accusers. He said,

> Bill Clinton, far worse. Mine are words and his was action. His words, what he has done to women. There's never been anybody in the history of politics in this nation that has been so abusive to women. So you can say any way you want to say it, but Bill Clinton is abusive to women. Hillary Clinton attacked those same women, and attacked them viciously. (Clinton & Trump, 2016b)

In this way, Trump challenged Clinton's claims to support women's rights softening the impact of his negative behaviour that the Access Hollywood tape revelaed. For his audience, Trump may have managed to make Clinton look both ineffective at controlling her husband and to cast her as a victimizer of other women.

Trump suggested that Clinton reacted in anger and emotion to the *D.C. vs. Heller* decision. He said, "She was extremely angry about it. I watched. I mean, she was very, very

angry" (Clinton & Trump, 2016c). In this way, he not only attacked for failing to support for the Second Amendment, but he also hinted at the risk of having an angry woman in the White House.

Finally, Trump used interruption and interjection, direct and indirect insults to control the pacing and tone of the debates. While numbers and definitions of interruption differed, most people who were counting agreed that Trump interrupted or interjected while Clinton was speaking far more often than the she interrupted him in the first debate (Koerth-Baker, 2016). Across all three debates, he continued this pattern of interrupting her far more than she interrupted him. According to Johnson and Wilson, he interrupted 55 times in the first debate, 15 times in the second debate, and 48 times in the third debate (Johnson & Wilson, 2016). Despite the fact that he interrupted more, he complained that the second debate was "one on three" due to lack of adequate moderator focus on Clinton's emails (Clinton & Trump, 2016b) and suggested that the election would be rigged in her favor. Numerous interruptions and interjections allowed him to comment directly as she spoke, to control the flow of the debates.

Trump used indirect and direct insults ranging condescendingly making a point of calling her Secretary Clinton to make her "very happy" because it was "very important" to him (Clinton & Trump, 2016a) to calling her a "nasty woman" in the third debate. He suggested that she lacked the temperament to be president. He said, "I have better judgment than she does, there's no question about that. I also have a much better temperament than she has, you know? . . . I think my strongest asset, maybe by far is my temperament, I have a winning temperament, I know how to win. She does not (Clinton & Trump, 2016a). Trump also claimed she had no business acumen, one of his major selling points. He said, "She has no business ability . . . you have to have some basic ability. And sadly, she doesn't have that" (Clinton & Trump, 2016a). Finally, he said, she did not have the look or the stamina to be president. He said,

> She doesn't have the look . . . I said she doesn't have the stamina, and I don't believe she does have the stamina. To be president of this country, you need tremendous stamina . . . You have to be able to negotiate . . . With Japan, with Saudi Arabia . . . You have so many different things, you have to be able to do, and I don't believe that Hillary has the stamina. (Clinton & Trump, 2016a)

The choice of Japan and Saudia Arabia as examples suggests a gendered component to this comment as the west has long viewed both as heavily patriarchal cultures which might have difficulty negotiating with a woman. Lack of stamina or the proper look to be president is also gendered as women may be stereotypically considered the weaker sex.

5. CONCLUSION

Understanding enthymeme as probabilistic allows for examination of arguments with which a critic may disagree. It also allows critics to investigate claims that may be non-verifiable or untrue in order to understand the emotions and perspectives of target audiences. Additionally, combining Smith's definition of enthymeme with Burke's understandings of enthymeme allows argument critics to theorize the strategic use of division. Trump, in fact, is accomplished at using division to shock and silence his opponents. Until his use of division is better understood, it will be hard to mount an effective argumentative response. Assuming that division is failure, not strategy, ends the discussion. As critics of argument, we must look to the argumentative proceeds of both identification and division. Finally, more work needs to be done on Trump's use of division as a strategy to target immigrants, black people, Muslims, women, and others. Clearly, Trump's argument for masculinity in presidential office resonated with some. It is our job, as critics of argument, to interrogate why and how that happened.

ABSTRACT: We present a study of the use of appeals to authority in debates on controversial cultural objects. Based on an empirical analysis of debates about the Palace of Culture an Science (Poland) and the Valley of the Fallen (Spain), we analyse the dynamics of this type of debate and we identify a new phenomenon, named historical ethos, where speakers attack or support authority of the historical figures associated with those monuments to argue about them.

KEYWORDS: authority, corpus analysis, cultural objects, historical ethos, Inference Anchoring Theory

1. INTRODUCTION

This paper addresses an empirical study of the use of appeals to authority in debates on controversial cultural objects in the realm of cultural heritage (Sullivan 2015). During the last two years, discussions about those cultural objects that represent historical figures have been gaining importance in the public domain. An example of this type of disputes is the case of Edward Colston, a slave trader and philanthropist from Bristol (United Kingdom) who bequeathed his wealth to charities[1]. His figure is honoured all over the city with several streets, statues and some buildings. Nowadays these objects are strongly criticised by the descendants of the slaves that were part of his business. Thus, policy makers have to decide upon the future of some of these monuments that honours him.

The initial hypothesis of this study was that in this genre speakers are using a mixture of logos and ethotic arguments. In order to validate or refute this hypothesis, we have conducted and empirical study consisting of the analysis of two real debates about controversial cultural objects in Poland (the Palace of Culture and Science) and in Spain (the Valley of the Fallen). We have selected two radio debates, one in Spanish and the other in Polish, with several speakers each and being them mainly journalists. In total, our corpora contain around 12,000 words, and it was analysed using Inference Anchoring Theory (IAT) (Budzynska and Reed

---

[1] https://www.bbc.com/news/uk-england-bristol-42404825

2011), a theoretical framework that allows us to connect the argument structure with the dialogical structure.

Notwithstanding, the analysis of our corpora revealed that these types of arguments are not as frequent as we expected. We discovered that references to the historical figures represented by these cultural objects play an essential role in these debates. Most of arguments discuss in fact whether or not some people have a good character so that they should be still honoured by such cultural objects. This then influence the decision or whether the cultural objects should be preserved or removed. This led us to consider the ethotic dimension as a key element of these debates.

Ethos is one of the three modes of persuasion, together with logos and pathos (Aristotle, 1991). Logos refers to the argument structure of the speech delivered by a speaker, pathos is related with the emotions and feelings of the hearer and ethos refers to the credibility of the speaker. It has been widely studied in modern argumentation theory, considering ethotic arguments (Brinton, 1986) through the study of the elements of ethos as interpersonal argumentation (Budzynska, 2010) or source indicators reasoning (Walton, 1998). In (Budzynska, 2013), a new model for the analysis and representation of ethotic structures independent of logos is presented, where a non-argumentative interpretation of ethotic utterances, just as simple assertions, can avoid the ethotic self-referential circularity fallacies.

After our analysis, we discover a new concept of ethos that we name *historical ethos*. In most of the arguments, ethotic manoeuvres are used to attack or support authority of historical figures associated with these cultural objects. This is different to the Aristotelian concept of ethos, since historical figures cannot be part of the debate as an active speaker and this is specific for the realm of cultural heritage.

The paper is structured as follows. In Sect. 2, we give an overview of cultural objects and cultural heritage realm and IAT. Sect. 3 and 4 describe our initial hypothesis with Sect. 3 presenting the use of the argument from authority scheme in cultural heritage debates and Sect. 4 describing the case of arguments based on logos structures. Sect. 5 characterises the notion of historical ethos with some examples. Finally, Sect. 6 summarises our main conclusions and future work.

2. BACKGROUND

This section introduces the notions of cultural object and cultural heritage, the two key elements in the debates about controversial cultural objects, and IAT, the theoretical framework that we apply in our analysis.

2.1 Cultural objects

Cultural heritage is defined as the legacy of physical artifacts and intangible attributes of a group or society that are inherited from past generations, maintained in the present and preserved for the benefit of future generations (Sullivan, 2016). Cultural heritage can be divided into three main categories: tangible culture, intangible culture and natural heritage. Tangible culture comprises elements such as buildings, monuments, works of art, monuments, etc.; intangible category denotes things such as folklore, traditions language, knowledge, etc. and, natural heritage refers to natural environments and biodiversity. Some well-known examples of tangible cultural objects are the Alhambra in Granada (Spain) or Michelangelo's David in Florence (Italy); of intangible are the Mediterranean diet in some countries of Europe or the beer culture in Belgium; example of natural heritage are Galápagos islands (Ecuador) or Serengeti National Park (Tanzania).

In this paper, we focus on controversial cultural objects, those physical artifacts or tangible elements which maintenance in the present and for the future is under discussion. This type of disputes uses to appear in the public domain, such as radio or TV programs, and involve different stakeholders, such as citizens, public administrations, experts in cultural heritage, etc. The arguments exposed there have a real impact on the decisions of policy makers about the future of this type of monuments, which makes these discussions even more relevant. On the other hand, any object or cultural manifestation that is not adequately supported or valuated by the surrounded community is a candidate to be removed from cultural heritage since it does not satisfy the mentioned definition.

During the last two years, debates about controversial cultural objects has been gaining importance in the public domain. For instance, as we said, in the city of Bristol (United Kindgom), the historical personage Edward Colston[2] is dividing its dwellers. He is honoured with several streets, statues and buildings all over the city because he bequeathed his wealth to charities, but a wealth acquired as a slave trader. The descendants of the slaves argue that they are still suffering the consequences of his business (e.g., they have a worse economic situation) meanwhile the other position argues that a lot of people were helped through charity thanks to his money and he deserves these honours.

In order to develop our research, we selected two very well-known cases of controversial cultural objects in Poland and in Spain: the Palace of Culture and Science (PKiN) in Warsaw and the Valley of the Fallen (VdC) near Madrid.

The PKiN, built in 1955, hosts several companies, public institutions and cultural activities in its 42 floors. In was originally named as "Josef Stalin Palace of Culture and Science" and, although Stalin's name was removed during the *destalinization* process, a debate about this building has arisen in Warsaw's public domain about whether it should be preserved or not for future generations. As a resource data, we selected the discussion between Sebastian Gajewski, the representative of the *Ignacy Daszyński Centre* and Michał Rachoń - the journalist working in the Polish national television. The program was broadcasted in the in the Polish national radio *Polskie Radio 24* on the 16th of November 2017. The full transcript of this discussion has 6,253 words.

The VdC is a religious complex and monumental war memorial built by the Spanish dictatorship Francisco Franco. It was officially inaugurated in 1959 and he was buried there in 1975. After the Spanish Historical Memory Law in 2007, a public debate appeared about its future; discussing whether this symbol of Spanish fascism should be preserved or not. For our research, we create a corpus from a debate broadcasted in the Spanish radio *Onda Cero* (10th of May 2017), with three speakers (the journalists Elisa Beni and Ana Pardo de Vera and the historian Fernando Iwasaki) and moderated by the Spanish journalist Julia Otero. The full debate was transcribed and it has 6,662 words.

2.2 Theoretical Framework: Inference Anchoring Theory

IAT (Budzynska and Reed 2011) is the theoretical framework that we applied in our analysis. Its main motivation is to explain and capture how a dialogue, a complex communicative structure that follows a protocol (Reed 2006) is linked to the argument structure of the communicative act; i.e., IAT allows us to connect communicative structures with argumentative ones. The general idea of IAT is sketched in the following brief dialogue:

(1)   a. Bob: *p is the case*.
       b. Wilma: *Why p?*
   c. Bob: *q*.

Figure 1. Interaction between argument and dialogue in IAT.

Fig. 1 shows the IAT structure corresponding to Example (1)[3]. On the left-hand side, the argumentative structure is represented, where the main claim or conclusion "p is the case" is supported by the premise "q". The named "Default Inference" box, which connects the premise and the conclusion, denotes that this is precisely an inference relationship.

IAT considers three basic types of relations between propositional contents:

- Relations of inference: They connect premises with conclusions, where premises are supporting conclusions.
- Relations of conflict: They connect propositions that are attacking each other.
- Relations of rephrasing: Two propositions that have approximately the same meaning.

On the right-hand side, the dialogical structure is drawn. The locutions (utterances) performed by each one of the speakers in each turn of the dialogue are contained in the boxes. These are connected by means of "Default Transition" boxes, which comprise the dialogue rules that guide the communicative interchange (Reed 2010). These rules may have a more informal character (as in natural discourse) or a more formal one (such as protocol in a dialogue game) (Prakken 2006).

The middle part of the diagram shows the illocutionary connections, which "anchor" the argumentative structure with the dialogical one. Illocutionary connections are based on the illocutionary forces (Searle 1969) and they capture the intention of the speakers in each movement of the dialogue. Illocutionary connections can be anchored both in transitions and in locutions:

---

[3] This diagram has been generated using OVA+ (Reed 2014), a web tool that support the analysis of arguments and it is compatible with IAT.

- Anchored in locutions:
  - Asserting
  - Questioning: Pure questioning, assertive questioning and rhetorical questioning
  - Challenging: Pure challenging, assertive challenging and rhetorical questioning
  - Popular concession
- Anchored in transitions:
  - Arguing
  - Disagreeing
  - Restating
  - Agreeing

IAT is compatible with *Argument Interchange Format* (AIF) (Chesñevar 2006), a standard ontology for the representation of argumentation and arguments. This makes possible the storage of IAT diagrams into AIFdb[4] (Lawrence 2012), which facilitates their computational treatment.

In addition to the argumentative structure, IAT also can represent ethotic structures (Budzynska 2013). Ethos, defined by Aristotle as the character of the speaker, plays an essential role in argument schemes such as arguments from authority of arguments from expert opinion. Example (2) shows a case of ethotic relationship, where Wilma is attacking Bob's ethos saying that he is not authorised to talk about *p*. Fig. 2 shows the corresponding IAT diagram, where Bob's ethos is represented by means of a new box and Wilma's attack by means of a relation of conflict ("Default Conflict"); in the case of ethotic support the relation is labelled as "Default Inference".

(2)   a. Bob: *p is the case*.
   b. Wilma: *You know nothing about p.*

Figure 2. Example of ethos attack in IAT.

The use of IAT as the theoretical framework in our research allow us to analysis both logos and ethotic arguments, which is an essential step in the evaluation of our working hypothesis.

---

3. ARGUMENT FROM AUTHORITY

Our initial working hypothesis, drawn from argumentation theory, was that a mixture between logos and ethotic arguments, such as arguments from expert opinion (e.g. historians, architects, lawyers, etc.) or arguments from authority (such as collective of victims) would be predominant in debates about controversial cultural object. These, most of the times, involve several technical questions (related with maintenance, legal requirements, historical meaning, etc.) in order to achieve a well-founded decision. In addition, policy makers have to justify their decision in front of public opinion and this type of arguments seems to be quite persuasive to achieve this aim.

The argumentation scheme approach (Walton, Reed & Macagno, 2008) provides us with an initial conceptual framework allowing to seek for typical reasoning patterns related to authority. Despite the variety of authority-related argumentation schemes such as argument from expert opinion, argument from position to know, and argument from authority (e.g. Walton 1997) as well as the diversity of argumentation schemes for arguing about authority (e.g. Araszkiewicz & Koszowy, 2016). For the purpose of this paper, we will refer to one pattern, namely to the general argumentation scheme for appealing to deontic or administrative authority, which has the following form (Walton & Koszowy, 2017):

Major Premise: δ is an administrative authority in institution X.
Minor Premise: According to δ, I should (or I should not) do a.
Conclusion: I should (or I should not) do a.

This reasoning pattern is in our view most suitable as a general structure that could be helpful for identifying arguments from authority in the disputes about the cultural heritage. For our initial hypothesis was that because of the fact discussions about cultural objects are mostly about what *should be done* with some cultural objects (either revere or remove them), this argumentation scheme is quite typical for appealing to authority in the cultural heritage disputes and it constitutes our point of reference.

We have analysed Spanish and Polish corpora looking for examples to validate our working hypothesis. In the Spanish dataset, we have found Example (3), which a clear example of argument appealing to authority. Julia Otero, journalist and moderator of the debate, said:

(3)   a. Julia Otero: *Julián Casanova [...] is the great historian of the Spanish Civil War, he was the right person to give an opinion and he has said that it is good to keep the Valley of the Fallen, but explaining, where is it? what happened? who did it?*

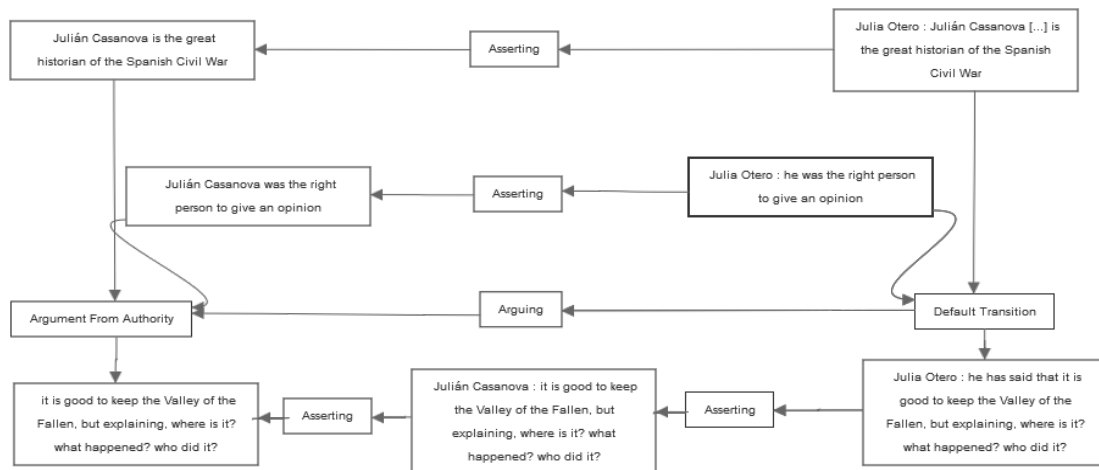

Figure 3. Argument from authority in the debate about the Valley of the Fallen.

Figure 3 shows the IAT structure. It includes a case of reported speech, where the main claim of Julia Otero is a quotation of the expert, Julián Casanova, and she is bringing his opinion into the debate. With respect to the argument structure, this conclusion, "it is good to keep the Valley of the Fallen, but explaining, where is it? what happened? who did it?", is supported by two propositions that provide information of Julián Casanova as an authority to talk about the VdC, since he "is the great historian of the Spanish Civil War" and "he was the right person to give an opinion".

However, in contrast to our initial hypotheses, this type of arguments is very rare in our data. We just found this single example in Spanish and Polish corpora, which denotes that is not as frequent as we were assuming.

4. LOGOS IN DISPUTES ABOUT CULTURAL OBJECTS

Logos arguments is the other type of arguments that we considered in our initial hypothesis. These do not include any ethotic component, but they usually refer just to intrinsic properties of the controversial cultural object. For instance, let us consider Example (4) (and Fig. 4) from the Spanish corpus, where Elisa Beni, one of the journalists that participates in the debate said:

(4)   a. Elisa Beni: *The Valley of the Fallen is terrible, and as I said, it must be dynamited. [...] And above all, because it has no artistic value.*

Figure 4. Using pure logos argument to claim the demolition of the VdC.

The speaker claims that the VdC should be demolished, and she argues its lack of any artistic value (i.e., "the Valley of the Fallen is terrible" and it "has no artistic value"). In this case, there is not any reference to experts or authorities, but just an evaluation of the its aesthetic features, which is an essential feature in any cultural object.

This type of arguments, based just on logos, are also not as frequent as we assumed in our initial hypothesis. Therefore, our empirical study led us to conclude that appealing to authority in debates about controversial cultural objects involves argumentative structures different to the usual ones postulated by argumentation theory.

5. ETHOS IN DISPUTES ABOUT CULTURAL OBJECTS: AUTHORITY OF HISTORICAL FIGURES

In our corpus study, we identified that references to ethos is still a very frequent strategy, but not types of ethos studied in argumentation theory or rhetorics, but as historical ethos which is associated with a cultural object (Josef Stalin in the case of PKiN and Francisco Franco in the case of VdC). Yet not all mentions of historical figures are the use of historical ethos. For instance, let us consider Example 5 (and Fig. 5) extracted from Polish corpus. Waldemar Sawicki, a former director of PKiN, expresses his opinion about the future of the building:

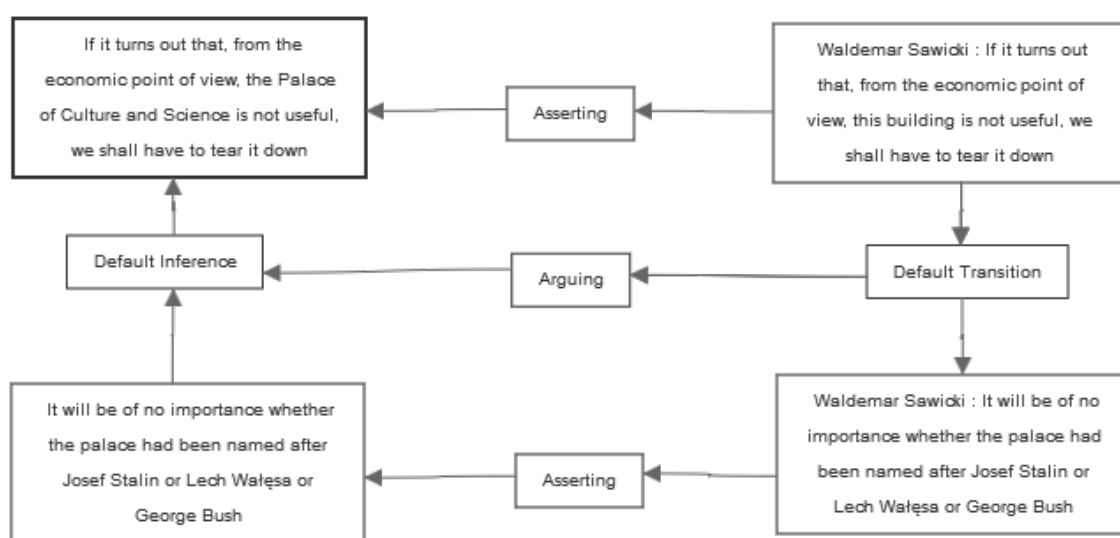
(5)   a. Waldemar Sawicki: *If it turns out that, from the economic point of view, this building is not useful, we shall have to tear it down. It will be of no importance whether the palace had been named after Josef Stalin or Lech Wałęsa or George Bush.*


Figure 5. Using reference to historical figures to claim the demolition of the PKiN.

His main claim is a conditional statement, asserting that the PKiN should be demolish if it is not economically sustainable. Economic sustainability can be considered as an intrinsic property of the building, as aesthetic properties of the VdC described in Example (4). Even though the premise used by the speaker includes references to historical personages related to the building, it is not attacking or supporting Josef Stalin, Lech Wałęsa or George Bush. In other words, the character of these figures does not play a role in argument structure.

Other example of the use of historical figures is presented in Example (6) and Fig. 6. The journalist Michał Rachoń argues in favour of demolishing the PKiN:

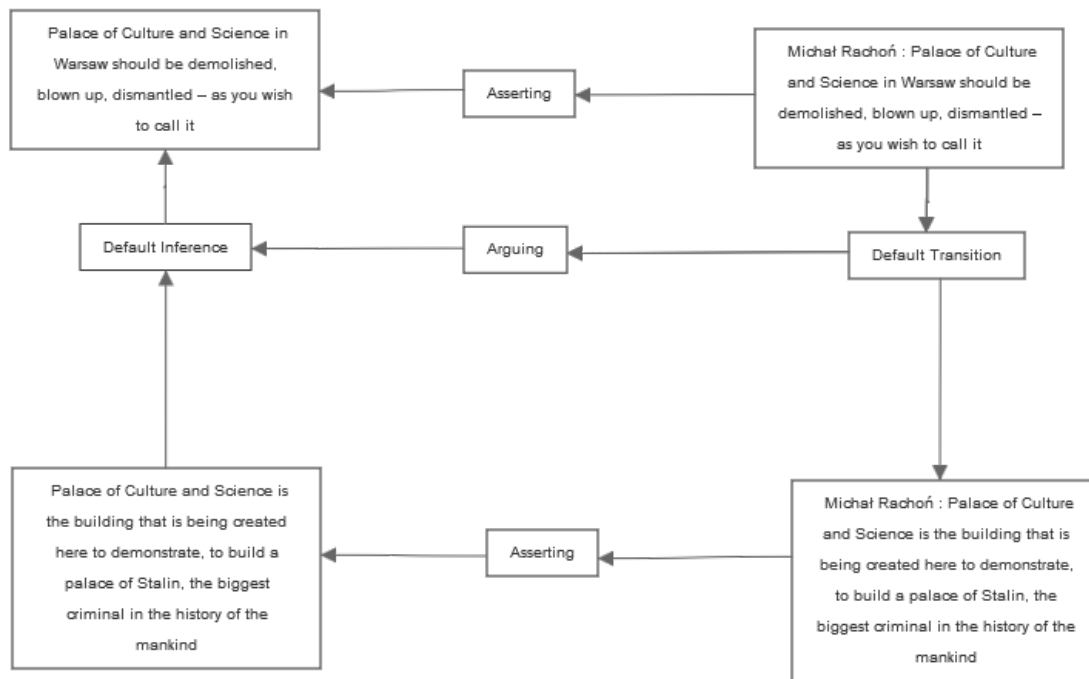
(6)   a. Michał Rachoń: *Palace of Culture and Science in Warsaw should be demolished, blown up, dismantled – as you wish to call it. Palace of Culture and Science is the building that is being created here to demonstrate, to build a palace of Stalin, the biggest criminal in the history of the mankind.*


Figure 6. Using pure logos argument to claim the demolition of the PKiN.

The speaker's conclusion is that PKiN should be demolished. The main reason to support this claim is that this building is a symbol of Joseph Stalin and he is "the biggest criminal in the history of the mankind". If we unpack the intrinsic structure of that premise, we can observe that, unlike Example (5), the historical figure is actively used in the argument. The intention of the journalist is to build his argument against the cultural object using the persona of Josef Stalin, not the intrinsic properties of the building (such as structural elements, economic viability, etc.). By means of an ethotic attack against his him (see Fig. 7) he asserts that the PKiN must be demolished. Therefore, it turns out that the discussion about controversial cultural objects is mainly a debate about the character of the persona, the historical figure represented by it.

We named this new type of ethotic structure - historical ethos. It builds on the Aristotelian concept of ethos with the difference that although historical figures play a central role in the debate (they are subjects to ethotic supports or attacks to discuss the future of the cultural object), but they are not active speakers themselves. As it is illustrated in Fig. 7, logos and ethos are used simultaneously in parallel in these debates with one proposition ("*Palace of Culture and Science is the building that is being created here to demonstrate, to build a palace of Stalin, the biggest criminal in the history of the mankind.*") both used to support the claim "*Palace of Culture and Science in Warsaw should be demolished, blown up, dismantled – as you wish to call it*" through logos structure of inference as well as attacking the claim "*Josef Stalin has historical ethos*" through ethotic structure of conflict (see Fig. 7).

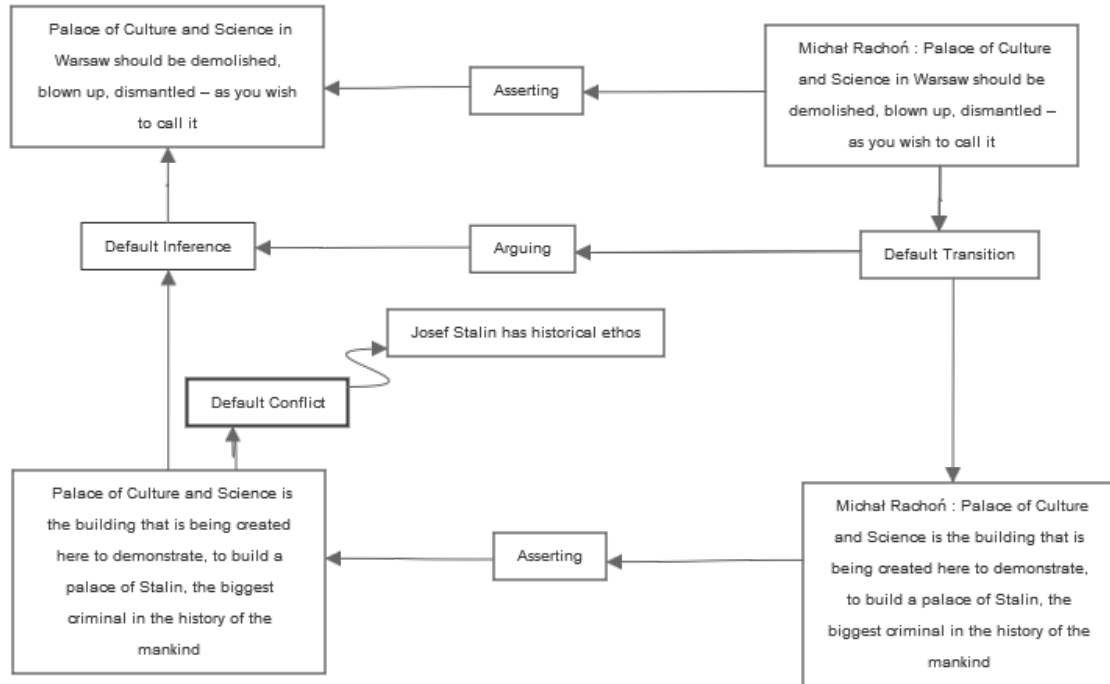
This type of arguments are the most frequent ones in our data, more frequent that typical ethotic arguments (such as argument from authority, see Sect. 3) or argument just based on logos (see Sect. 4).


Figure 7. Using historical ethos in a debate on the demolition of the PKiN.

6. CONCLUSION

This paper has presented the notion of historical ethos, a new concept of ethos inspired by Aristotle definition discovered in the domain of cultural heritage in controversies about cultural objects. It is related with the recurrent appealing to historical figures, the personages represented by this type of objects as authorities. In our data, we discover how they play an essential role in the disputes about whether a monument should be removed from the public space.

Logos and ethos constitute a parallel structure in this type of arguments, where an ethotic support or attack on the historical figure is performed simultaneously to a propositional relationship in the logos dimension. The mention of a historical figure during a debate does not necessarily entail the use of historical ethos, because this requires the joint use of ethos and logos structures. This shows the richness and complexity of the cultural heritage realm from the argumentative point of view. In addition, we have realised that other types of argumentative structures, such as argument from expert opinion or argument from authority, are relevant in this domain, but they are quite rare in comparison with arguments that use historical ethos.

For future work, we propose to enhance our current corpora with more debates about controversial cultural objects, mainly from other countries. We aim to analyse the similarities and differences between different cultures as well as elaborate a deeper and more systematic analysis of this new phenomenon.

ABSTRACT: Observations of play in young children reveal the dialogical (and not just individual) nature of argumentation and the complex symbolic and relational work that children have to accomplish in order to produce argumentation. They shed a developmental light on argumentation: discussion issues are likely to be transformed as they are talked about; standpoints are not always present before being co-constructed in the on-going dialogue.

KEYWORDS: adult-children dialogue, children's argumentation, children's worlds, developmental socio-cultural psychology, education, implicit premises, inference, inferential-procedural premises, material-contextual premises, reasoning

1. INTRODUCTION

When two- to six-year-old children produce argumentation, how do they reason? Our interdisciplinary team of linguists and psychologists has two aims in addressing this question. One is to contribute to the study of inference in argumentation: we are interested to see

whether studying how a child engages in argumentation can in some way contribute to Argumentation Theory, a discipline that up to now has largely focused on adult (or even expert) productions. Our other aim is to contribute to research in developmental socio-cultural psychology by investigating how children produce argumentations and thereby we hope to enrich the psychological understanding of children's reasoning. In the ArgImp project (see Acknowledgements), we have undertaken to study the inferences that children make. As we are not studying their language but their thinking, we are interested in delineating as much as possible not only their explicit verbal productions but also the implicit components of their reasoning in the contexts in which they occur.

We use models of Argumentation Theory as interpretive grids or 'lenses' that help to pay minute attention to the argumentations produced by children with the hope to get to novel descriptions of some aspects of children's reasoning processes. We will see that these models can also help to critically scrutinise whether young children have opportunities to actively participate in critical discussions with adults and to observe what happens when they do so. Studying the inferences young children make when they engage in argumentative discussions is a means both to gain insights into their reasoning and to appreciate their argumentative contributions to a different extent. Children were observed in a variety of contexts, such as everyday family discussions, interaction with adults in designed activities and discussions between them or with the adult when resolving a technical problem. We will see that our findings invite extending the existing analytical models.

2. THEORETICAL FRAMEWORK AND METHODOLOGY

2.1 From a psychological and educational perspective

When some of us started investigating argumentation in children from a psychological and educational perspective, our first attempts were mostly relying on what we will call 'Approach 1'. The focus of attention was argumentative *skills* and their promotion in students (Schwarz, 2008; Muller Mirza and Perret-Clermont, 2009), a line of research of which Kuhn (1991, 1993; Felton and Kuhn, 2001) and many authors have contributed to (for reviews see e.g. Golder, 1996; Rapanta *et al.*, 2013; Schwarz and Baker, 2017). Pedagogical activities based on creative inquiry-based approaches, accurate design and adequate teacher training have demonstrated both the possibility to support the acquisition of argumentation skills in students and the possibility to rely on argumentative activities to promote learning. Nevertheless, a recurrent question still remains open: why is it so difficult to get students to rely on argumentation in the classroom when our feeling as parents is that youngsters do have argumentation skills from an early age on? Therefore, we set out to explore children's 'proto-argumentations' (as we used to call them when we were not a priori convinced that we would observe 'real' argumentations). Our main questions at the start were the following: can two- to six-year-old children contribute to argumentative discussions? If so, when and how do they reason?

'Approach 1' considers argumentation a 'skill', a competence that the student has or does not have, that is manifested through verbal productions. The focus of attention is on the individual child (and not on the conversation in which the argumentation takes place), and the verbal productions are assessed according to various criteria that allow for a comparison between the child's skills and advanced (or even expert) adult skills. Children are usually observed and assessed at school, whereas expert skills that are de facto assumed as reference have traditionally been those of professionals who have to make decisions or try to convince their partners (politicians, lawyers, scientists, etc.) or those who are interested in

argumentation per se (logicians, philosophers, psychologists such as Piaget). Educationalists inspired by 'Approach 1' often aim at teaching elaborated linguistic skills that will allow students to make complex inter-relations, take into account different standpoints, pros and contras, and then advance standpoints backed up by structured argumentations. Of course, the hope of educationalists is that such skills, once acquired through specific school activities on specific tasks and contents, will then transfer to other situations, in and out of school. However, the issue of transfer raises important methodological questions that have not been much researched yet.

A sub-line of research within 'Approach 1' focuses on 'arguing to learn'. This focus considers the content of the argumentation, the information at students' disposal (e.g. texts, feed-back, etc.), and the decentration and social interactions that argumentation requires. It has been found that these processes are likely to contribute to a deepening of the understanding of the issues (Schwarz and Baker, 2017), including their epistemological status (Kuhn and Park, 2005). In this perspective, students are invited to use linguistic and reasoning or rhetorical resources as instruments to explore the multidimensionality of pedagogical objects (scientific phenomena, historical events, moral issues, etc.) and hence learn to inquire about them, reason and formulate a hypothesis. Let's note that students are often offered theories in which to situate their hypothesis (for instance: evolution in Asterhan and Schwarz, 2007) that allow them to 'deduce' their hypothesis as a check of their findings and of the theory. Hence, in such a school context, theory construction and fact explanation are often described as a combination of 'abductive' and 'deductive' processes, favouring the training of this type of reasoning and paying less attention to specific types of inferences. Conditions for decentration to occur are considered as well as their emotional concomitants (Muller Mirza *et al.*, 2009; Muller Mirza, 2010; Baker *et al.*, 2013; Schwarz and Baker, 2017) but not much attention has yet been paid to a fine-grained analysis of children's cognitive moves within argumentation. Such school activities require very careful designing (Andriessen and Schwarz, 2009). Commitment from the students is not always there, and in no way can it be just 'prescribed' by a teacher (Schwarz and Baker, 2017). Although our ArgImp project started within 'Approach 1', it rapidly shifted to 'Approach 2' for different reasons, among which was contradictory evidence: very young children were producing 'spontaneous' argumentations in daily life settings (Schär, 2018), but not in our activities around technical problems (Convertini, in preparation, in line with Greco Morasso *et al.*, 2015, and Miserez Caperos, 2017).

'Approach 2' considers argumentation a contribution to a critical discussion and not as an 'isolated' product. It is a dialogical activity (Nonnon, 1996, 2015; Plantin, 1996, 2005) within a specific context that bounds, more or less explicitly, the issues, mutual expectations, interactions, rules and scripts. Centring on a fine-grained analysis of the children's reasoning within this argumentative activity, ArgImp distinguishes two components in argumentative inference: the information and the reasoning process that is operated on this information. This distinction is to some degree analogous to Piaget's distinction between 'physical' knowledge about reality and 'logico-mathematical' knowledge (Piaget and Inhelder, 1967). 'Approach 2' does not expect an argument to keep all its meaning if abstracted from the context and imported into another activity setting with different characteristics. Whereas many studies of 'Approach 1' are concerned with the relation between language and thought, 'Approach 2' is concerned with the relation between argumentative activity and thinking. It considers the goals (e.g. decision making, knowledge building, problem solving, etc.) and the audience addressed. Research has illustrated how even very short socio-cognitive conflicts are likely to foster cognitive development (Carugati and Perret-Clermont, 2015). Hence, from an educational perspective, it is important to understand the socio-cognitive conflicts that occur

in critical discussions with children: what happens between adult and child or between children.

In 'Approach 2', there is no a priori normative model of what an educational intervention that enhances argumentation should look like. In both designed or in 'naturally occurring' situations, 'Approach 2' is monographic, descriptive and explorative: the intent is to identify early forms of argumentation in their context in order to observe how, why and when children try to contribute to critical discussions and if (non) existing common ground allows (or does not allow) their reasoning to unfold in the interaction (Trognon *et al.*, 2011). From a psychological perspective, 'Approach 2' is inspired by cognitive psychology and its studies of reasoning. But most of these studies have focused on the study of perception and deductive processes. ArgImp tries to contribute to an extension of this tradition along two axes: 1) a focus on children's structures of inference, somehow similar to Banks-Leite but with a revisited understanding of argument schemes or *loci* (cf. Rigotti and Greco, forth.); and 2) special attention to the context. Important traits of the context are the interpersonal and institutional relationships that frame the encounter, as well as the cultural premises. We consider these components not as 'biases' that can affect the child's rationality but as (often implicit) premises.

ArgImp follows in the footsteps of different lines of research, ranging from Vygotsky's attention to the role of interpersonal coordination for the development of thinking, to the studies of the architecture of intersubjectivity in communication tasks (Rommetveit, 1976; Hundeide, 1985; Linell, 2009), the role of cultural practices (Bruner *et al.*, 1966) and the contribution of pragmatics to psychology (Bernicot *et al.*, 2002). Jean Piaget had hypothesised that children's 'wrong' or 'seemingly illogic' answers are in fact quite rational if the different logic of the child is taken into account. Piaget (1926/1929) started dialoguing with children in open-ended conversations by means of which he tried to follow their reasoning and to question it in order to provoke counter-argumentations and hence access their deeper thoughts. Piaget then engaged in describing how when building on the logics of their actions children then develop different levels of logico-mathematical structures. Piaget's theory remains mainly centred on the study of deductive reasoning and causal demonstrations (Piaget and Inhelder, 1966). ArgImp tries to extend it to a careful consideration of inferential structures. Grize (1996), a former collaborator of Piaget, was critical of his logico-mathematical description of thinking and offered an alternative with his own model, named 'Natural logic'. Grize's endeavour is to account for any locutor's expression of thinking by considering it not as an abstract entity, but as a 'schematisation' addressed to a specific audience. Indeed, the early Piaget (1926/1929) was aware of the role of the audience and of how very difficult it is to access children's thinking because their thoughts are always likely to be affected by the questions of the interlocutor. However, Piaget seems to have neglected this in most of his later studies (with rare exceptions: e.g. Piaget, 1972). ArgImp and other on-going research projects (Kohler, in preparation) are re-assuming Grize's suggestion to consider the expressed reasoning of the child (i.e. the argumentation) as a schematisation addressed to an audience and, hence, based on implicit premises that need to be acknowledged in order to understand such argumentation. This perspective has also been fruitfully applied to explore children's 'failures' in a Theory of Mind test (Lombardi, Greco *et al.*, 2018). With the words of Pramling and Säljö (2015), we could say that ArgImp's effort is to consider "the child as a partner in conversations" and not as "an object of research". As illustrated by Anderson *et al.* (1997), new understanding of the child's logic can be opened by charitable approaches of their argumentation that reconstruct the implicit by taking into account the status of their speech acts and their taken-for-granted reality.

Theories of argumentation invite us to consider forms of reasoning that put the reasonableness (and not only the certitudes or opinions) at the centre of attention. This is

particularly interesting from a psycho-developmental perspective, as children do not often need to carry out demonstrations, but contrariwise have to continuously find their way in a world that they are discovering. They make decisions, look for similarities, construct images of the world for themselves (leaving them often implicit); they learn to understand the consequences of their actions and to decipher the expectations of the persons they meet. How do they reason and argue in such conditions that are quite different from those of professionals or experts engaging in argumentation?

2.2 From the perspective of theories of argumentation

We are interested to see whether studying how a child engages in argumentation may in some way contribute to the study of inference in Argumentation Theory. We therefore focus not only on the explicit part of the children's argumentation that becomes evident and 'audible' in a discussion, but we try to understand their entire inferential process, taking into account also what is left implicit during their contributions to argumentative discussions. This requires reconstructing these implicit components of children's argumentation in order to gain a better understanding of the entirety of their argumentative contributions.

ArgImp borrows models from Argumentation Theory. First, argumentative discussions[1] are reconstructed by means of the analytical overview from Pragma-Dialectics (van Eemeren and Grootendorst, 1984, 2004), a dialogical approach that considers argumentation in the specific context in which it occurs. Second, in order to understand what remains implicit in children's argumentative contributions at the level of inferential moves (i.e. at the level of the standpoint-argument relations), the Argumentum Model of Topics (Rigotti and Greco Morasso, 2009, 2010; Rigotti and Greco, forth.) is used. The Argumentum Model of Topics reconstructs two parts of any single argumentation: the material-contextual and the inferential-procedural.

The material-contextual component constitutes the part of the inference that is rooted in the context of the interaction. The major premise of this syllogism, the *endoxon*, alludes to a premise that is typically shared in a (local or broader) cultural community. Re-elaborating an Aristotelian definition, Rigotti and Greco Morasso (2009) define it as "an opinion that is accepted by the relevant public or by the opinion leaders of the relevant public" (ibid., 45). As such, endoxa are often expected to be shared by all the interlocutors involved in a specific argumentative discussion and may therefore remain implicit in a discussion for reasons due to the pragmatics of conversation. However, since children and adults have different knowledge of the world, it is possible that they may not always share the same endoxa (see e.g. Greco *et al.*, 2017). The minor premise of the material-contextual syllogism of the reasoning is called *datum*. The datum refers to physical facts that are observable in the situation in which the discussion takes place (see Rigotti and Greco, 2009) or anyway to factual evidence. In argumentative interactions, data might be explicitly stated, but they might also be left implicit, in particular when the speakers have relevant perceptual-factual evidence before their eyes.

The procedural-inferential component constitutes the 'logical' part of the reasoning or, better, the source from which the inference present in a single argumentation is drawn. The procedural-inferential component is directly based on a locus, i.e. a semantic-ontological relation (e.g. cause-effect, witness-position to know, opposite-opposite, to name but a few) on whose basis standpoint and argument are connected (Rigotti and Greco Morasso, 2010). Several maxims, or inferential rules, are associated with each locus; a maxim functions as the

---

[1] We consider an argumentative discussion as an interaction where an individual issue or related issues are discussed. Contiguous interactions about issues that are not related in a thematic way are considered two separate discussions.

major premise in the inferential-procedural component of the reasoning. It thereby allows one to reveal the precise inferential relation between a standpoint and an argument.

3. EMPIRICAL DATA

The ArgImp project works on various newly collected and already existing data. In particular, two multilingual corpora in two different settings were collected. Corpus 1 consists of 'spontaneous' argumentation in the family. This means that these discussions that occurred in everyday family interactions were not induced in any way. A researcher visited 12 families in their homes in three different linguistic regions of Switzerland and registered their natural talk. The researcher intended to take a marginal position and not interfere in the interactions that occurred within the families. However, as the researcher was physically present[2], sometimes she was asked by the children to participate in different interactions, such as playing a game. In these cases, the researcher engaged in interactions with the children and their parents. Corpus 2 was collected in two kindergartens, one in French-speaking Switzerland and one in Italy. It consists of semi-structured play activities that are inspired by Piaget (1974, 1980) and the foundation La main à la pâte[3]. Children are asked to help resolve a technical problem by constructing specific artefacts with building blocks.

The interactions of both corpora were audio recorded. In addition to the audio recording, the semi-structured play activities of Corpus 2 were also video registered. The oral data were transcribed according to an adapted version of the transcription signs proposed by Traverso (1999).

4. FINDINGS

What have we learned by shifting our perspective from 'Approach 1' (argumentation seen as a skill) to 'Approach 2' (argumentation seen as a contribution to a critical discussion)? This section will present some of the findings of the ArgImp research project that are of interest to psychologists and educationalists but also to Argumentation Theory; when relevant, we refer to previous publications in which more detailed observations and discussions of our findings can be found.

4.1 Children's argumentations are often interrupted by the adult

Registrations and videos have made us quickly aware that adults very often do not grasp or even interrupt children's argumentative contributions. This confirms our earlier observations of pedagogical activities (Greco *et al.*, 2017) and Piagetian clinical interviews (Greco *et al.*, 2015; Miserez Caperos, 2017). Sometimes, adults inadvertently do not leave space for full development of the child's argumentation even when they intend to do so.

---

[2] During a pilot study done in 2015 it became clear that the researcher's presence is needed during the data collection in order to guarantee the complete understanding of the registered interactions. Obviously, the researcher is in a paradoxical position: in order to be maximally "neutral", she needed to intervene in the discussion (to be perceived as an "adult friend" and not as a strange person who was there, observed everything, but did not do anything).

[3] See http://www.fondation-lamap.org/en/international, last visited May 2018.

4.2 Children are active contributors to critical discussions using multiple argumentation and introducing issues

Our data reveal that especially when given space to do so, children are not 'proto-arguers' but actively engage in argumentation. We observe that children even raise new discussion issues or sub-issues in already ongoing discussions. They do so in different ways, as for instance when they problematise an utterance of an adult or of a peer in order to raise an issue or a sub-issue or when they project a difference of opinion and put forward a standpoint and an argument supporting that standpoint in which the new issue is implicitly contained (see the proposal of a typology of the emergence of issues in adult-children discussions in Schär and Greco, 2018 forth.; Schär, 2018). The fact that children open up new issues shows that they are not only able to 'play the game' of an argumentative discussion initiated by an adult, they are also interested in setting up their own discussions. Once an issue is raised, young children engage in argumentative discussions by putting forward their standpoints and supporting them with arguments. In our data, children not only recur to single arguments to support their standpoints, they also use complex argumentation (coordinative, subordinative, multiple) (Miserez Caperos, 2017; Convertini, in preparation). Children also raise issues (Schär, 2018) and sometimes argue to question the issue... making the issue an issue! (Greco *et al.*, 2017).

The analysis of children's argumentation in our corpora shows that, in most cases, the inferential-procedural part of their reasoning is sound: children employ a variety of loci and competently rely on different maxims (Convertini, in preparation). The loci on which children's argumentation is based are often those that the researcher indirectly expects when she introduces the task; but children also bring out other kinds of reasoning that are neither requested nor expected by the adult. The analysis of the relationship between loci and maxims helps us to recognise the sophistication of children's argumentation and the children's capacity to take initiative in reframing adults' tasks and finding creative ways to solve them.

4.3 Standpoints are often co-constructed during the interaction

In order to contribute to argumentative discussions, children have to feel legitimate to do so. This is often the fruit of a 'conquest'. During the activities, we can observe them trying to find their physical place or struggling to have their voice heard (Convertini *et al.*, 2017). Children try to understand what is happening and what it means, and they test their explorative 'hypotheses' (Iannaccone *et al.*, in preparation); they also defend themselves when they feel neglected or offended; they try to convince others to 'ally' with them (Danish and Enyedy, 2015); to 'go against' their peer's contribution, or to coordinate their own perspective with that of their partners'. Argumentation emerges within these processes. Very often children do not have a pre-existing standpoint on an issue (see Greco *et al.*, 2015; Schär, 2018), either because the issue is proposed/imposed by the adults or because the issue responds to an 'emerging problem' in the reality of the conversation. When argumentations are co-constructed in the course of the discussion, it seems that the issue has precedence over the standpoint because the interlocutors do not have pre-existing standpoints on that issue (Schär, 2018). The co-construction of an argumentative discussion appears then to be a dialogic process; but this is possible only if the freedom rule of a critical discussion is fully respected (van Eemeren and Grootendorst, 2004).

The 'jigsaw example' (from Corpus 1, analysed by Schär, 2018) illustrates this. A discussion occurs when Amélie[4] (5:8-year-old), as requested by the rules of the board game, tries to add a puzzle piece to a jigsaw. But Amélie seems to hesitate. The researcher asks

---

[4] Names have been changed.

"should we check below?" (referring to the model of the jigsaw depicted on the game board). The researcher is thinking that this is a strategy to deal with the difficulty. But Amélie interprets this as an issue. She supports her standpoint that they should not check the model of the jigsaw with two coordinative arguments (they are too stupid for that and it is much too difficult). Hence, the standpoint and argument that Amélie puts forward emerges out of the interaction. This example also hints at another aspect that is recurrently found in the data of the ArgImp project, namely that socio-material artefacts (in this case: the pieces making up the jigsaw) may trigger an argumentative discussion. In this jigsaw example, it remains unclear whether the researcher is the only trigger of Amélie's argumentation or whether she would have started to argue her point of view even without the intervention from the researcher. In many cases, children open up discussion issues because they respond to 'emerging problems' derived from their playing situations (e.g. a toy car is too big to go into a tunnel; a toy person bumps her head). Hence, not only standpoints but also issues are co-constructed during the discussion via sub-discussions initiated by the children (see Schär, 2018 for more examples).

4.4 Available visual information is not verbally made explicit

In very young children, linguistic abilities could be a reason for leaving part of their reasoning implicit. However, in our analyses we find other aspects that better account for this fact. Grice's (1975) cooperative principle, stating that the interlocutors should make a verbal interaction 'as informative as is required', means that repeating what is obvious to the involved interlocutors should be avoided (see Greco *et al.*, 2017). In our data, the fact that something perceived as 'obvious' is left implicit is commonly observed in the presence of material objects that seem to have a clear meaning, or of persons who look like, for instance, an adult or a female.

In the 'missing pieces example' from Corpus 2[5], the activity has been designed by the researcher. Three children are involved in this activity inspired by Piaget (1980). A blue poster has been glued to the table and two manikins (and their cars) are each placed on opposite sides of the poster. The researcher presents the task and explains to the children that the manikins are friends who stay on opposite sides of a lake (the blue poster) and want to meet each other. The researcher then asks the children to build a bridge with the blocks. After they are finished building the bridge, they lift it up and place it on the blue poster to check their work.

Table 1. Discussion between Flavio (5:3 years) and Mattia (5:4 years)

Turn	Speaker	Transcript (in Italian)	Our translation
(0:25:44.7)			
1	Flavio	oh:: ((si avvicina Mattia e indica la costruzione del ponte fatta da Mattia)) tiriamolo su ((solleva la costruzione di ponte ed entrambi la guardano)) ma, deve essere ancora più lungo	oh: ((he goes close to Mattia and indicates the bridge construction made by Mattia)) let's lift it up ((he lifts the bridge and both children look at it)) but, it must be longer
2	Mattia	e allora aspetta ((prende dei pezzi di lego dalla scatola delle costruzioni e li attacca alla sua costruzione))	and then wait ((he takes pieces of Lego® from the construction box and puts them on its construction))
(0:25:46.6)			

---

[5] This example is also discussed in Convertini (in preparation).

In Table 1, the issue discussed by the children is about the adequacy of the instrument that they have built, i.e. the Lego® bridge, in relation to a goal (crossing the lake) that has been imposed by the adult. Flavio's argument is based on the locus from the final-instrumental cause (Rigotti and Greco, forth.): the bridge "must be longer".

In this case the instrument is the bridge and it is not adequate, because it is shorter than the blue poster (the lake). This datum, a material-contextual part of the reasoning, has a supposedly clear meaning for the children and it remains implicit in their discussion: they do not explicitly say that the reason why the bridge does not serve its purpose is because it is shorter than the blue poster, arguably because they can *see* it. However, the fact that they have in mind the goal of the task is clear from turn 1, because the children physically lift the bridge and verify whether they have done what the adult has asked them to do. Turn 2 is also interesting because, when the children see that the instrument they have built is not adequate, they immediately suggest a creative solution, i.e. to change the instrument: Mattia says "and then wait" and grabs new Lego® bricks.

In the 'TUC® cookie' example[6] taken from Corpus 1 (see Table 2), Levin (3:2 year old) initiates an argumentative discussion. When the researcher arrived at the home of this family, Levin's mother asks him to give a cookie to the researcher. Levin answers his mother's request by arguing that these cookies are "better not (given) to adults". Thereby, not only does he express his refusal to give a cookie to the researcher, but he also raises the issue "Can TUC® cookies be given to the researcher?" In fact, with his argument Levin explains the endoxon he bases his reasoning on: "TUC® are not made for adults". At the same time, Levin leaves implicit in his argument an aspect of the reality that corresponds to the datum: namely, that the researcher is an adult, because everybody can see this. This unsaid datum is necessary to understand Levin's reasoning: it is only by taking into account this premise that Levin leaves implicit that his argument is completely understandable.

Table2. Discussion between Levin and his mother

Turn	Speaker	Transcript (Swiss German)	Our Translation
1	Levin	d R. wett äu ä chli tee (1.0)	R. also wants some tea (1.0)
2	Mother	m:hm	m:hm
3	Levin	die do=	these ones=
4	Mother	und no es Tuc ((keks)) chaschere äno geh	and a Tuc ((cookie)) you can give her one too
5	Levin	es↑	a↑
6	Mother	es Tuc (3.0)	a Tuc (3.0)
7	Levin	nid ade erwachsnig gschider	better not to adults
8	Mother	momol die sind ä für die erwachsnige	yes yes they are for adults too

5. CONCLUSION

In our data, we have observed young children actively participating in critical discussions. Their reasoning is traceable. It can be described as relying on maxims derived from different loci and on implicit or explicit data. 'Obvious' or 'visible' (in children's eyes) contextual

---

[6] This example was presented and discussed at the European Conference of Argumentation ECA, in Fribourg, Switzerland in June 2017 (Greco, Perret-Clermont, Iannaccone, Rocci, Convertini & Schär, 2018). It is furthermore analysed from a different angle in Schär (2018).

aspects may make the explication of the entire argumentation superfluous. Children can produce multiple argumentations; their standpoints are seldom pre-existing to the conversation but often co-constructed and so are the issues. If the freedom rule is respected, children introduce issues, often via sub-discussions, but only if adults do not interrupt them as they often do, even when they don't intend to (by a lack of the decentration required to understand the child's perspective?).

Reconstructing the components children leave implicit in their argumentation allows for a better understanding of the role that argumentation has in their interactions: their 'Weltanschauung' as it is experienced and transformed by them when they meet other persons with their own 'Weltanschauung'. We are presently also fascinated to discover how children can use argumentation to explore the world or to appeal to sources of 'authority'.

The change of focus that we have operated moving from an analysis of argumentation as a 'skill' to argumentation as a "contribution to a critical discussion" allows us to introduce a time perspective and to better apprehend the social, cultural and material dimensions of the reasoning as an embedded activity. Models borrowed from Argumentation Theory (Pragma Dialectics and Argumentum Model of Topics) have been powerful analytical instruments. They could be now revisited in the light of the specifics of children's argumentation.

Rhetorical issues in robotics

CELINE PIETERS

PhD Candidate with Dir. Emmanuelle Danblon, FNRS Professor of rhetoric at Université Libre de Bruxelles, Belgium & with Dir. J.-P. Laumond, CNRS Director of research in robotics at LAAS-CNRS, Toulouse, France

ABSTRACT: The words used to describe robots are very familiar to our own human body (*autonomy, decision, intelligence,* etc.). In the meanwhile, machines seem to challenge the typical way of acting of the living organisms. Is it obvious to describe the robots within these terms? How is our conception of language reflected in our perception of robotics? We clarify this problematic by revisiting our rhetorical heritage and the bond between movement, action and language. In this sense, we aim to enlighten the rhetorical issues that occur from this relation.

KEYWORDS: robotics, robots, movement, action, logos, language, Aristotle, rationality

1. INTRODUCTION

The company ABB Robotics developed a robotic arm that sorts sausages. The machine is able to identify the position of each sausage on the belt, to choose the sausages according to the required size (defined by an operator), to adapt its movement in order to be able to grasp the sausages lying on the belt, then to place the sausages in a package without interfering with another sorting arm. Thanks to its sensors which give a feedback on the situation, the robotic arm is able to adapt to its environment. The algorithm determines the path of the robotic arm in order to reach the sausages. It also defines the strength and direction to be maintained for each sausage. In other words, the sorting arm *decides* which sausage to grab and how to grab it.[1]

So far, in our modern and occidental culture, machines and automatics are spontaneously combined. However, we talk nowadays about *intelligent* machines that show *autonomy*, can make *decisions*, can *learn*, etc. and one thing leading to another, the status of these words which are *a priori* exclusive to humans and/or living organisms, is disputed. This questioning is based on representations that combine fascination and fear rather than facts, but it remains crucial to understand how we come to formulate the problem in this way. Why and how the machines that are part of the history of technology challenge humans to the point of being thought (in the most extreme case) as the next step of evolution? Besides, this question is largely grasped by disciplinary fields such as philosophy, sociology, or anthropology that describe this vast and complex phenomenon from a specific point of view. In this paper, we propose a linguistic approach in order to question the role of language in our representations of robots; on one hand, discourses about robot performances are spontaneously judged as inadequate or even misleading by experts in robotics; on the other hand, these discourses are based on a spontaneous use of language that is not essentially condemnable. How is our conception of language reflected in our perception of robotics?

We suggest firstly to consider the lexicon shared by the livings and the field of robotics (words such as *autonomy, decision, intelligence, conscience, judgment, learning*, etc.). We observe that these words are used in the field of robotics, not only for humorous purpose or to popularize knowledge. We notice the discomfort of the experts in robotics towards this lexicon and clarify it by revisiting our rhetorical heritage. Secondly, we aim to dispel the allegations that are made against persuasion as we consider the case of the agentive language in robotics and its bond to our ability to represent moving objects. We refute the idea of persuasion as a risk for rationality based on the Aristotelian model of rhetoric and on cognitive aspects.

2. A LEXICON FOR ROBOTS AND LIVING ORGANISMS

In the media, occurrences that belong to the lexicon shared by living organisms and robots are easy to find (*autonomy, decision, intelligence*, etc.). In *Le Monde*, the topic of artificial intelligence was mentioned in 200 articles in 2017 (almost 15% more than in 2016).[2] Robotics fascinates the society and the agentive lexicon is more than frequent when it comes to report events involving robots, or to describe technological innovation developed by public or private laboratories.

In July 2017, the surveillance robot K5 designed by *Knightscope* for an American shopping center ended up crashing into one of the fountains of the store. Internauts and journalists made comments: "In the United States, a security robot throws itself into a fountain"(*Sciences et Avenir*, 18 July 2017)[3], "Did the android commit suicide by throwing himself into a pool? Security robots are supposed not to feel bored. Yet, one of them seems to have voluntarily dived into a fountain in a Washington mall." (*Le Monde*, 19 July 2017)[4], "It's ok security robot. It's a stressful job, we've all been there." (*Twitter*)[5].

The company *Knightscope* answered to these comments on Twitter with a *prosopoeia*:

🐦 Breaking news: "I heard humans can take a dip in the water in this heat, but robots cannot. I am sorry" said K5 in an official statement. (23:17 - 18 JUL 2017 - Milpitas, CA)

While it is obvious that the agentive lexicon is widely used in the media to describe a situation involving a robot (sometimes with humour), these words are not only used to popularize or amuse. The researchers in robotics also describe spontaneously the actions of robots in these same terms, even in daily conversations between experts in a professional situation: "I did the test this morning and HRP-2 was not *disturbed* when I pushed his leg or tried to move it." (Andrea, post-doc. student at LAAS-CNRS, announces to a phD student that they succeeded in changing the humanoid robot's control from a position control to a force control). Or, "I was really annoyed, [the robot] Pyrène didn't *want* to move his right arm in front of the group of visitors during the demo […]" (Olivier, research director at LAAS-CNRS). Referring to this matter, Denis Vidal makes an interesting comment in *Towards a new anthropomorphic pact,* while he describes a working session with a roboticist who tries to improve a robot performance in terms of vision: "So we can already understand that even in

this purely professional context, where the main part of the conversation is explicitly focused on the technical characteristics of the robot and on the tests that can be carried out with it, two ways of talking about the robot have constantly intertwined. Robots have sometimes been considered as simple artifacts (...), but the researchers have also referred to them as real "people"."[6]

Although experts in robotics spontaneously use these words, the agentive lexicon is often accused of initiating, or at least encouraging, the fantasies of laymen about robots. Indeed, if they (researchers and engineers who have acquired advanced knowledge in the field of robotics) are able to consider this lexicon as rhetorical figures, they worry about the confusion of the public regarding the status of these words (*intelligent* machines, *autonomous* machines, etc.) and by association of ideas, a confusion towards machines themselves. The concern of experts is not surprising as we observe the results of an experiment conducted by Van Duuren and Scaife in 1995 with the aim of understanding how the public represents the notion of intelligence applied to robots: "After interacting with a robot, adults and children seem to treat it as an intelligent entity, but intelligent in a particular sense, unique. A different meaning from the one used to describe living entities, and also different from the one used to describe objects."[7] Facing this observation, some scientists therefore opt for the solution of avoiding, or even forbidding, the use of the agentive lexicon. They describe it as being *ambiguous* or even *misleading* or *manipulative* as the words *supposedly* describe an action of the robot (the machine decides,…), or a disposition (this machine demonstrates autonomy,...): "I always tell my students to not use the words "intelligent machine", a machine is not intelligent." (Andrea, post-doctoral fellow at LAAS-CNRS). Anyhow, the relation of experts to this agentive language clearly expresses a discomfort. Gentiane Venture, roboticist and research director at the *Tokyo University of Agriculture and Technology*, shared her point of view at the workshop on "Wording Robotic", LAAS-CNRS Toulouse: "I deal with robots all the time, I talk about robots all the time, I do presentations with robots all the time and I found myself using "he" (and not "it") for the robot. I say things like: "Oh look at this cute guy, he is doing something here", and if the robot suddenly says "battery drained" and does[like it has no energy anymore], I say: "The robot is tired". When I found myself saying that, I think: "Oh damn, what did I just said! I shouldn't do that because I'm just playing in this game of the "artificial intelligence" and the agency,... and [people] are gonna actually think that yes, the robot is tired because he has been talking and walking too much,... But it's just out of battery. […] This is making the way of talking about robots very complex."[8]

This testimony outlines a common judgement expressed by roboticists about this lexicon: on one hand, it offers a fast and obvious access to the concepts, and on the other hand, it involves the risk of a confusion about the status of the robots. If the example of the robot *being tired* does not appear particularly problematic, the case of the humanoid robot HRP-2 which is not *disturbed* or the one of the sorting arm which *decides* what to do with the sausages, brings undoubtedly more questions for a non-expert reader. Consequently, some researchers in robotics start to support the idea that because of its powerful efficiency, the agentive lexicon that robots and living organisms have in common should not be provided to anyone. As for the

European Parliament, the public and especially vulnerable people and children,[9] would be too easily inclined to uncritically follow its fascination for robots. This statement mirrors the European Institution's intuition of a universal audience, described by Perelman and Olbrechts-Tyteca: all rationale beings, all normal, all adults.[10]

These considerations about agentive language in robotics reflect in fact a certain conception of language and rationality, i.e. of rhetoric, that has reached our modern societies in a caricatured form, carrying heavy *clichés* that remain vivid.[11] Inherited from a (simplistic interpretation of) the rhetoric of Plato, these preconceived ideas stem from a model of rationality that only encourages a reductionist view of the world. Indeed, it establishes a dichotomy between a "good" rhetoric, pure and demonstrative as it serves philosophy, and a "bad" rhetoric, manipulative even dangerous because of its bond to persuasion. In other words, if rationality stood on one side, persuasion (i.e. the trap of emotions, the one to fight in order to make a so-called rational decision), would stand on the extreme other side. Consequently, the prejudices about rhetoric as well as its bad reputation lead spontaneously humans to condemn the words as -the- problem of science, and in this case, of robotics: *manipulative language, rhetorical trap, misleading image, emotional response*, etc. would divert the public from rational judgments about robots. However, applied to language, this model of rationality is nothing else than an abstract and idealized conception of reasoning. Indeed, this model contravenes the most elementary psychology, as well as neurophysiology: the necessary bond between emotions and our ability to make decisions has been clearly established.[12]

As an alternative to this persisting myth (that pretends that rationality would be guaranteed if rhetoric and any persuasive tool would be avoided), the model of rationality that can be retrieved from Aristotle's point of view is especially useful. According to Aristotle, rhetoric is defined as "the ability to discern, in each case, what is potentially persuasive".[13] It is an art, a technique, that focuses on efficiency: Aristotle's rhetoric fulfills a series of functions (to tell stories or testify, to criticize, to decide, to judge, to think in action, etc.) without, however, dismissing human emotions. Language is then considered as being a *pharmakon*, able of both healing or degrading according to the speaker's intentions. Rhetoric, as an extension of the "spontaneous abilities that build social [relations] through the *logos*"[14], is introduced as a universal ability that covers multiple aspects of human rationality: "it is one of the many arts resulting from human ingenuity; it leads human to use its own nature and to develop its functionalities".[15]

From this point of view that refuses to demonize persuasion, it is therefore possible to question the function of agentive language in robotics.

3. MOVEMENT AND AGENTIVE LANGUAGE: MAKING ACTIONS VISIBLE

In 1944, Heider and Simmel showed how humans spontaneously attribute intentions to moving geometric figures[16].[17] While the forms moved randomly, it was observed that the subjects of the experiment describe the actions of the figures in the following terms: *continue*, *attack*, *follow,* etc. The experience reveals a cognitive mechanism that reflects the natural ability of humans to tell stories (the latter being a particularly useful quality especially for memorization)[18] and according to Fritz Heider, this process of attribution serves our concern for coherence in an world that is uncertain by nature.

Thanks to its representational dimension, the agentive language proves indeed to be particularly effective as we imagine the action. As reported in the news, the robot K5 "jumped" (not "fell") into the fountain: the robot K5 goes alone towards the fountain, dives into the water and sinks. "Jumping" directly rejects other meanings in terms of representations: no one pictures the robot being pushed into the water, or falling on the ground and rolling into the bottom of the pool. This representational dimension of the agentive language produces in fact the *enargeia,* i.e. an effect of visiblity or presence of the facts, which gives a fast and direct access to the action. Precisely, according to Aristotle, the primary function of any discourse is precisely the *enargeia* as firstly, the discourse must *show*. Besides, Ruth Webb explains that "the link between *energeia* with an "e" (movement, things in action) and *enargeia,* with an "a" (the life of the text, the process that consists in making the facts visible through language) is much more than a simple morphological resemblance".[19] François Hartog points out that if these two forms of presence are clearly offset, they both hold the power to show reality.[20] In the case of the robot K5, "throwing itself" *shows* the movement of the robot, as much as the surprising nature of the situation. From a model of rationality that explores language and perception as human tools*,* these two natural mechanisms are only strategies that reflect the ability of human to represent the world to its own level, rather than illusions essentially harmful.

This being said, if agentive language can be effective and its effect of visibility useful, we must not deny that the lexicon used to describe robots can also be confusing about the status of the robots. How much does the sausage sorting robot *decide* or will be able to *decide* in the future? Did the robot K5 have a reason to *jump* into the water? Did we lost control? This doubts that occur within our interpretation can be explained by the fact that the effect of visibility often comes with an effect of validity: what sounds right also sounds deeply true, correct and adequate. In this way, the bond between persuasion and validity brings a paradox: while our sensations and representations are deemed irrational (we would not dare to invoke them to justify judgments and decisions), yet, they always act and guide us.[21] A spontaneous reaction is to avoid the use of the lexicon shared by robots and living organisms in order to try to bypass this paradox. However, we must accept that the outcome of this solution may not be beneficial over time: while the roboticist who feels uncomfortable to use these words will stop to

communicate (*a priori*, the roboticist who is today "worried about doing wrong" will apply literally and strictly the principle of cautiousness in the future), the roboticist who will try to forbid the use of this lexicon and impose forcibly the idea that a machine is -not- intelligent, will only encourage the development of conspiracy theories ("The roboticists hide things from us", "they program robots to manipulate us and make us do what they want", etc.).

4. CONCLUSION: A RHETORICAL CULTURE

As we consider that discourses are based on a natural language concerned with coherence, the linguistic and the cognitive layers are introduced as the natural tools of a human being, and rhetoric as an extension of its nature.

If this conception of language does not mean to solve the problems that occur within the production and the interpretation of discourses about robotics, it allows to reconsider the bond between persuasion and validity and following this, to propose alternative solutions. Indeed, this point of view enables to handle the resolution of the paradox that lays between persuasion and validity in an other way than by avoiding the problem. This perspective makes indeed the dissociation of the discovery and the justification phases possible; the discovery phase provides conjectures[22], hypotheses and representations of the world, while the justification phase consists in an "evaluation of the representations obtained by intuition through refutation"[23]. Consequently, it is then no longer necessary to ineffectively try to banish a lexicon that is already well integrated in the language or to condemn a typically human cognitive process.

As Gilbert Simondon called on society to strengthen its technical education (which can certainly be welcome) for a better understanding of techniques and technology, there is also a need to reconnect to a model of rationality and a rhetorical culture that assume the reality of humans living in a complex world. Indeed, the rediscovery of the practice of the art of persuasion where experts and citizens meet on a similar level demands to quit a model where obviousness prevails (*I believe only what I see*) for a system governed by trust in which roboticist don't fear to nourish ideas of transhumanism as they present technological innovation, and in which the audience has a strong experience in critical thinking and judgements. According to this model, the agentive language proved as a natural mechanism that is useful in the discovery phase, does not compromise the justification phase in which the criterion of validity appears: as we say that a machine *decides* about the destiny of sausages, our ability to judge the *humanity* of the robotic arm is not essentially threatened.

ABSTRACT: The work we propose here is an argumentative study concerning the ancient Greek, as it was used in the time of Aristotle. We defend the idea that it is possible to carry out an empirical semantic study on ancient texts such as those of Aristotle, provided that a sufficiently large corpus is used (for example, all the known texts written in that language), and the rather fine knowledge which philosophers and, in this case, Hellenists have elaborated concerning the debates of ideas which permeated that epoch.

KEYWORDS: argumentation and ideology, argumentative ambiguity, ancient greek, use of argumentative analysis, authorship determination.

1. INTRODUCTION

This study also has a practical orientation: elaborate elements of a method allowing to provide evidence for or against the attribution, to an author, of a text whose origin can be considered doubtful. Here we focus on a text, the Problemata, which groups together a large number of arguments of its author(s) on various subjects, and whose attribution to Aristotle gives rise to some doubts.

We restrict the semantic study to the description of the Greek words ὀξύ (sharp, acute) and βαρύ (low, severe), in their different forms (nouns, adjectives to positive, comparative or superlative), as they appear in section XIX of that text. We show that these words introduce argumentative ambiguities, which can be discriminated using knowledge about the author's ideology at the time of writing. More generally, we will see that there is a link between the semantic properties of units of languages and the ideology of discourses which use them. On the basis of what we know of Aristotle's ideology, and taking into account the argumentative properties of some Problemata of Section XIX, we will explain how we can determine whether they can possibly be attributed in some way to Aristotle (or one of his close disciples), or if, on the contrary, they can certainly not be attributed to Aristotle.

2. PATERNITY PROBLEM FOR THE *PROBLEMATA*

Like the majority of the Problemata sections, the nineteenth section, with fifty problems, is not attributed to Aristotle. Nevertheless, according to the Hellenists Pierre Louis (1993) and Eichthal and Reinach (1892), it is probably the work of Aristotelian disciples testifying with more or less fidelity of the thought of Stagirite in music, while other sections are, rather, attributed to other later authors.

We will show how the study of the occurrences and the form of the adjectives ὀξύ (*sharp, acute*) and βαρύ (*low, severe*), can give indications about the genesis of some of the *Problemata*. In order to achieve this goal, we will have to show that there is a general way of linking linguistic facts to the ideologies underlying the discourses exhibiting these facts. From what we know about Aristotle's ideology, we will determine whether or not, examining some of the linguistic facts appearing in a set of *Problemata* classified in section XIX, provides evidence for securely attributing those *Problemata* to Aristotle or one of his close disciples.

2.1 A ... globally Aristotelian... text

The Hellenists consider that this section is written by Aristotelian disciples because it addresses the problem of music in terms recognized by tradition as Aristotelian. Indeed, we find here ideas close to (and often identical to) those of the philosopher, as well as his terminology. Nevertheless, it should be noted that we do not have a treatise on music on the part of Aristotle; at most, Book 8 of the *Politics* casts some ideas about the use of music for society, but nothing about what it is and how it is constructed.

Section XIX is what we have (even though indirectly) most accomplished on music from the philosopher. But it is also, and this is quite worthwhile, a testimony of a part of the Pythagorean ideas on music, as if, for this field almost exclusively, Aristotle did not find it useful to defeat the ideas of the Pythagorean philosophers, who, however, elsewhere and on other subjects, he used to fight.

As we will see, one of the formal characteristics which betray the Aristotelian (even indirect) origin of section XIX of the *Problemata* lies in the distribution of the positive or comparative form of the adjectives ὀξύ and βαρύ according to the context in which they are used.

2.2 Comparatives and infinite

Indeed, on the one hand, the adjectival form of the comparative or the superlative presupposes the possibility of considering in its gradual form the quality to which the adjective refers. The comparative form in -τερος means "more … than", whereas the superlative form -τατος can be relative ("the most") or absolute ("very").

Now, admitting that a quality can be more or less strongly manifest in a phenomenon, prevents from recognizing a limit in the plus or minus: the presence of ὀξύ or βαρύ to the comparative or superlative form commits with taking into account the *more or less sharp* or *more or less low* unlimitedly. This is indeed how, according to the conclusions of Wersinger (2008), the Pythagoreans represented the infinite or the unlimited:

> Pour les pythagoriciens, *l'apeiron* est donc « le plus ou le moins ». Sans doute l'infinitésimale telle qu'ils la conçoivent est-elle encore rudimentaire. Il n'empêche qu'elle constitue pour eux une représentation qui leur sert à reconnaître l'existence de l'infini en tant que différence évanouissante de deux grandeurs.[1] Wersinger (2008, p. 230)

On the other hand, we know that Aristotle, like other philosophers of Antiquity (but unlike the Pythagoreans), was reluctant to admit the existence of the infinite or the unlimited outside the field of mathematics. What is perfect is necessarily finite; infinity is not knowable, according to the Ancients.

---

[1] For the Pythagoreans, the *apeiron* is "the most or the least". No doubt the infinitesimal as they conceive it is still rudimentary. Nevertheless, it constitutes for them a representation which they use for recognizing the existence of the infinite as a vanishing difference of two magnitudes.

It is known that, if Aristotle refused to believe in the physical infinity of the world, he did not deny mathematical infinity; he was aware of Zeno of Elea's paradoxes, since he relates them in *Physics* before examining them.

In examining these problems, Aristotle presents a fundamental distinction between *potential infinite* and *actual infinite* that, according to him, must now be established. *Potential infinity* is a construction of the mind, necessary for the resolution of certain problems falling within mathematics, but not assuming a correspondence with something of the world; while the *actual infinity* must really correspond to something existing. But for Aristotle, no *real* object is infinite.

In the entirety of the texts attributed to Aristotle, we do find adjectives expressed in the positive form, the comparative form and the superlative form. However, this does not contradict, in general, what we know about Aristotle: even though every expression in the comparative or the superlative could be considered as a warrant in favour of the idea of infinity, we know that Aristotle, anyway, does not question the existence of a potential infinity, necessary to the understanding of the problems in particular mathematical, or 'mathematizable'.

3. WHAT WE AIM AT AND WHAT WE CAN EXPECT

For several decades, discourses have been known to give indications on the ideologies of their authors: from Viktor Klemperer to *Speech Analysis*, many authors have examined this aspect of the language sciences with regard to many living languages. But to study the possible links between the texts that interest us and the ideologies that we think we know, we face a major obstacle: we want to study the traces of utterances in an ancient language, that is, by definition, a language for which we have no living speaker...

3.1 Studying an ancient language using the tools of modern linguistics

Since we have no living speaker to verify or falsify, through the consequences on their discourses, what we say about the Greek language of the fourth century AC and what we say about the ideologies of Aristotle and Aristoxenus. We will not be able to test our descriptive hypotheses in this way. However, this apparent disadvantage has a definite advantage: the fact that there is no speaker any longer implies that there has no longer been, for a long time, authentic production in that language: in other words, we have *all* the texts, traces of statements in the Greek language, which have been found to date: constituting a corpus is therefore particularly easy, since the crucial problem of the selection criteria no longer arises.

Our corpus consists, on the one hand, of the XIX section of the *Problemata* and on the other hand, the *Elements of Harmony* of Aristoxene; the other texts of contemporary Greek authors, translations and commentaries from the nineteenth to the twenty-first centuries will play the role of interlocutors or will, in any case, be used to test our assumptions. On the other hand, although we cannot test our hypotheses with real-life subjects, the body of Greek texts puts us in the presence of past speakers and, as long as we can identify their ways of seeing, we have an indirect means of refuting or confirming the hypotheses we are led to formulate in order to describe the meaning of the words of ancient Greek. In order to secure reasoned hypotheses on the past speakers' ways of seeing, two tracks can be explored: on the one hand, the detailed analysis of successive translations of the target text, and their motivations and; on the other hand, the written knowledge researchers have accumulated about the ideological, philosophical and scientific debates of the time. In this study, it is this last means that we explore: firstly, we expose a set of non-linguistic data concerning these debates, and organize them in such a way

as to be able to formulate hypotheses, predictions and questions about the plausibility that such author supports or attacks such a position in these debates.

Of course, we will limit this exploration to data that will allow us to describe the meaning of βαρύ and ὀξύ, in order to understand the ideologies that their uses evoke. It is these results that will then enable us, as a kind of application of our study, to provide arguments for or against the attribution, to the presumed author, of texts whose origin is disputed.

3.2 Using a fine-tuned semantic model in order to account for the ideological bias that explains a statistically measured textual property

If the *Problemata* are indeed the work of Aristotle or his close disciples, and if there is a link between the linguistic fact and the ideology of discourse, then in section XIX, the fifteen or so problems that deal with ὀξύ or βαρύ should, in one way or another, reflect the acceptance of the *potential* infinity and the rejection of the *actual* infinite. In particular, we can expect that, in domains whose boundaries have not been clearly delimited, the grammatical form chosen for the adjectives ὀξύ and βαρύ reflects the Stagirite's will to block the penetration of infinity into the actual observable world. However, derogating from his own principles, Aristotle did not explain the external limits of the sound sub-domain of music: the refusal to use the comparative and superlative forms of these adjectives would allow Aristotle to partially compensate for this lack of limits and to continue to oppose the Pythagoreans by eliminating any possibility of expressing themselves in mathematical terms when talking about the sounds of music. In section XIX of the *Problemata*, out of 45 occurrences of ὀξύ or βαρύ, 11 are in the comparative or superlative form: we observe that these occurrences appear in passages where Aristotle speaks of the physics of the generation of sound, whereas, when he deals with the perception of sound, only positive forms are used. It seems, thus, that the total absence of comparatives and superlatives for these two adjectives should be explainable by some incompatibility between aspects of the meanings of those forms, and some biases with which the author's understands musical sound perception. In order to examine that question, we will thus need a semantic framework in which meanings and biases are related: this is where the ViewPoint semantics comes in.

3.3 Using philosophical and historical studies in order to justify the interest of a statistical disappearance

The disappearance of comparative and superlative forms of ὀξύ and βαρύ a part of our corpus is all the more remarkable, because we encounter a greater share of ὀξύ or βαρύ occurrences in the comparative or superlative form in the writings of Aristotle's own disciple, Aristoxenus of Tarentum, who was a distinguished disciple of Aristotle (he would even have been tipped to succeed the master at the direction of the Lyceum, if the master had not, at the end, preferred his own son-in-law).

As a result, we can also wonder about this apparently paradoxical use of Aristoxenus of non-positive forms: a disciple of Aristotle, who is fiercely opposed to the Pythagorean doctrines too, shows no reluctance to use comparative and superlative forms for adjectives ὀξύ or βαρύ. Whereas, as we have seen, Aristotle would avoid using these forms whenever they could contribute to strengthening the Pythagorean ideas, and, for that matter, the possibility of infinity for actual objects.

To feed our interrogation tracks, note that Wersinger (2008) is surprised to note that in Plato's *Philebus*, unlike *Parmenides* and *Sophist*, the form of the adjectives βαρύ and ὀξύ is always positive.

La disparition du comparatif qui caractérise les relatifs relevant de *l'apeiron* [l'illimité] (comme « le plus aigu » par rapport au « plus grave »), au profit des adjectifs simples (comme « l'aigu » et « le grave ») témoigne d'un glissement qui pose problème. Le grec ancien établit une distinction claire entre la forme grammaticale qui énonce les relatifs par les comparatifs et celle qui les absolutise.[2] Wersinger (2008, p. 251)

We derive at least two pieces of information from this passage: we consolidate our hypothesis that the comparative or superlative grammatical form has to do with the infinite, or the *apeiron* (the unlimited); we find that this 'slippage' is considered "problematic" by Wersinger. A few pages later, she explains this disappearance of comparative forms by the fact that the text is about "low pitched" and "high pitched" sounds, that is to say, concerns belonging to music, area in which ὀξύ and βαρύ play a limiting role (on which we will have the opportunity to return).

These remarks justify thus our questioning about the use of the grammatical forms of these two adjectives in a musical context: the words βαρύ and ὀξύ, used to refer to *low pitched* and *high pitched sound*, are often presented as at the heart of the issues related to music and mathematics. According to their grammatical form, did they bear the mark of the infinite or *apeiron* or, on the contrary, were they perceived as limiting?

And, since Aristotle, in *Problemata* XIX, uses several forms of the adjectives βαρύ and ὀξύ, it is necessary to ask whether, in some cases, he follows a Platonic way of proceeding and, in other cases, he eliminates the very idea of *apeiron* conveyed by the comparative and superlative forms of the adjectives.

From her part, Wersinger comes to the conclusion that, if Plato's position is ambiguous, that of Aristotle leaves no doubt.

On constate qu'Aristote rigidifie ce que Platon ne semblait qu'effleurer : un intervalle liminaire délimite un domaine. Alors que Platon affirme à la fois que l'intervalle est un infini et un limitant, comme en témoigne l'exemple de l'aigu et du grave, qui sont infinis et qui pourtant délimitent le domaine musical, Aristote refuse cette ambivalence ou cette ambiguïté et tranche en faveur de la limite. […] Par rapport à Platon, cela revient à déclarer qu'il n'existe pas d'intervalle non borné.[3] Wersinger (2008, p. 264)

Our next step is trying to understand more precisely in which cases, and for what reasons, Aristotle would use, sometimes the comparative form sometimes the positive form of these adjectives.

Aristoxenus, although disciple of Aristotle, seems to tame the idea of infinity by taking care to clearly delimit the space or the place subjected to his study of acoustic and musical phenomena, thus returning the notions of infinity or unlimited to the mathematicians heirs of Pythagoras while he faithfully follows the Aristotelian method by the very constituency of the area to be studied.

Wersinger (2008), insists that, (i) most probably, much of what we know about the Pythagoreans actually comes from the Platonists, who contributed greatly to founding the Pythagorean legend; and (ii) Aristotle, especially in the Metaphysics, is one of our best informers about the Pythagorean doctrines. Thus, Wersinger argues that:

---

[2] The disappearance of the comparative, that characterizes the relatives pertaining to the *apeiron* [the unlimited] (like "the sharpest" compared to the "lower"), in favor of simple adjectives (such as "sharp" and "low") shows a problematic shift. Ancient Greek makes a clear distinction between the grammatical form which states the relatives by the comparatives and the one which absolutize them.

[3] We can see that Aristotle rigidifies what Plato only seemed to scratch: an interval delimits a domain. While Plato affirms at the same time that the interval is infinite and limited, as is evidenced by the example of *treble* and *bass*, which are infinite and yet delimit the musical domain, Aristotle rejects this ambivalence or ambiguity, and chooses in favour of the limit. [...] In relation to Plato, this amounts to declaring that there is no actual unbounded (open) interval.

With this remark in mind, we can expect to find elements of Pythagorean thought through what Aristotle and Aristoxenus say about it, in comparison with their own thought. It may not help us to draw the exact outlines of Pythagorean thought, but that is not the goal we pursue. Indeed, we do not seek to understand Pythagoras through Aristotle, but only if the use of adjective degrees in *Problemata* section XIX can be mapped to what we know about Aristotle's ideology. With that purpose, we will explore the possibility of a link between linguistic facts and the ideology of Aristotle, exploration that supposes, more generally, the possibility of establishing a relationship between a linguistic fact, and statistical measures, and what we know about the thought of the author of the linguistic segment which exhibits the observed fact.

4. NON LINGUISTIC DATA

The opposition categories of ὀξύ and βαρύ are controversial…

The opposites of the type ὀξύ and βαρύ are, for the ancient Greeks, the first elements that can be enumerated and whose systematic opposition fascinated the ancients. These pairs of oppositions work (even now) as instruments of knowledge and seem reassuring because they are binary –no doubt they respond to a certain functioning of our thought. The next three sub-sections sketch an explanation of how the lists of oppositions used to work as an instrument of knowledge in the Greece of Antiquity.

4.1 The use of Sustoichiai as an instrument of knowledge

This process, which leads to knowledge through the opposites, favours the emergence of analogies, and particularly analogies of structures, which allow, among other things, an early, abstract description of the phenomena of the world. Thus were born the first descriptions of acoustic and harmonic phenomena, which the Pythagoreans and their followers described in largely mathematical terms.

Aristotle names συστοιχία (*sustoichia*) the list or table of opposites. He notes that this list is not disordered or unfounded: its construction obeys a set of rules that it brings to light; these opposites are coordinated and hierarchical.

Limited and unlimited	Rest and movement
Odd and even	Straight and curve
One and several	Light and dark
Right and left	Good and bad
Male and female	Square and oblong
Table 1: The Pythagoreans' Ten principles *(from Aristotle, Métaphysics 986a22-34)*	

---

[4] [...] it has been defended that only the testimony of Aristotle seems worthy of faith and that it is convenient to compare to this testimony the fragments that remain to us. Yet Aristotle is not always a reliable witness […]. He does not faithfully report Pythagorean thought, but translates its significance to his own thought.

The pairs of opposites established in this list are widely used by Aristotle in many of his works, when he undertakes to produce a complete description of a phenomenon he observes. He goes so far as to explain Nature by the obligatory observation of the opposites, without hesitating to artificially sneak his ideology. For example, noting that the heart is on the left side of the body, while this important organ, in his representation, should be on the right, he explains it by emphasizing that it must be so in order to compensate for the obviously natural coldness of the left side. (Aristotle, First analytics, 665a22 and following).

4.2 Analogy and pairs of opposites: two complementary paths

In the Greek thinkers of Antiquity, thus, we find a fascination for these pairs of opposites, and more generally for a system of almost automatic derivation of these opposites, a kind of declination by analogy, which would make it possible to cover the whole of the real world by this type of descriptions, which can be considered as a kind of abstract formalism.

Legend has it that Pythagoras, strolling through the busy streets, noticed that the sound of the anvils produced more or less high notes, sometimes consonant when the receptacles on which they were struck were, as to their volume, in a proportion ratio easily formalisable into simple fractions. What was his surprise when he noticed that the fractions were the same as those that could be observed on a monochord –a string stretched over a wooden body with resonance: the upper fifth of the sound produced by striking the full length of the string is obtained by striking 2/3 of its length; the upper fifth of the sound produced by striking a hollow and resonant object will be obtained by striking an object with identical shape, dimensioned to the 2/3 scale. The Pythagoreans like the other physicists of their time (and of the times that followed) tried to abstract from an observed experiment what could be duplicated on another.

We see, then, two closely related paths of knowledge: one pursuing the laws of proportion from [A is to B what C is to D], the other the laws governing opposites from [A is to B what -A is to –B] (where "-X" refers to the opposite of "X" in the list of opposites). Each of these paths has to do with analogy and abduction in its most elementary form, in that we extract from these observations a general rule which is said to constitute the rector principle of the phenomena of the world.

Note that the seduction exerted by couples of opposites on humans does not concern only the Greeks or even only the Westerners; it is also a peculiar characteristic of Eastern philosophies and religions, like Taoism with Yin and Yang; or, geographically closer, but more distant in time, Zoroastrianism and its simplified form, Manichaeism.

*4.3 Three types of oppositions*

The pairs of opposites in Aristotle, whether they are predicates or concepts, if they reflect the real phenomena, do so only because, moreover, they play the role of limits of the domain they allow to approach. To account for this, we propose to distinguish three types of opposites: opposites *with respect to their orientation*, opposites *in their domain*, and opposites *as concepts*.

Opposites as to their orientation concern qualities that can be attributed to objects of the world; they could be represented at each side of a geometric line on which, for example, the more (or less) hot or the more (or less) cold would degrade. This virtual representation in the form of a graduated geometric line can be abstract enough (from the Aristotelian real world) to run to infinity in one direction or the other: there will always be higher, warmer ... at least can we imagine it as far as mathematical infinity allows us. Some so-called *opposite predicates* may even designate the same absolute value according to the degree they display: *less cold than yesterday* at 12° C may denote the same as *warmer than tomorrow*, still at 12°C. Opposites within this category of *opposite-oriented predicate*, allow thus a certain superimposition of the

values of the predicates according to the context as well as a graduation to infinity; it is of course possible, later, depending on the object that one wishes to describe using these predicates, to determine a limit or graduation beyond which the object changes in nature. In any case, this type of oppositions makes it possible to determine open intervals (that is, either infinite or whose bounds are excluded). In such a context, + hot or + cold will be *opposed as to their orientation*. Diagram 1 illustrates this configuration:

+cold   *+hot*

Diagram 1 : *Opposed with respect to their orientation*
Opposites *in their domain* also concern qualities of objects of the world; they can be represented as two subspaces constituting a partition of an observed material space. They correspond to a gradual conceptual space, but the partition into two subspaces makes it possible not to take into account the gradualness of the domain. Thus, *hot* and *cold*, for instance, can be seen as two complementary sub-spaces of the space of (liquid) water temperature. This category of opposites does not allow the superposition of the predicates and limits the material domain considered: this type of oppositions makes it possible to determine closed intervals (that is to say finite and containing their limits). Diagram 2 illustrates this configuration:

COLD	
	HOT

Diagram 2 : Opposites in their *domain*
Opposites *as concepts* are distinguished from the previous two in that they only concern conceptual domains, do not constitute a partition of the domain, and do not concern a gradual domain. Thus, for example, the *open-closed* opposition determines neither the bounds nor the content of a material space. An object or a phenomenon of the real world cannot be said *more or less open* or *more or less closed*. *Open* and *closed* are logically opposed. One thing is either *open*, or *closed*.

Be they perceived as (1) opposed orientations (+ vs -), (2) opposed domains (hot vs. cold, sharp vs. low) or (3) opposed concepts (open vs closed), these opposites help to determine the nature of the phenomena that will be discussed –and not the opposite: indeed, when I speak of the opposition *the hot* vs *the cold*, I do not speak of the same phenomenon that would be describable with the help of ± *hot* and ± *cold*.

The so-called Pythagorean list of the ten opposites contains undeniable *conceptual* opposites: *the odd* and *the even*, *the one* and *the multiple*, *the rest* and *the movement*, *the square* and *the oblong*, *the male* and *the female*, *the rectilinear* and *the flexed*. It is more difficult to imagine that opposites such as *light* and *darkness*, *right* and *wrong*, *left* and *right* have no relative graduations. In our present representations, there is *more or less good*, *more or less right or left* and *more or less enlightened*. These opposites are formed of two qualities relative to each other. We can imagine a momentary shift of these representations into a more fixed and absolute form, which would then make these opposites belong to the category *as to the domain*. The essential question, one will guess, is to know what type of pairs of opposites the opposition between βαρύ and ὀξύ belongs to, according to our different authors.

5. THE VIEWPOINT SEMANTICS AND ITS USE TO ANSWER OUR QUESTIONS

We join the Ducrotians (see, for example Ducrot 1984), but also many other linguists, semioticians or discourse analysts (see, for example, Ouellet et al., 1994:137), in defending that semantic phenomena and, for that matter, opposites in the language, do not –cannot– inform directly about the world; nevertheless, they make it possible to understand how the speakers' and the hearers' way of apprehending the world is conditioned by the semantic properties of their language (see also Raccah 2015).

In order to do so, one must be able to follow the threads linking the semantic structure of the languages under study with the process through which speakers and hearers construct utterance meanings by way of applying sentence meanings to their perception of the world (subjective situation). Obviously, a semantic model based on a 'transmissional' conception of linguistic communication cannot help achieve such an enterprise: we now present a conception of communication that accounts for the fact that utterance meanings are not transmitted by the speaker but rather constructed by the hearer, and a semantic model based on that conception of communication, and that accounts for the fact that semantic phenomena do not inform about the world, but about the way speakers and hearers apprehend the world (cf. Raccah 2014).

5.1 Linguistic communication and instructional semantics

It has been shown, in many different ways, that communication using a (human) language is not about sending messages, but (roughly speaking) about manipulating people in order for them to construct the meaning one wants them to construct (this will be 'unroughed' in a while…). We will not reproduce the relevant demonstrations here, though it might certainly be useful, for the 'message transmission' conception is still taught, in most universities around the world, as the 'good sense' conception (if not the only one). However, in order to understand instructional semantics, it might be useful to, first, have a look at an alternative to the 'transmissional' conception, alternative that can be considered to be the background of the various instructional semantics.

Since nothing *really* goes from the speaker's mind to the hearer's mind, the transmissional conception of communication is but a metaphor of –successful– communication and, as such, cannot be used for scientific purposes. The impression that communication is about transmitting messages comes from the fact that, when both speaker and hearer are glad after a communication session, both the speaker (who also is a hearer for himself) and the hearer have the impression that the speaker had a message and that, thanks to that communication session, this message is now common to both the speaker and the hearer. Now, this impression can be produced by a much less metaphorical process: (i) the speaker wants the hearer to do something or to be in a specific disposition with respect to some subject; (ii) the speaker says something to the hearer in order to act on him/her towards that goal; (iii) if the communication session succeeds, [a] both speaker and hearer will have constructed a meaning for what the speaker said, [b] both have the impression that the two meanings constructed are the same, and [c] both have the impression that the goal aimed at by the speaker is achieved or will be shortly achieved. With such a conception of communication, successful communication does look like the transmission of a message (with the difference that this message did not pre-exist the communication session), and we can understand several ways in which communication can fail. This conception of communication, call it "manipulatory" (without *necessarily* retaining the negative connotations of that word…), is a sort of pre-requisite for the different *instructional* semantics.

The *manipulatory conception of communication* (MCC) is not a model since it does not specify what makes people build utterance meanings, nor how. A step towards modelling

communication using language is done by *instructional semantics* (IS): it specifies that human languages abstract units provide instructions on building meaning for their utterances out of one's knowledge and beliefs. These instructions are independent of the situations: they are acquired during the language acquisition process and their application by speakers-hearers, in situations, escapes the control of their conscience: *it is not possible not to understand an utterance that we are able to understand.* IS specifies that the semantic instructions must be such that they allow/force to act on speakers-hearers' representations of situations, in order to build the utterance meaning. However, IS does not specify the nature of these instructions, what aspects of representations are concerned, nor how they act; these specifications depend on the models that will be chosen, and IS is a sort of meta-model, which allows for different models.

5.2 Instructions on points of view

ViewPoint Semantics (VPS) is an instructional semantics (IS) which postulates that constraints on points of view are necessary and sufficient to account for the linguistic instructions for meaning construction. It follows from this position that, for VPS, constraints on points of view are the basic 'ingredients' of sentence meaning.

Within this theoretical framework, it has been shown that points of view:
- determine argumentative orientations
- characterize polyphonic voices
- participate in determining reference in situations

In addition, the ideology of a discourse is characterized by presupposed points of view. This will greatly interest us here; we insist that such a characterization of ideologies (the points of view one must admit in order to understand an utterance or a discourse) is not ideological: not all ideologies are evil…

Semantic descriptions using VPS involve, thus, constraints on points of view, some of which are directly asserted, others being presupposed: the ones that reflect ideological commitments. We saw that, using ὀξύ or βαρύ in the comparative or the superlative form commits to consider them as *opposites of the apeiron*, that is, to place them in an open interval, from which one should infer the possibility of actual infinity. Now, this is precisely the kind of commitments Aristotle would not accept.

6. CONCLUSION

As far as our subject is concerned, we have pointed out that ὀξύ and βαρύ, though often presented in the opposites of the *apeiron* (opposites *with respect to their orientation*), that is to say those carrying in the language the excess and the defect expressed by the comparative and superlative forms, they become opposites *in their domain* in Plato's *Philebus* and in most of the section XIX of Aristotle's *Problemata*, while they become again generally opposed *with respect to their orientation* in Aristoxenus' *Elements of Harmony*. The ideological filter produced by this move is systematic and compatible with Aristotle's point of view on infinity: the text of *Problemeta* XIX is thus probably written by Aristotle or one of his close disciples. In order to give that answer, we had to combine the efforts of historians and philosophers with a semantic description of Ancient Greek which put in light the points of view and ideologies that permeate discourses in human languages.

The non-existence of "inference claims"

GILBERT PLUMER

Test Development
Law School Admission Council (retired)
United States of America
plumerge@gmail.com

ABSTRACT: Some believe that all arguments make an implicit "inference claim" that the conclusion is inferable from the premises (e.g., Bermejo-Luque, Grennan, the Groarkes, Hitchcock, Scriven). I try to show that this is confused. An act of arguing arises because an *inference* can be attributed to us, not a meta-level "inference claim" that would make the argument self-referential and regressive. I develop six (other) possible explanations of the popularity of the doctrine that similarly identify confusions.

KEYWORDS: argument identity, associated conditional, Lewis Carroll, monotonicity, rule of inference, self-justifying arguments, suppositional reasoning, Stephen Toulmin

1. INTRODUCTION

It is widely believed that all arguments make an implicit "inference claim" that the conclusion is inferable from the premises. I do not think that this is true, and the purpose of this paper is to attempt to show that it is not. After trying to better see what the view is in section 2, in section 3 I develop a number of possible explanations of its popularity. I find that each explanation points to confusion that when cleared, removes motivation for the doctrine and leaves it as involving a vicious infinite regress.

2. WHAT ARE "INFERENCE CLAIMS"?

Perhaps the most succinct contemporary expression we read of the view in question is Leo and Louis Groarke's (2002, p. 51): "Every argument assumes that the premises warrant the conclusion." Others who hold this view include Scriven (1976, p. 84), Grennan (1994, p. 187), Hitchcock (1998, p. 19), and Bermejo-Luque (2011, p. 90). Hitchcock (2007, p. 2; 2011, p. 210) sees the idea as going back to the ancient Stoic logicians, specifically, Diogenes Laertius, who says that the argument-indicator term 'since' appearing at the beginning of a sentence "guarantees both that the second thing follows from the first and that the first is really a fact" (VII.71) [http://www.perseus.tufts.edu/hopper/text?doc=Perseus%3Atext%3A1999.01.0258%3Abook%3D7%3Achapter%3D1]. Alternatively, the idea is sometimes cast in terms of the arguer, rather than the argument, making the assumption or "implicit inference claim." For example, Hitchcock (2011, p. 191) maintains, with respect to argumentation inferences, that "the arguer implicitly claims that the conclusion of each constituent argument follows from the reason or reasons from which it is drawn."

Cast either way, the point is apparently supposed to be obvious, because it is usually not otherwise defended. Bermejo-Luque is an exception. She says that it is because an "implicit inference-claim can be attributed to us…that a mere transition from a cognitive input to a cognitive output counts as an act of reasoning, and merely putting forward a couple of claims counts as an act of arguing" (2011, p. 90). Whatever its defense or lack thereof, the view has

become entrenched in informal logic to the point where it sometimes even seems to be regarded as a matter of descriptive definition rather than theory. Grennan says (1997, p. 69): "Consider an argument utterance symbolized as '*A*, so *B*'. By definition, the inference claim is 'if *A* then *B*'." Furthermore, Grennan contends that the inference claim is "necessarily implicit" as follows: If we "add" this claim to the argument "in an attempt to make the inference claim explicit," then the argument's form evidently will be that of Modus Ponens. As if by magic, notice, what might have been a deductively invalid argument (e.g., where *A* is true and *B* is false) becomes valid.[1] Yet this new argument's inference claim is "if *A* and if *A* then *B*, then *B*," and when this is added to the new argument for the same reason—making the inference claim explicit—an expanded argument and corresponding inference claim is generated, and so on, ad infinitum (p. 69). In company with others, Grennan thinks that the way to avoid this regress, which is akin to the one identified by Lewis Carroll (1895), is simply to neither treat the original assumption/inference claim as a premise nor make it explicit (cf., e.g., Govier, 1987, pp. 96-97; Bermejo-Luque, 2004, pp. 174-175).

One should want to avoid this regress because it is vicious, as even the name *regress* suggests: Any alleged *progress* made in explaining or accounting for anything disappears in the infinite argumentative structure. Its quantitative extravagance is not a cost worth paying (cf. Nolan, 2001, e.g., pp. 536-537). In contrast, no such point applies to a benign infinite series, for instance, the fact that every counting (or natural) number has exactly one successor counting number. Representing this series enhances our understanding; it accurately depicts, rather than bloats, ontology.

In his brief but seminal paper Carroll describes an infinite argumentative regress, which can be symbolized as follows (the arrow for 'if-then'), keeping interpretation to a minimum:

A: $(\forall x)(\forall y)(\forall z)(((x = z)\ \&\ (y = z)) \rightarrow (x = y))$ ["Things that are equal to the same are equal to each other."]

B: $(a = c)\ \&\ (b = c)$ ["The two sides of this Triangle are things that are equal to the same."]

C: $(A\ \&\ B) \rightarrow Z$

D: $(A\ \&\ B\ \&\ C) \rightarrow Z$

.
.
.

$\therefore$ *Z:* $a = b$ ["The two sides of this Triangle are equal to each other."]

The vertical margin dots represent an infinite series of recursive iterations in the manner of *C* and *D*. We may take the assumption/inference claim to which Grennan and company refer first as *C* for the argument explicitly composed of *A*, *B* and *Z*; then as *D* for the argument explicitly composed of *A*, *B*, *C*, and *Z*; and so on. And again, their point is that the way to avoid this regress is to neither treat the original assumption/inference claim as a premise nor make it explicit.

---

[1] Grennan himself does not discuss this point. Hitchcock, inexplicably as far as I can see, expresses a denial of it: adding the "material conditional with the conjunction of the explicit premises as antecedent and the conclusion as consequent…as an extra premiss does not make any previously invalid argument valid" (2000, p. 6).

3. CRITICISMS

However, it is hard to see what an assumption of an argument is if not a premise (cf. Plumer, 2017, esp. pp. 474ff.), and it is hard to see what relevant difference it could make whether the claim is explicit or implicit. Rather, it seems to me that it is taking situated reasoning to warrant itself—whether enthymematically or not—that is the problem. Arguments make no such assumption or inference claim as that the premises support the conclusion. Instead, in an argument the conclusion is actually inferred from the premises (some of which may be implicit); it is not claimed to be inferable. The use of an argument-indicator term such as 'so', 'therefore', or 'since' means that the arguer is inferring; contra (e.g.) Grennan (1997, pp. 69-70), they do not mean that the arguer or argument is making a self-referential meta-claim that, if true, would warrant this inference (the meta-claim being that the premises support the conclusion). Perhaps the difficulties this idea encounters are to be expected in light of other paradoxes of self-reference, e.g., the liar paradox, which concerns the claim 'this statement is false', and Russell's paradox, which concerns the set property of being self-membered (although this connection will not be explored here). It is not because an '*inference-claim* can be attributed to us' but rather it is because an *inference* can be attributed to us "that a mere transition from a cognitive input to a cognitive output counts as an act of reasoning, and merely putting forward a couple of claims counts as an act of arguing." There is nothing for such an inference claim to do here (well, except cause trouble); it has no explanatory value. Furthermore, neither arguments nor inferences have a truth-value; rather, they are valid or invalid, or cogent or not. Hence, the view that we make an implicit inference claim simply by arguing or inferring represents us as doing something we are not doing—making a claim that is true or false.

The view that we make an implicit inference claim simply by arguing or inferring, or that "every argument assumes that the premises warrant the conclusion," is so widely held that subscription to it demands explanation. Below I offer six (additional) possible explanations. Each involves confusion that when cleared, removes motivation for the view (as in failing to see that the inference does the work attributed to an inference claim) and leaves it as implicating a vicious infinite regress.

First, deductive validity is of course monotonic, "that is, if you start with a deductively valid argument, then, no matter what you *add* to the premises, you will end up with a deductively valid argument" (this standard definition is from Sainsbury, 1991, p. 369). There is no question that adding C, D, etc. to Carroll's *A-B-Z* argument still gives you a deductively valid argument. Botting (2017, p. 35) contends that if you add C, D, etc. here, "it is arguable that these are not different arguments, since they each have exactly the same informational content." Botting further holds that in the absence of informational ampliation, "it is no problem at all that there could be an infinite number of premises." At a certain level of abstraction, this seems true. Needless to say, however, there would be problems if, for example, one was engaged in trying to accurately reconstruct an argument that when stated, was expressed simply along the lines of *A-B-Z*.

The serious mistakes arise in taking any of this to indicate that each of C, D, etc. is, as Botting claims, "not an ampliation, but is part of the argument's content and hence part of the argument" (p. 38). In the first place, this appears inconsistent: how could C, D, etc. be part of the argument's content yet add nothing to that content (no "ampliation")? Moreover, by definition, if a whole has parts, and some parts are missing or not included in the whole, the whole is *incomplete*. This means that for Botting, Carroll's *A-B-Z* argument would be incomplete without the inclusion of C, D, etc. And since there appears to be nothing relevantly special about Carroll's *A-B-Z* argument, such a view as Botting's would mean that at least every deductively valid argument is a vicious infinite regress. To this Botting has replied (personal correspondence), "C and D are redundant, but are part of the content for precisely that reason!"

We could go around and around, but the underlying problem appears to be a failure to distinguish between what *can* be added to a deductively valid argument (in virtue of monotonicity) and what *must* be added (such that otherwise the argument is incomplete).

Second, there is no doubt that by abstraction every argument has what is called an 'associated' or 'corresponding' conditional, in which the antecedent is the conjunction of the argument's premises and the consequent is the argument's conclusion (e.g., *C* for Carroll's *A-B-Z* argument). Per above, such an abstraction is in no sense part of the argument. However, confusion may creep in when considering the fact that an arguer is "committed" to the associated conditional insofar as it would be inconsistent for the arguer to deny it (e.g., Ennis, 1982, p. 83; Berg, 1987, p. 17; Hitchcock, 2000, p. 6). Certainly, it seems that if I sincerely argue "*A*, so *B*" I must *believe* that *A* supports *B* or *if A then B*.[2] Arguments (other than in the strictly formal sense of implication relationships between propositions) have intentional features, such as that the premises are intended to support the conclusion. But to believe that your premises are sufficient (or relevant or acceptable) is not to *claim* this at all, let alone to make it a premise or assumption in your argument. I might believe all sorts of things relevant to my argument that I choose not to incorporate in it. Believing is not claiming, yet in some (nonlogical) sense believing is *assuming*. Could that simple fact be the ultimate source of confusion?

Third, the idea that the way to avoid a Carroll-type regress is simply to neither treat the postulated assumption/inference claim as a premise nor make it explicit is a different point than—though possibly confused with—the idea that the way to avoid the regress is not to treat rules of inference as premises, which many have held, beginning at least with Russell (1937, pp. 35-36) and Ryle (1950, pp. 306-307). For example, in discussing Carroll's regress, Govier almost interchangeably uses the phrases "associated conditional" and "principle of inference" (1987, pp. 96-98). But a rule of inference, e.g., Modus Ponens or Simplification, is a general, topic-neutral principle that defines and licenses a specific pattern of reasoning or type of inference. The putative assumption/inference claim referred to in the Groarke & Groarke dictum that "every argument assumes that the premises warrant the conclusion" is not a rule of inference and accordingly the dictum is not a generalization about rules of inference; rather, for any particular argument, it is the associated or corresponding conditional (treated as incorporated into the argument) with content specific to the argument. And since the general idea of an implicit inference claim—that the conclusion is inferable from the premises—could apply to any argument of any form or pattern, it certainly does not define any such thing.

Fourth, it might be objected that in order to identify an argument, one must identify premises, conclusion, and its inference claim. Of course, the first two of these three are unexceptionable. Regarding the third, consider, for example, the argument 'it is widely held among population *S* that *p*, therefore *p* is true'. Is this a piece of fallacious *ad populum* reasoning, or a decent argument from authority or inference to the best explanation? The answer will depend in part on whether the inference claim is that the premises conclusively support the conclusion or that they inconclusively support it (Matthew McKeon raised this objection in personal correspondence). My response is that no doubt, determining the type or strictness of the implication relation in the associated conditional abstraction is required in order to identify an argument. Such a determination is facilitated by a broad set of indications, including the use of modal terms (such as 'must', 'probably', 'possibly'), context, and arguer behavior. It remains

---

[2] While it is true some hold that even conscious reasoning is "blind," i.e., is "reasoning that does not involve your having any belief that your reasoning's conclusion follows from your basis" (Dogramaci's definition, 2016, p. 889), it is not clear that conscious reasoning and arguing are the same thing. Moreover, in arguing against the postulation of blind reasoning, Valaris (2014) points out that its primary—and mistaken—motivation is thinking that such a belief ("that your reasoning's conclusion follows from your basis") would be a premise in a Carroll-type regress. For a fine summary of current work on such issues, see Kietzmann (2018, especially section 1).

however, that although the arguer is committed to the associated conditional, in no sense is the associated conditional a claim that is part of the argument.

Fifth, in standard contexts a phrase on the order of 'it follows that' does appear to make the meta-claim that the premises support the conclusion, in contrast to argument-indicator terms such as 'so', 'therefore', or 'since'. However, unlike what is alleged about its trouble-making counterpart, the meta-claim here seems explicitly made. This suggests that such phraseology is a holdover from suppositional reasoning contexts, because the basic form of suppositional reasoning is: 'Suppose *p*. It follows that *c*', where neither *p* nor *c* is asserted (to be true). In suppositional reasoning, the claim that *p* supports *c* is not a self-referential meta-claim about the argument (leading to a vicious regress) because essentially it *is* (identical to) the argument; the logical relationships between propositions is the sole argumentative and evaluative focus, not also the assertability of those propositions (soundness). This makes suppositional and nonsuppositional reasoning quite different, to the extent that often the propositional elements of suppositional reasoning are not regarded as premises and conclusion (e.g., Dogramaci, 2016; Valaris, 2016). For example, in order to show that there can be no largest integer, one might suppose that arbitrary *N* is the largest integer (*p*) and derive a contradiction (*c*). This is a *reductio ad absurdum*—one type of suppositional reasoning—and of course neither *p* nor *c* is asserted here, in contrast to the premises and conclusion of arguments in ordinary nonsuppositional contexts. Now the core idea of conditional proof is: 'Suppose *p*. It follows that *c*. Therefore, if *p* then *c*', where the conditional *inference claim* 'if *p* then *c*' is *unquestionably made or asserted*. A conditional proof or defeasible reasoning analogue may be embedded in a longer piece of reasoning, for example (Cohen, 2010, p. 153):

> I suppose that most pit bulls are dangerous. Relying on my background knowledge that Fido is a Pit Bull, I infer by statistical syllogism, that Fido is dangerous. Discharging my assumption, I infer that if most Pit Bulls are dangerous, then Fido is dangerous.

My point is, could the existence of suppositional reasoning, conditional proof, and such phrases as 'it follows that' be the source of the (false) belief that implicit inference claims are made by all arguments?

Sixth and last, a number of the authors we have considered cite Toulmin's notion of a "warrant," from his seminal book *The Uses of Argument* (1958), as pedigree and support for their postulation of implicit inference claims. I think this misunderstands or misappropriates Toulmin. For instance, Bermejo-Luque says about an argument's "implicit inference-claim" that "following Toulmin, we can call this link between data and conclusion the *warrant* of the argument" (2011, p. 90). She says Toulmin "claims that the warrant of an argument can always be made explicit as the corresponding conditional whose antecedent is the data and whose consequent is the conclusion of
the argument" (p.86). Yet Toulmin explains "propositions of this kind I shall call *warrants*": "general, hypothetical statements, which can act as bridges, and authorize the sort of step to which our particular argument commits us." For example, the argument *Harry's hair is red, so it is not black*, has the "warrant, 'If anything is red, it will not also be black'" (Toulmin, 1958, p. 98). If Bermejo-Luque's account were an accurate representation of Toulmin here, he would say that the warrant is 'If Harry's hair is red, it is not black', although Bermejo-Luque does think that Toulmin's "portrayal" of an argument's warrant "is defective in some respects" (p.86). So as I said, Toulmin is being misunderstood or misappropriated.

Epitomized argumentative strategies of disease mongering in medical advertising

ABSTRACT: In this paper, we delved into the widely spread malpractice of disease mongering – an orchestrated attempt to sell sickness to the well, the sick and those in between. We investigated some medical advertisements for branded conditions with the help of Pragma-Dialectics, and applied argumentation schemes and discourse analysis to test the effectiveness and reasonableness of the found strategic moves. Our findings are upsetting and they bear implications for public health literacy and shared-decision making.

KEYWORDS: disease mongering; medical advertising; argumentation in medical advertising; Pragma-Dialectics; fallacies; strategic maneuvering; hidden fallaciousness; argumentation scheme; shared-decision making

1. INTRODUCTION

When OxyContin made its first appearance in the U.S. in 1939, it was a bit like a white sheep in the flock. Like other prescription drugs, it was meant to cure moderate to severe pain, so it got lost in the mash, quite unnoticed. Slowly but steadily, and thanks to savvy marketing campaigns, the sales started to skyrocket. By 2001, it was the best-selling narcotic pain reliever ever sold in the country(AAC 2010). Many have praised its positive effects to cure psycho-physical conditions, but many more patients complained about strong dependency, even addiction, caused by the drug. "OxyContin – it gets you high" read the message splashed on many billboards plastering the streets of thousands of American cities, showing a giggling couple at the peak of their lives. Nevertheless, the soaring demographics of patients suffering withdrawals and dependency on OxyContin (still counting) showed another message – this pill either gets you high on life or high on drugs. The Sackler family, the producer of OxyContin and Oxycodone in the States, eventually came under fire as the family "who built an empire of pain". Public debates on ethical and moral responsibility of the pharmaceutical company in question enraged, protests rolled on- and offline. On 12 June 2018, the state of Massachusetts sued the family for "spawning America's opioid crisis", and named its executives and members responsible for perpetrating and causing pain to countless American households(Radden Keefe 2017).

The intention behind this example is not to ostracize OxyContin or the Sackler's, as there are certainly positive effects of the drug when and if prescribed to the right patients, but to highlight two aspects. The most implicit one is that regulation on drug production, distribution and use exists, for both over-the-counter or prescription medication, so it shall be applied. The fact that OxyContin is prescribed extensively for a wide array of different symptoms, including depression, moderate to severe pain, muscular tension, and anxiety (Skarnulis 2017) is nevertheless worrisome. The second, more explicit fact is that many people seems ripe, willing,

and receptive nowadays to be part of the social, health and economic debates that health care systems around the world pose, and to either publicly support or fiercely criticize them – these are good news for shared-decision making in medicine.

When approaching the subject of argumentation in medical advertising, we were interested in analysing some of the strategic moves that seemingly trigger and sustain disease branding in mass communication and prevention in healthcare. We went on to explore whether these are examples of strategic maneuvering and effective communication or rather of fallacious argumentation.

Hence, our investigation is a qualitative empirical analysis of indirect medical advertising speech acts used to monger or brand diseases (the words 'condition' and 'disease' are used interchangeably in this paper). These narratives have been partly extracted from a previous investigation on marketed diseases(Quattri et al. 2018).

In order to investigate their nature and possible fallaciousness, we applied Pragma-Dialectics (PD) as framework theory.

Our paper is structured as it follows: First, we introduce the concept of disease mongering and briefly explain the motivation to explore argumentative strategies in medical advertorials. Second, we briefly highlight the concept of PD and research on PD and medical advertising. We discuss the retrieved most common speech acts, discuss the argumentative moves and their implications, and conclude with a synthesis of the work.

2. EPITOMIZED CASES OF ADVERTISED DISEASE MONGERING

2.1 On disease mongering and on mongered conditions

Disease mongering (DM) is a moniker for disease or drug branding. A monger is a merchant, a peddler or an impostor whose manners are deceptive and careless. It follows that, when used with 'disease', like in 'disease mongering', these conditions are the peddlers, alias they probably are not (entirely or yet) diseases, or they are mixed up with real ones. The credits for coining the term shall go to Lynn Payer, a medical journalist and science writer who, in the 1990s, wrote: "Disease mongering is the attempt to try to convince well people that they are sick, or slightly sick people that they are very ill"(Payer 1992).

Payer's investigation on DM kick-started public and professionals' debate and triggered people's interest and outrage on the topic. Nowadays, DM is commonly known – and still, unfortunately, widely practiced. Despite being a wrongful medical, academic, social and professional malpractice, it is not exactly clear what diseases and conditions have been mongered over the last years. Therefore, we ran a review of medical articles on mongered conditions, published in medical journals over the last fifteen years (2002-2017)(Quattri et al. 2018). According to our results, we found an astounding (several hundreds) number of diseases that we should be scared of and diagnosed for. They seem to cover the full spectrum of medical diagnosis, from pre-conditions to well-known and even uncurable ones. Their range across medical specialties is also extensive - including chronicle diseases, such as osteoporosis or obesity, pre-conditions, such as osteopenia (also known as pre- osteoporosis), or dubious ones, like aging.

Paired with the mongered conditions, we also found examples of medical advertising used to promote them. These ads caught our attention and led us to investigate the strategic

moves used to sell them and public messages of warning, persuasion and prevention, all in search for fallaciousness or communicative efficacy. We decided to adopt PD or Pragma-Dialectics as the stepping stone for our research.

First, we will briefly analyse PD as framework theory, particularly as already applied to medical advertising.

2.2 On PD and argumentation patterns in medical advertising

To Van Eemeren, argumentation is "a constellation of different propositions or reasons to defend or discard a certain standpoint"(van Eemeren et al. 2014). The whole reason of arguing is to try to convince people about the soundness of someone's statement, by giving reasons and by subjecting those reasons to doubt or criticism, whilst being prepared to live up or to abide by certain standards of reasonableness.

PD as theoretical framework has been proved a valid and suitable argumentative scheme for the medical domain, including medical advertising. If you think about it, oftentimes we can find pragmatic argumentation supporting medical statements. For instance, and as discussed below, the standpoint "You should take medicine X or undergo treatment Y because it may prevent the upsurge of a certain disease / it may stop a disease or a condition from spreading / it may cure it" is prescriptive (it tells you want to do) and pragmatic. In fact, such piece of information gives you something to think about and to act upon (pragmatic in the literal meaning) and, as in the case of pragmatic argumentation, it is a kind of argumentation "based on the sequential relation between *cause* and *effect*" (van Eemeren et al. 1996, p. 112).

Another reason why we chose PD is that it uses natural language, not formal logic or formal systems. PD complies to a constructivist approach to reality, which suits the epistemological perspective of interpretivism, i.e., the blood and bone of discourse analysis and qualitative research.

Previous research by, among others, Snoeck Henkemans(Snoeck Henkemans 2015; Rubinelli and Snoeck Henkemans 2014; Snoeck-Henkemans 2016) and(van Poppel 2012; Wierda 2015) showed that the genre of medical advertisements (or advertorials, a term which implies different 'modes' of ads, such as audio-visual, electronic, printed, subliminal and explicit messages) contains argumentative patterns. This finding further validates van Eemeren's claim that "in any kind of communication activity type, we can retrieve some argumentative patterns".

The same author defines argumentative patterns "a particular constellation of argumentative moves or argumentative standpoints, in which, in dealing with a particular kind of opinion to defend a particular kind of standpoint, a particular argumentation scheme or a combination of argumentation schemes are used for a particular kind of argumentation structure"[1]. Through the identification and analysis of argumentative patterning, i.e., through the analysis of these argumentation structures, one can prove the strength or weakness of the effectiveness and reasonableness of someone else's argument.

Snoeck Henkemans in(van Eemeren 2017) and(Snoeck-Henkemans 2016) has showed that argumentative patterns can be basic patterns of the main argumentation or elaborated patterns of an extended argumentation, as showed in Table 1. For instance, the example of medical argumentation presented above ("you should take medicine X because it is good for

---

[1] Frans van Eemeren, spring 2017. Lectures on Pragma-Dialectics at ILIAS, International Learned Institute for Argumentation Studies, Jiangsu University, Zhenjiang, P.R. China.

you"), follows a minimal pragma-dialectical scheme of causality and can hence be defined a basic argumentative pattern. In this basic scheme, the prescriptive [pres] standpoint is defended at the first level of argumentation by a pragmatic [prag] argumentation (1.1 or also an implied (1.1')), which is coordinative. Nevertheless, when there exists the need to prevent or rebuff possible counter-arguments advanced against statement 1, one can either add further pragmatic coordinative arguments, or adopt a more sophisticated scheme, i.e., argumentation at a more subordinate level, as presented in the right column of Table 1, in the attempt to provide more and convincing standpoints to the main argument. In this case, the main prescriptive standpoint is supported by other kinds of argumentation (e.g., argumentation from authority; further causal argumentation) to strengthen the claim that the drug/treatment is effective(Snoeck-Henkemans 2016).

As van Eemeren states, over-the-counter medical advertisements seem to follow basic patterns of argumentation(van Eemeren 2017, p. 175).

Basic patterns of the main argumentation	Elaborate patterns of an extended argumentation (main argumentation and supporting arguments)
1[pres] <1.1[prag] 1[pres] <1.1.[prag]< 1.1'[prag]	1[pres] <1.1.[prag]<1.1.1 [prag] < (1.1)1a-n [prag] < 1.1'[prag] < (1.1').1a-n [prag]

3. EXEMPLARY ANALYSIS OF MEDICAL ADS

In the following, we are going to present a couple of examples of argumentative patterns retrieved during our investigation of medical advertorials on disease mongering. This is just a fragment of the whole body of evidence that we were able to retrieve from our investigation,

but it should still give an idea of the issue at stake. These examples show when strategic maneuvering is at work and when "the treacherous character of fallacies" derails it(van Eemeren et al. 2014, p. 27). Fallacies are "invalid arguments which for some reason or other give the impression of validity" (van Eemeren and Grootendorst 1984, p. 181).

The first example reads:

"What would you say if we told you about an epidemic that would erupt and affect hundreds of millions around the world? …. This epidemic is already here and it's called osteoarthritis (press release # 1427)(Shir-Raz and Avraham 2017)

The excerpt above comes from a database of advertorials, divulged by Israeli medias and collected by Shir-Raz and others in 2017 to make a point on mongered conditions. The ad has been truncated, and the original text is not retrievable online, although it appears to be strikingly similar to another message published by Osteoarthritis Action Alliance, a coalition of MSs and MDs based in North Carolina, with the mission to inform the public about the danger of OA.

"As a nation, we are experiencing an under-recognized public health crisis: an epidemic of osteoarthritis (OA). There is urgent need to elevate OA as a national public health priority.
Today, 30.8 million people – 1 in almost every 10 American adults – have this serious disease that mainly affects the hands, knees and hips. Even more alarming, OA rates are expected to increase in the years ahead as Baby Boomers age and the effects of obesity epidemic continue to manifest. Osteoarthritis is common, expensive and a leading cause of disability[1]".
(Source: https://oaaction.unc.edu/policy/osteoarthritis-a-troubling-picture/)

The words used in both messages are calculated and sensationalistic – the readers worry about "Osteoarthritis – a troubling picture" and "osteoarthritis – the epidemic". Metaphors are also put in place, to further amplify the feeling of uneasiness. In ad 1, osteoarthritis is compared to a volcano, a supernatural force that bursts out - "an epidemic that erupts". In public warning number 2, the physical condition is also deemed an epidemic and "an under-recognized crisis". Osteoarthritis is depicted as a public enemy, a threat that is going to become bigger with age and obesity, a "serious" illness, common, expensive and crippling. We are under siege – there is an "urgent" need to raise OA to "public health priority".

Is osteoarthritis really such a bully? The Dorland's Illustrated Medical Dictionary, an authoritative source among medical dictionaries, defines the condition a "noninflammatory degenerative joint disease mainly seen in older persons, … accompanied by pain, usually after prolonged activity, and stiffness, in the morning or with inactivity"(Dorland's 2012). The WHO defines OA a "long-term chronic disease… associated with a variety of both *modifiable and non-modifiable* risks *including* obesity". "An estimated 10% to 15% of all adults aged over 60", continues the WHO report, "have *some degree* of OA" [2]. Both sources acknowledge osteoarthritis as a serious disease, but they refrain from using catchpenny language to define it and seem to be more prudent in framing its symptoms and causes.

Argumentatively, both example 1 and message 2 show cases of appeals to emotion. Kienpointner, in(van Eemeren 2009, p. 64), defines the use of emotions a strategy to silence the opponent "that clearly exceeds rational techniques of argumentation". Yet emotions belong to the most recurrent natural constituents of what makes us human, and disease mongering seems to vastly use them as a weapon. (Kochen and Cordoba 2013) state: "Disease mongering exploits the deepest atavistic fears of suffering and death". In their investigation of PR strategies adopted

[2] Italics added. Source: http://www.who.int/medicines/areas/priority_medicines/Ch6_12Osteo.pdf, last accessed on 27 September 2018.

in pharmaceutical press releases, (Shir-Raz and Avraham 2017) revealed that 753 out of total 1,578 press releases (i.e., 48.6%) appealed to readers' emotions by framing drugs as "the solution/the hero", while 722 press releases (i.e., 47%), defined disease "the problem/the enemy". This is intimidatory tactics at its best, and it is interesting to notice that, in this picture, we too, as readers, patients and potential consumers of anti-osteoarthritis pills, are implicitly framed as antagonists that need to be persuaded of a message, instead of being its simple recipients.

Emotions are a threat, but a threat to reasonableness, as van Eeemeren explains: "*Reasonable* means that they [language users, n.a.] will display an open attitude both toward their interlocutors and toward the objects discussed and will not allow themselves to be guided by mere emotions or mere traditions and habits"(van Eemeren et al. 2014, p. 313). In our research, appeals to emotions in medical advertorials were the majority.

Are these messages though still effective?

If we try to reconstruct the argumentation structure of ad 1, it will look like Figure 1.

Main argumentation
1.   (Consumers should start taking medication X/undergoing treatment Y)
1.1 An epidemic is a wide-spread disease
1.1a If there were an epidemic, then you would take the medication/undergo the treatment
1.1b Osteoarthritis is an epidemic
1.1c Medication X/ treatment Y helps against osteoarthritis

Figure 1: Argumentation structure of the osteoarthritis advertisement no. 1

The ad seems to follow a basic argumentation structure with an implied main standpoint, supported by premise 1.1. The implied standpoint is prescriptive and is made reasonable through the support of further arguments. By using 'epidemic' instead of 'disease', preventative or curative actions against OA are automatically encouraged. This argument is strategic given that, by introducing the urgency of an epidemic, it rejects any potential attempt to minimize or discourage deprescription or demedication. Moreover, by focusing on the epidemic rather than the cure (medication X or treatment Y), another strategic move characteristic of disease mongering is made – it is the disease instead of the treatment or the medication that is branded. This tactic is also often used to circumvent regulations on direct-to-consumer advertising. The rhetorical question "What would you say if we told you about an epidemic?" is another strategic solution, since rhetorical questions trigger by nature obvious answers or (re)actions.

Despite being effective in communicating the matter at stake and probably in awakening the urge to do something, it has to be noticed that ad 1 and message 2 also contain deceptive information, especially if compared to the authoritative definitions of OA as presented above. For instance, "the hundreds of millions of people" affected by OA in ad 1 are not further identified, leading the reader to suspect a statistical fallacy (i.e., "a hasty generalization"), given the lack of evidence or data to support such statement(Grootendorst and Snoeck Henkemans 2011, p. 190). The same seems to apply to example 2. Although it is said that OA affects "1 in almost every 10 American adults", it is unspecified what "almost" means and what "adults" stands for – and, based on how these two vary, they can tell a wholly different story. Furthermore, the superscript number 1 at the end of message 2 does not lead to a footnote in

the publicly available webpage, thus making it impossible to prove the veracity of the provided information.

The second example that we want to propose reads:

"Bones act like a calcium bank. If you do not take in enough calcium from your diet, the body will withdraw calcium from your 'bone bank' for use in other parts of the body. If your body withdraws more calcium than it deposits, your bone density (bone strength) will gradually decline and you may be at risk of developing osteoporosis…. We call this disease a silent thief: If you are not vigilant, it can sneak up on you and snatch your quality of life and your long-term health" (Source: Osteoporosis Australia, Medical and Scientific Advisory Committee, 2014)(Moynihan et al. 2002)

Metaphors are at work again in the text, twirling around the concept of "bones are your treasure and calcium is your bank, so keep your treasure safe". In fact, this ad could have been easily taken from a brochure on investment funds, due to the similarity of the language used - "withdraw", "deposits", "decline", "at risk". In the second half of the passage, osteoporosis is compared to "a silent thief", who "sneaks up on" us and "snatches" away our quality of life. Another appeal to fear.

The main argumentation is implicitly prescriptive: "Consumers should use medicine X / undergo treatment Y to tackle osteoporosis". It is further supported by coordinative argumentation and subordinate arguments. The first half of the ad is all about causality, i.e., the explanation of how calcium decrease in the body triggers osteoporosis. It is claimed that calcium is taken from the body because of its scarce intake through diet. Therefore, bone density declines because more calcium is withdrawn than available.

The argumentation by authority is made evident with the use of the pronoun "we". While 'you' in the text refers to an existing patient or consumer (with or without osteoporosis), 'we' embodies the physicians members of the Medical and Scientific Advisory Committee of Osteoporosis Australia[3], who urge us to do something to avoid getting robbed of our bones.

The argumentation scheme for example 2 looks like Figure 2.

Main argumentation
1.   (Consumers suffering or prone to suffer from osteoporosis should use medication X/undergo treatment Y)
1.1 Osteoporosis is caused by a lack of calcium due to poor diet
1.2 Osteoporosis requires you to be vigilant
(1.2)(Vigilance means taking medicine X / undergo treatment Y)

Supporting arguments
1.2.1a Osteoporosis can sneak up on you
1.2.1b Osteoporosis can snatch your quality of life and long-term health
  1.2.1a.1 Osteoporosis is a silent thief
  1.2.1b.1 Osteoporosis acts fast

Figure 2: Argumentation structure of the osteoporosis advertisement

Like in the case of ad 1 and message 2, the main standpoint of message 3 is made reasonable by the use of both coordinative and subordinated arguments to further strengthen the claim. Therefore, the last proposed advertisement also seems to be an example of strategic

---

[3] Osteoporosis Australia is "a national non-for-profit organisation responsible for providing osteoporosis information and services to the community and health professionals". Although not-profit, one of the organisation's supporters is Caltrate®, a high potency calcium supplement, produced by Pfizer. Another supporter is US pharma company Amgen. This information is publicly available on the organization's website.

maneuvering. Though, like for example 1 and message 2, the message is also partially deceptive and lacks evidence. In fact, it is not clear whether the proposed definition of osteoporosis has been paraphrased from another source or whether it has been suggested by doctors, but it reads simplistic. Osteoporosis is described as merely related to a lack of calcium due to a poor diet, although publicly available information defines osteoporosis "a reduction in bone mineral density" (i.e., not only calcium), which can also be caused by trauma or as a consequence of an underlying medical condition(Dorland's 2012).

Furthermore, in the second half of the ad, the physicians (or assumed so) do not really inform us about the disease, but merely share with the public the moniker they use for osteoporosis ("we call it").

Still, the fact that this ad has been (assumingly) released by a medical and scientific advisory committee inevitably pushes the readers to assign credibility to these words – a perfect spot for a fallacious argument to lurk in. As Grootendorst and others state: "As examples of inappropriate argument scheme, van Eemeren and Grootendorst (1992: 122-125) cite [the case of] presenting a standpoint as right […] because an authority says it is right (*argumentum ad verecundiam*) [although] the standpoint at issue is not appropriately justified by expertise"(Grootendorst and Snoeck Henkemans 2011, p. 190).

All three presented messages showed that, although the arguers (i.e., those who penned these advertorials) seemingly effectively communicated the issue at stake (all three ads made it to the public, therefore we can assume they were revised and approved), the information they contain is also deceptive. Van Eemeren teaches us that "in case arguers neglect their commitment to reasonableness in their pursuit of effectiveness and violate one or more of the rules for critical discussion, their strategic maneuvering "derails" into fallaciousness (van Eemeren 2010, p. 198)", or as he labels it, "hidden fallaciousness"(van Eemeren 2017, p. 11).

So, in the end, whom should we trust? Which source should we believe?

By only considering the sheer number of medical advertorials released on the daily, it is rational to believe that the messages that we are going to notice first and the most are probably ads, leaflets, consumer guides, factsheets, precautionary, preventive, explicit or subliminal narratives in ads and patients' and doctors' associations' websites.

This is medical information "on the go" that reads fast and should be understood easily. Yet our examples have showed that to make sense of the arguments in these narratives, they need to undergo a process of deconstruction and critical scrutiny, so to test their effectiveness and reasonableness. To expect consumers and patients to do the same analysis that we carried on for each piece of medical advertisement they are exposed to is unrealistic. The risk that many of these advertorials thus end up being accepted by the wide public without even raising an eyebrow is real. It is a scary scenario, considering that these messages appeal to our health, our physical and mental well-being.

The example of OxyContin and the social outrage it caused was provided to show how powerful an informed society can and should act and how the active and conscious participation of citizens in matters of private and public health can lead to tangible positive changes for the collective well-being. Nonetheless, if the vast majority of medical information delivered to the masses is compromised, massaged and distorted, while being kept in the hundreds of messages on the daily, social awareness risks to get mummed even before being called upon. Especially medical advertising should be as much unambiguous and as much clear as possible, or, as Alan

Cassel says: "We need good, clean healthcare information as urgently as we need good clean water"[4].

4. CONCLUSION

In this paper, we applied pragma-dialectical theory on some medical advertorials for mongered conditions to understand what strategic moves seemingly trigger and sustain disease branding in medical mass communication and prevention. We applied argumentation schemes and discourse analysis and found that despite these ads show to be valid examples of strategic maneuvering, they also seem to contain fallacies (hidden fallaciousness). The latter and the strategic use of figurative language can distort and manipulate discourse, thus representing a high danger particularly when it comes to medical communication, where the harms on patients and consumers can be real.

Argumentative reinterpretation

PIERRE-YVES RACCAH

pyr@linguistes.fr

ABSTRACT: a careful observation of human languages leads to question the idea that any utterance that plays a role in argumentation necessarily *has* an argumentative orientation. This paper presents these questioning observations, explains how they challenge this idea, and suggests some hints for a position in agreement with these observations. Two groups of facts are examined: one concerns the status of [B] in [A, therefore B]; the other group concerns segments containing a prosodic break.

1. INTRODUCTION

It seemed unquestionable that any utterance which plays a role in argumentation necessarily has an argumentative orientation (AO). However, a more careful observation of human languages leads to question this idea. The purpose of this paper is to present the corresponding observations, explain how they challenge this idea, and suggest some ideas for a position more in agreement with these observations.

The first group of facts that question this idea concerns the meaning that should be attributed to statements of type [A, therefore B]$_S$ in situations S in which they are understood as formulating a reasoning that leads from A to B. In general, it is usual to consider that in statements of this type, B is a formulation of the conclusion aimed at by a statement of A in S.

It is at this point that the problem I signal arises: if the first member of [A, therefore B]$_S$, [A]$_S$ is clearly an utterance, is its second member [B] also an utterance? If this were the case, [B]$_S$ should have an AO, but since B is just the AO formulation of a (different) utterance, it is not clear which AO [B]$_S$ itself could have. What status can we grant [B]$_S$?

The second group of facts concerns segments of speech containing a prosodic break: according to a recent description of the semantic effects of the prosodic break, it imposes an *argumentative reinterpretation*: when the segment preceding the break has the status of *formulating an AO*, after the break, the same segment acquires the new argumentative status of *being oriented towards another AO*.

Thus, an utterance with an argumentative role would not necessarily *have* an AO but could also *be the formulation* of an AO; human languages would have indicators (like prosodic breaks) of reinterpretation from one of these two functions to the other.

This paper examines the methodological, theoretical and descriptive consequences of such a suggestion.

2. STARTING POINTS

When speaking, we use abstract units of some language and utter them in a perceptible string. When hearers understand such a string, they build (subjective) *utterance meanings* using the (public, conventional) *sentence meaning* of the language units and their (private, subjective) perception of the situation. Those two kinds of contributions to the understanding can be seen as the use of a tool (*sentence meaning*) in order to work a kind of material (perception of the situation) for shaping an *utterance meaning*, or, like described in Harder (1990), as a set of *instructions* in order to build utterance meaning. *Diagram 1* gives a pictorial representation of this idea:

Diagram 1: the characterization of an utterance

With that representation in mind, we can now proceed to examining the facts that challenge the assimilation of *having a role in argumentation* with *having an argumentative orientation*, when speaking of an utterance.

2.1 Autonomy of argumentative links with respect to denotation

It is now firmly established that human languages allow presenting, in a situation S, an utterance $[A]_s$ as an argument in favour of a conclusion C independently from what $[A]_s$ refers to in S. The following example, chosen for its apparent striking absurdity, illustrates that point:

(E1) Max wears a beard; therefore this leaf is red

(E2) Max wears a beard; however this leaf is red

The fact that it is rather difficult to find a situation in which either (E1) or (E2) can be uttered without provoking a feeling of absurdity does not make *using these examples* absurd: on the contrary, this fact emphasizes the generality of our point, for, what produces the feeling of absurdity is that, in (E1) (respectively in E2)), the first segment is presented as an argument *in favour of* (respectively *against*) the second segment, in spite of the absence of conceivable referential relation between the two segments. That clearly proves our point: presenting $[A]_s$ as an argument in favour of C *is* independent of what $[A]_s$ refers to in S… Sometimes it looks absurd, sometimes not, but that is another question. What will be useful to remember is that:

> (a) The argumentative value of an utterance
>   does not rely on its informational value

2.2 Not all utterances have argumentative orientations, but…

It is also generally accepted that not all utterances are arguments. For instance, an utterance of the Spanish sentence

(E3) S*on las cinco* ("it's 5 o'clock")

can be used as an answer to the question

(E4) *¿qué hora es?* ("what time is it?"):

in that use, (E3) is not an argument *and has no argumentative orientation*.

However, in other situations, utterances of (E3) *are* arguments and *do* possess an argumentative orientation. This is the case, for instance, when an utterance of (E3) is proffered in order to urge someone to hurry up, or, on the contrary, in order to relieve stress on someone who believed it was later than 5 o'clock: in these situations, utterances of (E3) *are* arguments.

More generally, for any sentence of any language, one can find a situation in which an utterance of that sentence in that situation is an argument for some conclusion. So that:

> (b) *Any sentence, whatsoever, can be uttered in a situation in which the resulting utterance has an argumentative orientation in that situation*

It follows from (a) and (b) that, since an utterance can be considered to be totally determined by the pair <sentence,situation>, a pair <sentence,argumentative_orientation> is sufficient to characterize those utterances which are arguments. However, in spite of the apparently formal character of that statement, it is ambiguous: section 3 shows in what this ambiguity consists.

3. UTTERANCES *ORIENTED TOWARDS* VS. *FORMULATING* CONCLUSIONS

As was pointed out in the introduction, an utterance may play a role in the argumentative value of statement that contains it, without having an argumentative orientation: we saw the general case of statements of type [A, therefore B], where [B]$_S$ is a formulation of the intended orientation of [A]$_S$ in situation S. A more detailed analysis of an example will allow to better understand why this challenges the assumption we started with. In utterances of (E5):

> (E5) *Ha llovido, entonces, la carretera estará atascada*
> ("it rained, therefore the road will be jammed")

the second member formulates an argumentative orientation of the first member, while in utterances of (E6), the same segment is oriented towards the conclusion formulated by the second member:

> (E6) *La carretera estará atascada: te conviene ir andando*
> ("the road will be jammed: you'd better walk")

Thus, the Spanish sentence *la carretera estará atascada* can give rise to two different types of utterances:

1) the *formulation* of an argumentative orientation concerning the state of the road (E5);

2) an utterance *orientated* towards some conclusion, which hearers can determine taking into account, among other factors, the language units which are used and their perception of the situation in which those units are used (E6).

As a result, speaking of the pair <*S,O*> is ambiguous in that it may refer to either an utterance of sentence *S* with orientation *O*, or an utterance of a formulation of the orientation *O,* by means of sentence *S*.

It follows that, even though an utterance can still be characterized by a pair *sentence* and *argumentative orientation*, such a pair may characterize the utterance in two different manners (either the orientation *is the argumentative conclusion* of the utterance, or the orientation *is what is formulated* by the utterance).

If things stayed as simple, in order to account for what has been observed, we would only have to disambiguate the formulation <S,O>, in order to name utterances, according to one or the other function they play, adding, for instance, an explicit third term for *formulation* or *conclusion*: <S,O,*f*>, or <S,O,*c*>. However, things get more complicated, as we will see in the next section, in which we will also propose a more complex solution.

4. THE NECESSITY OF ARGUMENTATIVE REINTERPRETATION

The facts corresponding to the cases analysed in section 3 can be considered as simple cases, where nothing more is required than the 'meta-disambiguation' proposed above. We will now see, through more complex cases, that (and why) that solution is not general enough, and will propose a more general solution, which supposes a new kind of markers. And, fortunately, we will be able to exhibit this new kind of markers.

4.1 Simple and complex cases (with respect to our concern)

In both examples (E5) and (E6), the global utterance was composed of two segments related by a connector (*entonces* for (E5), the colon for (E6)). But utterances can be composed of several segments, with several (minus one) connectives.

In cases of utterances of sentences with more than one occurrence of a connective, things get more complicated. The observation of examples (E7)-(E9) will show why and how. (The following notations are used for the transcription of the examples: "+" means that the utterance is easy to understand; "?" means that hearers need a major effort of imagination in order to understand the utterance –if they can; "…" indicates a prosodic pause)

> (E7) +*Ha llovido, entonces, la carretera estará atascada, ... por lo que te conviene ir andando*
> +"It rained, therefore the road will be jammed, … consequently, you'd better walk"
>
> (E8) ?*Ha llovido, pero la carretera no estará atascada, pero te conviene ir andando*
> ?"It rained, but the road will not be jammed, but you'd better walk"
>
> (E9) +*Ha llovido pero la carretera no estará atascada, ... pero te conviene ir andando*
> +"It rained, but the road will not be jammed, … but you'd better walk"

Utterances of (E8) are difficult to understand, and this, in spite of the fact that usual semantic descriptions of *pero* (established for a usual mono-occurrent *pero*)[1] provide a straightforward description of what their meanings should have been…

Indeed, the classical argumentative descriptions of A *pero* B indicate

(i) at the presuppositional level, that any utterance of [A *pero* B]$_s$, in any situation s presents [B]$_s$ as oriented towards a conclusion which is opposite to that of [A]$_s$, in the same situation; and

(ii) at the asserted level, that any utterance of [A *pero* B]$_s$, in any situation s is oriented towards the same conclusion as the one towards which [B]$_s$ is oriented.

Descriptions of this type are not sufficient in order to deal with sentence containing several occurrences of *pero*, precisely because they do predict a meaning, obtained by simply applying twice rules (i) and (ii), though utterances of these sentences are not, actually, easily understandable, and when they are understood, they are not understood as predicted by these rules.

In contrast, utterances of (E9), which differ from utterances of (E8) in that they have a pause between the second segment and the second connective, are, however, easily understandable.

---

[1] One of the proposals for a description *but* can be found in Raccah (2005: 73-75)

When (E7) is understandable, it is understood that its second member formulates the orientation aimed at with its first member and, then, becomes argument in favour of the third member. For (E9), in a first step, the second member formulates the orientation opposed to the one aimed at with the first member, and, in a second step, is re-interpreted as an argument opposed to the conclusion formulated in the third member.

4.2 The prosodic pause as an argumentative reinterpretation marker

The prosodic pause seems to function as a *reinterpretation marker*: comparing the behaviour of (E8) with that of (E9) supports this hypothesis. The fact that the prosodic pause may have a semantic effect is not really surprising: lots of well-known examples already support that idea, as can be seen in table 1 (pause in a dialog), and table 2 (pause in an utterance), which show the contrasts between utterances with vs. without a pause:

– Do you love me? – Yes I do!	– Do you love me? – … Yes I do!
– Max? – Yes?	– Max? – … Yes?

Table 2: pause in a dialog

This is nice, isn't it?	This is nice, … isn't it?
Max is nice, nice	Max is nice, … nice
? Tom has finished almost	Tom has finished, … almost
Jim was here	? Jim was… here

Table 1: pause in an utterance

There is something common between the effects of all those utterances with pauses (including our examples (E7) and (E9)): they involve an (possibly partial) evaluation of what has been said and / or of possible continuations[2].

The fact that occurrences of prosodic pauses are numerous in dialogs and discourses, combined with the fact that they produce the same effect (instruct an argumentative reinterpretation), at least in a great number of languages, compels to consider that those languages have a corresponding sign (call it the *prosodic pause*) whose meaning is the instruction to reinterpret. A reader who finds that reasoning hard to admit could compare it with the following:

> The fact that occurrences of [kæt] are numerous in dialogs and discourses, combined with the fact that they produce the same effect (instruct to include a cat in the universe of the discourse), at least in some languages, compels to consider that those languages have a corresponding sign (call it /kæt /) whose meaning is the instruction to include a cat.

Since the second reasoning is identical to the first one and is a prerequisite for studying semantics, the introduction, in the first reasoning, of the *prosodic pause* in the realm of the signs of (at least some) languages cannot be dismissed without very good reasons.

A contrastive analysis involving very different languages would be interesting, especially in order to test the surprisingly likely hypothesis according to which all languages share this same sign, ... and with the same meaning.

---

[2] Adam Makkai (1980) suggested, almost forty years ago, that "A semantic pause […] is a chance to change your mind in mid-utterance".

5. CONCLUSION

The principal benefits of the work presented here can be divided into (i) *descriptive consequences*, and (ii) *theoretical consequences.*

    (i) In order to correctly account for the facts presented in this paper, one must include the following phenomena in the set of semantic facts that must be taken into account in a semantic description:

    (a) when the utterance of a sentence is involved with the argumentative aspect of a discourse that actualizes it, it may either *be oriented towards* some conclusion, or else *formulate* some conclusion;

    (b) the *prosodic pause* is a semantic unit (like a lexical item of some language), whose meaning is to indicate the hearer that the segment preceding it (the pause) has to be reinterpreted from a *formulation*-utterance to an *oriented*-utterance.

    (ii) Adding facts (a) and (b) in the set of facts that must be taken into account in a semantic description has important theoretical consequences.

    (C1) Argumentative utterances can no longer be simply characterised by a pair (sentence, conclusion): their role with respect to that conclusion (*oriented towards* it or *formulating* it) must also be specified. This change may have interesting consequences on theoretical semantics.

    (C2) Admitting that a prosodic pause in a discourse is the actualisation of a sign of the language (sign that we called *prosodic pause*) requires a change in the conception of what a *sign* is. I haven't explored yet the consequences of such a change, but one can guess that it can lead to interesting challenges in several disciplines, among which, linguistic theory and semiotics.

Expanding the toolbox for argument reconstruction: Making a (preliminary) case for considering dialogic syntax

MENNO H. REIJVEN

ABSTRACT: Pragma-dialecticians, in order to study the complex speech act of argumentation, have to reconstruct the argumentative discourse. They have an ideal model to guide them through this process, but are supposed to remain as close as possible to the actual discourse, such that the ultimate reconstruction represents the commitments of the protagonist. In addition to the current tools available, I suggest that dialogic syntax may offer complementary insights relevant to the study of argument reconstruction.

KEYWORDS: argument reconstruction, complex argumentation structures, dialogic syntax, pragma-dialectics, resonance, syntactic cues, syntactic implicature

1. INTRODUCTION

Human communication is a complex phenomenon. Various kinds of linguistic action are simultaneously pursued, while various cultural backgrounds are also reflected in one's speech. Consequently, the argumentative discourse which is woven into our speech is often messy and seemingly disorganized. Following the pragma-dialectical theory on argumentation (Van Eemeren & Grootendorst, 1984; 1992; 2004; Van Eemeren, 2010), the analyst has to reconstruct this discourse based on the ideal model of a critical discussion. This model, the problem valid set of rules to realize the hypothesized function of argumentation as a speech act complex to resolve a difference of opinion on the merits, has multiple functions within a pragma-dialectical research project (Van Eemeren & Grootendorst, 2004, p. 59; p. 96ff). First of all, it is a heuristic tool to identify relevant discursive elements. Second, it functions as an analytic guide to determine the function of an utterance within the overall argumentation. Third, as a normative benchmark, it enables the analyst to evaluate the quality of the discourse encountered in practice. Thus, the pragma-dialectical ideal model does not describe how argumentation occurs, but it does describe what argumentation is. It articulates the commitments arguers take on when advancing an argument.

This last observation is why the analyst is allowed to reconstruct the discourse at all: the arguer is committed to wanting to resolve the difference of opinion on the merits. The analyst has to reconstruct the discourse such that the functional role of each contribution is clear (Van Eemeren & Grootendorst, 2004, pp. 96-97). However, ideally, the reconstruction of the discourse should match the intentions of the speaker (as this is what a speaker is truly committed to). Unfortunately, these can never be known absolutely. Yet, arguers continuously alter their commitments while speaking, which can be used instead. Thus, the analyst is given the task to remain close to the actually spoken discourse, while the cues to those commitments provided in their discourse may not prove sufficient to complete the reconstruction, leading the analyst to resort to other, theoretical, strategies (e.g. maximally argumentative analysis, see Van Eemeren & Grootendorst, 2004, p. 117) . Consequently, the analyst may jump from

the talk to the interpretation too soon, running the risk of distancing themself from the argumentation as actually advanced.

In this paper, I review the current toolbox offered to pragma-dialectical scholars to reconstruct complex argumentation structures. Thereafter, I make a case to include dialogic syntax, and specifically its focus on resonance, in this toolbox. Namely, this will allow us to remain closer to the actual discourse without jumping too soon to empirically unsubstantiated assumptions. In this paper, I do not develop a comprehensive, or even applicable, perspective on dialogic syntax which can be used for the reconstruction of argumentative discourse; I merely want to open up this perspective to be developed into a useful additional tool for argumentation theorists. This paper is just meant as an initial meditation on the potential opportunities dialogic syntax may offer.

2. THE TOOLBOX FOR ARGUMENT RECONSTRUCTION

Scholars have been using a variety of tools to remain close to the discourse, and not to interpret the argumentative discourse in a way which is too far removed from the commitments (or externalized intentions) adopted by the arguer in the actual discourse. The job of the analyst consists of searching for clues and indicators which point to these commitments. If no sufficient clues and indicators are present to justify a particular reconstruction, pragma-dialecticians pursue a maximally argumentative analysis (Van Eemeren & Grootendorst, 2004, p. 117). Specifically, this means that utterances are included in the argumentative structure as single argumentation to prevent that no premises are missed and that false premises cannot weaken the argumentation. However, it is essential to keep in mind that the analyst should always try to avoid using this principle, as it means to distance oneself from the actual discourse as a maximally argumentative analysis is justified only on theoretical grounds (see Van Eemeren & Grootendorst, 2004, p. 117). Thus, specifically, what I am after in this paper is whether there is another tool which can be added to the already existing toolbox at our disposal to better avoid using this analytic strategy.

Each of the tools for argument reconstruction should help the analyst to decide among the various alternative possible reconstructions of the argumentative discourse in terms of its structure. There are three basic forms which should be possible to be distinguished through these clues in the discourse: complex argumentation can be multiple, coordinative and subordinative (Snoeck Henkemans, 1992). Multiple argumentation refers to premises which separately justify the same proposition, whereas coordinative argumentation refers to premises which collectively justify the same proposition. Subordinative argumentation concerns premises which form an argumentative chain: a standpoint is defended by one of these premises, which, in turn, is defended by the other premise. Thus, how can the analyst decide which reconstruction to pick?

A first thing the analyst can do to avoid using the strategy of a maximally argumentative analysis is to look for words which suggest that one reconstruction is more suitable than another. Pragma-dialecticians have conducted various studies (e.g. Van Eemeren, Houtlosser, & Snoeck Henkemans, 2007; Snoeck Henkemans, 2003) on how certain words, or combinations of words, are connected to certain argumentative structures and functions. This recurring, or pragmatic, link between those terms and structures can justify an analyst's reconstruction of the argumentative discourse. For example, a discussant could use words which imply that a particular assertion is obvious ("we all know", "we agree", "obviously", see Van Eemeren, Houtlosser & Snoeck Henkemans, 2007, p. 103). Thereby, it is brought into the discourse as a starting point: its argumentative function is to ground the argumentation, and is not subjected to doubt itself. Words like "because" and "for" imply that

what follows should be seen as a premise, as it implies that the following phrase supports the foregoing claim (Van Eemeren, Houtlosser, & Snoeck Henkemans, 2007, p. 110). The use of the words "cause" and "causing" support a similar implication for the argumentative discourse[1] (Van Eemeren, Houtlosser & Snoeck Henkemans, 2007, p. 166). Thus, argumentative discourse is filled with a variety of indicators, ranging from conjunctions to nouns and verbs, which imply certain statuses of and relations between utterances and propositions and can therefore enable the analyst to justify a particular reconstruction of the argument structure.

These verbal indicators are the most salient clues at hand. In order to stay close to the discourse, there are also various less direct clues available (Snoeck Henkemans, 1992). Thus, second, the analyst can turn towards various pragmatic cues provided in the discourse. The formulation and type of standpoint will suggest the need for a particular argumentative structure. For example, if the standpoint is worded rather strongly, it is likely that a stronger defense is needed to justify this position successfully. Consequently, this would help making the case for a coordinative reconstruction of the discourse. However, the context of the argumentation could also provide a need for particular structures. Thus, in order to defend a reconstruction, the analyst will have to look at the setting, situation and institutionalization of where the argumentative discourse occurs as this context may impose certain demands on the protagonist with regards to the required structure of the argumentation. For example, when analyzing argumentation used in a political election campaign, a reconstruction of the discourse as multiple argumentation could be justified on grounds that candidates for the political office have to appeal to different segments of society who have highly different argumentative needs. Thus, each segment needs to be appealed to with a different argument.

Another set of clues identified by Snoeck Henkemans (1992) are dialogical cues. It is presumed by pragma-dialecticians that argumentation is advanced in the light of anticipated criticism. Namely, if one would not expect any criticism, there would have been no need to provide further justification of one's claim. Hence, if there is actualized criticism present in the interaction to be reconstructed, this provides information about the argumentative structure the protagonist is held committed to by their interlocutor. For example, if an argument has been met with doubt, the protagonist has to react. If they decide to not withdraw the argument, but to strengthen their defense, the argumentation should likely be reconstructed as coordinative or subordinative. However, if the argument is withdrawn, and a new line of reasoning is advanced instead, the discourse should be reconstructed as multiple argumentation. Namely, in the case of multiple argumentation, the protagonist can retract a premise without consequences, while this is not the case for coordinative and subordinative reasoning.

Lastly, Snoeck Henkemans (1992) argued that there are also dialectical cues as to how to reconstruct the argumentative discourse. Within the pragma-dialectical framework, different types of argumentation schemes are studied, which are used to connect premises to their respective standpoint. Through the critical questions which belong to each argumentation scheme it is possible to clarify the organization of premises.

I hope that ultimately we can add a fifth type of clues to this toolbox for argument reconstruction: syntactic clues. Of course, the syntax of single utterances may have little to say about argument structures, but *dialogic* syntax (Du Bois, 2014), which focuses on the similar or contrastive use of syntax in utterances, can.

---

[1] Note that these indicators can also point us towards the argument scheme used. However, this is not a topic discussed in this paper.

3. DIALOGIC SYNTAX AND IMPLICATURES IN DISCOURSE

Dialogic syntax is a theory on syntax which does not focus on the grammatical structure within utterances, but among. According to Du Bois (2014, p. 359), "[d]ialogic syntax encompasses the linguistic, cognitive, and interactional processes involved when speakers selectively reproduce aspects of prior utterances, and when recipients recognize the resulting parallelisms and draw inferences from them." Thus, what dialogic syntax focuses on is not just the structural organization of an utterance, but the engagement of participants with prior utterances. These syntactic structures are created through the selective reproduction of what has been said before and thus constitute a fully dialogical phenomenon. Consequently, focusing on dialogic syntax, the analyst can formulate various implicatures because the selective reproduction of prior utterances implies certain linguistic, cognitive and interactional processes. That is, the copying, or not, is a way of commenting upon previous utterances. It enables to identify syntactic implicatures.

As dialogic syntax is a phenomenon which happens among utterances, it should be seen as a higher-order phenomenon than 'ordinary' syntax. The unit of analysis in dialogic syntax is the diagraph, which is a "supra-sentential syntactic structure that emerges from the structural coupling of two or more utterances (or utterance portions), through the mapping of a structured array of resonance relations between them" (Du Bois, 2014, p. 376). Thus, the reproduction choices of the speaker with regards to syntactic structure of previous discourse leads to parallel structures across utterances consequently portraying clear similarities and contrasts, referred to as resonance. Namely, the structure of a previous utterance resonates through the current one. Consequently, resonance is not only activating the structure of another sentence, it is a way of elaborating upon each relationship between comparable linguistic elements which results in the utterance carrying pragmatic implications (i.e. syntactic implicatures), primarily because other things could have been said which would not produce this resonance with the previous discourse. The utterance becomes a commentary upon the resonating one.

Consider the following case, example 1, taken from a visit of Donald Trump (DT) to *The Tonight Show Starring Jimmy Fallon* (on January 11th 2016) while talking with the host, Jimmy Fallon (JF), about his just-proposed Muslim Travel Ban. This topic is introduced some lines before the excerpt presented in example 1. Fallon starts off with noticing that Trump often says things which are "a little controversial", like "not allowing any Muslims into the United States". This observation is followed by a response by Trump justifying the need for his proposal. Then, at the end of his argument in defense of his Muslim Travel Ban, he utters what is quoted in example 1 (presented as diagraph, the supra-sentential structure of interest in dialogic syntax).

(1) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (01/11/16)

1. DT		I guess	a lot of people agree		with me	
2.	(0.4)					
3. JF	Well	I mean	some people	don't agree	with you	as well

Thus, after Trump talked about why his then-proposed Muslim Travel Ban would be a good idea, he states that "I [Trump] guess a lot of people agree with me" (1:1). Fallon responds, after a 0.4 second pause (1:2) with "Well, I mean, some people don't agree with you as well" (1:3). Thus, next to the discourse marker "well" (1:3), which indicates a dispreferred response in this case (for various uses of 'well' see Heritage, 2015), there is also a lot of resonance going on, as indicated by the diagraph presented as example 1: Fallon uses a mirroring sentence structure. Not only is the content of the sentence opposed to Trump's, and not only is

this indicated by the use of a discourse marker, but this is also happening through contrastive resonance.

Besides the central opposition between "agree" and "don't agree", first of all, in Fallon's response, "I mean" is opposed to Trump's "I guess". It suggests that Trump's "guess" is from Fallon's perspective not correct. Specifically, his guess is wrong and Fallon has evidence for this. Yet, note that Fallon does not deny the correctness of the content of Trump's guess, which is especially marked with Fallon's additional "as well" (1:3), but also with Fallon's moving away from "a lot of people" to "some people", but its implication. Namely, as Fallon chooses to emphasize that there are people who do not agree "with you [Trump]" -- thereby placing an extra emphasis on Trump as a person -- it becomes clear that this disagreement primarily concerns the initial prompt on Trump being controversial. Thus, by introducing that many people agree with him, Trump attempted to counter this claim. Fallon brings it back to the foreground by emphasizing that his argument is not successful at countering that he is divisive, and thereby rejecting Trump's argument. Thus, through this resonance, Fallon comments on Trump that his guess does not yield the implication that he is not divisive. and that he did not yet resolve the accusation that he is controversial.

This at least shows that dialogic syntax has potential to help the analyst gain insight in the implications carried by a statement with regards to its argumentative function. Here, the diagraph enabled us to observe hidden criticism on a premise defending Trump's standpoint that he is not controversial by putting forward his Muslim Travel Ban. The question is whether dialogic syntax can also imply a particular argumentative structure. For this, it is important to note that dialogic syntax is not just about engagement between utterances of different participants. It is also possible to comment upon one's own utterances (Du Bois, 2014). Each and every utterance can resonate through other utterances. Namely, the primary process of resonance which is relevant in this regard is its use to show alignment among various stances in the interaction (Du Bois & Kärkkäinen, 2012, p. 440).

4. DIALOGIC SYNTAX AS TOOL FOR ARGUMENT RECONSTRUCTION: A PRELIMINARY CASE STUDY

Let's examine an argument to investigate preliminarily how dialogic syntax may interact with the other cues from the toolbox for argument reconstruction to justify our reconstructive analyses. The next example, example 2, is another visit of Trump to *The Tonight Show Starring Jimmy Fallon* (on November 15th 2016). After Fallon has greeted Trump and congratulated him with being the frontrunner in the Republican primaries, Fallon poses the question, as reported in example 2.

(2) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (09/15/16)[2]
1. JF   You (0.3) You still have ti:me you still wanna do this?
2.   >↑I think there is ti::me↑<
3.
4.   [3 lines omitted]
5.
6. DT   We'r:e eh we're doing well. It's been really a lot of fun and
7.   it's eh an amazing movement all over the country it's been
8.   incredible so-. (0.4) No. It's: been an honor for me (0.2)
9.   I have to say. (0.2)

---

[2] Transcribed loosely following the conventions of conversation analysis (see Jefferson, 2004).

The question Jimmy Fallon poses to Trump (2:1) is about whether Trump does still want to run for president; moreover, the question is tilted towards a negative response, implying that he does not really want to run. Thus, Fallon suggests that Trump "still has time" to quit if he does not really "wanna do this" (2:1) -- at least, Fallon "thinks there is time" (2:2). With this question, consequently, Fallon casts doubt upon Trump's implicit standpoint that he wants to run for president. In the next lines (2:6-9), after some laughter from the audience and initially hesitating, Trump defends his implicit standpoint. The question we are faced with is: what is the argumentative structure Trump can be held committed to? Let's go through the types of clues we could find, one by one.

(1) Argumentative Indicators. In this fragment, two words catch attention immediately as being relevant to argumentative structure: "so" (2:8) and "no" (2:8). Usually, the word "so" is used to indicate that the information presented before this word supports the next phrase. Unfortunately, next to this indicator is some silence of 0.4 second (2:8). Moreover, after this silence, Trump uses the word "no" (2:8). This suggests that he made a conversational repair (and thus, advanced multiple argumentation). In conclusion, it seems that there are two clusters of propositions: one group before the "so", pause, and "no" (2:6-8) and after (2:8-9). Unfortunately, the conclusion did not follow its likely indicator. Luckily, we already know the standpoint being defended, as the need to defend it was the reason this turn at talk happened at all: Trump wants to run for president. In this turn, there is another word which catches some attention: "and" (2:6). However, as this is a fairly argumentatively ambiguous word, we should just keep in mind that this word connects the two adjacent propositions in some way.

(2) Pragmatic Cues. The standpoint at stake ("Trump wants to run for president") does not by itself imply the necessity of a particular argumentation structure. Given that this performance is part of his bid for the U.S. presidency, the context may provide some cues. The part of the electorate which matters with regards to Trump's standpoint is rather small. Most people either would not vote for him either way or are not concerned about this issue at all. Yet, whereas the first group does not matter at all, Trump has to make sure his argument does not alienate the second. This does not, however, specify whether he needs to advance coordinative or multiple argumentation. Of course, Trump needs to produce an argument that is sufficiently acceptable to Fallon, as he is the only other direct participant in the conversation.

(3) Dialogical Cues. Within this fragment, no dialogical cues are given. Yet, directly after this response, Fallon requests more argumentation: "There's probably a kid watching you right now (...) [and] ask you they wanna grow up [and] be president". Implied is the question of why someone would want to become president beyond just enjoying their campaign. Thus, with this statement, Fallon challenges the argumentation Trump has advanced before because it is not saying anything about him wanting to be president. Fallon rejected Trump's defense because it defends his position that he wants to run president because he enjoys and is even honored by doing this campaign. He does not comment on why he wants the job in the first place. In sum, example 2 presents one argument as the whole turn is criticized through Fallon's comment.

(4) Dialectical Cues. The basic structure of the argumentation seems thus to be: I want to run for president, because I enjoy this campaign. Yet, there are no clear signs as to which argument scheme has been used, and consequently, we cannot determine which critical questions can help determine the argument structure.

(5) Syntactic Cues. Lastly, this fragment has some resonance, and thus there may be a chance that there are syntactic cues as to how to reconstruct this fragment appropriately. Let's take a look at the diagraph in example 3.

(3) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (09/15/16)[3]

1. DT		We	're			
2.		We	're	doing	well	
3.		It	's	been	really a lot of fun	
4.	and	it	's		an amazing movement	
5.					all over the country	
6.		it	's	been	incredible	
7.	so					
8.	No	it	's	been	an honor	for me
9.		*I*		*have to say*		

In example 3, note that there are a couple of parallel structures which seem to mark dialogical engagement. First, there is a contrast between the first part where Trump uses "we are" (3:1-2) compared to the second part where he says "it's" (3:3-8). Thus, he moves from the campaign as a group of people ("we") to the campaign as a thing ("it"). There is also a contrast between him saying "it's been" (3:3, 3:6, 3:8) and when he just says "it's" (3:4). Namely, there is the contrast between talking in the past/passive compared to the present/active. Moreover, when Trump uses "it's been" in the first two instances (3:3, 3:6), he is talking about the earlier-mentioned "we" (3:1-2) passively, which is reifnorced by his last move in the diagraph (3:8) where he explicitly adds "for me" to his utterance. Thus, this line (3:8) constitutes a contrastive parallel structure with the earlier lines in the fragment (3:1-6).

The contrast between "we're" and "it's been" (3:2 and 3:3) suggests a subordinative structure. As Trump implies that they "are doing well" (3:2) *in the campaign* (because they are currently doing well and they are currently doing the campaign), pragmatically, the switch to "it" (3:3) suggests that he produces a commentary on this campaign -- specifically, on the campaign implied in the previous utterance where they "are doing well" (3:2). Through the resonance in syntactical structure between those lines (3:2 and 3:3) the first sentence is implicitly present while uttering the latter. Thus, Trump seems to imply that "we're doing well" (3:2) as "it's been really a lot of fun" (3:3). Similarly, the other uses of "it" (3:4-8) seem to be such a commentary as well. Consequently, in addition to the "fun" (3:3), "we're doing well" is also due to "it [being] an amazing movement all over the country". Here, the word "and" (3:4, see also 2:6) seems to connect these two lines together. In coordination, these lines (3:3 and 3:4) provide a full commentary on them "doing well" (3:2).

The next line, "it's been incredible" (3:6), resonates with them having "fun" (3:3) and thus also contrastively with them "doing well" (3:2), but it also has contrastive resonance with the previous line (3:4). This is an instance where the repetitive structure seems to imply something, but, to me, what it signifies is not yet unambiguous. At this point, I am tempted to hypothesize that it is again a commentary on the previous lines due to the adjacent contrast. Namely, Trump could have said "it's incredible", which would have aligned it more closely with the previous line, producing a different, similarity-based syntactic implicature. However, this is a point to be further investigated, perhaps by taking into account research which connects resonance and stance-taking (e.g. Du Bois, 2007; Du Bois & Kärkkäinen, 2012) or a dialogical perspective on speech acts (e.g. Weigand, 2015).

The last line of the diagraph (3:8) is interesting as it has a strongly resonating character due to the use of "it's been", but contrastive due to the fact that Trump has added "for me" at the end. First, the other sentences lack the qualification *for whom* at all. Second, the implied qualification for the first sentences is not "me" but "we", as the campaign team as a whole was the entity introduced initially (3:1-2). This suggests that this latter statement is

---

[3] There is no resonance claimed in the lines presented in *italics* (following Du Bois, 2014).

still a commentary like the other lines, but separate due to its contrastive qualification: instead of *for us*, it is now *for me*. Note, this was also suggested when discussing the argumentative indicators above. Moreover, interpreting this last move as a repair of the earlier argument, it suggests that it is a completely different line of argument than each of the previous lines focused on "we" (3:1-6). Thus, this seems to comment upon the previous turns that it is a different argument for the same point (i.e. the campaign is why I still want to become president).

Hence, this discussion seems to suggest a couple of things:

1. The standpoint at issue is the fact that "Donald Trump wants to become president of the United States";
2. There are two main branches of argument (multiple argumentation), which are split in the middle through the use of "so" and "no", as well as a 0.4 second pause (2:8);
3. There is an instance of repair of the first lines (2:6-8) into the latter ones (2:8-9);
4. The two propositions surrounding "and" (2:6-7) are connected in some way;
5. In some way, the argumentation is one line of defense for the overall standpoint under attack;
6. The lines using "we're" are commented upon by the lines using "it's" (3:1-2 vs. 3:3-8);
7. The contrast between "it's" and "it's been" (3:4 vs. 3:6) suggests a difference in function, most likely again a commentary upon the previous line;
8. The last line (3:8) does different work than the previous lines (3:1-7).

And would result in the reconstruction presented as example 4.

(4) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (09/15/16)
(1. Donald Trump wants to run for president)
    1.1 They [those involved in the campaign] are doing well
        1.1.1a [The campaign] has been really a lot of fun
        1.1.1b [The campaign] is an amazing movement all over the country
            1.1.1b.1 [The campaign] has been incredible
    1.2 [The campaign] has been an honor for Trump

This reconstruction requires me to comment on the previously identified dialogical cue that Jimmy Fallon rejected Trump's argumentation through a single comment. As premise 1.2 was identified through both argumentative indicators and syntactic cues as a repair of the first premises, the argumentation advanced in multiple as the first line of defense has been withdrawn. Consequently, there is only one line of defense left to comment upon. Moreover, in case this reasoning is not convincing, one can note that the dialectical cue undermines the premise that no argument by Trump centering around him liking the campaign is sufficient. Then, the dialogical cue does not suggest that the turn as a whole can only support a single line of argument, just only arguments which are based on a particular premise.

This discussion has not resulted in a case in which dialogic syntax has been systematically introduced as a fifth cue for analysts. However, this was also not the purpose of this discussion. The only case I wish to make is that dialogic syntax offers implicatures which are potentially relevant to the study of argument reconstruction, and the task ahead concerns to further study the meaning of those implied meanings through syntactical engagement with regards to complex argumentation structures.

5. CONCLUSION

In this paper, I first reviewed the practice of argument reconstruction as a fundamental part of pragma-dialectical studies on argumentation. In their attempt to reconstruct the argumentative discourse, analysts run the risk of distancing the resulting reconstruction too much from the actual discourse. Of course, analytic strategies, like conducting a maximally argumentative analysis, are developed on theoretical grounds, but it is always best to try to avoid using these. The only way to avoid this is to find indicators and clues in the actual discourse. In this paper, I discussed four central ways which guide pragma-dialecticians in their pursuits. There are words which are argumentative indicators, but also pragmatic, dialogical and dialectical cues. In addition to these, I proposed to add insights from the theory of dialogic syntax, specifically their concept of resonance, to this list as a syntactic cue.

I recognize that the development of dialogic syntax as a tool for argument reconstruction still lacks proper conceptualization. However, with this paper I hope to have made a case that this perspective has potential as another tool to be added to our toolbox for argument reconstruction. Further work will have to be done to more precisely develop the pragmatic implications of the use similarity and contrastive resonance in argumentative discourse with regards to argumentation structure. A lot of work still has to be done in this respect, but the other tools at hand offer a solid framework which can guide the development of this tool. If cases with resonance structures are found where the argumentation structure can be identified through the other four tools at our disposal, it will be possible to study the exact implications of dialogic syntax, which can then be used in more confusing and messy instances.

This is not the only way to proceed. The study of dialogic syntax and its implications for argument structures could also focus next on the relationship between resonance and stance (e.g. Du Bois, 2007; Du Bois & Kärkkäinen, 2012). Once a better understanding has been developed of how resonance relates to the positioning of the speaker towards the previous utterance implied through parallel structures, it will be possible to articulate the argument structure between the propositions, seen as linguistic objects. This pursuit would probably benefit from looking at speech acts from a dialogical perspective (see, e.g., Weigand, 2015). This would enable the analyst to assess the interactive meaning of directly adjacent speech acts. Of course, ideally, development of dialogic syntax as a tool for argument structure would focus on both strategies: the use of stance and the use of the other four indicators.

ABSTRACT: Late-night talk shows have become a central medium used in presidential campaigns in the United States. In this paper, we provide the groundwork for research into the prototypical argumentative patterns which are central to this discourse by identifying that this discourse is (1) focus on the omnipresent standpoint "you should vote for me" which is (2) discussed through future policy and the candidate's identity. We conclude that deliberation and promotion are the central genres.

KEYWORDS: entertainment political interview, late-night talk show, omnipresent identity, omnipresent standpoint, political argumentation, presidential campaign, prototypical argument patterns, strategic maneuvering, topical potential

1. INTRODUCTION

U.S. politicians frequently appear at late-night talk shows to be interviewed. These interviews, although their format is aimed at entertaining the audience (Munson, 1993), should be seen as a form of political interview (Parkin, 2014), to which we refer as the Entertainment Political Interview (EPI). This genre becomes particularly interesting when the politician in question is running for office, such as for the U.S. presidency. In this paper, we argue that this interaction becomes a political interview (next to it being an entertainment interview) primarily because the identity of 'politician' has omnipresent relevance in this genre of communication. Moreover, since we focus on the omnipresence of the identity 'presidential candidate' specifically, the consequences upon the interpretation of the discourse become even more significant. Instead of just being a discourse aimed at entertaining the audience, it becomes part of a political campaign discourse. For this reason, the discourse advanced also becomes argumentative, as it functions as a supportive discourse to their presidential bid.

Thus, whenever presidential candidates converses with the host on the EPI, their position as a credible candidate is continuously potentially threatened because everything that

is said in these conversations can be used by the electorate to evaluate their suitability for office. Specifically, the host's talk may undermine the candidates' bid for the presidency as it may highlight an unfavorable quality or problematic idea. The link to their goal of becoming president is a continuously relevant interpretation of the discourse, as, due to the identity 'presidential candidate' and the activity 'campaign' being omnipresent within the discourse, the standpoint "you should vote for me" is omnipresent, as we discuss in section 2. Additionally, we show that this leads to also having an omnipresent standpoint ("you should vote for me") in the discourse. In section 3, we provide an overview of the ways in which the omnipresent standpoint is attacked in the EPI by using Aristotle's typology of 'genres of oratory' to articulate the disagreement space. Namely, if the types of support for the omnipresent standpoint can be articulated, it will be possible to investigate the prototypical argument patterns in this discourse. Lastly, based on the findings on the use of the disagreement space by the participants, we argue that two genres of communication are central to the argumentative discourse on EPI. On the one hand, politicians pursue the genre of promotion. On the other, they participate in deliberation. These genres are the foundation for the prototypical patterns to be identified in this communicative activity type.

2. OMNIPRESENT STANDPOINTS IN ENTERTAINMENT POLITICAL INTERVIEWS

In late-night talk shows, and specifically the EPI, when politicians visit they pursue multiple goals. On the one hand, they visit the show as a celebrity guest. It is commonplace for those shows to invite well-known, popular people – celebrities, people the audience wants to see and hear – to talk about a variety of topics (Munson, 1993). In this role, the task at hand which is highlighted is to maintain an entertaining conversation with the host of the show. On the other hand, they are specifically invited because of their identity as a politician – and a particularly relevant one, since they are running for the U.S. presidency. This everyday identity makes them a worthy guest. However, when politicians appear on these shows this puts them in an interesting position as they have to negotiate between these two identities: them being on the show as a celebrity guest and as a politician in the midst of their campaign may lead to having to fulfil opposite demands.

In their role as a celebrity guest, they are not supposed to pursue their political goals on those shows. They should simply attempt to uphold a light-hearted conversation, which is enjoyable to watch for the show's audience. However, when the politician visiting is a candidate for a public office, and especially the U.S. presidency, it is hard to not interpret anything of their talk as an attempt to support their bid. Each and every utterance may support or undermine their case; each and every member of the audience, present in the studio or at home watching them being broadcasted, is a potential voter. It could be said that their identity as a presidential candidate is omnipresent in the current discourse produced between the entertainment show host and the candidate themself; as such, the whole discourse carries implications based on this identity (see Fitzgerald, Housley, & Butler, 2009). Thus, even though they cannot explicitly campaign and directly claim that they are the better candidate due to their role on the show as a celebrity guest, the audience will, because it is aware of the omnipresent relevance of them being a presidential candidate, be able to interpret whatever has been said as relevant to this standpoint. As such, "you should vote for me" or "I am the better candidate" are continuously implicit standpoints, and all the time being defended by the candidate's discourse. These standpoints could be called omnipresent standpoints.

When Donald Trump (DT) visited *The Tonight Show Starring Jimmy Fallon* (JF) during his campaign for the U.S. presidency in 2016 (excerpt 1 is taken from his visit at September 15th 2016), the first topic raised was about him being a presidential candidate

(specifically, it implied that it was rather odd that that was his current identity), showing the relevance of this identity in this interaction (because it had to be acknowledged right away).

> (1) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (09/15/16)
> 1.   JF   It's nice to see you!
> 2.   DT   It's nice to see you!
> 3.   JF   Thank you for coming back to the show, I appreciate this.
> 4.   DT   Always love it.
> 5.   JF   So, this is getting real?
> 6.   (0.8)
> 7.   DT   Yeah
> 8.   JF   Ya
> 9.   DT   It's getting real, I agree.
> 10.   JF   You still have time, you still wanna do this? I think there's time!

In excerpt 1, the first exchanges between Trump and Fallon of that evening's show are presented. After the usual greetings and pleasantries (1:1-4), Fallon poses Trump a question: "So, this is getting real?" (1:5). Here, Fallon refers to Trump's presidential bid. Initially, it was joked about, but he secured his nomination for the Republican Party, and as such, his bid seems to be "getting real". Note that this line does not only invoke Trump's identity as a presidential candidate, but also challenges it. This would explain the awkwardness and hesitation expressed afterwards (1:6-8), as it remains silent for another 0.8 seconds followed by a fairly minimal response by Trump. With a further reformulation of the question by Fallon as "you still wanna do this" (1:10), Fallon seems to want to discuss Trump's motivations to actually run for president.

Thus, it is not only that Trump's omnipresent identity is invoked and challenged, with this comment, Fallon also undermines Trump's goal of being elected. If Trump does not really want to run, then there is also no good reason to vote for him. It functions as a counterargument to Trump's bid to the presidency, and specifically against his position that one should vote for him. It seems that this discourse is central to presidential candidates' campaigns! This reasoning is further supported by David Letterman, who invited both the Republican and Democrat candidates for the presidency onto his show during the 2000 elections, when he claimed that "the election will be decided here" (quoted in Niven, Lichter & Amundson, 2003, p. 118). Thus, the late-night talk show is also recognized by participants as a central medium in pursuing a political campaign. Participating on these shows is essential to gaining the votes necessary to win. It is precisely a place where candidates can go to defend their standpoints "you should vote for me" or "I am the better candidate".

However, this standpoint is continuously implicit in the discourse. Throughout, the candidates will present and defend substandpoints, following the question or comment posed by the host of the show. In excerpt 1, the substandpoint invoked by the host (through attacking it) was that Trump "wants to become president". In excerpt 2 (numbering continues from excerpt 1, skipping some laughter and hesitations), Trump's response to the challenge to this substandpoint for his omnipresent position that "you should vote for me" is shown.

> (2) Donald Trump at *The Tonight Show Starring Jimmy Fallon* (09/15/16)
> 14.   DT   We're doing well. It's been really a lot of fun and it's
> 15.   an amazing movement all over the country. It's been
> 16.   incredible. So.
> 17.   No. It's been an honor for me, I have to say.

Thus, after Fallon challenged Trump with the fact that he doubts that Trump actually wants to run for the presidency (which is consequently interpreted by the audience as doubts concerning whether one should vote for him), Trump defends that he actually wants to run. Specifically, in the campaign, he is "doing well" and it is "really a lot of fun" (2:14). He has "an amazing movement" (2:15). In one word, the campaign "has been incredible" (2:16). Running for the U.S. presidency is "an honor" for him (2:17). Hence, Trump takes up the challenge posed by Fallon and provides argumentation in defense: Trump truly wants to run for president. In this way, he ensures that he is seen as a viable candidate for the U.S. presidency. Thus, it has implicitly justificatory potential for his omnipresent standpoint that "you should vote for him". Without ever being explicitly mentioned, this standpoint is continuously implied and part of the interpretation of the discourse.

3. TYPES OF SUPPORT FOR OMNIPRESENT STANDPOINTS IN ENTERTAINMENT POLITICAL INTERVIEWS

Strictly spoken, the candidates do not maneuver strategically themselves in terms of the topical potential (see Van Eemeren, 2010, p. 96ff), as they are dependent upon the host to challenge their bid. Yet, the challenge raised is a strategic maneuver by the host in terms of topical potential, which has to be addressed by the candidate, subsequently. Next, we want to look at the possible challenges or defenses – it is just a matter from whose perspective we are looking at the discourse – for the omnipresent standpoint. In this section, we want to make the claim that each of the questions and challenges raised by the host will be a doubt casted upon the omnipresent standpoint that one should vote for the respective candidate. As such, we want to show the different kind of criticisms used to attack and premises used to defend the omnipresent standpoint in entertainment political interviews with presidential candidates. This taxonomy can be the basis of studies on prototypical argument patterns in such discursive environments as it will enable us to formulate the actual genres of communicative activity employed.

One has to study the topical potential analytically by characterizing the disagreement space of the participants (Van Eemeren & Houtlosser, 2001, p. 153). In this paper, we use Aristotle's genres of oratory (Booth, 2004, p. 17). The first genre is deliberative speech. Here, the speaker is focused on the future. It is concerned with figuring out how the people involved are supposed to act, in order to achieve a desirable result. The second genre is forensic speech. This pertains to "attempts to change what we see as truth about the past" (Booth, 2004, p. 17). Speakers who perform this genre of speech attempt to shed light on what has happened. Third, there is the epideictic genre of speech. This concerns attempts to "reshape views of the present" (Booth, 2004, p. 17). With a communicative performance, it is possible to present oneself or someone else in a certain way. It "can change the reality of how we value people and their creations" (Booth, 2004, p. 17). This speech can affect how we currently see someone. It is speech which gives insight into someone's character. Let's look at how late-night talk show hosts have utilized the disagreement space based on this typology.

(1) Deliberative Criticism and Reasoning. In late-night talk shows, the hosts recurrently refer to policies the candidates have proposed. As such, the hosts question the candidates' standpoints "you should vote for me" due to what they propose as a desirable course of action. Outside of their visit to the late-night talk show, candidates articulate a variety of plans, which, supposedly, they want to execute once elected president. Problems the United States is facing could be countered by introducing a Muslim travel ban, building a wall or lowering taxes. Alternatively, health care could be improved, college could be made affordable and taxes could be raised for the rich (all of these examples come from our corpus

of transcribed interactions of presidential candidates in EPIs). A central part of a campaign for the U.S. presidency is to evaluate what plans the candidates have, as these proposals indicate how they will work on improving the country. If the electorate does not agree with their ideas, that these plans will not be effective or sufficient to make the country a better place, their bid for the presidency is weakened. Thus, each of the policies they propose is a substandpoint for their position "you should vote for me".

Consider excerpt 3, concerning Fallon (JF) and Trump (DT).

(3) JF (to DT): But you say things sometimes that go like "that's a little controversial". (...) I mean the Muslim thing is – not allowing any Muslims into the United States.

In excerpt 3, Fallon is asking and inquiring about a proposed policy Trump has said he would want to pursue if elected president. Consequently, this comment by the host would prompt a response about the candidate's future actions. Specifically, Fallon notes that the Muslim travel ban is "controversial", and thereby requests Trump to defend this ban. It requires Trump to produce deliberative speech as he has to explain why his proposed policy is beneficial to America.

In excerpt 4, we show the response of Trump to the comment by Fallon as quoted in excerpt 3.

(4) DT (to JF): But you know, there is something happening. And we are talking about on the short term basis. Temporary. But Jimmy, there is something happening out there.

Here, in excerpt 4, Trump takes on Fallon's call to talk about future policies. He starts his argument in defense of his policy with observing that "there is something happening". His Muslim travel ban is a solution which he hopes to install as president in order to solve these issues "out there".

(2) Forensic Criticism and Reasoning. A second inquiry the host of the late-night talk show can make is about the qualification of past facts. In these cases, the hosts question the omnipresent standpoint based on disqualifying evidence from the past which make them unsuitable to serve as president. Not being able to responsibly deal with emails may disqualify someone to be an appropriate candidate for the presidency (again, these examples are taken from our corpus). Another important aspect of a presidential campaign is to assess the suitability of the candidate based on their past actions. If the electorate does not believe that there is evidence for the candidate being a true potential candidate for the presidency, the standpoint "you should vote for me" will barely meet sufficient support. Thus, each time the host inquires about their past actions, the presidential candidates are invited to advance forensic discourse. It is their task to redefine the situation such that the evidence provides support for their presidential bid.

Consider excerpt 5, where Jimmy Kimmel (JK) suggests a label for Hillary Clinton's (HC) past actions in her role as a member of the Obama administration.

(5) JK (to HC): Look at…. Who could have guessed that this audience would be so enthusiastic about the cofounder of ISIS!

In excerpt 5, Kimmel refers to a widely known fact from Clinton's past, specifically her involvement in the Obama administration's interventions in the Middle East, to question her being qualified to become president of the United States. In this case, the facts are supporting the conclusion that Clinton is "the cofounder of ISIS". With her past actions, Kimmel jokes and emphasizes, she contributed to the rise of a terrorist organization, which is against the United States. Obviously, Clinton does not want this conclusion to stick, as it would severely

undermine her case to gain votes during the upcoming election. Being the "cofounder" of an anti-American organization is not something that contributes positively to one's case to become the leader of the country.

Next, in excerpt 6, consider Clinton's response to Kimmel, where she advances forensic speech to redefine the situation.

> (6) HC (to JK): Yeah, that was one of the crazier things that has been said this campaign.

Thus, in her response, Clinton redefines the situation by calling the observation that she is "the cofounder of ISIS" "one of the crazier things that has been said this campaign". This means that she believes that this conclusion based on the facts is unsubstantiated and therefore wrong. She thus claims that she does not have this anti-American nature. Moreover, she continues to argue that it is exactly her opponent who has this anti-American nature as these "crazy things" are making things better for the terrorists (not shown here).

(3) Epideictic Criticism and Reasoning. Third, the host of the late-night talk show could inquire about qualities the candidate has to succeed as president. In contrast to forensic criticism, this criticism is not based on facts from the past which challenge the bid. This criticism is based on a perception of the character of the candidate, which can only be diverted by using speech to alter this perception. If one is seen as weak, but not because of past acts which have to be redefined, one has to argue their way out. If the perceived character is not what is generally seen as one which belongs to a presidential candidate, the standpoint "you should vote for me" is under attack. An argument should be produced to show that the candidate does have the required trait in order to be an appropriate, even desirable, president.

Consider excerpt 7, which portrays an interaction between Clinton and Fallon.

> (7) JF (to HC): You know, what I'm saying by that? You – a lot of people would go, is, oh, "are you tough enough to be president?" Are you tough enough to be president?

In the discourse preceding this question, Fallon asserts that he would "not mess with her". The question about Clinton's toughness is not a qualification of her past actions, but a general perspective on her character. Clearly, one should be tough enough to be president.

How does Clinton respond to this challenge to her omnipresent standpoint? Her response is quoted in excerpt 8.

> (8) HC (to JF): Yes, I think so. But, you know – look – you gotta be a lot of different things to be a good president.

Here, Clinton makes a case that she is "tough enough to be president". Specifically, she explains that toughness is not the only quality you need. A president also needs empathy and diplomatic skills. With this response, Clinton displays her current skills and character and thereby supports her case.

The three 'genres of oratory' of Aristotle seem to be represented in the discourse of the entertainment political interview. In the next section, we want to connect these genres to genres of communicative activity types (see Van Eemeren, 2010, p. 143) in order to assist the further work to be done in identifying prototypical argumentative patterns in this domain.

4. GENRES OF ARGUMENTATION ON ENTERTAINMENT POLITICAL INTERVIEWS

Given the above discussion on the 'genres of oratory', where we reviewed criticism and reasoning belonging to the deliberative, forensic and epideictic genre, it seems that with regards to political speech on late-night talk shows there are two major themes to attend to. First, there is a focus on *future actions* which determine whether the presidential candidate is the right one to become the next president. In this discourse, the candidates are compared in terms of the quality of their proposals. Which candidate proposes a course of action that is best for the country? Which political agenda is preferable? Second, the forensic and epideictic genre seem to point to a different set of discussions. Here, the criticism is not focused on the candidate's platform, but at their *identity*. The criticism seems to center around whether they truly are a potential member to the category 'president'. Do they have the qualities necessary to be successful and effective? Will they be able to cope with the demands of the job?

With regards to the first cluster of criticisms and arguments, as part of the deliberative genre, this argumentative discourse seems to be deliberation. As Van Eemeren (2010, p. 143) notes, this genre is also commonplace in the domain of politics. As such, we should not be surprised that it plays a central role in the entertainment political interview as well.

With regards to the second cluster of criticisms and arguments, as part of the forensic and epideictic genre, this argumentative discourse seems to be promotion. Namely, the focus on their identity in terms of character, qualification and personality is not to settle a dispute. In a presidential campaign, candidates are branding themselves as a good candidate. The focus on their person is a form of advertising a person to become president.

This conclusion that the discourse on the entertainment political interview consists of two genres, deliberation and promotion, can ground further research into the prototypical argument patterns in this form of communicative activity.

5. CONCLUSION

In this paper, we laid out the groundwork for an investigation into the prototypical argumentative patterns in entertainment political interviews. In order to do this, we first investigated the standpoints being defended. We concluded that in this type of discourse, there is an omnipresent standpoint, as everything a presidential candidate says is considered in light of their presidential bid. Next, we looked at possible criticisms and defenses for this omnipresent standpoint in terms of the topical potential which can be used in strategic maneuvering. We used Aristotle's 'genres of oratory' to organize the criticisms and arguments advanced in the discourse. Third, these criticisms and arguments seemed to lead us to two clusters – two types – of argumentative discourse. On the one hand, arguments seemed to be focused on the proposed policies in terms of a candidate's future actions. This political agenda is assessed in terms of the merits of the course of action for the country. As such, this kind of discourse belongs to the genre of promotion. On the other hand, other arguments and criticism surrounded the identity of the presidential candidate. Past actions lead to a conclusion of that candidate's qualifications to be president. Thus, these facts could undermine the idea that the candidate is an appropriate candidate for the presidency. Additionally, other perceptions on the candidate's character and personality could be posed as criticism without factual backup. In these cases, the candidate has to advance argumentation not to redefine the facts to present a favorable identity, but just to address their identity. These arguments and criticisms surround the genre of promotion. Namely, in political campaigns, candidates are branded as the right person for the job. It is the electorate's task to assess this claim. This conclusion, that both the genre of promotion and deliberation are central to the

discourse on late-night talk shows when a presidential candidate is the celebrity guest, can be the foundation of future research on argumentative patterns on these shows.

Ethos and pathos: Philosophical analysis

MAGNE REITAN

Department of Philosophy and Religious studies
Norwegian University of Technology and Science
Norway
magne.reitan@ntnu.no

ABSTRACT: It is argued in this paper that *ethos* and *pathos* have dual natures, with both being argumentative and causal. This dual nature is based on both trust and emotions having a complex nature, that they are composed of both a cognitive component and a non-cognitive component. One can argue with respect to the first, but not the second. The second has a causal role, and this makes *ethos* and *pathos* forceful means of persuasion.

KEYWORDS: causal mechanism, emotive arguments, *ethos*, *pathos*, rhetorical argument

1. INTRODUCTION

Rescher (1998) made a sharp distinction between rhetoric and strictly rational argumentation. In rational argumentation one deploys the resources of inferential reasoning to support a proposition: it is either deductive or inductive type of support. One puts forward some propositions which support another proposition. The first group of propositions are intended to provide probative or evidential grounds for the next. The role of rhetoric is to induce acceptance of propositions by non-inferential appeal.

But then a question arises: How is it possible that non-assertoric content such as emotions, sentiments, and passions can affect or give rise to assertoric content, because these two groups by their very natures are discrete? And how is it possible for the speaker to give rise to emotions, sentiments, and passions in the audience by presenting assertoric content?

These problems are fundamental to the general question of whether emotions, sentiments, and passions can have a role in argumentation, that is, whether *pathos* and *ethos* are really argumentative.

Before we discuss these questions, we will characterize both argument and rhetoric.

2. WHAT IS AN ARGUMENT?

It has become popular to distinguish between three different perspectives on argumentation on the basis of Aristotle's *Rhetoric* (I.2, 1356[a]): the logical perspective, the dialectical perspective, and the rhetorical perspective (Wenzel, 1990; Tindale, 1999). Wenzel associated these perspectives with notions of product, method, and process, respectively, so that logic is about describing and evaluating the arguments; the dialectic is concerned with the method and principles by which an argumentation proceeds; and the rhetoric is about understanding and evaluating arguing as a process of persuasive argumentation (Wenzel, 1990, p. 11; Tindale, 2004, p. 7). Wenzel claimed that separating the perspectives of logic, dialectic, and rhetoric does not imply a classification of different types of arguments, only different perspectives on arguments.

2.1 Logical perspective

Hacking (1973) opened his lecture on Leibniz and Descartes by telling us: 'Leibniz knew what a proof is. Descartes did not.' But what did Leibniz knew that Descartes did not? Leibniz knew that a proof is valid because of its logical form and not because of its content. For Descartes, the truth of propositions depended on not only rationalistic intuition but also the steps in a proof proceeded by intuition.[1]

Leibniz's notion of proof depended on logical form, which was also the Aristotelian theory of the syllogistic. Aristotle saw clearly that logical validity depends on the logical form and not on the subject that is being reasoned. From the very beginning of logic, it was defined on purely logical notions, and it did not depend on any other science or any philosophical considerations (Łukasiewicz, 1951, p. 6). For Frege (1980), a proof is something that can be written on a piece of paper.

Today, logic in a proper sense is the study of logical consequences between sentences. The common way to define a formal logic is to use mathematical notions to define the formal language, proof theory and model theory.

Govier (2014) defined 'argument' as a certain structure of claims, where some claims are an attempt to justify another claim (pp. 1-2). Although she widened the scope of the argument from that of deductive logic closed under logical consequence, including inductive, analogical, and conductive arguments, an argument is still a certain structure of claims that can be written down on a piece of paper.

Regardless of the narrow or broad sense, logic is not about causality. Causality is the natural order, or how nature 'behave', and it can be described by natural laws or something similar. Logic is about relations between sentences that are true, probable, or plausible.

2.2 Dialectical perspective

In the dialectical perspective an argument is viewed within the process of examining a position or a disagreement. It aims to devise rules governing correct exchanges in a dialogue (Eemeren & Grootendorst, 1984; Walton, 2008). An argument is viewed against an overall purpose and function of the argumentation and one might define certain stages in the dialogue with its specific types of rules.

Johnson (2000) formulated a general theory of argument where the main purpose is rational persuasion of the other part in a discussion. But as Rees (2001) pointed out in his review of Johnson's book '[t]he dialectical tier is not internal to the notion of argument as a single structure' (p. 233). Arguments within the dialectical tiers are certain complex structures within the discourse. The basic meaning of 'argument' in the dialectical perspective thus rests on what 'argument' means in the logical perspective.

2.3 Rhetorical perspective

The rhetorical process is governed by the purpose of persuasion of the audience, to impact beliefs or to affect actions.

According to Perelman (1982) rhetoric encompasses not only every discourse and all argumentation, but also things such as the colour or lighting in a restaurant, which is meant to affect the public (p. 162). But then psychology and sociology become the basic theories.

Tindale (1999, p. 6) claimed that of the three perspectives on argumentation, the logical, the dialectical, and the rhetorical, the rhetorical is the fundamental. But searching in

---

[1] Descartes made clear in *Regulae ad Directionem Ingenii*, Rule 3 that in a proof there is nothing but intuition that grants the transition from one truth to another one (Descartes, 1985, $369, pp. 14-15).

his work for a definition of argument is to search in vain. One would want to see something regarding how logical notions are extracted from rhetorical ones, but nothing is written about this.

In the rhetorical perspective the character and interests of the arguer and the nature of the audience and its beliefs become important in addition to the arguments.

3. RHETORIC

We will take Aristotle's *Rhetoric* as our starting point, as his theory of argumentation was reasonable, principled, and considerate. We will refer to some key notions in his theory of rhetoric and take these as our framework for discussion.

According to Aristotle there are three features of a speech: the speaker, the subject matter, and the audience. Accordingly, there are also three modes of persuasion (*pisteis*): the character of the speaker (*ethos*), the arguments of the subject (*logos*), and the emotional states of the audience (*pathos*). Of these, *logos* is the most central, the substance of the persuasion. This view fits well with Aristotle's general epistemological view.

Aristotle's term *pisteis* is sometimes translated as 'proof', but it is much broader in its meaning than the common definition of proof today. Aristotle used the term *pisteis* to include all of the rhetorical means. Therefore, it is misleading to simply understand *pisteis* in a purely logical way. Instead, we will use the term 'persuasion'. We will discuss *logos*, *ethos*, and *pathos* but focus on the last two.

3.1 Persuasion by logos

Aristotle said that persuasion by *logos* is when the audience is persuaded by the speech in itself, by way of a proof or something that looks like a proof (*Rhetoric*, I.2, 1356ª19-21). He called the special form of proof in the rhetoric *enthymeme* (*Rhetoric*, I.1, 1355ª5-8). There have been many discussions on the meaning of Aristotle's *enthymeme*, but we will not go into the complexity of the interpretation here.

An *enthymeme* relied on the structure of the syllogistic, which meant the *enthymeme* had to display the structure of premises and conclusion as in deductive arguments (*An.Pr.*, 2.23, 68ᵇ9-14). Thus an *enthymeme* was a structure where a proposition was supported by other propositions. Today, it is reasonable to view *logos* in accordance with development within informal logic.

3.2 Persuasion by ethos

Aristotle said *ethos* is a persuasion by the spoken words that depends on the speaker's character of trustworthiness (*Rhetoric*, I.2, 1356ª5). The speaker's *ethos* first of all comes through the present speech. But the *ethos* also comes from what the audience knows about the character of the speaker beforehand, including the general moral character of the speaker.

He also said that confidence in the speaker's character may be established by good common sense, a virtuous character, and his goodwill towards the audience (*Rhet*oric, II.1, 1378ª6-9). Anyone who has all these qualities will inspire trust in the audience, who will see the speaker as telling the truth and giving good advice. The *ethos* therefore includes both certain features of the speaker's character and the speaker's relation to the audience. The *ethos* of the *Rhetoric* was related to Aristotle's ethics. Thus a good *ethos* is given by the standard of the 'good man', requiring both intellectual skills, moral virtues and the goodwill (Brinton, 1986). Commenting on several writers on rhetorical theory in the Antique, Brinton (1985) wrote that the speaker should have 'competence in the subject-matter at hand, good

intentions, shared values and interests and assumptions with the audience, truthfulness, trustworthiness' (p. 55).

For Aristotle, the notions of truthfulness, trustworthiness, competence, and the like are basically moral and intellectual notions. We think this view of *ethos* presupposes too much of an Ancient philosophical outlook and a too tight connection between *ethos* and ethics. We will here be more modest, because even a morally blameworthy person can give a forceful rhetoric. We will rather use Searle's theory of speech act (1969). Among the conditions in his definition of successful and non-defective speech act is the sincerity condition, that the speaker is sincere in her utterance of *p*, and the competence condition, that she has evidence or reason for the truth of *p* (p. 66). The audience could presumptively accept *p* if the audience thinks the speaker has evidence for *p* and believes the speaker holds *p* to be true.

We will give a tentative schematization of the structure of *ethos* as the following:

$$a \text{ says that } p \longrightarrow B_b p$$

$$b \text{ is trusting } a \xrightarrow{\text{brings it about that}} \begin{array}{l} B_b \ a \text{ believes that } p. \\ B_b \ a \text{ has evidence for } p. \end{array}$$

Figure 1: The structure of persuasion by ethos.

Figure 1 spells out the conditions for taking the speaker's speech act as evidence for *p*. But how is it that audience b can accept the sincerity and preparatory conditions, and presumptively accept *p*? First, b has to trust the speaker. Trust is not a belief. It has as its intentional content the character of a person, not a proposition, which beliefs have as their intentional objects. Trust is not an emotion, because it is something long-term. We will call trust a sentiment. It stands in a causal relationship from certain antecedent conditions for its arousal and can have beliefs as its consequences. If b has trust towards the speaker, it will causally trigger b to believe the sincerity and preparatory conditions are fulfilled. But trust can be broken if b discovers the speaker is insincere. It is possible for another agent to start to argue against the trust by an *argumentum ad hominem*, and if this is successful, the audience may discard its trust.

Ethos is working through the audience's trust towards the speaker. The role of trust is not argumentative but causal. We will later discuss the very nature of emotions and sentiments. The key role of trust in *ethos* means that *ethos* is partly of argumentative nature and at the same time rests on a causal mechanism.

3.3 Persuasion by pathos

Persuasion by *pathos* consists of touching and moving the emotions, sentiments, and passions of the audience by speech. In virtue of this the audience is affected in such a way that they accept or reject a proposition or desire to perform or refrain from participating in an action (*Rhetoric*, I.2, 1356ª14-15). Persuasion by *pathos* is very effective in producing effects on the audience's beliefs, thinking, and behaviour.

We schematize the structure of *pathos* in Figure 2:

$$a \text{ says that } p \xrightarrow{\text{brings it about that}} B_b p$$

$$a \text{ is moving } b \text{ emotionally}$$

Figure 2: The structure of persuasion by *pathos*.

This structure indicates that *pathos* relies on a causal connection that goes through the emotion of the audience. The structure is not to be understood as an argument. We will come back to how this can be understood.

The standard view within informal logic on argumentation with emotions states that appeals to emotions are simply fallacious, for example *argumentum ad misericordiam* (appeal to pity). This is because the standard view holds that affectional states cannot provide reasons for a proposition (belief)—they will simply be irrelevant reason (Govier, 2014, p. 170). The basic view is that emotions are akin to feelings and they are of a different category than propositions and beliefs.

Although it may be fallacious, it is nevertheless forceful, which is certainly puzzling. To give an explanation of this, we need a theory that explains why appeal to emotions can be such a forceful persuasion; how emotions are triggered; and how they cause effects on beliefs, thinking, and action.

4. EMOTIONS AND OTHER AFFECTIONATE STATES

There are many works that describe the role of emotions and feelings in argumentative settings, but we seldom find any characterization of the notions (see, for example, Walton, 1992; Gilbert, 2004; Tindale, 2004). The lack of any characterisation makes them descriptive in character, wherein there are many examples with accompanying analysis of the structure of the examples; the works are not explanatory of the role of the emotions. We will here refer to modern theories of emotions.

4.1 Characterization of emotion

In argumentation, one puts forward propositions *pro* or *con* with respect to another proposition. Argumentation is thus essentially about propositions. The problem of how emotions can enter into argumentation is fundamentally about the relationship between propositions and emotions. We need a theory of emotions to explain this.

Examples of emotions are anger, fear, hate, friendliness, love, gratitude, and pity. They are of a certain type and we classify them by general terms, for example, 'anger', and define them. They typically arise quickly and last for a short time. Their function is typical to create a readiness for action, but they also affect our beliefs and thinking. To have emotions constitutes the normality of the psychology of human beings, and they constitute a central part of our rationality (Elster, 1999).

The traditional view on emotions and beliefs (propositions) see them as discrete entities. Because they are of different sorts, neither can affect the other and consequently one cannot argue about an emotion.

More recently, we have seen the development of a cognitive theory of emotion (see for example Frijda, 1986; Lazarus, 1991; Scherer, 1999). This new orientation is referred to as 'appraisal theory'. This type of theory echoes much of Aristotle's theory of emotion. A key feature of the new orientation is that emotions come with a cognitive antecedent.

An emotion is a complex attitude that has several features: cognition, evaluation, motivation, and feelings (BenZe'ev, 1996). Emotions are situated and carry with them information about aspects of the agent's situation. Emotions also have an evaluative feature, about the personal significance of the information. Agents value a situation differently and this appears in the personal significance of the information. Given the evaluative feature of the situation, there arises a motivational feature: a desire or inclination to act. Finally,

emotions are accompanied by feelings. Feelings are certain primitive modes of consciousness. Emotions and feelings are fundamentally different in that feelings are not themselves directed to any object; they are not intentional. Feelings are a part of emotions, but emotions cannot simply be reduced to feelings. Because emotions typically arise in a social situation and have a propositional content, they are thus principally communicative in character. But feelings are foremost private in character, such as the feeling of pain.

Elster (1999) characterized emotions by three groups of conditions: cognitive content, subjective feel, and visceral features (pp. 246-283). The cognitive content is composed of the cognitive antecedent and the intentional object of the emotion. The cognitive antecedent makes an emotion something other than a simple visceral state, such as hunger or pain, and makes the emotions part of our rational life. An emotion can have as its intentional object a proposition as well as an object, such as a person.

The subjective feel is the unique experience of the agent; on the other hand, visceral features include both the physiological arousal and outward expression. Visceral features include the emotion having a valence on the pleasure–pain dimension and a characteristic action tendency. The visceral attributes are common between emotions and other states such as hunger or pain. Often, the visceral attributes of an emotion are the most outstanding to others observing an agent that is moved emotionally—what an observer sees in the behavioural manifestations. These features become a part of the grounds for making a hypothesis about what emotion an agent is having. The visceral attributes make an emotion something other than simply a belief–desire complex.

The appraisal view put forward here is clearly a simplified view of how emotions function in our nature. Emotions also work in the opposite way by affecting our beliefs and how we think. Frijda and Mesquita (2000) provided a multitude of evidences for the fact that emotions can cause creation of beliefs, strengthening or weakening of beliefs, other emotions, or sentiments. For example, if agent a has become angry at agent b, this might lead a to look for and discover new information about b; a might even accept rumours he hears about b, which in turn strengthens a's angriness towards b.

4.2 Other affectionate states

Frijda described emotions as shading over to similar more persistent psychological events, which he calls 'sentiments' and 'passions' (1986, p. 101). Emotions rise and fall quickly, but sentiments and passions are long-term affectionate states that are also directed towards other people. Examples of such are trust, friendliness, and antipathy. Although emotions are characterized by their action tendencies, sentiments and passions normally do not involve a change in action tendencies. Nevertheless, they may result in spontaneous action, for example, when love causes someone to buy flowers for the beloved. When meeting the loved one, the flowers are given, emotions burst out, and perhaps action occurs as well.

Certain sentiments, such as trust, involve a readiness to accept what another agent says, whereas other sentiments, such as distrust, may involve reluctance to accept it. Because a sentiment such as trust has cognitive antecedent, one can argue about it similarly to arguing with emotions.

In ordinary language, we sometimes use the word 'emotion' to refer to all of emotion, sentiment, passion, and feelings (see for example Gilbert, 2001; 2004). We might also use the term for a typical emotion, such as 'hatred', to refer to an emotion, a sentiment, or a passion. We often focus on the feeling when talking about having an emotion, as in 'I feel pity about …'. The focus is on the most salient feature for the agent having the emotion.

4.3 The causal mechanism in social science

Unlike propositions and beliefs, emotions have causal power; most notably, they can cause us to act. Our minds work as a causal mechanism in the way that emotions develop, but the notion of causality is rather problematic in this connection. It may work well in some areas of natural science, but in social science and in considering the mind, it is problematic. Both Hempel's (1965) covering law model and probabilistic explanation are problematic.

Elster and others have proposed an alternative model for causal explanation, which they call 'mechanism' (Elster, 1989; 1999; 2007; Hedström & Ylikoski, 2010). According to the notion of mechanism, we cannot predict but can explain what has happened with reference to previous conditions.

Elster characterizes two types of mechanism: Type A, where we do not know the exact conditions that trigger an event and there is indeterminacy; and type B, where we do not know the exact consequences of an event and there is indeterminacy.

Sometimes, similar situations can trigger opposite reactions, and we explain the reactions with the same situation. For instance, we explain that a person became an alcoholic with reference to the fact that he grew up in a home with two alcoholic parents. Another person became a fanatic in never drinking alcohol, and we explain this with reference to the fact that she grew up in a home where her parents were alcoholics. Both explanations seem reasonable, and thus show we cannot predict the outcome of children growing up in homes with alcoholic parents.

4.4 How emotions arise

How we perceive a situation gives us the cognitive antecedent, our beliefs about the situation. The link from the cognitive antecedent to the emotion is a causal one. Given our evaluation system and our motivation, visceral features and feelings are triggered. A certain cognitive antecedent can create different emotions in different agents, one may become angry, another getting fears. The difference depends partly on different perceptions of the situation, and partly on having different evaluation systems.

Thus, given a certain situation and cognitive antecedent, we cannot predict if a certain emotion most likely will develop in an agent. However, afterwards we can give a hypothesis about the probable causes of developing the specific emotion.

5. EMOTIONS AND ARGUMENTS

We have seen that an emotion is composed of three groups of conditions: cognitive content, visceral features, and subjective feel. An argument with its propositional content can be directed only towards the cognitive content, not the other two. An argument cannot in itself directly affect the visceral features, nor can it affect the subjective feel, as neither of them have propositional content.

We shall first address the cognitive antecedent of an emotion. An agent can argue *pro* and *con* in the usual way with regards to this. What is special with the context of emotion is that the argumentation may affect a causal mechanism that may give rise to, strengthen, or weaken an emotion.

Let us first consider a case where a speaker a says *p* to an audience b. In short for agent b having an emotion of type *T* with cognitive antecedent *p* we write '*emotion$^T_b(p)$*'. We will assume only informal readings for this formula. In what follows, we assume that the

audience considers the speaker to have a good *ethos*, and thus considers the speaker's speech act as evidence for *p*, and the audience will presumptively accept *p*.

Depending on b's evaluation system, b might form a relevant emotion, $emotion^T{}_b(p)$. The link from believing *p* to forming the $emotion^T{}_b(p)$ is a causal mechanism. There is nothing argumentative in this link.

But considering *p*, agent b might reason to *q*. As a consequence of realizing *q*, b might or might not form an emotion with *q* as cognitive antecedent. Part of such a chain is normal reasoning, another part is causal mechanism. The reasoning in this is with respect to the propositional content. There is also a possibility that b does not form any emotions at all. It might even be possible that b finds *q* unacceptable and starts to argue against *p*.

Let us now consider a case where agent a does not say anything at all but has an emotion and displays it. In other words, a displays certain visceral features. When observing a and the situation, agent b forms a hypothesis about what type of emotion a is having and its cognitive antecedent. However, b also needs some knowledge about a's value system. This may be based on knowledge about a or cultural knowledge.

With the right conditions (b's evaluation system), b might form a similar emotion. There need not be any argumentation in this process. The emotion that b forms might be of same type as a's emotion, but it need not be so.

The hypothesis about a's emotion is a relatively unsure empirical hypothesis and needs to be tested and evaluated in a communication exchange between the two.

But given the hypothesis about *p*, agent b might start to reason about *p* and come to *q*. Realizing *q*, this might trigger b to form $emotion^T{}_b(q)$, regardless of having formed the first emotion or not.

Let us now turn to the other features of an emotion, the visceral features and subjective feeling. These are also essential features of an emotion. Similarly to the fact that one cannot direct arguments towards hunger or pain, one cannot direct arguments towards visceral features or subjective feelings. Because they have no propositional content, visceral features and subjective feelings cannot enter into arguments.

When we consider arguing about emotions, we need to be careful how we view the matter: We cannot detach everything but the cognitive content and focus only on this. In that case, we are arguing only about propositions or perhaps belief–desire complexes. This means one cannot argue with respect to an emotion in entirety. But when arguing about the cognitive antecedent of an emotion, the context is the emotion in its entirety, and the rise and fall of the emotion is a matter of causal mechanisms.

Micheli (2010) asserted a thesis that emotions can be objects of argumentation. In his argumentation, he focused on the cognitive feature of emotions. He in effect treated emotions as nothing more than the propositional trait, but this is an oversimplification: Because emotions come as a 'packet', one cannot detach everything but the cognitive component and still have an emotion. What is missing in Micheli's work is the notion of causal mechanism.

As a consequence of this view, he ended up removing the distinction between *pathos* and *logos*, reducing *pathos* to *logos* (p. 16). This is problematic, first because we lose the outstanding features of emotions, the visceral features and the subjective feeling. Second, by addressing only the cognitive part of emotions, they lose their causal role in our beliefs, thoughts, and action.

A more adequate treatment of emotions in argumentation is to carefully distinguish between what argumentation can address and what is part of the causal role of emotions in our beliefs, thoughts, and action. Features being a part of the causal role cannot be reached by argumentation.

Micheli criticized the tradition that treats appeal to emotions as irrelevant ground in arguments, wherein they are thus considered to be fallacious (Govier, 2014, pp. 170-171).

With respect to the cognitive antecedent, Micheli was right in his critique. Appeal to emotions, for example, appeal to pity, may be legitimate in argumentation. But with respect to emotions in entirety, emotions get a causal role in our beliefs, thoughts, and action—not an argumentative role. Thus the traditional view still has something to say.

Because of its dual role, an emotion such as pity may be a forceful means of affecting people's thinking and action. This forcefulness does not come about through argumentation alone but through the causal role.

BenZe'ev (1995) accepted the complex view of emotions and argued that we need a broader view of argumentation than restricting it to the propositional view. He did not give any characterization of this sort of argumentation, only said that 'an emotion can often be seen as a non-typical form of argumentation' (p. 190) and that 'this sort of argumentation is different from the intellectual, propositional ones' (p. 192). The core of his view was that emotions are functional responses to certain circumstances. Being functional, they are rational according to Ben-Ze'ev though not propositional argumentative. Being rational, they should be viewed as argumentative.

But his notion of function was rather unclear. We need some theory to define the term, which is exactly what the theory of causal mechanism does. Elster (1999) explained how emotions can be a part of our rationality and his theory is still relevant. When accepting the distinction between argumentation and causal mechanism, there is no need for any non-propositional theory of argumentation.

6. CONCLUSION

In this paper, we have given an argumentative analysis of *ethos* and *pathos*. Emotions and sentiments are 'closed under' the agent's rationality, but at the same time, they have a causal role to play in the agent's beliefs, thoughts and behaviour.

Persuasion by *ethos* can be given an argumentative analysis, but we have seen how this depends on the audience's trust, a sentiment. From the audience's trust, there is a causal path to the audience coming to believe that the speaker is sincere and competent. Given this, the audience can tentatively accept what the speaker says.

Persuasion by *pathos* relies on the emotions of the audience. Referring to contemporary theory of emotions, we have seen that agents can argue *pro* and *con* in the normal manner about the cognitive antecedent of emotions and sentiments, but arguments cannot be directed to the subjective feelings or visceral features of these states, as they are unreachable by arguments. Thus one cannot argue about emotions in entirety.

Emotions and sentiments are triggered according to a causal mechanism. The consequences of them are also triggered according to a causal mechanism. The triggering of emotions by a causal mechanism makes *pathos* a powerful means of persuasion.

Thus both *ethos* and *pathos* are partly argumentative and partly causal, and neither can be reduced to *logos*.

mreyes@lclark.edu

ABSTRACT: This essay develops a novel analytic approach for critical engagement with algorithms, both at the level of their discursive construction into complex arguments and at the level of how they transform and reshape material culture. Ultimately, I argue that rhetoric and argumentation scholars have much to offer to the critical study of algorithms: not only can we teach others how to unpack them as complex arguments, we can also illuminate the hidden agendas concealed within.

KEY WORDS: algorithms, argument, Latour, rhetoric

1. INTRODUCTION

> We imagine . . . algorithms as elegant, simple, and efficient, but they are sprawling assemblages involving many forms of human labor, material resources, and ideological choices. . . . To truly grapple with the age of the algorithm and our growing entanglement with computational cultural processes, we need to take action as scholars, teachers, and most of all performers of humanistic inquiry.
>
> --Ed Finn, *What Algorithms Want*, pp. 7-13

Algorithms have never been more influential, yet our collective understanding of how they transform massive networks of cultural power has not kept pace. This is due in part to narratives that consistently stress human agency and in part to corporate interests who benefit from keeping algorithms proprietary. Whatever the causes, algorithms today operate as black-boxes largely inaccessible to the majority of citizens whose worlds they continuously reshape. We do not understand as a result the unparalleled productivity of these algorithms, how they work, nor what they *mean* for the social collectives they transform.[1] We cannot see the parameters of judgment—both human and nonhuman—that constitute them; thus those parameters appear as horizons, always present yet distant and untouchable. Unable to see or understand their judgment parameters, we have no comprehension of what these algorithms assume to be true, nor what might happen if those assumptions are violated. This essay develops a humanistic rhetorical approach to reading algorithms with the hope of making the horizons of judgment within them more accessible—not only to challenge the naïve apotheosis of algorithms within a growing algorithmic culture, but more importantly to position rhetoric and argumentation scholars as critical informants, intellectuals who can answer Ed Finn's call in the epitaph and open up these black-boxes for fellow citizens, examine the hidden assumptions therein, and study how they *actively transform* our social-material worlds.[2]

---

[1] On issues of algorithmic inaccessibility see Finn, 2017, especially chapters 1 and 3.

[2] The concept of the horizon of judgment refers to the network of human and nonhuman assumptions, constraints, and delimitations necessary for a mathematical algorithm to have specificity and validity. I use the metaphor of horizon to underscore the distant but no less present domain of validity that constrains every mathematical algorithm.

Our route to a rhetorical analytic of algorithms, one capable of addressing both their discursive construction *and* the ways they transform the social-material world, must first address the critical literature on algorithms. Doing so reveals an asymmetry in which a great majority of scholarship has focused on problems of algorithmic implementation (perpetuation of bias, inequality, etc) to the exclusion of algorithmic construction. The main problem with this asymmetry is that calls for a regulatory ethics of algorithms is emerging from the critical literature sans a deep understanding of the practices of argument construction that constitute algorithms in the first place. Without an understanding of those processes of construction, any ethics of algorithms is highly unlikely to have the effects intended.

In this essay I begin to develop an analytic approach designed to address both the discursive construction and social-material consequence of algorithms. To do so, I suggest we turn to two allied resources: the first comes from a growing body of research into rhetoric and mathematics.[3] From this research we can borrow ideas and methods for engaging with the construction of algorithms as complex discursive processes that do not merely reflect an *a priori* reality hidden from quotidian view but instead actively constitute new realities as they produce new social relations that enable novel hybrids to emerge and expand our social-material world. Tracing the social-material consequence of algorithms, however, requires a second analytic resource, one that I argue Bruno Latour's work provides in an undeveloped form. Across Latour's many projects we will find innovative ideas for study of mathematical discourse—and the algorithms that emerge from it—as networked modalities of argument that materially expand the social collective.[4] The goal of this essay is to interweave these two resources into a hybrid analytic capable of engaging with the complex algorithms that increasingly shape contemporary culture.

2. CRITICAL ALGORITHM STUDIES

Algorithms are rapidly transforming the human experience. Consider, for instance, the elementary but significant shift in how we remember. Prior to the twenty-first century, remembering and forgetting happened individually and collectively through rituals, oratory, photography, monuments, museums, the list goes on. Yet with each mnemonic practice humans had a central role. In recent years, however, a new mnemonic regime has emerged—a memory practice governed primarily by algorithms, one Neal Thomas describes as a "mnemotechnology" that "embeds a neoliberal logic into memory" (Thomas, 2013, p. 10). The edges of this regime come into focus when an algorithmically selected photograph emerges unbidden on Facebook (or any other social media platform). Why that image? How was it selected for recirculation? While answers to these questions are strategically proprietary, one need not see Facebook's algorithmic code to note how the motives for remembrance have shifted from the social (about ethos, identity, association/dissociation, etcetera) to the economic (about how recollection can create surplus value). Likewise, one might note the change in one's own role relative to this algorithmic memory work—from catalyst and inventional resource to recipient and node in a techno-economic network of circulation.[5]

---

[3] For the original article on rhetoric and math see Davis and Hersh, 1987. For useful recent review of literature on rhetoric and math see Reyes, 2014; Wynn, 2012.

[4] It is important to note here that while I take up Latour's ideas about mathematical discourse as a provocative way to extend thinking in rhetoric and argumentation studies about mathematical algorithms, I do not see it as necessary or productive to take up Actor-Network Theory (ANT) as a whole. Doing so would entail an extended theoretical discussion well beyond the scope of this essay.

[5] As Bernard Steigler notes, "something absolutely new happens when the conditions of memorization . . . becomes concentrated in a technico-industrial machine whose finality is the production of surplus value. . . .

Significant in their own right, the algorithmic shifts in mnemonic practice mentioned above amplify another critical problem: increasing levels of what one might call "transparent opacity." By that seemingly paradoxical union I mean to underscore how algorithmic culture simultaneously enables powerful forms of publicity and surveillance (most social media platforms benefit from both) *and* increasingly numerous obstacles for understanding how decisions happen within algorithmically driven domains. These twin phenomena are of central interest to a growing number of scholars within critical algorithm studies, giving rise to—in Frank Pasquale's memorable phrase—not simply a collection of "walled gardens" but a culture that "closely resembles a one-way mirror" (Pasquale, 2015, p. 9).[6] On one side of that mirror stand private corporations and government institutions using sophisticated algorithms to "know" its customer/citizenry. From this privileged position, a population becomes increasingly transparent (tracked, quantified, computed, and controlled). On the other side, however, people encounter numerous obstacles to understanding the forces behind complex decision making. Those obstacles come in many forms: the technical complexity of mathematical code; established legal precedence that enables proprietary claims; and the recursive evolution of "learning algorithms" that are difficult for even the best engineers to decode.[7]

This one-way mirror is rapidly destabilizing traditional social institutions. Representational democracies are under algorithmic attack from abroad. Algorithms producing "fake news" regularly undermine the credibility of a "free press" as a check on demagogic power. Algorithmically governed crypto-currencies are competing with and transcending Federal Reserve Banks. Centralized educational systems are scrambling to adapt to digital pedagogy platforms. Even our juridical institutions are under extreme pressure from the rapid proliferation of algorithmically enabled forms of surveillance, drone warfare, gene editing, and cloning (to name a few).[8] For many scholars, the problem here lies not with the algorithms themselves—those can be beneficial or detrimental—but with the associated acquiescence to an increasingly influential yet silent and opaque bureaucracy. As Cathy O'Neil notes, "we have a total disconnect between the people building the algorithms and the people who are actually affected by them" (O'Neil, cited in Upchurch, 2018).[9] That disconnect is undermining basic democratic principles, where informed decision making depends on information access and where privacy grants citizens the autonomy to thwart authoritarianism. "When every move we make is subject to inspection by entities whose procedures and personnel are exempt from even remotely similar treatment," Pasquale concludes, "the promise of democracy and free markets rings hollow" (Pasquale, 2015, p. 4).

In response to these challenges, scholars have called for an ethics of algorithms. Efforts are currently underway to create legal standards for privacy and data use as well as greater transparency regarding profiling practices and information filtering (see Mittelstadt et. al., 2016, pp. 12-14). Again, for most scholars algorithms are not the problem. The problem is with their implementation, and specifically how that implementation perpetuates subjective biases or exacerbates inequalities. Scholars have thus called not just for *a priori* ethical

---

There has today occurred a veritable inversion in the relation between life and media: the media now relates life each day with such force that this 'relation' seems not only to anticipate but ineluctably to precede, that is, to determine, life itself" (Stiegler, 2009, pp. 80-81).

[6] For a recent review of critical algorithm studies, see Mittelstadt et. al., 2016.

[7] Pasquale and many other scholars see in the rise of an algorithmic culture the simultaneous and correlated rise of societies of control. On the structure and characteristics of societies of control see Deleuze, 1992; Hardt and Negri, 2000; Ascher, 2016. On the recursive structure of complex "learning" algorithms see Gillespie, 2016; Neyland, 2015.

[8] For an excellent collection of relevant literature on these issues see The Social Media Collective reading list on "Critical Algorithm Studies" (https://socialmediacollective.org/reading-lists/critical-algorithm-studies/).

[9] O'Neil details the rise of this opaque bureaucracy in her book *Weapons of Math Destruction* (O'Neil, 2016).

standards but also creation of an independent auditing agency that can address issues as they emerge, something especially important within the context of adaptive "learning" algorithms that evolve as they process data.

The increasing presence of adaptive learning algorithms, however, places pressure on scholars to go beyond problems of implementation. There are countless studies of how algorithms promote bias, inequality, subjective values, a culture of secrecy, and ideological polarization. Yet nowhere near the same level of scrutiny exists for the *construction* of algorithms. To some extent this asymmetry makes sense: humanists and social scientists are naturally drawn to the socio-cultural consequences of algorithms and, at the same time, few have the training to unpack technical mathematical code. As a result, the critical literature on algorithms is rich with analyses of implementation problems (promotion of bias; fragmentation of social institutions; spread of positivistic culture) yet thin on study of how algorithms are built. This observation is hardly new: as Marc Lenglet notes, "when we want access to what they precisely make . . . we face a black box that we usually fail to understand thoroughly and open completely" (Lenglet, 2013, p. 319). That failure has a high cost, since most recommendations for an ethics of algorithms are emerging sans a deep understanding of how complex algorithms are assembled, much less how they evolve.[10]

What we need to address this asymmetry is a critical mathematical approach to algorithms, something that can attend closely to both their discursive fabrication and their social-material consequence. Rhetorical analysis of mathematical discourse, when combined with Latour's approach to math, offers a promising path.

3. RHETORIC, MATHEMATICS, AND ALGORITHMS

Rhetorical scholarship on mathematical discourse has a few key strengths central to the study of algorithms. First, rhetorical scholars approach math from an abiding interest in language, persuasion, and how discourse can move an audience. As such, rhetoricians are highly suspicious of implicit or explicit claims to objective truth. Such habits of mind position us well to question discursive processes that claim to move from conjecture and thought-experiment through mathematical modeling techniques to seemingly objective algorithmic technologies. A common presumption within contemporary culture is that mathematical discourse has the power to expose subjective bias and purge subjective judgment, yet those trained in rhetoric know that all symbol systems—whether mathematical or not—select and deflect reality, meaning that all symbol systems have horizons of judgment and that claims to objectivity often serve to conceal those horizons. Rhetorical scholars are hence inclined to examine not how math derives truth but how it enhances the power of arguments in the minds of particular audiences. How does the use of mathematics bolster an author's credibility? How can math create the appearance of objectivity? These are just some of the questions that rhetorical scholars ask that can serve as useful starting points for critical engagement with algorithms (see Mudry, 2009; Seife, 2010; Majdik, 2011).

If rhetorical study were to stop there, however, one would not get very far in revealing the horizons of judgment within complex algorithms. Those horizons are intricately woven networks of human and nonhuman agencies, assumptions, and delimitations that often begin

---

[10] Over-emphasis on algorithmic implementation also tends to treat algorithms as finished products, thus reinforcing the perception of them as cold, objective, and refined machine technologies instead of, as Gillespie notes, "in fact a fragile accomplishment" (Gillespie, 2014, p. 169). When scholars speak of algorithms, Gillespie observes, they often reify into a singularity what is in actuality "a complex sociotechnical assemblage" (Gillespie, 2016, p. 24). A few scholars are beginning to address the assemblage of mathematical discourse constitutive of complex algorithms. See especially Kockelman, 2013.

in recognizably rhetorical forms of natural language, only to be translated into and transformed by mathematical discourse. To examine those practices of translation one must go beyond study of the rhetorical effects of math and delve into mathematical discourse as a constitutive rhetorical force.

When rhetorical scholars describe math as a constitutive rhetorical force several points are implied. First, mathematics is no longer treated as an arhetorical medium of truth that might or might not be rhetorically distorted. This amounts to a major challenge to conventional views of both math and rhetoric. Mathematical objects are typically conceived as existing independent of human cognition. Mathematical symbols are, accordingly, more or less adequate representations of ideal mathematical objects, and the purpose of doing mathematics, as mathematician Brian Rotman suggests, is to discover "objective irrefutably-the-case descriptions of some timeless, spaceless, subjectless realm of abstract 'objects'" (Rotman, 2000, p. 30). From this perspective—broadly known as "mathematical realism"—mathematical discourse is always secondary to genuine mathematical thought and the ideal objects which that thought contemplates. As such, any role that rhetoric might have regarding mathematics is largely parasitic, at best helping spread mathematical truths and at worst actively obscuring them. A shift to rhetoric as constitutive, however, challenges this realist paradigm and the metaphysics that traffic with it. Instead of considering mathematical statements as better or worse representations of preexisting mathematical objects, a constitutive approach encourages scholars to see symbols, inscriptions, and arguments as the material out of which mathematical concepts emerge, coalesce, and are (if successfully articulated) integrated into existing mathematical lore. Thus rhetoric—not as persuasion but as symbolic action *in toto*—plays a significant role not just in the communication of math but in the very practices of invention within mathematics.

This brings us to the second implied point: Rhetoric—as embodied material practices of inscription—is not an enemy or an obstacle to mathematics but rather an engine of its evolution. From a constitutive perspective, what is most interesting about math is not the *a priori* reality it reveals but how mathematical propositions and apparatuses—such as the golden ratio or the Cartesian coordinate system—actively constitute realities as they emerge and interact with the social-material world.[11] Rhetoric and mathematics, then, are not separate nor at odds but rather intricately intertwined. One might even say that rhetorical processes of symbolic action lie at the heart of mathematical invention, as Reyes has shown with the invention of the Calculus and infinitesimals and Lakoff and Núñez with their cognitive metaphor analysis (Reyes, 2004; Lakoff and Núñez, 2000).

This constitutive rhetorical approach invites scholars to engage with algorithms anew. As mentioned above, most critical scholars do not see a problem with algorithms as such, but instead with the people or institutions behind them.[12] From this perspective, most if not all agency remains (comfortably) in the hands of human actors, with algorithms as an extension or enhancement of that agency. A constitutive approach, however, sensitizes one to the

---

[11] A fuller explication of a constitutive approach to mathematical discourse can be found in Rotman's work (see especially Rotman, 1993; Rotman, 1987). Within rhetoric and argumentation studies see Charland, 1987; Reyes, 2004; Mudry, 2009. Barad's excellent book *Meeting the Universe Halfway* shows how a constitutive approach challenges several intellectual orthodoxies, including the central tenet of representationalism that assumes words and things are both independent and determinate; the atomistic metaphysical belief that the world is composed of individual entities with definite boundaries and characteristics; and the foundationalist faith in the separability of knower and known concomitant with the notion that proper experimental measurement reveals the intrinsic properties of independently existing objects (Barad, 2007, p. 107).

[12] There are a few scholars that buck this trend, challenging the human-centric approach to algorithms (see Gillespie, 2016 and Kockelman, 2013), yet those challenges are few and far between and seemingly constrained by the absence of a critical method that effectively engages with the mathematical discourses constitutive of complex algorithms.

congealing of agency as human actors triangulate their thinking with nonhuman actors, including symbol systems, discursive formations, and environments of encounter. Such sensibility is alive to the agencies of discourse and symbol and how those agencies interact with and sometimes exceed human agency even as humans use those symbol systems to articulate "their" thoughts. One must be careful here, as it would be too convenient (especially for corporate entities) to offload agency onto algorithms, thereby minimizing individual and collective responsibility. Instead, a constitutive approach demands a symmetrical treatment of the various distributed agencies at play in complex algorithms. Analytically, this manifests as a tacking back and forth between traditional forms of human agency, the forces of agency within discursive formations, and the material agencies that algorithms both draw upon and occasionally transform.

4. A LATOURIAN EXTENSION

However promising this constitutive approach to algorithms, questions persist. If, as constitutive theorists claim, rhetoric is the material out of which new mathematical objects emerge (algorithms and otherwise), how exactly does that happen? Surely argument and inscription alone are necessary but insufficient conditions. Equally vexing, if algorithms really do reconstitute realities as they interact with those realities, how do we explain such alchemy? How, in short, does the language of math become materially manifest in the world? Bruno Latour's work might seem a strange place to find answers to these questions, preoccupied as he is by science studies and his Actor Network Theory (ANT). When gathered together, however, Latour's engagements with math (which are spread throughout his many projects) offer several productive ways to *trace the materiality of mathematical discourse*. And it is the tracing of that materiality that will carry this analytic from the academic and technical spheres into the public sphere, where algorithms are rapidly reshaping material culture.

Following Latour's lead, let us begin with a vignette: King Hiero sits on his throne—troubled by the forces threatening Syracuse—when a letter is delivered from a young man named Archimedes, who (according to Plutarch) made the astonishing claim that "with any given force it was possible to move any given weight" (Plutarch, 1967, pp. 7-9). The young Archimedes was so bold, tells Plutarch, that he professed, "if there were another Earth, and he could go to it, he could move this one" (Plutarch, 1967, pp. 7-9). Astonished, King Hiero requested a demonstration, leading to the oft told story of Archimedes raising a "three-masted merchantman of the royal fleet" simply by "setting in motion with his hand a system of compound pulleys" (Plutarch, 1967, pp. 7-9). Struck by the potential of his art, King Hiero immediately set Archimedes to work at designing "offensive and defensive engines to be used in every kind of siege warfare" (Plutarch, 1967, pp. 7-9).

However incomplete Plutarch's account, for Latour it reveals several interesting things about mathematics. Math, according to convention, is the language of abstract thought, the contemplation of the common forms that lie beneath the appearance of things. As Bertrand Russell once opined, "mathematics takes us still further from what is human, into the region of absolute necessity, to which not only the actual world, but every possible world, must conform" (Russell, 1907, p. 30). Russell's mathematical realism—the dominant narrative of math since Plato—tells of a world of abstract but unchanging objects hidden from quotidian view.[13] Math here becomes an escape from and corrective to the whims and follies of

---

[13] For evidence of realism's continued influence within mathematics see Putnam, 1979 and Resnik, 1997, both highly regarded and widely circulated texts.

politics.[14] But from Plutarch's account (and the many others like it) Latour assembles a different mathematics, one that does not escape but rather *extends* politics; a practice of thinking that assembles powerful apparatuses of translation through which our social collectives *materially expand*. Indeed, Archimedes did not simply reveal to King Hiero the secret power of ratios exercised through compound pulleys; instead, he massively transformed "power relations through the intermediary of the compound pulley;" in doing so, "he also reversed political relations by offering the king a real mechanism for making one man physically stronger than a multitude" (Latour, 1993, p. 110). Pre-compound pulley, the Sovereign, while representative of his people, was not stronger than his people. Post-compound pulley, the Sovereign—allied with a new technology—was suddenly more formidable, and thus less indebted to his subjects for his power. How to make sense of this moment of empowerment? One could, as Plutarch does, tell a story of transcendence, Archimedes becoming the sage, tapping the secrets of nature written in mathematical code. Doing so establishes a clear hierarchy between math and politics: the latter indebted to the former, the former purified of the latter. Latour offers us a different reading.

What is fantastic about mathematics for Latour is how it accomplishes the opposite of what we are told. Instead of allowing humans to transcend the political and the social, math in fact actively extends those realms through novel alliances. In the Hiero-Archimedes story, we find an emergent alliance between a political form and the compound pulley that materially transforms the social collective. King Hiero's power has expanded not merely through Archimedes' genius but also through a new association between humans and nonhumans (compound pulleys; reengineered siege engines) that Archimedes' mathematical propositions made possible. But those mathematical propositions do not reveal an *a priori* law of nature and Archimedes did not "discover" said law. Thinking in these traditional metaphysical ways only apotheosizes math while concealing the practice of mathematics as a practice of assemblage, one that far from separating humans from nonhumans in fact breeds hybrids of humans and nonhumans, materially expanding our social collectives in the process.

Everything sensible seems simple once said, but the difference between this Latourian understanding and the conventional realist understanding of math is profound. Realists, as we know, make the ontological presumption that mathematical objects exist *a priori*. Ontologically, they are absolute beings that transcend all historical and environmental change; they are, as Russell opined, that "to which not only the actual world, but every possible world, must conform." Change is thus an illusion, an appearance that conceals the unchanging truths that lie beneath, which only humans (that highest of being) can discover through the forms of pure reason that gave rise to math in the first place.[15] In contrast, a Latourian approach rejects (at least initially) all ontological presumptions and instead begins with practice, seeking to understand not what mathematics "is" but what mathematics does, how it works, how those who think mathematically practice their art. In doing so he finds that math is not that to which all things must conform but rather *a practice of translation that renders what was once incommensurable commensurable.* In this light, Archimedes' propositions were powerful because they rendered commensurable what was, prior to the compound pulley, incommensurable: politics and ratios, the one and the many. The consequences were extensive:

---

[14] Martha Nussbaum shows how geometry emerged for thinkers like Parmenides and Plato as an alternative to *doxa* and *tuche* (opinion and luck/chance)—see Nussbaum, 2001, p. 110.

[15] For economy's sake, I dare not go too far into the woods on this point. Suffice it to say that whole books have been written teasing out the implications of mathematical realism on everything from mathematics itself to mathematics pedagogy to the ontological positioning of the human *vis a vis* nature to the relationship between democracy and the mathematical and natural sciences. For those interested in pursuing such topics from a rhetorically friendly perspective, see Rotman's and Latour's work.

> Up to that time, the Sovereign represented the masses. . . . Archimedes procured a different principle of composition for the Leviathan by transforming the relation of political representation into a relation of mechanical proportion. Without geometry and statics, the Sovereign had to reckon with social forces that infinitely overpowered him. But if you add the lever of technology to the play of political representation alone, then you can become stronger than the multitude (Latour, 1993, p. 110).

The two key phrases here are "principle of composition" and "transforming the relation," for they capture two points essential to understanding *how* math works for Latour. Point one: *mathematical propositions are principles of composition*; they are not representations of transcendental truths, they are actors that enact a re-composition of the existing collective. This means that mathematical propositions have an agency unto themselves that is excessive to human agency. Archimedes was certainly aware of how his mathematics of ratios made commensurable the incommensurability of the large and the small, but it's unlikely he foresaw how those same propositions would recompose relations of power between Sovereign and citizen. These unintended reverberations—or, following Barad, "diffractions" —are traces of the agency of mathematical propositions (Barad, 2007, pp. 71-94). Understanding mathematical propositions as actors (or actants) renders any claim that they reflect an *a priori* reality nonsensical, since they so clearly transform and extend the collective of humans and nonhumans that we call reality. In order to understand how math works as a networking force, then, Latour suggests we must forego the metaphysical logics of representation for the modalities of translation and mediation.[16]

Translation and mediation bring us to point two: like all discursive formations that perdure, mathematical discourse is a powerful system of translation and mediation out of which new hybrids emerge, and those hybrids can, in the right circumstances, "transform the relations" of the networks that compose our world. If we want to understand how mathematical discourse becomes materially manifest, we cannot begin with the presumption of the *a priori* object, which conceals from view the material practices of inscription, translation, and assemblage that constitute mathematics; instead "we start from the *vinculum* itself, from passages and relations, not accepting as a starting point any being that does not emerge from this relation that is at once collective, real and discursive" (Latour, 1993, p. 129). What careful rhetorical study of mathematical practice teaches us (perhaps better than any other discursive form) is that there are not two worlds, one made of symbols and one made of things, but one world of relations and that, while some of those relations certainly existed prior to human thought (relations between oxygen and hydrogen for instance), many others have emerged through the practices of inscription and symbolic action that bind humans and nonhumans together in increasingly novel ways.

How exactly do these practices of inscription give rise to novel relations? Consider the annual census: every ten years the demographers office, one center of calculation among many, uses numbers to "know" a population. But the power of mathematizing a population does not lie in the numbers themselves; it lies in the concentration of diverse phenomena— age, gender, wealth, religious affiliation—into *one form*. Centers of calculation gather data "from totally unrelated realms but with the same shape (the same Cartesian coordinates and the same functions, for instance). This means that *transversal* connections are going to be established in addition to all the *vertical* associations made by the cascade of rewriting" (Latour, 1987, p. 244). Numbers, then, are a basic technique of mathematization, which is a practice of *vertical and transversal rewriting*, of translating the world into mathematics—into a formal language that renders commensurable what once appeared incommensurable. Out of that process many new potential relations emerge. They are potential relations precisely

---

[16] Latour's position here is consistent with his broader philosophical rejection of modernist metaphysics, which emerged historically with the rise of Cartesianism, modern algebra, and a renewed commitment to mathematical realism (see Cifoletti, 2006; Latour, 1993; Latour, 1988).

because they do not yet exist. But once the census data is collected and analyzed one can begin to link the number of babies in the land with something like fertility rates, which might correlate with pollution or the size of public parks or the quality of schools. Numbers, in short, manufacture a commensurability of form that encourages the humans that interact with them to *imagine* novel relations, unconstrained as they are by the radical heterogeneity of everyday life. Those humans can then take those novel relations to those in power (just as Archimedes did), and those novel relations can then lead to the creation of new hybrids, new machines, new institutions that ultimately reconfigure the social-material world. This is how agencies congeal. [17]

Thinking of mathematical discourse in this fashion advances the rhetorical study of algorithms in several ways. Through a neo-Aristotelian approach scholars study the strategic use of algorithms to persuade and/or manipulate an audience. Through a constitutive approach scholars examine the powers of algorithmic subjectification and the role symbolic action plays in the invention of new algorithmic relations. But with a Latourian approach we can extend beyond symbolic-conceptual realms and study algorithms as discursive-material assemblages. The task of a rhetorical study of algorithms shifts accordingly, focusing not on suasion in or through them but on how algorithms translate the existing relations of a collective into new relations; how those new relations form novel hybrids of humans and

---

[17] European exploration of the East Pacific in the eighteenth century offers one last example to underscore the materiality of mathematical discourse. When Lapérouse first visited the East Pacific (which was then called Segalien) in 1787 he was weak: he had no knowledge of the land, the navigable straights, or the points of danger; he was dependent on his native guides. Yet when he returned a decade later he was stronger—no longer dependent on those same guides. What changed in ten years? The modalities of number and calculation combined with the Cartesian-coordinate system allowed explorers to extract traces through the use of log books; those traces enabled the production of navigational maps; those maps facilitated flows of capital, extraction of resources, exploitation of peoples. Through numbers and Cartesian coordinates and logbooks Segalien was transformed into the East Pacific, which did not name a place as much as it did a new relation of power we now call colonialism. And colonialism is in part a name for the desire to control at a distance. "How to act at a distance on unfamiliar events, places and people? Answer: by *somehow* bringing home these events, places, and people" (Latour, 1987, p. 223). Numbers, Cartesian coordinates, logbooks: combined they formed an apparatus that transformed the ragged unknown coastlines of Segalien into the stable forms of East Pacific navigational maps. How? The inscriptions in the logbooks, through number and an agreed upon system of coordinates, became "immutable mobiles," which traveled back from Segalien to the centers of calculation in Europe, which then allowed European scientists to create simulacra (navigational maps) of what they increasingly referred to as "the East Pacific" (Latour, 1987, pp. 242-247). Those simulacra had a number of material consequences: (1) they allowed Europeans to *simulate* their next expedition before ever leaving shore; (2) as a result, those Europeans became less indebted to the peoples of Segalien for their safe passage; (3) simultaneously, the heterogeneity of the peoples and places of Segalien were transformed into the stable forms of the simulacra, rendered into faceless image; (4) the simulacra worked in tandem with other cultural forces to slowly transform the subjectivities of Segalien into the objectivities of the East Pacific; (5) those objectivities could now be easily *located, extracted, and sold*. The point of these examples is not to condemn math for reductionism, which would be a massive misunderstanding of how it works, but on the contrary to try to understand the unparalleled productivity of the mathematical sciences. Reduction of incommensurability to commensurability, heterogeneity to homogeneity, is only the first moment of mathematization and if emphasized too much can eschew the fact that the purpose of such reductionism is not sameness but transformation, differentiation, and extension. Through a reduction to similarity of form math can reveal potential relations that often materially transform networks. Like an atomic detonation that must first implode before exploding, math first reduces or, better yet, transforms into a common form the elements and constraints of the problem-situation, which occasionally leads to the realization of a novel relation that (again, occasionally) becomes materially manifest in the world. This is why Latour says, "The sciences multiply new definitions of humans without managing to displace the former ones, reduce them to any homogenous one, or unify them. They add reality; they do not subtract it" (Latour, 1993, p. 137). Just like Archimedes' compound pulleys, European navigational maps were in the eighteenth century novel hybrids that materially expanded the collective of humans and nonhumans that existed at the time.

nonhumans; and ultimately the consequences of those relations for the collectives we find ourselves in.[18]

None of these approaches in isolation, however, would be up to the task of examining the horizons of judgment within complex algorithms. Those horizons are diverse phenomena, full of intention, motive, analogy, delimiting assumptions, human-nonhuman hybrids, vertical and transversal relations, commensurabilities, and domains of validity; and that does not begin to mention how well these horizons are hidden from view, buried through strategies of argument and various appeals to realism (some subtle, some overt). This again is why I use the metaphor of *horizon*—something always far off, present but intangible. Rather than take a strictly Latourian approach, then, we need to draw from all our resources—from a neo-Aristotelian attention to argument structure and appeal, from a constitutive interest in symbolic action as the substance of mathematical invention, and from a Latourian focus on practices of translation that actively transform problem-situations and create space for new hybrids to emerge. Only through this imbricated reading strategy can we begin to bring the horizons of judgment within complex algorithms into view such that critical scholars can begin to reveal the assumptions and delimitations within all algorithms, which might just challenge the entrenched but naïve apotheosis of algorithms as objective, unbiased technologies.[19]

4. CONCLUSION

In order to address algorithms as complex entanglements of mathematical discourse and rhetorical argument with horizons of judgment that ultimately enable the transformation and expansion of the social-material world we must extend our understanding of both rhetorical argument and math. Within the configuration that animates this analysis, for example, rhetoric expands beyond argumentation and symbolic action without leaving them behind; rhetoric extends to include the study of symbolic-material relations, their emergence, their productivities and their material consequences, adding to our accounts of words and deeds what Nathan Stormer describes as studies of "addressivity," or the ways symbolic-material practices establish "a set of capacities for address that forms and fades within fields of power" (Stormer, 2016, p. 306). One's scholarly positionality shifts accordingly, from the confines of negative critique—who did this; who's responsible; or even, how did algorithms betray us with obfuscation and reductionism—to the realms of symbolic-material production, where we ask instead—how do symbolic-material practices make certain forms of addressivity possible; how does math as a symbolic-material practice translate, transform, and mediate, enabling novel algorithmic relations to emerge that expand our social collectives; what forms of agency must we account for in order to understand the unparalleled productivity of algorithms; how can we trace the ontological force of algorithmic relations and the ways they shift our capacities for address—how they mark us as we mark them?

---

[18] The question of what becomes of rhetoric through a Latourian approach would require a whole other essay to adequately address. Suffice it to say that for all his strengths, this question reveals a weakness in Latour's thought, for he marshals a fairly conventional notion of rhetoric as agonistic argument and persuasion (see especially Part I of Latour, 1987) even as his novel approach seems to call for an equally novel notion of rhetoric. A burgeoning scholarly conversation is currently emerging around this very question, and at this point I find Nathan Stormer's notion of rhetoric as polythetic the most developed response (see Stormer, 2016, p. 300). Another excellent point of entry into this conversation is Lynch and Rivers, 2015.

[19] This approach is both pragmatic and philosophically disinclined to adoption of a single method, for the point of analysis here is not merely to reveal the hidden or to illuminate (though those are crucial elements of analysis) but more importantly to multiply our critical capacities for address and encounter with algorithms within any field of power. On analysis as a force of multiplication see Latour, 2005, p. 144.

These questions implicitly reject old modernist divisions between rhetoric and math, humans and nonhumans, societies and natures, not out of some antipathy for the past but because those ontological relations are becoming increasingly inadequate for understanding the proliferating realities of the twenty-first century. Instead, this essay attempts to practice methodological symmetry, which requires one to attend to the multidirectional feedback loops between rhetoric and math, humans and nonhumans, societies and natures such that those divisions begin to transform into hybrid networks and we begin to see their productive and increasingly consequential relations. Those new relations are the entities that mark the irreversible entanglement of symbolicity and materiality, the results of which often expand our social collectives. Ultimately, the theory developed here seeks to promote critical engagement with practices of mathematization (algorithmic automation being one form), with the hope of encouraging others to become critical informants—citizen-scholars with the skills to unpack the algorithmic black-boxes within fields of power and trace the ways they translate and expand material culture. In this way rhetoric and argumentation scholars will be in a better position to contribute something of value to an increasingly mathematized and algorithmically driven world.

ABSTRACT: This study is a narrative analysis of social media arguments that emerged from the denuclearization conflict between North Korea and the U.S. with a focus on the relationship and exchanges between Kim Jong-Un and Donald J. Trump. The stories about the possible future of this diplomatic relationship and the world in general differed enormously depending on the political stance of the arguer. The Twitter data are analyzed both as single messages and as threads that constitute conductive arguments and definitional stories that together support ideologically driven master narratives. These tweets also incorporated a strong sense of argument as play through visual political humor and strategic maneuvering.

KEYWORDS: conductive argument, media diplomacy, North Korea, political orientation, South Korea, thematic analysis, Twitter, United States

1. INTRODUCTION

The Singapore summit between Kim Jong-Un and Donald J. Trump in June 2018 was organized to discuss the denuclearization of the Korean Peninsula. This event was widely understood to be an attempt to reduce tensions between Washington and Pyongyang, and also between the two leaders - Kim and Trump, and perhaps make actual progress toward a treaty. Barely six months prior to the summit, the state of relations between the two countries was such that all-out war, rather than diplomatic discussions, was discussed globally as a serious possibility (Haruki, 2018). At the end of the summit, both sides declared that it was a great

success, however, international affairs experts were skeptical about the nature of the agreements given the broad language of the joint statement and the lack of details (Hass, 2018). At the time of this writing, negotiations are not progressing, but the inflammatory rhetoric is more sporadic and less personal.

This study is grounded in the knowledge that public disagreements between nations with stockpiles of nuclear warheads, about those potentially world-ending weapons, can unnerve populations around the world. As anxieties increase, the opportunity for ripple effects across nations rises and could lead to a number of unhappy scenarios including what military experts call "accidental war" (Mosher, 2018). To better understand the impact of this tense relationship between these two leaders, this study investigates the online conversations that were taking place about this rather startling turn of events to better understand how two nuclear powers, led by two volatile and incendiary personalities were shaping the narratives of likely outcomes for the future --locally and globally.

2. HISTORICAL CONTEXT

North and South Korea were split into two nations following the defeat of the Japanese occupying army in 1945. In 1950, the Northern regime invaded the South and a horrific war commenced. The US and UN allies returned to this region of the Pacific and helped repel the invaders, but China then entered the war to aid the North and this prolonged the conflict. A cease-fire was reached in 1953 but approximately 2 million people had been killed, 900,000 from China (Lucas, 2015). To this day, emotional memories of the war remain a vivid part of the fabric of both North and South Korea (Shorrock, 2018).

The two Koreas were roughly on par economically until the late 1960s when North Korea began to stagnate after the collapse of the Soviet Union and the Communist bloc, and repeated famines (Weissmann, 2011). The South, however, emerged as an economic powerhouse (an Asian 'Tiger') with a strong export economy in high-technology goods; it overthrew a series of dictatorships and consolidated its democracy (Sarel, 1996; Rich, Choi, Carlsen & Specia, 2018).

North Korea, officially as the Democratic People's Republic of Korea (DPRK), is under the rule of the third generation of the Kim family - Kim Jong-Un - one of the most authoritarian and repressive regimes in the world (Weissman, 2011). The situation on the Korean Peninsula remains tense, with approximately 28,000 U.S. military personnel stationed there to deter Pyongyang, which is armed with not only a large conventional force but also nuclear weapons, the latter being the product of a decades-long effort (Warrick & Vitkovskaya, 2018). The proliferation efforts have started and stopped many times as the United States, South Korea and other nations have alternately threatened, negotiated, and gone to the United Nations to win the support for economic sanctions intended to discourage the development of the nuclear capacity (Diamond, 2017).

North and South Korea are separated by the Demilitarized Zone (DMZ), a narrow strip of land that is surrounded by thousands of troops and tons of conventional weapons. The North Korean military has an estimated 12,000 pieces of tube artillery and 2,300 multiple launch rocket systems around the DMZ (McCarthy, 2017). The ascension of Kim Jong-Un to power in 2011 has proved to be a turning point where the proliferation of nuclear weapons and other weapons of mass destruction (WMD) accelerated. Threatening to turn its enemies (i.e., South Korea and the U.S.) into "heaps of ashes" (Browne & Starr, 2016), Kim proceeded to fire an intercontinental ballistic missile (ICBM) that passed over Japan a year later, along with reports that he boasted that North Korea's missiles could strike Guam and the West Coast of the United States (Ripley, 2017). Past U.S. presidents had responded to such threats through diplomacy and by imposing harsh economic sanctions. The election of Donald Trump

signaled a new era, however, as Trump communicated to the world that he could be just as brash and aggressive at the North Korean dictator.

During the second half of 2017, Trump and Kim began exchanging disparaging remarks, threats and personal insults. These claims ranged from "mentally deranged U.S. dotard" (from Kim to Trump) to "Little Rocket Man" (from Trump to Kim) (Stevens, 2018)). These statements were conveyed via two distinct communication platforms - official North Korean media such as the *Korean Central News Agency* and *Rodong Shinmun* (*de facto* and *de jure* propaganda) for the insults hurled by Kim. Although Twitter has long been Trump's favorite means of communication (Liasson, 2017), he has also used public speeches, and media interviews, to counter Kim Jong-Un's threats with his own taunts which have ranged from his famous "fire and fury" threat against the DPRK, to his vow to "totally destroy" North Korea if the U.S was forced to defend itself or its allies (Bierman, 2017; Ward, 2017). Kim's rhetoric was surely not outdone, as he declared his intent to "definitely tame the mentally deranged U.S. dotard with fire" (Ward, 2017). Refusing to allow Kim the last word, Trump went so far as to call Kim "Rocket Man" in a speech before the United Nations, with this morphing into "Little Rocket Man" on Twitter (Novak, 2017; Associated Press, 2017).

This escalation of words and provocative acts in the days preceding the Winter Olympic games, hosted by South Korea in early 2018, significantly stirred up the political tensions. The threats, however, were somewhat lessened when the International Olympics Committee (IOC) reached out to Kim Jong Un to invite the DPRK to find a way to participate in the Pyeongchang games. What followed was a series of diplomatic efforts led by President Moon of South Korea that eventually led to a series of inter-Korean summits, in April and September 2018.

At the turn of the century, Beck (2000, p. 38) introduced the concept of "world risk society" claiming, "threats create society, and global threats create global society." Nuclear war probably represents the greatest global risk facing humankind. This study is part of a larger project that examines how the US-DPRK's roller-coaster foreign relationship was being discussed by publics around the world and investigates, in particular, how the escalating controversy over personal insults and threats of mass destruction, followed by what appeared to be an abrupt turn to *rapprochement,* helped shape public understanding and attitudes about the future of the world. Social media is currently one of the best venues for public discourse and Twitter is an appropriate space for this research since it has been energized by Trump's devotion and is used by many others of all political stripes to share their opinions on issues great and small (Naughton, 2018). This study examines these tweets to discover the contours of digitally mediated public arguments surrounding these events. Due to space limitations, this study focuses only on tweets in English.

3. LITERATURE REVIEW & THEORETICAL RATIONALE

This study takes a media diplomacy perspective. Media diplomacy merges formal governmental diplomacy and public diplomacy, journalism, and now social media interactions and explains how people come to understand rapidly developing controversies and conflicts. Unlike formal diplomacy, public diplomacy arguments are framed within multidirectional information flows from a variety of sources. Media diplomacy permits political actors to "use the media to send messages to leaders of rival states and to non-state actors (Gilboa, 1998, p. 63). This was demonstrated in this instance when both Kim and Trump used the media to speak directly to each other (especially since the two nations do not have formal diplomatic relations), to other nations and to the general public. This confrontation represents an example of the way in which new media technologies afford changes in global affairs.

Castells (2009) argued that new developments in communication technologies and media systems have led to the creation of an increasing array of strategies for both states and non-state actors to exercise their power in what increasingly is becoming a 'networked' society.

Castells (2012, p. 5) argued further that technological developments in media have also altered the power relations between nations, and "this is why the fundamental power struggle is the battle for the construction of meaning in the minds of people." Nye (2004), writing about the concept known as "soft power," noted that "politics has become a contest of competitive credibility. The world of traditional power politics is typically about whose military or economy wins. Politics in an information age may ultimately be about whose story wins." Trump and Kim's exchange of threats constituted rival stories that fed into narratives at multiple levels, competing for the attention and adherence of other governments and the world's citizenry.

Media diplomacy narratives are, by their instantiated praxis, less controlled by the authors of their starting arguments; they often become quickly co-constructed with others on social media who have stature in the mediaverse (pundits for example) and possibly with members of the general public (through memes that go viral or tweets that dominate trending lists) (Riley, 2014). Thus our approach is to utilize the concept of conductive argument (Wellman, 1971; Govier, 1987; Zenker, 2011; Blair, 2013). The theory of conductive arguments explains how in the flow of arguments, often narrative or enthematic, incomplete arguments become understandable within the context of the master narrative. These smaller arguments may not have been individually compelling, but when taken together they can provide arguers with the confidence to render conclusions (Zarefsky, 2014). Blair (2013, p. 12) argues that as these arguments unfold, "new information calling the premises or the conclusion into question can appear, and for some arguments a reformulation of the premises or the conclusion in light of that new information can save the gist or spirit of the argument, although the revised argument will be literally different from its predecessor."

The new information that arguers encounter is evaluated in accordance with their existing beliefs. We see humans as "storytelling animals" and they evaluate new arguments in accordance with the tests of narrative probability and narrative fidelity (Fisher, 1987). Rather than being "blank slates," audiences have prior beliefs that had been actively shaped, which in turn influence their engagement with media narratives (Hollihan, 2014, pp. 12-13). Hollihan (2014) also found that legacy media, primarily newspapers and national network TV news sources, provided coverage that was often closely aligned with national diplomatic and foreign policy narratives; social media, in contrast, tended to greatly amplify more extreme positions both on the left and the right on these same issues. Interactions on social media, in turn, may constitute one aspect of public opinion that alters the way legacy media covers a given issue (Chen & Zhang, 2016), and this bidirectional framing interaction between the two types of media may lend itself to more emotional appeals made by online media outlets on Twitter (Guggenheim, Jang, Bae & Neuman, 2015).

This study also draws upon the analytical tool of strategic maneuvers from pragma dialectics but with an expanded conception of "reasonableness" as a framework to analyze media diplomacy efforts (van Eemeren, 2010). Strategic maneuvering recognizes that arguers create arguments that achieve their intended outcomes while simultaneously living up to the expectation that their claims are reasonable. In this study the data are constituted by arguments that may be linked to official statements, or legacy media videos, and social-media outlets through Twitter, (and yes, the DPRK has an account) in English. Rather than a unidirectional influence of framing from media outlets to the public (Entman, 2004), a more interactive, 'bottom-up' framing process is evident in the digital space (Nisbet, 2010, cited in Groshek & Al-Rawi, 2013). Social media audiences may be less likely to engage in macro-level frames that create context for stories and more likely to experience micro-level framing

that draws upon "strongly connected interpretive packages" (Qin, 2015, p. 179). This view of framing closely aligns with the principles of narrative reasoning (Fisher, 1987).

4. METHOD & RESEARCH QUESTIONS

Tweets were collected through the DiscoverText platform using the open API. Tweets were imported every 15 minutes using the following boolean search terms: "Trump AND Kim" and "Trump AND Moon NOT Kim." This logic was designed to observe how Twitter users were articulating and engaging with the national leaders as individuals and as pairs--Trump and Kim, and Trump and Moon--which in turn constituted a focus on the U.S. and DPRK, as well as between the U.S. and the Republic of Korea. This sampling frame of Twitter data was cleaned by first removing duplicate tweets, and second, by testing highly prolific Twitter accounts to check for potential bots such as excessive, incessant tweeting (Aral & Walker, 2012; Ferrara, 2017), followed by cross-checking with *Botometer* (https://botometer.iuni.iu.edu/#!). Twitter accounts not deemed legitimate were removed from further analysis.

The cleaned dataset was then filtered to select tweets from March 10th to June 15th, 2018. This time frame coincided with two significant events: first, the visit of a high-level South Korean delegation to Pyongyang, announcing a North Korea-U.S. Summit (March 5th), and second, the actual summit between Trump and Kim which was held in Singapore (June 12th). The final dataset contained 104,153 tweets. The metadata indicted that slightly under 22% of the entire dataset consisted of unique tweets, i.e., those that included commentary by the Twitter user which were of primary interest in this study.

Three coders completed three rounds of coding, each using a randomly selected sample from the larger dataset. The first two samples were investigative: they were used to develop the coding protocol for liberal and conservative tweets with an inter-rater reliability of approximately .75. The random sample for the third round of coding (n = 1050) constituted the qualitative theoretical sample for this study (following Glaser & Strauss, 1970), where researchers jointly analyze data. A thematic analysis was used to identify, analyze and uncover patterns for each of the research questions. This approach can organize and describe a given dataset in a variety of ways depending on the content and structure of the dataset (Braun & Clarke, 2006) and has previously been used with political Twitter data in Australia (Burgess & Bruns, 2012).

4.1 Research Questions

Because the political discourse is currently so polarized, it is important to identify the political orientation of Twitter users whenever possible so a preliminary analysis was developed to code the political orientation of an account through a qualitative analysis of each of the: tweet, prior tweets in a Twitter user's timeline, and the Twitter user profile. This approach is consistent with prior research that categorized the profiles of Twitter users (Vainio & Holmberg, 2017; Paskevicius, Veletsianos, & Kimmons, 2018). Also, recent research has documented that liberally oriented Twitter users tend to be linked with liberal-leaning political content, and conservative Twitter users show a preference for conservative-leaning content (Himelboim, McCreery & Smith, 2013). Thus while there tends to be little ideological exposure to arguments and stories from other perspectives, on certain policy issues liberals were more likely than conservatives to engage in cross-ideological retweeting (Barberá, Jost, Nagler, Tucker et al., 2015, p. 1539). Previously, master narratives, defined as "culturally shared stories that guide thoughts, beliefs, values, and behaviors" (McLean & Syed, 2015, p. 323) were identified for two polarized political groups - Trump and Clinton

supporters - in the aftermath of the 2016 Presidential Election by coding for despair or hope expressed about America's future (Dunlop, Harake, & Wilkinson, 2018). Master narratives are sometimes clearly stated in tweets such as "America is going to be great again" but they can also be identified through what Bennett (1979) described as "definitional stories," where smaller story pieces fit into a developing narrative thus the coding is sometimes of individual tweets and sometimes of threads that will be analyzed conductively as a group.

RQ1. Which political orientation dominates the discourse around the possible denuclearization of North Korea and what stories define each perspective?

RQ2. How are liberal- and conservative-leaning tweets imagining the narratives of the future international relationships that Trump, Kim and Moon will create for their countries involving either nuclear war and/or possible denuclearization?

RQ3. What if any narratives and arguments are being developed to describe the future of U.S. - DPRK relations that appear to be independent of these individual leaders?

5. RESULTS AND DISCUSSION

The Twitterverse took significant notice of the North Korea/US negotiations on May 10, the date that marked the start of the top ten dates by volume of tweets in our sample (Figure 1). That day the U.S. citizens who had previously been detained in North Korea were released and returned to the US, which likely served as sign evidence that the Summit negotiations around denuclearization were not just bluster and were beginning to show actual results. Unsurprisingly, June 12th (the day of the Trump-Kim summit) generated, by far, the largest number of tweets for a single day (13,611 tweets). May 24th, when Trump sends Kim a letter canceling the summit, turned out to be the second most active day (7,703 tweets) in our sampling frame. In this sample, the most commonly used hashtags were #Trump and #NorthKorea (2,670 and 1,047 tweets, respectively). The next most common hashtag was #MAGA (Make America Great Again) but after that, none of the hashtags significantly dominated over others.

Figure 1. Volume of Tweets

For RQ1, the coding of accounts for political orientation was further split into two groups: the accounts of individuals and those of media organizations. Individual accounts were 14% Conservative, 33% Liberal and 52% Neutral. Justified by cross-checking with a specific media bias fact-check website (https://mediabiasfactcheck.com/), as was done in prior academic research (see Darwish, Magdy, & Zanouda, 2017). Over three-fourths of the tweets that had embedded URLs to media websites that were progressive-leaning media (76%); and a little less than a quarter (23%) of all tweets were linked to conservative-leaning outlets.

The results of RQ2 indicate that the Twittersphere was very energized by Trump and Kim, both extraordinary characters in a highly charged drama. The primary storyline of the future for conservatives was simple: Trump will prevent a nuclear war! The messages such as the ones pictured below were mostly about how the democratic establishment thought Trump would never be successful internationally. These stories simultaneously reaffirm Trump's arguments about complete verifiable denuclearization, which are unsupported by any evidence, but are offered as a definitional story. In one thread, Trump is positioned as hero and savior in a movie plot line where he saves us all from nuclear war, a storyline that conservatives claim would be unbelievable if pitched in Hollywood (because they are liberals all), but the joke is on them because this is true and it is going to be our real future!

A subsequent tweet that was highly retweeted maintained that Trump is the hero and Pelosi is the disbelieving villain along with the un-American democrats (Figure 2). Democrats are similarly scoffed at for first being dystopian about the future -"OMG There will be war" - and then for shifting to: "Trump is worst president ever for shaking hands with Kim," a *Tu Quoque* argument (fallacy of hypocrisy). This story builds on multiple previous tweets to create their claims in support the master narrative.

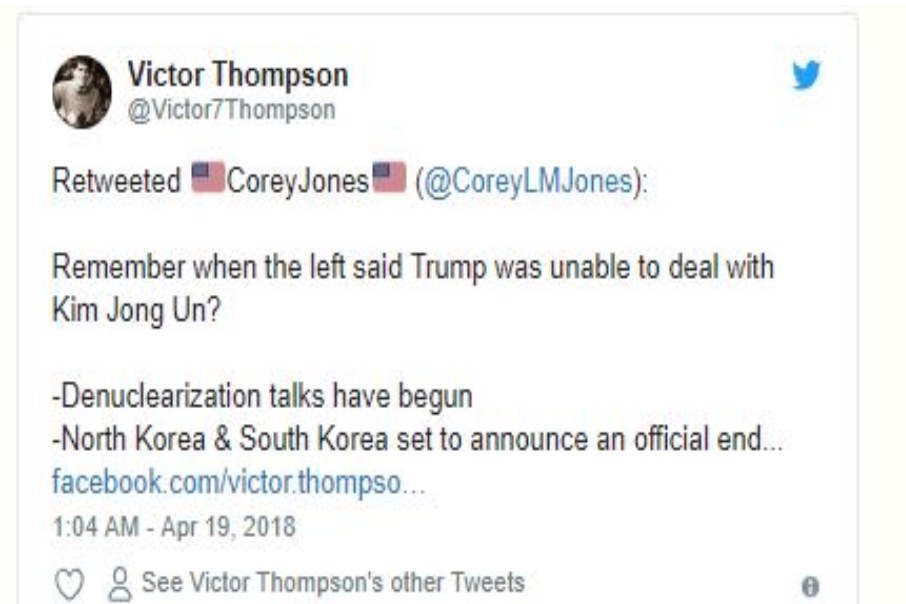

Figure 2. Trump as Hero, Pelosi as Villain

Figure 3. Trump Proving the Left Wrong

In Figure 3 above, a conservative Twitter user pulls together evidence for the hero master narrative where Trump is both effective and strong as he denuclearizes North Korea. "The left" is positioned as incorrect in claiming that Trump could not handle Kim, and Trump's leadership is by definition the reason for North and South Korea's bright future, and for the benefit of the entire world.

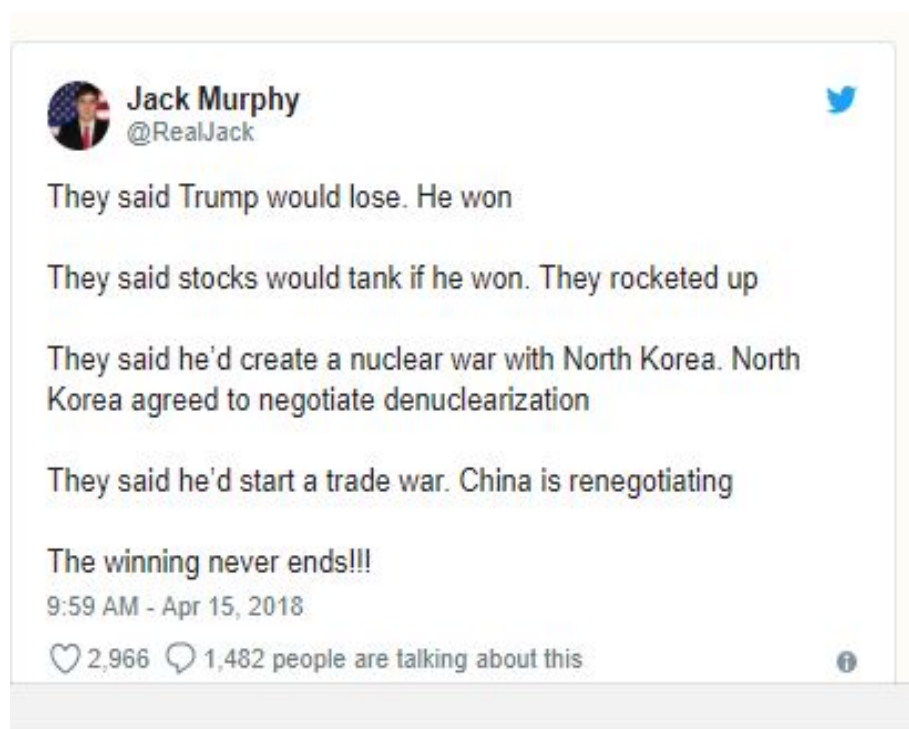

Figure 4. Trump as Beating the Odds

Figure 4, above, shows a tweet that was quickly retweeted, and describes the positive future that will be brought about by Donald Trump. This claim is based on his ability to negotiate deals and win, a storyline within the hero narrative that draws on his background in business as evidence for a variety of claims most of which are factually incorrect.

The final storyline links multiple internal arguments about the Summit and denuclearizing North Korea together using a pattern of conductive argument to re-substantiate a commonly told conservative narrative: that the media are biased against Trump (see Figure 5.). Again a list of issues related to some true claims and some that are incorrect are offered in support of their hero-Trump but this time the conclusion is that most people will never know about his wonderful deeds because the media will not cover these stories—a claim that is in line with another conservative master narrative about the US media being inherently biased against conservatives.

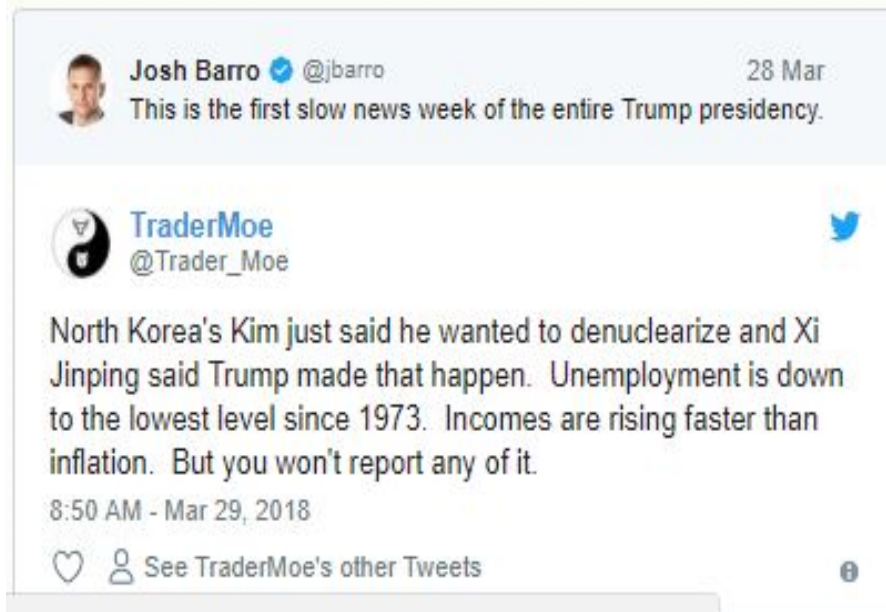

Figure 5. Media as Biased against Trump

The liberal master narrative is similarly simple: Trump is a danger not just to the US but he presents a global risk. For example, tweets from Japan claim that Trump does not understand that he is being "played" by Kim. This thread argues that he is such a narcissist that he is unaware that the flattery and positive statements from Kim during Summit discussions are just stratagems that are used to stall for time and prevent any real commitments from being made. These arguments ridicule the lack of specific details in the signed agreement going forward. In Figure 6 below, a list of foreign autocratic leaders that he has befriended along with actions such as pulling out of the Paris climate accords are offered as examples of his poor decision-making and contrasts him with Obama who was said to be unfairly attacked by republicans for appeasing our enemies and ignoring our allies.

The second type of arguments in support of the master narrative indicate that Trump is a danger to us all and chastises him for his use of *ad hominem* attacks and *reductio ad absurdum* arguments like the "little Rocket Man" tweets mentioned earlier. These arguers claim that name-calling is both beneath the dignity of the office and simultaneously identifies him as a buffoon who is not intellectually capable of being a leader on the global stage because he misunderstands how his words and actions are seen by our allies. Thus he is not just damaging his own relationships but creating difficulties for the US far into the future.

Figure 6. Trump as Global Risk

Figure 7. Anti-Trump Political Humor

Other examples included the liberal appropriation of an evangelical thread that envisioned a future where Trump received the Nobel Prize for his peacekeeping summit—written in a highly satirical voice. These tweets use political humor as argument similar to what one would see on websites like the *Onion*. Recent research has investigated other digital spaces to show how Clinton and Trump supporters engaged in political identity work through digital political humor (Davis, Love & Killen, 2018), as well as the ways that visual argumentation can serve to capture attention and spread widely and quickly as memes. Figure 7 is an exemplar of this approach--it contains both biting political humor with a visual of the US being 'screwed" by the Republican Party and using #MASA--the best of the liberal hashtags--which stands for Make America Smart Again!

We also found examples of strategic maneuvering (van Eemeren, 2010) in ongoing threads that we analyzed as conductive arguments. For example:

1. Context: Twitter was flooded with Liberal arguments that claimed Kim Jong-un was a despot-- evidenced by his atrocities and keeping thousands of N Koreans in prison camps (gulags) in remote areas of the DPRK
2. New tweets add evidence that Trump discussed building fancy hotels on DPRK beaches with the proven despot Kim Jong-un
3. New tweets then argue that Trump has lost his grip on reality because no one in his right mind would suggest building 5-star hotels when the appropriate conversation

would be to halt the construction of gulags and stop abusing the North Korean people (farcical parallel antonyms)

4. Thus the implied claim that Trump is an idiot by virtue of the absurdity of his comments about luxury hotels appear to not be *ad hominem* attacks but reasonable.

It is also possible, if not likely, that Trump is indeed a danger to the world. In this case, retweeting the hotel comment, which was likely offered partly for its humorous appeal, may also be an attempt at aggressive "play" (Hample, Han, & Payne, 2010), a form of verbal aggressiveness that emerges from an individual's "motivation to attack the other person's character and identity" (Hample & Anagondahalli, 2015).

The results of RQ3 indicate that there were three main story types about the future represented in this dataset. The first story type was related to the nuclear proliferation of North Korea to American domestic politics. These tweets focused on topics such as the relentless progress of North Korea toward its goal of becoming a nuclear power. An example is a series of tweets whose authors pessimistically claim that North Korea will never denuclearize. The conservative arguments are rooted in the failure of the Obama administration to deter North Korea because sanctions had not been successfully implemented. The liberal tweets claimed that the sudden increase in North Korea's nuclear capability was accelerated by nations helping each other because of the uncertainty regarding a Trump administration full of pro-war hawks.

The second storyline involved the US's global role in maintaining stability in a chaotic world without specifically referencing Trump. These mostly liberal groups of tweets referenced topics such as ongoing negotiations with North Korea, which may not appropriately involve other allies such as Japan. The claim is that Japan might lose faith in America's military support and decide it needs to develop its own nuclear capability which would add, not subtract, to global risk. Another major narrative was specific to the Korean nation states, or the Korean peninsula as a whole. This story suggested that the US might not remain a viable player in the region's future should there be a *rapprochement* between the two Korean countries. In this scenario, South Korea would no longer need US soldiers or bases and the US would lose its hard power in the region.

Interestingly almost all of the arguments coded about the future that did not involve the leaders were liberal. The conservative stories are mostly personified by Trump as the identity and articulator of conservative futures.

6. CONCLUSION AND NEXT STEPS

The stories that emerged from the global risk discussions regarding a potential nuclear war between the US and North Korea found that the leader of one of the most isolated nations in the world is able to stride around the social media stage and challenge Donald Trump, the leader of the world's only remaining superpower. The shifting tenor of the two leaders' messages, captivated attention and overshadowed Moon's communication in this dataset although the historical review indicates that he has played a profound role in the ongoing negotiations—that of the adult in the room.

The possible futures narratives that emerged on Twitter are as polarized as is the general political discourse in the US, although the traditional sentiment poles are flipped, with upbeat, positive stories coming from conservatives and dystopian narratives offered by progressives. Most concerning to the authors of the study are the credible narratives of damage to important international relationships that have brought stability and peace to millions around the world along with the real possibility of accidental wars or futures without viable leaders.

The project has a number of limitations that can be improved upon as the project continues but others that are inherent to the type of data and the method—Twitter is not all of social media and coding schemes all have flaws. There are many tweets remaining to be coded so a machine learning classifier is being developed in English so that simple arguments and narratives can be coded automatically. Conductive arguments and other sophisticated threads of messages, however, will still have to be human coded. Next the coding scheme needs to be translated into Korean, Japanese and Chinese in order to repeat both the human and machine coding processes. This will broaden our understanding of perceptions internationally and culturally and one can only hope that others see a silver lining somewhere that is hiding in the data.

Smuggling fallacies: The joke as a Trojan horse of argumentation

VIKTORIJA ROMASCENKO

Department of General Rhetoric
University of Tübingen
Germany
viktorija.romascenko@uni-tuebingen.de

ABSTRACT: Some jokes function as arguments and as such are prone to being fallacious. Would not a claim in a form of a joke provide a competitive advantage? My thesis is that arguments that appear in a humorous form are less likely to be scrutinised. The aim of this paper is to show that jokes have more than an ornamental function by examining how fallacy-containing humorous utterances are strategically used within political communication.

KEYWORDS: argumentation, fallacy, humour, joke, persuasion, political communication, political entertainment, rhetoric

1. INTRODUCTION

The year was 1858. During the Great Debates, Stephen Douglas accused his opponent Abraham Lincoln of being two-faced and shifting positions to pander to his audience, to which Lincoln famously replied "If I had another face, do you think I would wear this one?" (Cary, 1959, p. 154). An answer that has been repeated and reproduced countless times as an example of the exceptional wit and quick thinking of the future president. Not as an example of fallacy of equivocation with an ambiguous middle term: where the adjective 'two-faced' means 'deceitful, insincere' in one premise, and 'having two faces' in the other. Lincoln did not refute the claim, but he answered it. Protected by wit, he smuggled a fallacy.

The advice to use humour in speeches is almost as old as the history of rhetoric itself. Jokes have more than an ornamental function. They can lighten the mood, wake up dozing audiences, highlight shared beliefs, allow criticising in a socially acceptable way, just to name but a few. The topic of this paper is one of these effects: the ability of humour to reduce argument scrutiny, which can be a competitive advantage. In order to describe this phenomenon, I use the metaphor of a Trojan horse: a trick that allows entering a securely protected place undetected. The securely protected place are the beliefs, the guard is the reason. Thus, my first hypothesis is that arguments that appear in a humorously amusing form are less likely to be scrutinised. Followed by the second hypothesis – that this can be used in order to smuggle fallacies.

Let me begin by clarifying some key assumptions and usage of terms. I use 'humour' as an umbrella term for describing all kinds of instances causing a feeling of mirth: including jokes, witticisms, irony, etc. As for the notion of 'argument', I understand it as sequence of statements where one statement aspires for validity and other statements provide reasons for it. Whereas 'fallacy' is a persuasive argument that is logically unsound or weak. Within this paper, I concentrate on one application case: the strategic use within political communication. The preponderance of research concentrates on political humour, as in humour with politics as a topic, whereas my area of research is the humour of politicians, as in funny utterances strategically made by professional politicians.

There is a notable increase in academic interest in comedy entertainment and its role in opinion building. A great deal of research is oriented towards estimating the role of

entertainment media (particularly late-night show comedy) in generating political opinion, as a key democratic component. A look at previous research shows that there is no proven direct correlation between humorous attempts and persuasion (Martin, 2007, pp. 136-139; Nabi, Moyer-Gusé, & Byrne, 2007, p. 30; Warner et al., 2018, p. 3). A considerable number of studies since the 1970s did show correlation between humour and persuasion; unfortunately, they resulted in different, sometimes contradictory conclusions (Holbert & Young, 2013, p. 485; Innocenti & Miller, 2016, p. 368; Young, 2008, pp. 120-121). Nevertheless, one cannot assume the absence of such a link on that basis. Instead, it is worth considering that a multitude of interrelated factors might be at play here. It might be argued that humour is able to influence people unconsciously (Kayam, Sover, & Galily, 2014, p. 7), up to statements of inability of masses to evaluate logical constructs (Дмитриев & Сычев, 2005, p. 578). Broadly viewed, empirical evidence suggests that political entertainment has an impact on voters. Yet it becomes more difficult to recognise individual mechanisms involved in the process of persuasion: to translate a temporal correlation into a rational explanation.

2. ARGUMENT IN A JOKE

In order to understand how smuggling fallacies work, we need to consider the implicit premise of the first hypothesis: that there is an argument in a joke. Admittedly, not all humorous instances have a recognisable argument, for example absurdities or incongruities that rely on psychological effects. Many, however, do and they are the subject of our interest. In the core of this paper is humour as an expression of a position. At the same time, even a joke containing an argument is undoubtedly more than the argument that lies behind it and cannot be fully reduced to an underlying syllogism.

The argument in a joke can be best demonstrated with the help of an example. At the 2017 annual press conference the President of Russia Vladimir Putin was questioned on whether the increase of military budget will not harm the social programmes. To which he replied by telling a joke (in my translation):

> A retired officer asks his son: "You know I had a dagger. Have you seen it?" – "Dad, please don't yell," the son answers, "but I have exchanged the dagger for a watch." The father says, "Ok, show me the watch. It's a good watch, well done. You know, if tomorrow bandits and robbers show up, they will kill me, they will kill the mother, your older sister will be raped. And you will come out and say "Good evening, the time in Moscow is 12 hours and 30 minutes." (Администрация Президента России, 2017)

The core of the argument: Protection is important. When one does not have enough means of protection, bad things could happen. We do not want bad things to happen, so we will invest in means of protection. Presented with the frightening and unacceptable scenario of not being able to protect his family, the boy would understand he was wrong to exchange the dagger. Thus, by analogy, it is wrong to exchange military spending for other projects. This analogy is demonstrably weak on many levels. The most obvious are the red herring of emotional appeal (*argumentum ad metum*) and a weak analogy.

3. INABILITY TO RECOGNISE A FALLACY IN A JOKE

If we recognise the argument in the joke, is it then true, that presented in a humorously amusing form it is less likely to be scrutinised? The evidence falls into two different groups (cf. Young, 2008, p. 121). First group of evidence addresses the question of "Why don't we see the fallacies in jokes?", which addresses the level of ability to recognise a fallacy.

1) The first consideration is that jokes are quick, a least the good ones. Even a good punchline can be easily spoiled by stretching the telling of the joke out. Jokes often rely on an enthymeme structure, so we just don't have time to process the critique. It just happens too fast.

2) Another argument is that of attention. As early as "Rhetorica ad Herennium" we read that humour should be used in order to capture the attention of the audience ([Cicero], 1964, I:10). A quality that has become essential in a contemporary high-choice media environment of overabundance of information and entertainment offers. At the same time as attracting the attention, a joke distracts from the statement (Sternthal & Craig, 1973, p. 14; Young, 2008, p. 122). This distraction might be used in various ways, including changing the topic to avoid disadvantageous matters or introducing favourable ones. Distraction from the argument is particularly prominent in advertisement: hiding a weak argument behind the laughter.

An explanation for what exactly is going on is offered by neurosciences. In short, "getting a joke" is cognitively draining, leaving no energy for scrutiny. More accurately: when processing humour, we engage in frame-shifting. During the frame-shifting, we try to establish coherence by adjusting the new information in working memory to the knowledge we already have in the long-term memory. The working memory has a limited capacity (thus the tendency to seek shortcuts like cognitive bias), which makes the task of "getting a joke" cognitively demanding. Thus a reduction in available cognitive recourses for a critical examination of the message (Young, 2008, pp. 121-122).

Why do we act that way? An answer could be found in fMRI studies, which highlight two prominent cognitive processes during humour comprehension: semantic processing and affect. It appears that the brains prefrontal cortex is activated already during the joke, before the punchline, in an anticipation of an affective reward. This means the cognitive capacities are concentrated on "getting the joke" and receiving the affective payoff, leaving fewer resources for message analysis (Young, 2008, p. 123).

3) We are cognitively inclined to stay in a good mood. This is another argument from neurosciences: there is evidence to think that people in a positive mood are prone to reduced systematic processing. Thus, being in a good mood is linked to a decrease of motivation to process information in a systematic way (Young, 2008, pp. 123-124). In other words, we are not very motivated to scrutinise the message because we want to stay in a good mood. After an endless afternoon of serious talks, there is finally a joke. We just want to enjoy it. We are not motivated to disagree with the content (Nabi et al., 2007, p. 40). A later study demonstrated that humorous political information lead to a suppression of negative thoughts, when compared to the processing of serious information (LaMarre & Walther, 2013, pp. 317-319).

4. RELUCTANCE TO ANALYSE HUMOUR

As we can see, there are various mechanisms preventing us from quickly recognising and evaluating the quality of an argument in a joke. Yet there are many situations in which we make quick judgements, but then reconsider and analyse despite the initial heuristic reaction. Like spontaneously picking up an item at a shop. Then putting it back on the shelve because, regardless of the initial desire to buy, you don't actually need that item. A quick reaction, rationally revised. Why don't we do that humour? This is the second group of evidence: addressing the question of "Why is there so little inclination to analyse and criticise humour?"

1) There is a powerful social component to it. Even if I do notice the fallacy, there is the social pressure not to ruin the joke. The one who does so (killjoy, grinch) shall be shunned. Even if we are consciously required to criticise at a given moment (for example during a debate), the ability to do so is likely to be underdeveloped, due to lack of practice in other communicative situations. Social conventions surrounding humour uptake work both ways: on the one hand, by laughing in a social situation we highlight the common beliefs and accentuate shared opinions. On the other hand, it is highly undesirable to be seen as one without a sense of humour, as one of the reasons for not laughing could be the inability for the sophisticated cognitive processing involved in humour comprehension. This creates a vicious circle: In order not to risk being branded as a person without sense of humour it is safer to laugh, which in turn creates an illusion of a shared belief. Admittedly, this does not work in all cases, yet there is a tendency for this mechanism to be set in motion in social gatherings.

2) Even if there is no audience to exercise the social pressure of not ruining the joke, the motivation to scrutinise the content might be lessened because we recognise the humorous attempt and appreciate it. There might be a certain gratitude for causing a feeling of mirth and it seems we might not want to discourage the future humour attempts by criticising the speaker.

3) There is interesting recent empirical evidence of jokes influencing the perceived trust levels. A study by Jason T. Peifer supports the idea that a more positive disposition towards the speaker leads to more mirth, while negative predisposition hinders the amusement. The additional findings were that mirth correlates with the media trust: that is, the more we enjoy the joke, the more we trust the source (Peifer, 2018, pp. 19-20). This could mean, that under the increased eagerness to enjoy the joke, we see the source of a joke as more trustworthy, thus leading the recipient even further away from critical analysis of the content.

4) The fourth and the most problematic reason for not analysing humour after we have perceived it, is the veil of fictionality. It is just a joke; it is not a "real" statement. Just to make sure, one can mark an utterance as fictional just moments after with a "Joke, joke!" or "Just kidding!". Purely fictional contexts enjoy more freedoms. Especially if their primary aim is to entertain. For political speeches, especially in non-entertainment contexts, being entertaining is an added bonus. Because of being described as fictional, the content is discounted. Why go through the trouble of analysing if it is just a joke? As soon as content is recognised as humour, its message is classified as irrelevant for opinion-building. Consequently, we do not even start with critical analysis (Nabi et al., 2007, p. 33).

A 2013 study by Heather L. LaMarre and Whitney Walther showed that late-night political comedy viewers, compared to serious political news viewers, were thinking more about comedy content in general. However, it did not lead to increased scrutiny of the target of the message. In other words, exposure to humorous content provoked thoughts about the issue, but little critical thoughts about the immediate content of the humorous message (LaMarre & Walther, 2013, pp. 317-319). A later study from 2017 by Amy B. Becker and Don J. Waisanen concluded that subjects engaged in message elaboration much more when

viewing serious political content. The humorous presentations were swiftly discounted as fictional. Thus, their conclusion is that political humour has much less influence than some speechwriters and some academics claim (Becker & Waisanen, 2017, pp. 14-15).

For the purpose of persuasion through humour these are worrying conclusions. Why? Because message elaboration is directly associated with learning and attitude change (Eveland, as cited in Becker & Waisanen, 2017, p. 4). When the message is discounted, no message elaboration takes place and thus reasonable doubt can arise as to whether there is any persuasive effect taking place at all. There is abundant evidence for thinking that humour scrutiny is cognitively hindered. At this pessimistic moment we are left with the question: Is there any trace of message cognition? Or is joke just an *ornatus*, a mere decoration for our enjoyment? If so, the question of smuggling fallacies would be irrelevant, as even if, formally seen, there were a fallacy, it would not leave any argumentative consequences such as attitude change.

5. PERSUASION BY HUMOROUS ARGUMENT

As the title of this paper might suggest, there is reason for optimism. Fortunately, there is evidence of "sleeper effect" (Nabi et al., 2007). That after one week, a significant gain in attitude change has been observed, which could be explained by the memorable nature of humorous content and the influence of the availability bias.

For persuasion, a solid argument would be better (Nabi et al., 2007, p. 31), but that is not always possible for a multitude of reasons. It might be that (for some reason) I cannot publicly disclose the true reasons for my claim (for example out of fear of civil unrest). Or it could be that my arguments would get lost in the overabundance of information. Or it could be that I just do not have a solid argument: As it is often the case in advertisement where the consumer is persuaded to choose a product that is virtually identical to the rival products.

It might serve as a "foot in the door" strategy: In order to get a joke, you must share the premise. Beliefs are not black and white, and the joke might just activate that little portion of belief. For the pleasure of the joke we allow ourselves to accept the thesis, even if we disregard it consciously a moment later.

6. CONCLUSION

Thus, we construct a Trojan horse around a claim. True, it appears to have has less persuasive power than a clear-cut argument, but it also has the ability to the sneak by undetected. In fact, if you look at the definition of a fallacy as a "persuasive argument that is logically unsound or weak", you can see that by calling an argument a fallacy it is already being stated that it is persuasive.

How can we use it strategically? To smuggle either structurally or factually controversial content. Whenever you do not want your argument to be scrutinised. Whilst factual mistakes are relatively easy to identify, structural are not as easy to detect. This makes fallacies a good match for a Trojan horse of a joke.

Does it mean that we have discovered an indestructible secret weapon, only to be detected by eagle-eyed academics? I am afraid, no. There are considerable risks associated with such behaviour. It is not going to work if the audiences do not share the premises at all. Plus, there is an added risk of a satire backfiring when the receiver misses the cue of irony and interprets the information literally (Young, 2018). In the long term, it is worth considering that the use of such joke-fallacies might harm the image of the speaker. When too many of joke-fallacies are used, or when the audience is skilled in recognising fallacies, there is a risk

of coming across as logically incompetent or manipulative. This, in turn, might damage the credibility of the speaker.

In conclusion, let us turn to another example. During the general Debate in Bundestag, the Chancellor of Germany Angela Merkel addressed the Greens with the critique (in my translation):

> You are of course for the sport. Who would not be. Probably for sport in the constitution. Yet when it comes to Olympic games in Germany, you are of course against it. […] Ladies and Gentlemen, if things continue like this, the Greens will be for Christmas, but against the advent season that precedes it! (SPIEGEL TV, 2010)

This was not simple entertainment – though there is no doubt a bit of that – this was a statement about the unreasonable views of the Green party. The Greens support sport, but are against the Olympic games. If such reasoning is acceptable, then soon the advent season will be cancelled. This is obviously an undesirable consequence. Thus, the reasoning of the Green is faulty. The charges are numerous: you might recognize a *reductio ad absurdum*, appeal to consequences, a slippery slope, or a false dichotomy in the premises (as the difference between doing sport and organizing Olympic games is being downplayed). Ultimately, I have found no trace of comment in the media on the logical soundness of the claim. The topic of the Greens being against things, however, got picked up by the press including major national newspapers (Alexander, 2010; "Merkel attackiert Grüne: „Verbandelt mit dem Wort dagegen"," 2010; "Merkel sieht Koalition auf Kurs," 2010; "Restlos verschleudert," 2010). One and a half centuries after Lincoln, a funny fallacy still gets the laughs and the attention, but no scrutiny.

Trump's ideological worldview

ROBERT C. ROWLAND

Department of Communication Studies

rrowland@ku.edus

ABSTRACT: Argumentation scholars have noted the power of definitional argument in political movements. The election of Donald Trump shocked political scholars, as well as commentators in the mainstream press. This essay lays out the ideological and narrative dimensions of Trump's worldview, concluding that the ideological definition in Trump's rhetoric was well adapted to creating a sense of shared identity with working-class voters, but ill adapted to developing public policies that would improve their circumstances.

KEYWORDS: definition, ideology, narrative, Trump

1. INTRODUCTION

Donald Trump's successful campaign for the presidency violated every principle that scholars and commentators understood about presidential campaigns. The comment of Giridharada (2016, March 14) that Trump's campaign disrupted "American politics" especially "the established rules of communicating with voters" is typical of the scholarly consensus. Again and again during both the primary and general election campaign, Trump committed gaffes that commentators claimed would this time, surely end the campaign. *Politico* counted "37 Fatal Gaffes that Didn't Kill Donald Trump" that had occurred by late September 2016 (Kruse and Gee, 2016, September 25). Of course, a few days later the greatest gaffe of all, the *Access Hollywood* tape, would show Trump bragging about having committed sexual assault ("Transcript: Donald Trump's taped comments about women," 2016, October 8).

After the *Access Hollywood* disaster seemed to end any chance that he could win the presidency, Trump went on to have what virtually all commentators saw as a disastrous performance in the two remaining presidential debates, confirming a pattern that began with the first debate where there was a strong "consensus that Donald Trump badly lost" (Hohmann, 2016, September 27). Inexplicably, from the perspective of commentators and scholars, Trump went on to win the election. The key to explaining this surprising result is to understand the worldview that Trump presented that was so appealing to his base of supporter in the white working-class. Identifying that worldview in turn requires identification of the ideological, narrative and value principles undergirding it.

2. THE POWER OF DEFINITIONAL ARGUMENT

A number of argumentation scholars have noted the power of definitional argument in animating political movements. David Zarefsky observed that "the power to persuade is, in large measure, the power to define" (1986, p. 1) and later added that in some cases the definition acts as a "a frame of reference" that "hegemonically excludes alternative frames of reference" and "profoundly influences how the public responds to an issue" (1988, p. 6; also see Zarefsky, 2004). In such cases, the definition functions as a "terministic screen" that acts as a *reflection*

of reality," a "*selection* of reality" and a "*deflection* of reality" (Burke, 1966, p. 45, emphasis in original). In the strongest form of this strategy, ultimate definition, ideological, narrative, and value-laden forms of definition are consonant with each other and together provide a consistent worldview for understanding the problems, solutions, heroes and villains, as well as positive and negative values energizing a nation (Rowland & Jones 2010; Jones & Rowland, 2015; Rowland & Jones, 2016, Rowland & Jones 2017). Such a worldview can be understood as all-encompassing in that it provides an "encyclopedic" (Frye, 1971, p. 36) understanding of the world that functions as what Richard Weaver (1965, p. 11) labeled a "'tyrannizing image' which draws everything toward itself."

Weaver's reference to a "tyrannizing image" and his statement that such an image "draws everything toward itself" is particularly powerful for describing the influence of Trump's rhetoric on his core supporters, a group that constantly chanted "Make America Great Again," or wore the ubiquitous red hats with that message printed on them. They cheered when Trump called for "draining the swamp" or used a derogatory nickname to attack "Crooked Hillary" or one of his rivals for the Republican nomination. And they cheered loudest when Trump angrily warned of the dangers of immigration or terrorism and called for building a "wall." It is important to identify the characteristics of Trump's definition of the world that created an image that drew everything toward him. At the same time, one might object that Trump's worldview was hardly coherent. He often took inconsistent policy positions and lacked a developed issue platform, creating a situation in which his appeal was "rooted in emotional attachments, not policy goals" (Taub, 2017, April 13, p. A10). In this case, however, incoherence did not detract from the emotional resonance of Trump's worldview with core supporters. In fact, the absence of a clear policy agenda magnifies the importance of understanding the power of Trump's definition of the world.

In what follows, I confront this puzzle by laying out the ideological, value-laden, and narrative dimensions of Trump's worldview, concluding that Trump's rhetoric was well adapted to creating a sense of shared identity with working-class voters, but ill adapted to developing public policies that would improve their circumstances. Given the consensus that Trump's appeal was based in emotion rather than a coherent policy agenda, it makes sense to focus upon the physical and virtual places where that affective relationship was most evident: Trump rallies and Twitter. In order to isolate the ideological, value-laden and narrative aspects of his worldview in rally speeches, I focus in detail on the acceptance speech that he presented at the Republican National Convention. While the convention speech was at a formal political event, rather than a rally, the speech was largely a compilation of "greatest hits" from campaign rallies.

Writing in the *New York Times*, Patrick Healy and Jonathan Martin (2016) labelled the convention speech a "vehement appeal to Americans who feel that their country is spiraling out of control and yearn for a leader who will take aggressive, even extreme, actions to protect them" (p. A1) and added that the speech included "dark imagery and an almost angry tone" (p. A1), characteristics that were typical of Trump rallies. Alex Altman (2016, July 22) identified the "dominant narrative thread" of his campaign as "describing an American dystopia," a theme that was quite evident in rallies and especially the convention speech that functioned as "a fiesta of fear."

Similarly, Trump used Twitter to extend the rallies to virtual space, in that way magnifying the emotional connection created at rallies. Müller (2016, pp. 35, 43) noted that Trump used his "Twitter account" to create "the illusion of direct contact," in this way creating "an aesthetic production of 'proximity to the people.'" Through this mechanism, as Johnson (2016, November 10) noted, his "campaign successfully crowdsourced a message of anger and fear by leveraging the knowledge, contacts and skills of his followers to disseminate his tweets widely." Writing in *The Conversation,* Johnson observed that "One political operative

characterized the candidate's presence on the social networking site as 'a continuous Trump rally that happens on Twitter at all hours.'"

3. TRUMP'S DYSTOPIAN WORLDVIEW

The key to understanding Trump's worldview is found in the dominant narrative that undergirds it. Trump described a nation in crisis because of dangerous "Others" who threaten it and feckless leaders who undermine it. Into this crisis, he strides as the strongman who can return the nation to the greatness of the past. It is a narrative that bore little resemblance to the actual status of the nation, which had experienced an extended period of job growth, low crime, reduced immigration, a modest level of terrorism risk, and a reduction in American troops lost in combat over the last six years of the Obama administration, after the great recession was overcome (Kessler & Lee, 2016, July 22), but it was clearly a narrative that resonated with a large portion of his core audience.

In the convention address, Trump (2016, July 22, future references are by paragraph number in the text) described a dystopian American landscape. Quite early in the speech he stated that the nation faced "a moment of crisis" and then went on to add that "attacks on our police and terrorism in our cities threaten our way of life" (5). He then referenced "recent images of violence in our streets and the chaos in our communities" and a few paragraphs later cited statistics indicating that "Homicides last year increased by 17 percent in America's 50 largest cities," before moving on to focus on murders in Baltimore and Chicago (6, 17, 19). In fact, the murder rate in 2016 remained close to a fifty year low, the increase was concentrated in a limited number of major cities, especially Chicago, and the overall rate was less than half that of 1984 (Lopez, 2017, September 25). Trump then tied the rise in crime to "180,000 illegal immigrants with criminal records, ordered deported from our country, [who] are tonight roaming free to threaten peaceful citizens" (22).

Trump also discussed the economy in dystopian terms. Here, he spoke about problems largely created by the Great Recession that began in the administration of George W. Bush and occurred because of a failure of regulation of the financial industry. He referenced a decline of household income of "more than $4,000 since the year 2000," an "800 billion" trade deficit, "43 million Americans . . . on food stamps" and "roads and bridges . . . falling apart," as well as a host of other issues (30, 31, 34). Again, he ignored the vast economic progress that occurred in the Obama years as well as role of Republican deregulatory efforts that he supported in causing the Great Recession.

Trump also described the world as in crisis defined by American "humiliation" in Syria, Libya, and elsewhere (39, 40). He blamed multiple world hotspots on Hillary Clinton and Barack Obama, stating "In 2008, pre-Hillary, ISIS was not even on the map. Libya was stable. Egypt was peaceful. Iraq was seeing a reduction in sanctions, Syria was under control" and then added "This is the legacy of Hillary Clinton: death, destruction, terrorism, and weakness" (44, 53). It is astonishing that his dystopian description of the world ignored Obama's efforts in dramatically reducing American forces in Iraq and Afghanistan as well as the role of President George W. Bush's invasion of Iraq in causing crises in the region.

The hero of Trump's narrative was Trump himself. Trump made very clear quite early in the speech that he would be the solution to the problems that faced the nation. In paragraph 8, he promised "The crime and violence that today afflicts our nation will soon come to an end. Beginning on January 20, 2017, safety will be restored." In policy terms, this promise was obvious nonsense. But in narrative terms, it reflected the consistent claim that as president Trump would be the strongman who would through sheer force of will produce what can only be described as magical results. Nicholas Lemann astutely observed in 2016 that "Trump has

spent this year running for "strongman," adding that this persona "has struck a chord" with a large group. In the section of the speech ostensibly on his proposals, he again and again promised to solve problems, without providing any explanation of what he actually would do. For example, he described his "plan" for "safety at home—which means safe neighborhoods, secure borders, and protection from terrorism" (63). Rather than developing a coherent ideological perspective, Trump claimed to embody the voice of the people. Trump stated that ordinary people are the "forgotten men and women of our country" and added "I am your voice" (74, 75). The importance of his role as strongman was quite evident when he stated "I have joined the political arena so that the powerful can no longer beat up on people who cannot defend themselves" (83). The key to his role as strongman was that "Nobody knows the system better than me, which is why I alone can fix it" (84).

Against Trump's heroic strongman, his political opponents and other elites were portrayed as weak and "politically correct" (12). He claimed that he would "tell you [the American people] the plain facts that have been edited out of your nightly news" (26) and added that the "problems we face now—poverty and violence at home, war and destruction abroad—will last only as long as we continue relying on the same politicians who created them" (55). The other villains in Trump's narrative were dangerous "Others" who threaten the nation. The "Other" includes criminals in inner cities, undocumented immigrants, and Islamic terrorists. Through his references to inner city crime, Trump used "coded language" "appealing to whites' racial anxieties about crime" (Associated Press, 2016, July 22). He also included several passages warning about the danger of undocumented immigrants in "sanctuary cities" (126). Late in the speech, he said, "The damage and devastation that can be inflicted by Islamic radicals has been proven over and over—at the World Trade Center, at an office part in San Bernadino, at the Boston Marathon, at a military recruiting center in Chattanooga, and many more" (105). Shortly after this passage, he called for the nation to "immediately suspend immigration from any nation that has been compromised by terrorism" (115). Here, he drew on Islamaphobia, the irrational fear of Islam that influences millions of Americans, a fear which "was at the center of Trump's presidential campaign" (Shephard, 2017, November 29).

The key to the power of the "Other" in Trump's narrative is not that these groups in fact posed any significant national problem, but that they weren't white. I've already noted that crime in America was quite a modest problem compared to the 1970s and 1980s. A similar point can be made of immigration and crime committed by undocumented immigrants (Krogstad, Passel, and Cohn 2017, April 27; Burnett, 2018 May 2). Nor was Islamic terrorism a major crisis facing the nation. From September 12, 2001 through the end of 2016, extremists killed 225 Americans, 106 of whom were murdered by right-wing extremists (Nichols, C, 2017, August 31). Over this fifteen year period, on average eight Americans were killed by Islamic extremists per year, definitely a problem, but hardly a national crisis. The key to Trump's narrative was not that these ordinary Americans were in fact dangerous, but that they were "Other" than white Americans.

To this point, I have focused on the dystopian narrative in the speech, in large part because there was no developed policy analysis. He summarized his policy approach as "put America first" (59), a description both so vague as to be meaningless and insulting in its implications that leaders of both parties had not put the needs of the nation first. Essentially the only specific policy advocated in the speech was for the nation to build "a great border wall" (133), although he did make clear his general opposition to free trade and support for fair trade (144-162), as well as support for tax cuts and deregulation (163-169) and of course opposition to immigration. Rather than a developed ideological worldview, as in Reagan's small government conservatism, Trump offered a series of slogans and his promise to transform the nation through his strongman leadership. None of those slogans were fleshed out into actual

policy prescriptions. Rather, they all relied on the power of his strongman leadership to magically bring them into effect.

The same can be said about the value principles implicit in Trump's narrative. In Trump's case, the focus was on victimage of ordinary (white) Americans, the monstrous values of the elites and the "Others" who threaten the people, and the power of his strongman persona to "make America great again." The values implicit in Trump's speech were consonant with his narrative and his quite limited ideological worldview.   Trump's Republican National Convention address did not present a coherent ideological statement to the nation or defend a set of policy proposals. But it did present a narrative, set of ideological principles, and value statements that functioned as a form of ultimate definition. In this case, the ultimate definition was almost entirely contained in the dystopian narrative, his definition of elites and the "Other" as the villains of that narrative, and his self-presentation as the strongman hero. The power of the address was that it fulfilled the emotional needs of the core of his audience who felt left behind in the nation. James and Tom Risen (2017, June 25, p. SR2) argued that Trump used a "politics of fear" to tap into "a broad and unspoken fear of the looming loss of white dominance in American society" and added that "Trump supporters want to make America great again," by going "back to what they believe were the halcyon days of the 1950s."

4. TRUMP'S DYSTOPIAN TWITTERVERSE

Trump presented the same dystopian narrative, ideology, and set of values in his use of Twitter, as he did in rallies and other partisan speeches, but in more concentrated form. His use of Twitter was "like nothing we've previously seen from an elected politician" (Buncombe, January 17, 2018). The character limit of Twitter did not allow for Trump to present in complete form the narrative that he presented at the Republican National Convention or at rallies during the campaign and his presidency. Rather, Trump used Twitter to present a scene from the larger narrative, a vignette that reinforced his attack on elites or his warnings about a dangerous "Other" or his claims of heroic strongman achievements. In his case, the function of Twitter was to bring the rally to supporters in the virtual world. In a discussion of *The New Rhetoric,* Chaim Perelman and L. Olbrechts-Tyteca wrote about the power of rhetoric and argument to create what they call a sense of "presence" which "acts directly on our sensibility," by making "something present to the consciousness" (1969, pp. 116, 118). Twitter is a particularly influential means of creating presence by using rhetoric "to center attention" in the "foreground" of the audience's "consciousness" through the power of "repetition," which can be a powerful means of creating "emotion" (1969, pp. 142, 144, 147). Trump's Twitter use created a sense of presence that allowed followers "to experience firsthand the candidate's activities" (Cos & Martin, 2013; Johnson, 2012, p. 56). It gave Trump's "followers the sense that anytime Trump is tweeting . . . he's talking directly to them" (Phillips, 2015, December 10). In that way, he extended the rally atmosphere to the virtual world, using every tweet to call for draining the swamp and vanquishing his enemies in the press and politics as a way of reinforcing his emotional connection with core supporters.

Trump used Twitter to support the following themes: the threat posed by "Others," the complicity or responsibility of his opponents for this threat, the failure of elites to care about ordinary (white) Americans, the danger posed by "Fake News," (a synonym for negative press coverage of Trump), and his own greatness. These themes are quite evident in the Trump twitterverse. In order to demonstrate this point, I relied on two primary sources. The *New York Times* has compiled a running list of every person or organization Trump has insulted since his campaign began (Lee & Quealy, 2018, April 30) and a much shorter list of people he has complimented (mostly Trump, his family and supporters) (Quealy, 2018, February 14). In

addition, the Trump Twitter Archive (2018) presents a searchable compilation of his more than 30,000 tweets.

Trump's tweets are heavily focused on describing a dystopian American landscape that has been created by some dangerous "Other." A common topic was the threat posed by undocumented immigrants. The Trump twitter archive includes over 170 tweets focused on immigration, which overwhelmingly send the message that the nation faced an immigration crisis. For example, on August 10, 2015 he said, "We must stop the crime and killing machine that is illegal immigration. Rampant problems will only get worse. Take back our country!" On November 8, 2015, he called for supporters to "fight illegal immigration it is destroying USA." Many similar tweets could be cited. Trump used the same approach to create fear about terrorism and crime committed by African-Americans. For example, on November 15, 2015, he tweeted "When will President Obama issue the words RADICAL ISLAMIC TERRORISM? He can't say it, and unless he will, the problem will not be solved!" A few days later on December 8, 2015 he reemphasized the terrorist threat, stating "Our country is facing a major threat from radical Islamic terrorism. We better get very smart, and very tough, FAST, before it is too late!" Similar to his tweets on terrorism, he used Twitter as a way to amplify fear of crime in cities. On July 6, 2016, he said "Crime is out of control, and rapidly getting worse. Look what is going on in Chicago and our inner cities. Not good!" On August 29, 2016 he said, "Inner-city crime is reaching record levels. African-Americans will vote for Trump because they know I will stop the slaughter going on!" On the surface these tweets appeared to be reaching out to African-American voters. In reality, he was focused on activating white fear of African-American crime. He was a master of using Twitter to create or reinforce fear of some "Other," especially immigrants, Islamic terrorists, and black Americans.

Even more common than the tweets where Trump reinforced his dystopian description of the nation, were those focused on attacking political enemies, other elites or the media. Trump used Twitter to create abbreviated definitions in the form of petty name calling to attack opponents as a means of labeling them as weak or corrupt and so forth. For example, the Twitter archive includes more than 250 tweets in which he labeled Hillary Clinton as corrupt by calling her "Crooked Hillary." More generally, Trump used Twitter to attack opponents as a way of reinforcing the sense of conflict present in his dystopian narrative. For example, the Twitter archive includes more than 800 tweets attacking Hillary Clinton. He used a similar strategy in attacking journalists. The Twitter archive includes more than 200 tweets attacking "Fake News." He also often attached individual journalists. The *New York Times* compilation of Trump insults includes attacks on literally dozens of journalists. With these attacks, Trump created conflict, reinforced his image as a populist outsider, and attempted to inoculate himself from media attacks.

Unsurprisingly, the positive tweets were heavily focused on praising some aspect of his campaign, his abilities, or his accomplishments. The Twitter archive includes a long list of "Personal superlatives" about himself that he has tweeted, as well as a list of more than thirty times he has claimed that he is "Key to solving issues." As an example of self-praise, a tweet on March 10, 2016 is typical: "The media is so after me on women Wow, this is a tough business. Nobody has more respect for women than Donald Trump!" Similarly, on April 30, 2016, he said, "the economy is bad and getting worse-almost ZERO growth this quarter. Nobody can beat me on the economy (and jobs). MAKE AMERICA GREAT AGAIN."

Twitter was a blunt instrument that candidate and then President Trump used to extend the campaign rally beyond the confines of the rally itself. Trump's use of Twitter was not subtle. He used it to create fear, attack his political foes, undermine the media, and praise himself as the savior for a nation that had been failed by the political class. For his base, Trump was a "bullying presence" on Twitter who as George Lakoff indicated used the medium as a "remarkably effective" "weapon to control the news cycle" (Buncombe, 2018, January 17).

Moreover, Trump's Twitter feed was largely immune from public reason. David Folkenflik observed that as with his other rhetoric, Trump's use of Twitter reflected a level of "estrangement from truth" that "is so complete that it defies belief" (2018, April 7). Trump didn't use Twitter to develop substantive policy argument. Rather, as Mathew Ingram pointed out, Twitter allowed "him to state untruths with impunity, knowing that his tweets will be widely redistributed by his followers and the media, and to dodge follow-up questions or criticism" (2017). This problem is broader than Twitter. Rhetoric that creates a strong sense of presence can be difficult to undermine with refutation. Alan Gross observed that "An absence of justification . . . cannot counteract the strong psychological tug that presence exercises" (2005, p. 19), a conclusion that certainly applies to Trump's use of Twitter and more broadly his campaign and presidential rhetoric.

5. CONCLUSION

In the introduction, I cited the wide literature on the power of definitional argument for shaping the worldview of an audience and therefore achieving great political influence. There is strong support for the view, including my own research indicating that the two most transformational post World War II American Presidents—Ronald Reagan and Barack Obama—both used "ultimate definition" to present small-government conservatism and community-oriented liberalism worldviews, respectively. One might question the application of ultimate definition to Donald Trump by noting that unlike Reagan or Obama, he hardly made an argument at all. He lacked a coherent ideological message and instead substituted for the absent ideological argument a dystopian narrative, a populist attack on elites and various groups that could be depicted as dangerous "Others," and a depiction of himself as the strongman hero who would magically "Make America Great Again." At the same time, while Trump failed to present a developed ideological worldview, his message still functioned as a version of ultimate definition. His worldview was coherent, if dystopian. In that world, the United States was falling apart, threatened by unfair trade practices, dangerous Islamic radicalism, illegal immigration, and an explosion of inner-city crime. The solution was to embrace the strongman, who could confront the dangerous world. The world that Trump described was widely at variance from the actual state of the nation, but it was a coherent worldview. The ideology and value principles that went with it were closely tied to the narrative.

Trump's rhetoric was particularly powerful with the roughly 44 percent of white Americans who possess an authoritarian personality type (Taub, 2016). The rhetorical pattern I have described activated the fears of this group, a conclusion validated by two polls that found that "authoritarianism . . . seemed to predict support for Trump more reliably than virtually any other indicator" (Taub, 2016). Diana Mutz (2018, p. 2) argued that the key to explaining the reaction of Trump voters is to focus on "dominant group status threat" (changing gender roles and increasing diversity in American society, along with the loss of manufacturing jobs for non-college educated white Americans), which can "make status quo, hierarchical social and political arrangements more attractive." Race also played a key role. Mutz noted, "when confronted with evidence of racial progress, whites feel threatened and experience lower levels of self-worth . . . [and] perceive greater antiwhite bias as a means of regaining those lost feelings of self-worth"(2018, p. 2). Trump's rhetoric created what Thomas Edsall (2018) called "an authoritarian moment" that linked to "recent developments experienced by many voters as alarming—including the financial collapse of 2008, the surge of third-world immigration in the United States and Europe and continuing fears among traditionalists that the social order is under assault." In this way, Trump's dystopian rhetoric activated fear of social changed and "fueled authoritarianism" (Edsall, 2018). Trump's use of racially coded or simply racist

language, his many attacks on immigrants, his incendiary comments about Islam and terrorism, as well as his constant attacks on the press, calls for harsh punishment of criminals, support for torture of terrorism suspects, defense of violence at his rallies, along with his opposition to equal rights for trans-gendered people, all appealed to those who possessed an authoritarian mindset. The source of his electoral success is disquieting to say the least.

If judged by any of the main approaches to pragmatic argumentation (Pragma-dialectics, Informal Logic, the American rhetorical tradition, and so forth), it is immediately obvious that Trump's rhetoric failed to make a coherent case for his agenda. In fact, he quite rarely attempted to support claims with anything like the kinds of arguments used by major political figures of the left and right, such as Reagan and Obama. The argumentative weakness of Trump's approach, however, did not undercut its political power because of the resonance of its narrative structure. Trump's many false statements and the lack of rational support for his America First worldview were strongly attacked by political opponents and exposed by the press. It is shocking that the critique of his program had so little impact. Moreover, his dystopian message was wildly inaccurate. The United States faced no crisis related to immigration, crime, terrorism, or trade. Trump's rhetoric strongly resonated with a group of Americans centered in the white working-class who felt that they were losing their place in American society and who possessed an authoritarian personality structure. His success with this message, despite the absence of argumentative support for it, is strong evidence of the limited power of ideological argument in particular and public reason more generally in the public sphere. Trump's success, along with the failure of Clinton's refutative approach to confronting it, indicates that progressive political movements need not just a strong argument, but also an empowering narrative. It is a tragic irony that despite the transformational effects of Barack Obama on American politics, progressives did not understand the importance of combining reasoned argument with an empowering narrative and corresponding values.

ABSTRACT: The article is about a study of argumentative loci in the *New Galateo*, a book of manners written by Melchiorre Gioja in 1802. Gioja proposes a model of politeness based on reason ('social reason'), and he argues for the reasonableness underlying each prescription. For these reason we explore the set of loci mobilized to support each prescription because they can provide precious insights on the worldview, the belief and values underlying the corpus.

KEYWORDS: argumentative loci, politeness, evaluation, nineteenth century, Italy, digital annotation, utilitarianism

1. INTRODUCTION

AMT Theory (Rigotti, Greco, in press; 2010) addresses the issue of argument schemes by revisiting the tradition of loci, or *topoi*. Given a semantically defined class of standpoints (e.g. descriptive, interpretive or evaluative; cfr. Rocci 2017), exploring the set of loci mobilized to support standpoints of that class in a given corpus can provide precious insights on the worldview, the social and intellectual habits underlying the corpus in a way that is complementary to the study of the beliefs and values that are appealed to as *endoxon*.

The target of our investigation is the *New Galateo* written by Melchiorre Gioja in Italy in 1802. This 600 pages manual positions itself in opposition to the previous tradition. Instead of elucidating a model based on obedience to 'ceremonies', Gioja proposes a new code of conduct in which reasonableness ("social reason") becomes the only instrument capable of correctly guiding polite behavior. In this book argumentation acquires a particular significance: the argumentative justification of a prescription is at the same time a demonstration of the metacognitive reasoning that is to be performed by the agents in regulating their behaviour in society. For Gioja the polite person is also a reasoner drawing inferences about the social world. It is therefore natural to look at the study of *topics* as potentially revealing of the social ontology that the polite reasoners rely on for the inferences they draw about social situations in order to deliberate a polite course of action.

Using UAM-CorpusTool we have annotated for structure and loci a series of key argumentative passages of Gioja's work. One result of the annotation is the development of growing collections of examples for repeatedly invoked loci: about 10 collections, mostly concerning loci connected with practical reasoning, have been established as an aid to the textual interpretation of Gioja's treatise and to better understand his notion of social reason.

The first part of the article is about the theoretical premises, both historical and methodological, the second part is about the annotation of the corpus and the study of three loci.

2. THEORETICAL PREMISES

2.1 The corpus and its historical context

In 1802 Melchiorre Gioja published the *Nuovo Galateo* ('New Galateo'). With a revealing title, this book positions itself in opposition to the norms of the aristocratic conduct model epitomized by the books of manners written in the eighteen century. Instead of reproducing the existing model based on conformity to detailed 'ceremonies' and conventions that regulate interactions at all levels of Italian social life, Gioja proposes a new code of conduct in which *ragionevolezza* 'reasonableness' becomes the only instrument capable of correctly guiding polite human behavior. It is important to note that the conduct treatise was but one aspect of Gioja's literary production: he was a prolific author and a prominent figure in Italian public life. Gioja was the official historiographer of Napoleon's Cisalpine Republic, he later became the Director of the Bureau of Statistics of the Napoleonic Italian Kingdom. Melchiorre Gioja publishes four different editions of the *New Galateo*, the first one in 1802 and the others in 1820, in 1822 and finally in 1827. From 1802 to 1827, contemporary social thinking (in particular Bentham's utilitarianism and his theories on the greatest happiness principle, and Condillac' sensism according to which all human faculty and knowledge are rooted in sensation) leads Gioja to rewrite his *Galateo* three times and to adopt an approach increasingly based on what, starting from the 1822 edition, he would call 'social reason' which means that the criterion for polite behaviour is rooted in reason and in sensation. Only if the interaction with other people is controlled by reason, can it mitigate individual selfishness and create social happiness. As we show in our recent article (Saltamacchia, Rocci, in press) reason, and in particular 'social reason' plays an important role in the argumentative architecture of the treatise. Moreover, the main scholars who have studied Gioja's *New Galateo* (Botteri 1999; Tasca 2004) believe that utilitarian ideology and his own writings on statistics hugely influence the subsequent importance of the concept of reason in the *New Galateo.*

For this reason we believe that, in this text, argumentation acquires a particular historical significance: the very practice of polite interaction (*pulitezza*), grounded in 'social reason', is similar to the practice of rhetoric polite interaction. Polite behaviour is based on a reasoning process, even more, an inferential calculation anticipating the uptake of the interactional partner and hence its effects. Such calculation is aimed at obtaining one overarching social effect ('social happiness'). For Gioja, since politeness is grounded in 'social reason', it requires that an individual reasoning process has to be performed in deciding every single polite act, rather than being the result of rules following behavior as in the ceremonial politeness model.

2.2 The relevance of argumentative loci

The study of argumentation in this volume can offer a precious method in order to investigate the cultural background of the author. We refer in particular to AMT Theory (Rigotti, Greco, 2010; in press), which combine a material component, which "integrates into the argument scheme the implicit and explicit premises bound to the contextual common ground" and a procedural component "based on the semantic-ontological structure, which generates the inferential connection from which the logical form of the argument derived" (2010: 489).

On one hand, the study of *endoxa* (i.e. the salient beliefs and values that are considered part of the cultural common ground[1]) in our corpus can provide precious insights on the author's worldview, beliefs and values. In Saltamacchia, Rocci (in press) we in particular assume that the world *ragione* 'reason', and its morphological derived lexemes, can be considered an argumentative keyword (cfr. Williams 1976; Rigotti, Rocci 2004) of the treatise, i.e. a word that evokes beliefs and values that function as pointer to *endoxa*. On the other hand, not only the analysis of *endoxa* can offer a precious insight on the cultural beliefs and values but also, and it is less obvious, the study of loci.

Loci are, according to Cicero, the source from which arguments are taken, "unde argumenta ducuntur" (see Rigotti, Greco 2010 and Rigotti 2009); they reveal the ontological relation on which a certain argumentative reasoning is based, its logical structure. Following Rigotti 2009 we can distinguish loci according to their proximity to the standpoint, into intrinsic, extrinsic and middle loci. We now refer to a revised AMT taxonomy of loci in Rocci 2017:

---

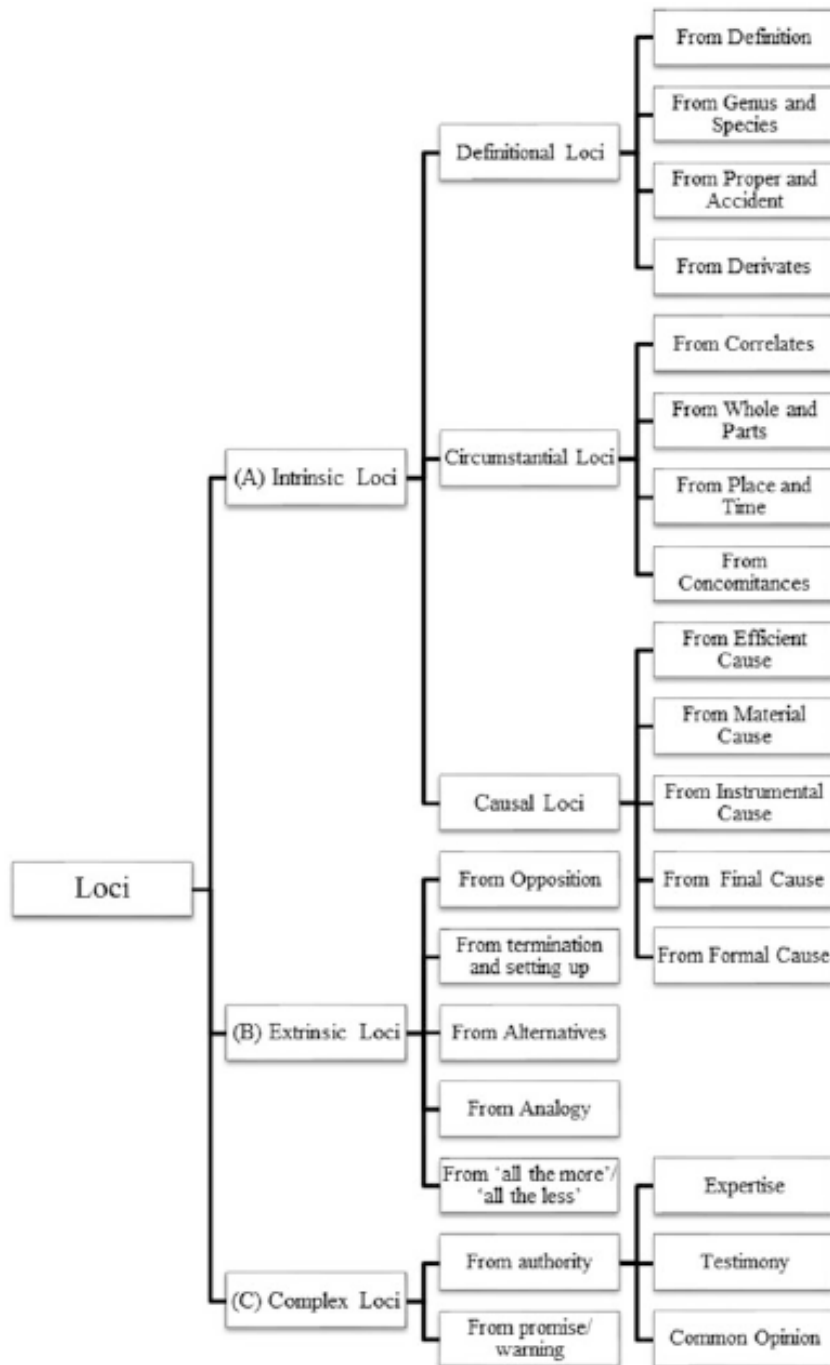
[1] According to Aristotle *endoxa* are "opinions that are accepted by everyone or by the majority, or by the wise men (by all of them or the majority, or by the most notable and illustrious of them)" (*Topica*, 100b.21; we refer to the translation of Rigotti, Greco 2010).


Figure 1. A revised AMT taxonomy of loci in Rocci 2017.

We now only focus on three loci, one per class:

a) The locus from cause (and in particular from final cause): belongs to the class of intrinsic loci (i.e. "loci taken from those factors that are directly established by the standpoint", Rigotti 2009:166)

b) The locus from termination and setting up: belongs to the class of the extrinsic loci (i.e. "loci taken from the outside" Rigotti 2009:166)

c) The locus from authority: belongs to the class of middle loci but as noted in Rigotti (2009: 167) it is more adequate the label of complex loci because "on one hand, pointing to the quality of the 'producer' of the message, it recalls the syntagmatic locus from agent and efficient cause" but on the other hand "the validity is not based on the thing, but is guaranteed from outside", from and expert, an authority indeed.

Section 3 shows the study of the three loci in our corpus.

3. ANNOTATION AND ANALYSIS

3.1 Annotation

Using UAM-CorpusTool (a multi-layer hands-off corpus annotation tool by Mick O'Donnell, freely available at http://www.wagsoft.com/CorpusTool/index.html) we have annotated for structure and loci a series of key argumentative passages of Gioja's work[2]. Given a semantically defined class of standpoints (e.g. descriptive, interpretive or evaluative; cfr. Rocci 2017), we focus in particular on evaluation, which are according to Freeman (2005) statements that "characterize something as either good or bad, better or worse, preferable or avoidable, an act as either right or wrong […], an action as morally good or morally bad" (2005: 101). The connection between politeness and evaluation is stressed by Watts (2005) who investigates politeness from the point of view of evaluation and defines politeness as a "positively marked politic behavior […] open to overt interpretation as polite" (2005: xliii). Moreover, evaluation can be subdivided in evaluation as such and deontics propositions (see Rocci 2017: 320). So at a first level our annotation distinguishes between norms expressed by the construction 'you should/you should not' (deontic modality) and norms that contain an evaluation. For each proposition, at a deeper level, we distinguish if the standpoint is argued or not. If it is the case we reconstruct the argumentative structure and the locus on which the argumentation is based. We annotated about 10 "collections" (cfr. Mondada 2005) of examples for repeatedly invoked loci mostly of them connected with practical reasoning.

We now focus on evaluative propositions and in particular on those evaluations that are based on a locus from final cause, a locus from authority and a locus from termination and setting up. Table 1 shows the number of segments that contain the loci mentioned. We can notice that the locus from final cause occurs many times since in Gioja we find numerous precepts that are argued for in view of a goal, and, more specifically, in view of a utilitarian motivation.

Typology of Loci	n. of segments annotated
Locus from final cause	57
Locus from authority	17
Locus from termination and setting up	9

Table 1. Number of segments annotated for the locus from final cause, the locus from authority, the locus from termination and setting up.

---

[2] We consider in particular the following editions: Gioja, Melchiorre. 1853 (1802, 1827). *Il primo e il nuovo galateo*. Turin: Pomba (the volume contains both the first and the last edition and, interestingly, editors signal in footnotes the differences between the second, the third and the fourth edition); Gioja, Melchiorre. 1820. *Nuovo galateo di Melchiorre Gioja, autore del Trattato Del merito e delle ricompense*. Milan: Pirotta.

3.2 Analysis

    a.   Locus from final cause

According to Rigotti and Greco (in press) we have a locus from final cause when an argumentation more specifically deals with the goal of an action and its reasonableness. If we look at the content of the preface of the *New* Galateo (in particular the third and fourth edition), in which Gioja explains his idea of social reason, it is clear the utilitarian motivation on which his politeness model is based. The principles of 'social reason', listed in the preface, in fact, seem to have an altruistic intent:

(1) *1. Esercitare i proprii diritti col minimo dispiacere degli altri; 2. Rispettare i loro diritti, ancorchè dannosi a noi stessi; [...] 7. Sacrificare le affezioni personali all'interesse pubblico [...].*
('1. Exercise your rights with least displeasure of the others; 2. Respect others' rights even if they cause you damage; [...] 7. Sacrifice your affections for the public interest'[...]'. Gioja 1853 [1822]: 109-110, all translation are our).

However, the reasons why they should be followed reveal a rather practical-utilitarian interest:

(2) *1. Il piacere che si gusta nel fare del bene agli altri [...]; 2. I servigi che possiamo sperare da quelli cui venne da noi fatto qualche bene; 3. La stima pubblica [...]; 4. Le cariche e gli onori [...]; 5. Le ricompense religiose [...].*
('1. The pleasure of doing good to others [...]; 2. The services other people can provide us with; 3. The public esteem [...]; 4. The offices and honors [...]; 5. The religious rewards [...].') (Gioja 1853 [1822]: 110), etc. (There are in total eight practical justifications).

The preface contains a sort of 'hierarchy of goals' for politeness as we show in the "generic argumentation structure" (cfr. Pollaroli, Rocci 2015: 164) in Saltamacchia, Rocci (in press):

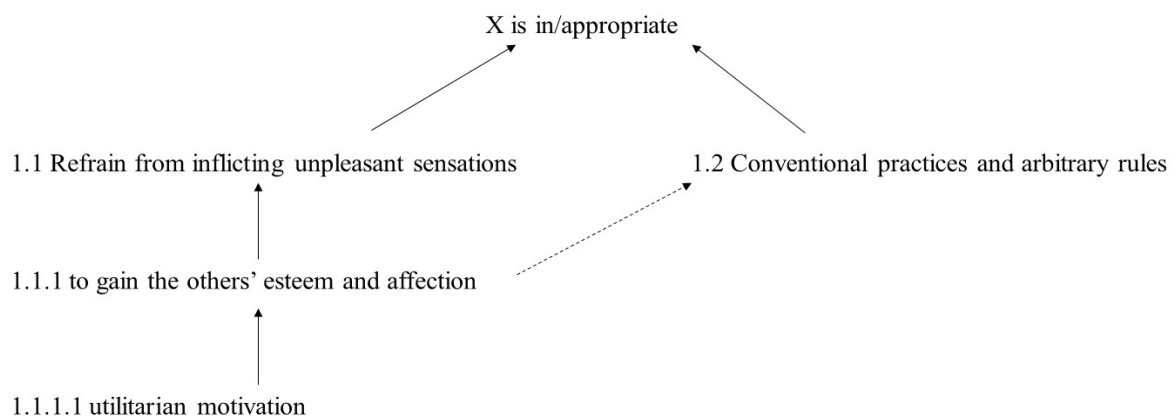

Figure 2. Generic argumentation structure of the preface of 1822 and 1827 *New Galateo* (in Saltamacchia, Rocci, in press).

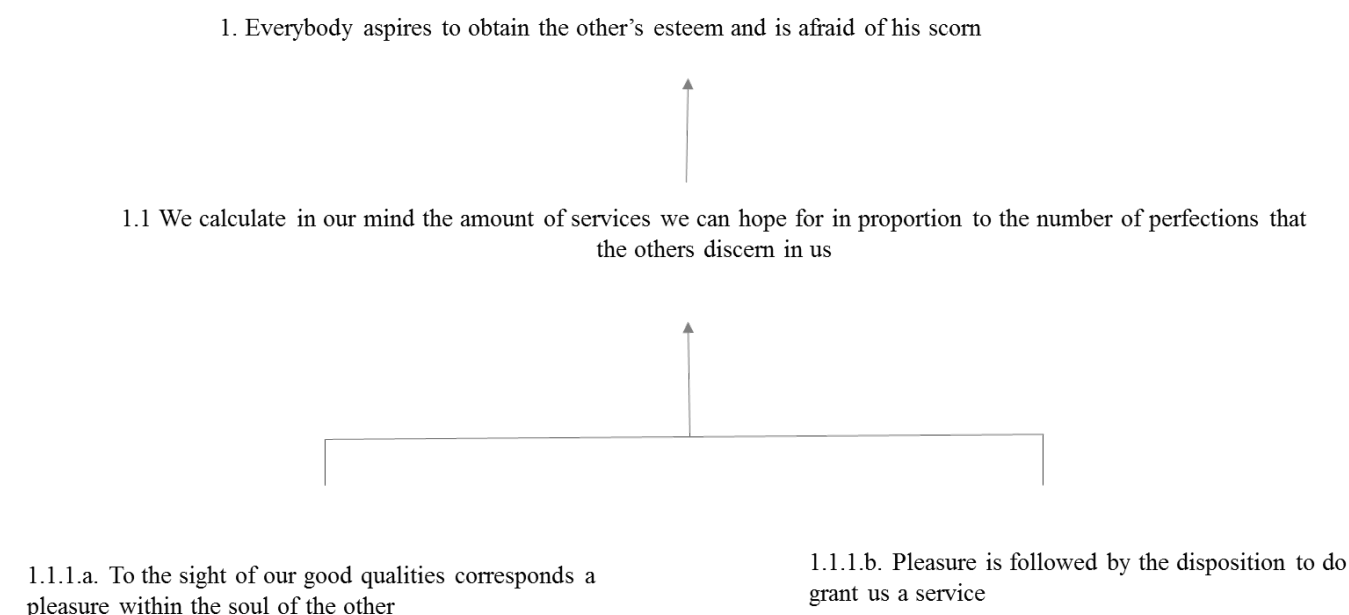
As the argumentative reconstruction of the preface (Fig. 2) shows, a particular behavior X (or even a person or an action) can be evaluated as appropriate or inappropriate for two reasons (which are independently subordinated to the standpoint): "conventional practices and arbitrary rules" (1.2) and the goal of "refrain from inflicting unpleasant sensations" (1.1). But this is an

intermediate rather than a final aim: because conventions are approved by Gioja only if they serve the strategic goal of acquire esteem and affection (1.1.1.) of other people and this is Gioja's idea of 'social reason'. If we gain the other's esteem and affection, in fact, we can obtain pleasure, public esteem, honor, religious rewards… and this is precisely the utilitarian motivation.

We can see an example of this idea in this passage:

(3) *Alla vista delle nostre belle qualità e perfezioni corrisponde nell'altrui animo un piacere. Alla vista delle nostre brutte qualità o imperfezioni corrisponde nell'altrui animo un dispiacere. Il piacere è seguito dalla disposizione a renderci dei servigi; il dispiacere, dalla disposizione a negarci de'servigi. Quindi nella nostra mente noi calcoliamo la somma dei servigi sperabili sul numero delle perfezioni che gli altri ravvisano in noi. [Questo] sembra il motivo principale per cui ciascuno aspira alla* stima *degli altri e ne teme il disprezzo.*
('To the sight of our good qualities corresponds a pleasure within the soul of the other. To the sight of our bad qualities corresponds a displeasure within in the soul of the other. Pleasure is followed by the disposition to do grant us a service; displeasure is followed by the disposition to deny us a service. Thus, we calculate in our mind the amount of services we can hope for in proportion to the number of perfections that the others discern in us. This seems to be the main reason why everybody aspires to obtain the other's esteem and is afraid of his scorn. Gioja, 1820: 27).

Adopting the pragmadialectical approach (Van Eemeren, Grootendorst 2004), the analytical reconstruction of example 1 is this:


1. Everybody aspires to obtain the other's esteem and is afraid of his scorn

1.1 We calculate in our mind the amount of services we can hope for in proportion to the number of perfections that the others discern in us

1.1.1.a. To the sight of our good qualities corresponds a pleasure within the soul of the other

1.1.1.b. Pleasure is followed by the disposition to do grant us a service

Figure 3. Argumentative reconstruction of example 3.

Example 3 reveals the reason because it is necessary, according to Gioja, to 'gain the others' esteem and affection', which is one of the argument that he exposes in his preface (1.1.1 in Fig. 2). If we create pleasure in the others we can obtain the others' esteem and affection and this is followed by the disposition to do grant us a service (1.1.1.b. in Fig.3). The argumentation is based on the locus from final cause (Rigotti 2008): everybody wants to create pleasure in the others in order to obtain services (this is the final aim) rather than esteem and affection (this is the intermediate aim). Moreover, the verb 'to calculate' shows the inferential calculation that

sustains Gioja's politeness model. As we show in our recent article (Saltamacchia, Rocci, in press), the utilitarian influence and the new interest of Gioja for statistics bring him to insert in his text an expression that embodies the idea of calculation for personal advancement. The expression is *by reason of* (which we can translate with 'in proportion to') and occurs more than 40 times in the book. Interestingly, most of the sentences in which *in ragione di* 'by reason of' occurs manifest an argumentation from the final cause. We only show an example (ex. 4) in which the construction is adopted and we refer to Saltamacchia, Rocci (in press) for the argumentative analysis.

(4) *Ciascuno aspira al libero esercizio delle sue facoltà e conta i suoi piaceri in ragione degli atti possibili. Ciascuno, appena concepito un desiderio, lo vorrebbe soddisfatto e conta i suoi dispiaceri in ragione de' ritardi e degli impedimenti. Ciascuno vorrebbe eseguire i suoi desiderj col minimo incomodo, e calcola gli aggravj in ragione degli atti che è costretto ad eseguire e che non sono necessarj all'intento. Quindi senza essere manifestamente ingiusti, si può essere inurbani:*
1. *Diminuendo il numero degli altrui atti possibili;*
2. *Ritardandone od impedendone l'esecuzione*
3. *Rendendo necessarj degli atti che si potrebbero risparmiare.*

('Every man wants to freely exercise his faculties and he counts his pleasures *in proportion to* the number of acts that are possible. Every man, as soon as he desires something, wants to satisfy this desire and he counts his displeasures *in proportion to* the delays and the obstacles. Every man wants to realize his desires with the least displeasure, and he counts the aggravations *in proportion to* the acts that he is obliged to do and that are not necessary in order to achieve his aim. Thus without being blatantly unjust, it is possible to be impolite by: 1. Reducing the number of acts that are possible for others; 2. Delaying or preventing the execution of those acts; 3. Causing acts that could be avoided') (Gioja 1820: 17, our emphasis).

Both example 3 and example 4 contain an actual proportional calculation which we reformulated (in Saltamacchia, Rocci, in press) with a mathematic proportion as follows:

$$\text{n. of pleasures} = K \times \text{n. of possible acts}$$

The number of pleasures is directly proportional to the K number of possible acts (where K is the constant of proportionality). In view of example 4 and of the mathematic proportion, we can easily reformulate argument 1.1 (in Fig.3) in this way: the number of perfections that the others discern in us is directly proportional to the number (amount) of services we can hope for.

b. Locus from authority

In the preface of the *New Galateo* Gioja not only introduces the new concept of social reason but he also criticizes the 'old' model that he wants to replace, characterized by imperative, but arbitrary norms. He thinks that the rules for human behavior are established by the need for individual comfort and not by conventions. But, interestingly, this book positions itself in continuity and not in opposition with the 'old' *Galateo* by Della Casa, as the analysis of the locus form authority shows. So, which is the old model that he wants to replace?

We can distinguish between three types of authority: the authority of an expert, of a testimony or of the majority, or of the common opinion. In the *New Galateo* Gioja refers both to the expert, i.e. the literary writers, and to the majority, which he calls the tradition. We refer to the authority of the literary writers as revealing the locus from authority and we refer to the authority of the tradition as revealing the locus from termination and setting up.

The book is full of quotations of different authors mostly of them belonging to the nineteenth century. Interestingly there are also quotations taken from the first two books that inaugurated the history of politeness in Italy: *Il libro del cortegiano* 'The book of courtier', 1528 and the

Galateo ovvero de' costumi' of Monsignor Giovanni della Casa (1558). The latter, in particular, gives rise to the new genre of the Galateo. In the nineteenth century, in fact, most Italian conduct books have the word *galateo* in their title as a reference to the original *Galateo* by Della Casa, so much that the term becomes a common noun indicating the discourse genre of the conduct book (cfr. Tasca 2004:41).

In the *New Galateo* there are 13 occurrences of quotations taken from Della Casa and Castiglione and Gioja always appeals to them as authoritative sources – as one Gioja's comment shows: "*dice saviamente monsignor Della Casa*" ("says wisely monsignor Della Casa") – that follow the same way of thinking: "*per la medesima ragione dice monsignor della Casa*" (for the same reason monsignor della Casa says) – the same cannot be said for other authors from which he diverges.

If we look at the contents it is clear the continuity with the first *Galateo*: both Gioja and Della Casa position their book clearly in opposition to the aristocratic model of conduct, and – particularly – to a model based on strict conformity to conventional 'ceremonies ' (cfr. Gioja 1853 [1802]: 9; Gioja 1820, I vol.: 161, 232, 1820, II vol.: 27, 230, 258, 259 and Della Casa 1817 [1558]: 60, 62, 70, 72, 74, 76, 78, 80, 82). It is clear that Gioja does not have Della Casa and the first *Galateo* as a polemical target. When the old *Galateo* is mentioned it is mostly treated as a respected authority. Let's now focus on the second authority, the tradition.

c. Locus from termination and setting up

The *New Galateo* contains 50 occurrences of the word "*uso*" (custom) with three different semantic meanings:

> (in idiomatic construction): *fare uso = servirsi* (to make use of)
> (in non idiomatic construction):
> i. Habit/custom
> ii. Tradition: where the use is considered as an authority on which Gioja takes a position

In order to understand i. and ii. let's consider this example:

(5) *L'uso di portare il lutto non va scevro d'inconvenienti. Infatti, mentre la medicina e la filosofia raccomandano, per es., ad una madre d'allontanare dal pensiero l'idea del figlio perduto, acciò possano cicatrizzarsi le piaghe del suo animo, l'uso la costrinse ad avvolgersi la nera gramaglia che il perduto figlio le rammenta ad ogni istante. [Dunque] le leggi furono costrette a stabilire de'limiti al lutto, affinchè la sensibilità del pubblico non fosse continuamente punta da idee lugubri.*
('The habit of putting on mourning wear is not free of disadvantages. In fact, while medicine and philosophy recommend, for example, to a mother to remove the idea of her lost son from her thoughts, so that the wounds of her soul can heal, tradition forced her to dress in black mourning wear, which at all times reminds her of her lost son. [Thus] the law was forced to establish a term to mourning in order to avoid the public's sensibility being continuously stung by grim thoughts'. Gioja, 1820:14).

In this sentence Gioja compares the habit and the tradition and we can infer an implicit reasoning that answer to the question: 'how should I behave if the habit imposed by the tradition becomes inconvenient?' In an another passage of the *New Galateo* he affirms that:

(6) *Cresce il diritto di scostarsi dall'uso, allorché questo disagevole riesce ed incomodo.*
('The right to diverge from tradition increases when it becomes/we find it inconvenient and uncomfortable'. Gioja, 1820:114).

This sentence introduces the idea of the locus from termination and setting up. As noted by Rigotti and Greco (in press), this locus includes a dynamic of comparing two different worlds. In particular, when one uses the locus from termination and setting up, he or she is comparing the current situation with a future possible world; following this comparison is an evaluation about the opportunity to set up (start or begin) an activity or to cease ("terminate") an existing state of affair.

In the *New Galateo* Gioja repeatedly evaluates if the norms imposed by the tradition are reasonable and comfortable or not: according to him one should diverge from tradition when it becomes uncomfortable. As reported in example 5, in fact, "the law was forced to establish a term to mourning in order to avoid the public's sensibility being continuously stung by grim thoughts".

This last practical evaluation exemplify this:

(7) *Levarsi il cappello per salutare [...]. Quest'uso, che si deve rispettare finché sussiste, ci espone all'eventualità di raffreddarci allorché siam sudati ; e pigliar un buon catarro se ci è forza salutare molta gente: è dunque desiderabile che cessi, e che gli si sostituisca un altro che meno incomodo sia e più naturale.*
('Taking off one's hat exposes one to the eventuality of catching a cold when one is sweaty, and of catching pneumonia for the sake of good manners, if we need to greet many people. It is therefore desirable that this custom ends, and that it is replaced by another one, which is less uncomfortable and more natural'. Gioja, 1820:54).

As shown by the argumentative reconstruction (Fig. 4) we have a single argumentation based on the locus from termination and setting up: because to take off one's hat causes one to catch a cold – and we infer that 'to catch a cold' is uncomfortable –, thus this custom needs to end.

1. To take off one's hat is a custom that needs to end

1.1.: it causes one to catch a cold

Figure 4. Argumentative reconstruction of example 7.

The reasoning between sentence 7 is something like: if an action causes problems, thus it is desirable to stop it. According to Gioja reason should prevail over conventional rules (costumes); this idea is a clear break from the previous model, based on ceremonies.

4. CONCLUSION

This study shows that Gioja's practical evaluations of polite behavior are explicitly argued for; moreover, according to him, the reasonableness of an action or behavior is a sufficient argument to attract an evaluation of politeness. This idea is clearly exemplified by the study of loci, which is a useful instrument to better understand the logical structure that sustains the whole text. This structure reveals, at a deeper level, the belief and values of the author himself.

On one hand, the locus from authority and from termination and setting up allow us to understand Gioja's position in respect of the tradition, the convention. If we reconsider the preface reconstruction of the *New Galateo* (Fig. 2) we can affirm that these two loci exemplify his idea according to which he approves of existing conventions (1.2 in the reconstruction) only if they serve the strategic goal of social reason (i.e. 'to gain the others' esteem and affection'). On the other hand, the locus from final cause shows the utilitarian motivation that justify the norms and the inferential calculation on which his reasoning process is based.

Argumentation and self-deliberating: Speaking to oneself and speaking about oneself. From individual to the social

LINEIDE SALVADOR MOSCA

Classical and Vernacular Department
University of São Paulo
São Paulo, Brazil 05508-080
lineide@usp.br

ABSTRACT: Individuals are submitted to a number of questions in everyday life. One of these situations is the self-deliberating, exposed by Perelman and Tyteca in their *Treatise on Argumentation.* These authors state that "the deliberating subject is often regarded as an incarnation of the universal audience (p.40,§9). The self-awareness leads him to conduct his own thinking, preparing for the choices he has to make. The figures of dissociation (op.cit. p.436, §93) as the dilemma and the impasse are responsible for the high tensiveness, origin of passionate conflicts.On the other hand, when talking about oneself, on a relation of otherness, the construction of one's image and identity assumes a major importance, favouring a social coexistence.

KEYWORDS: argumentation, dialogical communication, dilemma, Perelman & Tyteca, self-deliberating, social coexistence, universal audience

1. INTRODUCTION

The following topic which I am going to approach refers to issues connected with the act of convincing and persuading: the first, convincing, by means of several resources, such as tests, justifications, defending a determinate point of view; the second, persuading, in order to achieve adherence of someone else, which implies a certain grade of attraction, seduction, as an ultimate analysis. To know the human being and its profundity is a search that torments since immemorial times. These are questionings of existential order which involves decisions of ethnical nature. This process constitutes a kind of argumentation which Perelman & Tyteca give the name of *self-deliberating.* In fact, it is about to make the world intelligible for oneself, before the enigma and the mystery that involves everything, which implies in a work of self-awareness, more or less concious, in which the argumentation acquires a shape of self-persuasion.

2. THE *INNER MAN* AND THE UNIVERSAL AUDIENCE

A dialogic shape is given in the confront between a speech and an opposite speech, as a form of refutation, like in the evaluation of pros and cons, in which the arguments of double hierarchy prevail several times, such as cases of choosing the lesser evil, the less ugly, the less cruel, etc.

It is about an act which the individual unveils for himself and becomes conscious about his fragilities, about the imperfections and incompleteness and at the same time, this self-awareness goes after his pretensions and desires. In a solipsist act, which oneself unfold into another, in this suffered and anguishing search, mingled with the presence of passionate elements. This stance makes that exist a conduction of one's own thoughts, that organize themselves in a reasonable disposal, a necessary *dispositio* for the achievement of the targets which are proposed and consists, on a last analysis, the *attribution of sense* that is searched. In

a last analysis, every dialectic process is envolved in the search of this sense. For this process, which gives to the individual some compatible capacities with himself, in the knowledge of his limits, measures and possibilities, he goes to the pursuit of references and the structuring center of his own life. Also, it is in this moment that he supplies himself with courage, joy and hope before crisis, catastrophes and sufferings. This can be called the "inner man", a psychology of depths, according to Lionel Bellenger in his conception of persuasion. This is the psychology about the defense systems of the "ego", the process of identification, the place of emotions, the role of desires and necessities and even for the anxieties. It is as similar as a grumble, because when someone grumbles, he speaks from the inside, representing a high grade of introspection, a self-reflexive awareness, in which the self-deliberating can be externalized or not. The question concerning the public and private order is very important here, and we must mention the theorization made by Habermas regarding these aspects, as well as the modes of communicative action.

When the self-deliberating is placed in relation to the sense of *universal audience***,** so that the individual embodies this audience, the statement of Perelman & Tyteca, postulated in *The New Rhetoric: a Treatise on Argumentation (p.*40) establishes contact with the issues of *topica* and the doxa, making merge the *values*, the *hierarchies* and the *preferable places*, points of great tension and conflict. It is evident, due to it, that the particular is also the universal. In *De Anima* Aristotle studies the mental phenomenon in correlation with the physical ones, but without submitting one to the other, both interdependents.

3. EXPECTATIONS AND PREDICTION

Contemporary experts and here are neurologists and psychologists to prove, point the fact that in the perception of things itself there are elements of *expectations* in our mental categories, in other words, our perceptions does not constitute a faithful register of external incentives, as it used to be thought. These are, by and large, molded by expectations that already have the control called "top down" of brain. However, the abstract ideas are more susceptible to interpretation and problematization than the ones of concrete nature. They are not so concrete and with the objectivity which intend to assign. Therefore, perception, cognition and action are not so easy to distinguish and can give rise to many conflicts, disputes and confusions, without mentionning the ambiguities, field for excellence of argumentation in all its aspects. There are also the *predictions* that search for sense to the data mass that comes to us all the time. Nowadays, the "sensorial installations" allow to foresee how would be our image according with the clothing, new shapes of hair or make up and other experimental anticipations.

4. EMOTIONS AND FEELINGS

In the elocution (*elocutio)* of *speaking to oneself*, confessional tones are given, from conversation tones and even daydreaming, as means of reflexion, owned from the free indirect style, one of the high traces of the literary genre that is manifested on the free mind flow, without the reins of rationality, without concerning the logical coherence and where are frequents the syntactic ruptures, such as the anacoluthon, the ellipsis, the paradoxes, the dissociation. There is a relaxation in the construction of the events and opinions. In this extravasation of the "self", thoughts and ideas merge the emotions and feelings. The regrets of incompetence, of non-corresponding from the other are very common in this kind of argumentation that might not come to persuade oneself, but serves a *retraction*. Being equally part of this game, the laugh about yourself and the inquiries such as: *why did I do it? Was this*

the right decision? I was a fool. The *ridiculous sensation* is also part of this scenario, which takes a *humoristic tone*, with mimicries and burlesque and caricatual imitations: *I made a fool of myself. I made a goof. What a shame!* It is about a humoristic logic, easily perceptible, sometimes playing the *non-sense* likewise, the absurd.

It is also considered the fact that the rhetoric figure is part of a process in the production of knowledge with heuristic function, acting in the perception of reality, like phenomenology, and in its interpretation with hermeneutical paper. This statement becomes evident in many approaches of current theories, could be on Paul Ricoeur theory, with *La métaphore vive,* could be on the perspective of Lakoff and Johnson, with *Metaphors we live by,* could be from Toulmin and also from the informal logic, as it is sponsored by Blair and Walton, Salvador Mosca, among others. It is significant, for the question which shall be presented, the last chapter of *The Uses of Argument* where Toulmin, focusing on intuition and cognitive mechanisms, points how can one be exempt from presenting reasons and justifications, in determined situations, without losing the validity from what is stated. That is the case of the topic about "Sixth sense" (p.343-354).

5. ALTERITY AND IDENTITY

The act of *speaking about oneself,* on the other hand, brings a *situation of dialogue*, a communication where a relation of alterity must be necessarily present, not incurred on the same process of self-deliberating. It has to turn out of himself towards the other, presenting either as a supporting, or as an opponent, being many arguments *ad hominem* in the disqualification processes. Using an argument against oneself may occur in talking to oneself, but very little in talking about oneself, except for an impropriety or impaired modesty. It is when the dialogicity is shown either in a constitutive way, through the discursive memory of the collective, or by the presence of the other, in a work of mutual constitution, which is shown in the heterogeneity of the speech. It is when one works the question of *identity* and in which the *interests* account for and in which talking about oneself is like a lawyer advocating in his own favor. It is possible, from the *enunciation level*, to have approximations and access to this interlocution, in which are involved concepts of context, implicit and interdiscursivity

The discursivity itself among several users requires other skills that the Rhetoric seeks to account in the search for the best results for the interlocution and to reach the objectives that are in mind. In a narcissistic society in which we live nowadays, the image created for oneself matters as much as the one built for the other, according to the desired patterns and that the virtual environment accentuates in a forceful way. The failed acts, indicators of many subjective states and dear to psychoanalysis, indicate a certain transition between the intimate and the socialized.

In what refers to the *construction of the image* and *identity*, the *ethos* of each one is built by means of euphemisms, by the disguised lies, the deception, the false modesty, the arguments *ad verecundiam*, among others. The last touches very closely the design and shaping of the image, in phrases like "to have arrived to what I am, I've made many sacrifices", in which the overvaluation of oneself is associated with the character of victimization.

6. SOCIAL DIMENSION: DISSOCIATION AND FALLACIES

The situation of choice requires living dilemmaticaly and that is part of the notion of citizenship and political action, since governing and being governed always implies taking decisions, taking into account the social dimension of public policies. The dissociative figures, pointed out by Perelman and Tyteca in their classification of argumentative techniques, in addition to those of association, constitute the concrete manifestation of what is exposed here. Dissociation

can be given by rupture of connection and dissociation of notions, expressing a worldview and establishing hierarchies, in which the most frequent pairs are: middle/end; act/person; accident/ essence; being/appearing; Illusion/truth; oppositions like: Relative/absolute; subjective/objective; individual/universal; legal/illegal, among the principals.

In a combination of the pair, whose elements may occur jointly, one of the members will be emphasized, in a gesture of appreciation, and may also reach an *impasse,* as not resolution of the dilemma and hence the conflict. In the resolution of the dilemma, as it is seen in the Aristotelian ethic, the Common Good must prevail over the whole collectivity and not the privilege of the few.

The place that the *fallacies* occupy both in speaking to oneself and in speaking about oneself differs not as to the strategies used, but to the purposes that one wants to achieve, going from self-deception and self-description to euphemisms and hyperboles. In fact, in the speaking to oneself the resources are not exactly fallacies, because pertinent to the desired effects and which we describe at the beginning of this exhibition. In the speaking about oneself, it is a fallacy when it doesn't consider the criteria of relevance, being necessary to know the context of interaction and its persuasive force, since an argument is not intrinsically fallacious. It can be legitimate in a resolution of divergence of opinion. Thus, from a perspective of interaction, it is possible to consider an argument not as fallacious, but within a framework of a speech. Otherwise, every convincing process would involve fallacious procedures.

7. DISCURSIVE GENRES

Regarding the discursive genres, the academic memorial *genre* is one of those that approach the self-deliberation on question, because it constitutes the revision of a life trajectory and the search for a conductor wire that gives it a meaning, in a movement of *flashback* . According to Socrates, a not evaluated life is not worth living. It becomes a kind of charge in the academic environment. For Zygmunt Bauman, hardly the authors have time to do that in their daily life, that is, "to examine in retrospect the road they have made – or rather to organize the footprints to produce a road simulation" (2012:09). This work has remained for the authors ' scholars.
Likewise, another discursive genre, in which the subject speaks of himself is the *autobiography* (the one who writes about his own life) or the accounts of life, centered on the narrative. They constitute examples, the work *Confessions,* of St. Augustine, written in the year 400 A.D.; The *Confessions,* of Rousseau, in the 18th century; *Memories,* of Taunay, from 1948 and many other works of this kind. It might seem that the best person to speak about oneself could be the subject himself, however, this is misleading, because there is a possibility of deformations, deliberate omissions, forgetfulness, arising from the desire to refine the self-image and narcissistic attitudes. Border genre is the journal, the day after day record of a life, in which the speaking to oneself manifests itself, and there may also be the underlying intentionality of perpetuating the self-image. It is also subject to the conditions of other genres, and can assign a romantic character to the various occurrences.

7. CONCLUSION

A positive fact is that self-knowledge can become a transforming agent and bring benefits of a social nature, decreasing the distance between the subjects and the asymmetries of the society, that is, the existing differences. The mutual representations come into play, in which mediation plays a very important role, leading to greater efficiency, when it refers to persuasion and

resistance to what is postulated. From this confrontation, the *stasis,* one can reach a better understanding and a less conflictive coexistence.

Finally, joining the *speaking to oneself* and *speaking about oneself*, among the traits that bind them together there is *reasonableness*, not certainties, but what is plausible, probable and accepted by others. According to Perelman & Tyteca:

> Accordingly, from our point of view, it is by analysing argumentation addressed to others that we can best understand self-deliberation and not vice versa (Op.cit.p.41).

In both situations, it is worth considering the *Critical Place* that subjects occupy, in relation to themselves and others, a place of transformation, which can lead an old order to a new perspective, in which the rational and the affective are joined in the production of a New Order, so that they will make corrections and adjustments necessary for a fairer balance of life in society and for living together.

The translator's visibility. Translators' critical argumentation on their translating effort

LUCIA SALVATO

ABSTRACT: At the atypical intrapersonal monological level, this paper explores critical argumentations in contemporary translators' notes of literary texts, in which translators both reveal the richness of their encounter with literary masterpieces and provide reflections on their translating practice. Using the general framework of a Pragma-Dialectical standpoint, the study aims to investigate the argumentative structures, argument schemes, and linguistic markers used by translators to explain the cultural-linguistic constraints they have to address in their work.

KEYWORDS: argumentative monologue, critical argumentation, expository questions, monological discourse, translator's notes, translator's visibility

1. INTRODUCTION

Setting aside the interpersonal level, at which argumentation is generally conceived of as a dialogic activity between two or more interlocutors, this paper explores a particular type of critical discussion, namely the *argumentative monologue* (see Dascal, 2005; Rigotti, 2005; Rocci, 2005; Rigotti & Rocci, 2005; van Eemeren & Peng, 2017). The focus is on notes of contemporary translators, in which they describe their way of both interpreting a literary source text and rewording it into a target text (henceforth ST and TT respectively).

In many of their practical—and sometimes theoretical—descriptions, translators offer an articulate and convincing account of the solutions they find for the cultural and linguistic problems met in a text, displaying a naturally critical attitude in arriving at a reasoned evaluation of their work. Indeed, such evaluations are offered in light of their evident consciousness of the whole translation process, which is both an interlingual and intercultural mediation. In their accounts, translators comment on the strategies they have used to align two linguistically and culturally different worlds; they reflect on their activity and the motivations behind their inclinations, pointing out argumentatively and descriptively the relevant aspects of their work.

In the literature on argumentation, scholars' studies usually cover a wide range of text types, in which the dialogical interaction mainly takes place face to face between a protagonist and an antagonist, both exchanging moves on a central issue and aiming to resolve a difference of opinion on it. By contrast, to our knowledge, relatively few analyses have been conducted on "intrapersonal argumentation" (Zampa & Perrin, 2016, p. 10) and on the argumentative moves which underpin it. Interaction within oneself is mainly investigated in psychology (e.g. Billig, 1987, pp. 82-117; Vygotsky, 1934/1987) and philosophy (Bakhtin, 1981, pp. 259-422; Perelman & Olbrechts-Tyteca, 1970, pp. 53-59), but the interdisciplinary approaches that examine the encounter between Argumentation Studies and Translation Studies (e.g. Malcolm, 2001; Kharmandar, 2016; Williams 2001, 2004) remain few in number.

Approaching translators' notes from an argumentative viewpoint means, therefore, not only increasing the investigation into an untypical form of argumentation—the monologue—, but also casting new light on the specific strategies translators choose to reword a literary text into a new language and culture. Moreover, translators' accounts are a form of illustrative reflection that can be of interest to both readers—eager to know the revealed secrets of a translation—and translation critics and theoreticians, who *should be* willing to become familiar with the case reports and illustrative examples which form the basis of their speculations. Indeed, Annette Kopetzki (Hamburg 1954), one of the most recognized contemporary German translators of Italian literature, advises theoreticians to ground their theories in translators' vivid examples and reflections on the alternative methods of rewording a literary ST (Kopetzki, 2015, pp. 71-72).

With the aim of moving forward along this new path, in this study I will analyze the translators' standpoints in their descriptive-argumentative texts. Editorial notes can, in fact, be approached in a variety of dimensions and contexts, according to their informative, operative-demonstrative, or descriptive purpose (cf. Balbiani, 2018, pp. 47-48). With most of the texts having a descriptive intent, the focus of this study will be directed towards those accounts in which translators use argumentative moves to give reasons for their linguistic and cultural choices.

In discussing the topic, I will structure the paper as follows. In section 2 I situate my study within the theoretical framework of the Pragma-Dialectical approach. In section 3 I present my analysis of two of the collected translators' accounts, while in section 4 I offer some general discussion about the main results of the analysis and the possible research avenues it opens up.

2. THEORETICAL BACKGROUND

The starting point for the study is the criticism made by Lawrence Venuti (1995) of the translator's invisibility, in which translators typically remain unseen, not usually even being quoted on the Front Page of the text they have translated. Since the strategy of *domestication* is nowadays largely applied in technical translations and usually involves a loss of information from the ST, Venuti's criticism is particularly valid for literary translations, in which the applied methodologies involve translators' evaluations on a relevant level.

Argumentation actually arises "in response to, or in anticipation of, a difference of opinion, whether this difference of opinion is real or merely imaginary" (van Eemeren, 2010, pp. 1-2). On the whole, argumentation per se is considered a social phenomenon, in which the dialectical dimension concerns two or more interlocutors, who are present to each other and tend to come to a solution on a common central issue through a critical discussion (see Dascal et al., 2005). By contrast, because of the monological character of translators' notes—identified by Rocci as "a one-speaker discourse addressed to others" (2005, p. 114)—the way translators tend to resolve a difference of opinion within their argumentation is by autonomously criticizing previous translations. When translators argue their case, the argumentation is part of an implicit dialogue between a protagonist (translators describing their work) and an implicit antagonist (authors of criticized translations). Hence, translators actually defend their own standpoint and criticize the different linguistic and cultural choices of their colleagues in rewording the same ST, making the assumption that their comments are not directly shared by the addressees. Therefore, in line with their pragmatic-dialectical dimension, translators' notes will be analyzed here as verbal activities with a descriptive-argumentative function.

The approach of the study is founded on both the Pragma-Dialectical theory of argumentation developed by van Eemeren and Grootendorst (1984, 1992, 2004) and the fundamentals of *critical argumentations* by Walton (2006). The four meta-theoretical principles, *functionalization*, *socialization*, *externalization*, and *dialectification* (see van Eemeren, 2010, pp. 27-28; van Eemeren & Grootendorst, 2004, pp. 52-53) form the point of departure for the analysis. Translators' notes are, in fact, a purposive verbal activity achieved through speech acts (*functionalization*) and directed at other people (*socialization*); but they can also be seen as a complex speech act, whose issue involves certain commitments for which translators can be held responsible (*externalization*), and whose purpose of resolving a disagreement is allied to a constant appeal to 'reasonableness' (*dialectification*).

However, when compared to this ideal model, translators' argumentative descriptions often show a *discrepancy* in the use of arguments. Like most critical discussions in everyday life, they are sometimes *defective*, and some of their moves remain implicit or play no part in the argumentation. The aim of the study is, therefore, to verify whether translators' argumentative moves can be recognized and evaluated in line with the proposed theoretical background. To this purpose, their moves will be reconstructed in relation to three main levels: the four dialectical stages (*confrontation*, *opening*, *argumentation*, and *concluding stage* as identified by van Eemeren and Grootendorst, 1984, pp. 154-175), a syllogistic internal organization of explicit/implicit premises and conclusions, and the speech acts which form their basis. In addition, the analysis will consider a specific type of questions, namely *expository questions* (cf. Estes, 2013, pp. 107-111; Kiefer, 1981), which are used as a rhetorical tool to preface one's own answer. As with *critical questions* in traditional dialectical argumentations, through which both interlocutors compel each other to give a relevant reply, expository questions allow the protagonist to better organize the structure of a monological argumentation articulated in multiple moves and hence "to bring about a deeper reflection on the question at hand" (van Eemeren, 2010, p. 75).

3. TRANSLATORS' NOTES AS CRITICAL DISCUSSIONS: DATA ANALYSIS

The corpus chosen for the analysis is composed of 30 texts written by contemporary German translators, including Burkhard Kroeber, Annette Kopetzki, Moshe Kahn, Luzius Keller, Andreas Loehrer, Maja Pflug, and Rosemarie Tietze. Their practical and theoretical descriptions constitute significant reflections on their experience of translating classical Italian masterpieces. Consequently, they can be regarded as a sort of "paratext", in line with all verbal and non-verbal productions analyzed by literary critics both within a volume—name of the author, preface, introduction, notes, chapter titles, illustrations—and outside the volume—interviews, conversations, diaries, correspondences—which accompany the text and guide the readers' curiosity (see Balbiani, 2018, pp. 45-46).

However, translators' notes have not yet been codified or systematically studied, partly because of low levels of interest from editors and translation theoreticians. Moreover, as their descriptions can be found in different types of text, the resultant problem was how to collect an adequate number of texts for the analysis. Under the heading of "translators' notes" it was thus inevitably necessary to consider not only preliminary remarks to any new editions—such as prefaces and introductions, of which there are still only a few—but also scientific articles by the same translators, as well as lectures, guest contributions, or speeches at award ceremonies.

In the following paragraphs the analysis will focus on extracts taken from two prototypical essays written by Burkhard Kroeber and Annette Kopetzki, who have

distinguished themselves through the finest linguistic and cultural interpretations of Italian masterpieces.

3.1 Burkhart Kroeber

The German translator and writer Burkhart Kroeber (Potsdam 1940) is considered one of the finest contemporary German translators from Italian. He has been honored with important awards and acknowledgments, including the literary prize of the *Kulturkreis der Deutschen Wirtschaft* (1985), the *Johann-Heinrich-Voß-Preis* for translation (2001), the *Translation Prize* of the City of Munich (2006), the *Christoph Martin Wieland Translator Award* (2011), and the Award in German-Italian translation for his lifetime achievement (2013).

Kroeber's fame is closely interwoven with Umberto Eco's masterpieces[1] and with the ultimate German version of Alessandro Manzoni's *I Promessi Sposi*[2]. Since 1971 he has worked as a freelance translator rewording literary masterpieces from English, French, and Italian. He has also worked as non-fiction editor for the premier publisher of plastics technology and metalworking titles Hanser Publications, but since 1982 has been investing his time and effort in translating Italian authors like Italo Calvino and Giacomo Leopardi.

Among the many accounts on his lifelong translating efforts, one in particular is noteworthy, because it has not yet been published and is nevertheless full of remarkable argumentative moves. Its title reads as follows: "Zu meiner in Arbeit befindlichen Neuübersetzung von Giuseppe Tomasi di Lampedusas *Il Gattopardo*. Ein bisher nur vorläufig skizziertes Nachwort"[3]. The analysis of this account is the subject of the next paragraphs.

3.1.1 Preliminary remarks on Tomasi di Lampedusa's masterpiece

The critical argumentation of Kroeber's text can be divided into four critical discussions concerning four different translation problems. The present analysis regards the first one and starts from the reconstruction of the logical-chronological facts at its basis. These can be summarized as follows:

- ✓ the masterpiece *Il Gattopardo* was never declared ready for publication by its author;
- ✓ a first publication by the editor Feltrinelli was printed in 1957 according to a first typewritten version;
- ✓ a manuscript version containing the author's corrections was found later;
- ✓ in 1963 the editor Feltrinelli published a second version containing the author's corrections.

3.1.2 The argumentation

In line with the highlighted facts, the central proposition at issue can be reconstructed as follows: *any correction an author makes to his manuscript can be judged as an improvement, so that an editor can consider them as appropriate and insert them in the version to be published.*

The issue involves two different statements or theses, the key viewpoints that can be divided into a *pro point of view* and a *contra point of view*. The first one is implicit and should be ascribed to the editor Feltrinelli, who decided to publish a second version incorporating the

[2] *Die Brautleute: Eine Mailänder Geschichte aus dem siebzehnten Jahrhundert* (2000).
[3] I thank Burkhart Kroeber for allowing me to quote this unpublished text.

manuscript's corrections: 'the manuscript found later is the version sanctioned by the author and his corrections are improvements'. The *contra point of view* is explicit, because Kroeber openly declares that the motivations for the author's corrections are mostly unspecified or erroneous: 'not all corrections can be considered reasonable and hence as improvements'. To solve the opposition between the viewpoints, Kroeber puts forward arguments, whose purpose is to clarify his decision in rejecting most of the author's corrections.

3.1.3 The four dialectical stages

The starting point of the stages to be examined analytically coincides with the first fact that the text was never declared ready for publication by the author:

> Der Text des Gattopardo ist also nicht vor dem Druck, wie sonst allgemein üblich, vom Autor für publikationsreif erklärt worden.

A second step regards the translator's viewpoint, which affirms that the publication of the second version of *Il Gattopardo* could be considered a reasonable decision by Feltrinelli only if the corrections were always improvements:

> Natürlich spräche nun nichts dagegen, die korrigierte Manuskriptfassung als die maßgebliche, da zuletzt vom Autor abgesegnete zu betrachten, […] wenn die im Manuskript vorgenommenen Korrekturen tatsächlich immer Verbesserungen wären.

The problem arises because Kroeber does not accept the premise as a valid reality in all cases and because he declares that the author's corrections cannot be always considered improvements. In this *confrontation stage* the difference of opinion is expressed both by the adversative conjunction *aber* (*but*) and by the negative adverb of time *nicht immer* (*not always*):

> Das ist aber, wie sich bei genauer Betrachtung zeigt, meines Erachtens nicht immer der Fall.

After this move, the translator should introduce the common procedural and material starting points of an *opening stage*. However, as highlighted above, translators' accounts are often defective and, as in the everyday, spontaneous way of arguing, they often show a discrepancy with the ideal model. Here, the translator passes directly to the *argumentation stage* and puts forward his arguments. One of these is *based on example* and concerns the critical discussion on the difference between both decisions, that is, to insert all the author's corrections as improvements or to consider them inappropriate on the basis of exemplary cases:

> So etwa, wenn es im Typoskript auf einer der ersten Seiten des Ersten Teils heißt: *»I raggi del sole calante ma ancora alto di quel pomeriggio di Maggio«* (»Die Strahlen der sinkenden, aber noch hochstehenden Sonne jenes Mainachmittags«, S. 5), und dann im Manuskript die Worte *»ma ancora alto«* (»aber noch hochstehenden«) gestrichen sind, obwohl sie den Stand der Sonne an jenem Mainachmittag sehr zutreffend beschreiben, denn umstandslos »sinkend« ist die Sonne im Mai erst abends nach acht, und das Rosenkranzgebet war gegen sechs Uhr zu Ende.

In a further move, Kroeber makes an *appeal to authority*, that of Tomasi di Lampedusa's adoptive son, who played an important part in the decision to accept all the corrections inserted by his father:

> Gioacchino Lanza Tomasi, der Adoptivsohn des Autors und Herausgeber der korrigierten Manuskriptfassung, zitiert diese Korrektur ausdrücklich als prominentes Beispiel dafür, dass der Roman »vor allem glaubwürdig« sein müsse: »Der Fürst erinnert in den ersten Zeilen des Buches nicht mehr an die ruhm- und schmerzensreichen Mysterien, sondern korrekterweise nur an die letzteren.« […] Damit meint er wohl, dass es inkorrekt wäre, wenn der Fürst im Gebet an zwei Arten von *Misteri* erinnerte, denn im Rosenkranzgebet werden die verschiedenen »Geheimnisse« über die Wochentage verteilt, sodass an jedem Tag nur eins davon dran ist. Der Autor hätte hier also nicht eine sprachliche, sondern eine inhaltlich-sachliche Korrektur vorgenommen, nachdem ihm bewusst geworden (oder gesagt worden) ist, dass beim Rosenkranzbeten immer nur *ein* Geheimnis pro Tag angesprochen wird.

After explaining the reasons why the author's corrections should not all be considered improvements, Kroeber's final move is made in line with the typical *concluding stage*. In further passages he openly declares that the undefined motivations for the author's corrections simply led him to reject them and to prefer the first typewritten version as ST:

> Warum der Autor die drei Worte hier gestrichen hat, ist nicht zu erkennen, vielleicht nur aus rhythmischen Gründen, jedenfalls ist die Streichung kein Gewinn, im Gegenteil, und so habe ich mir erlaubt, sie zu ignorieren und den Satz so zu schreiben, wie er in der Typoskriptfassung steht.
> Ein ähnliches Beispiel ist etwa zehn Seiten später, als der Fürst beim Abendessen seine Söhne kritisch betrachtet, der Halbsatz »das Gesicht voll modischer Melancholie« (S. 16), der einen charakteristischen Zug jener damaligen jungen Aristokraten beschreibt. In der Manuskriptfassung ist auch dieser Einschub (*con sul volto la malinconia di moda*) ersatzlos gestrichen, auch hier wieder, ohne dass der Grund dafür ersichtlich wird, und so habe ich mich auch hier an die Typoskriptfassung gehalten.

The result of the whole argumentation can be explained as follows. Even if the conflict of opinion is not decisively resolved through a 'successful dialogue' in the ideal way, the argumentation still provides a benefit. The translator clearly deepens his understanding of the underlying issue, adding clarifications through examples and quotations, and reasonably clarifying his divergences from other translators; hence, his argumentation can be considered *effective* (see van Eemeren, 2010, pp. 25-38).

3.2 Annette Kopetzki

Annette Kopetzki (Hamburg 1954) is a well-known German literary translator with a PhD in literary translation problems. She worked as a lecturer both in Italy and Germany: at *Scuola Superiore per Interpreti e Traduttori* in Rome (1990-1992) and at the Department of Literature at the University of Hamburg (1997-2000). In collaboration with the Germanist and literary scholar Friedmar Apel, she wrote one of the standard texts on the theory and history of literary translation[4], and since 1988 has worked as a freelance translator of Italian authors such as Andrea Canobbio, Erri De Luca, and Pier Paolo Pasolini. Each of their work has taken her "to a different Italian regional culture", bringing about "an enriching experience" and involving an "ongoing professional learning"[5].

---

[4] Apel, F., & Kopetzki, A. (2003). *Literarische Übersetzung*. Stuttgart: Metzler.
[5] In http://authors-translators.blogspot.com/2013/10/annette-kopetzki-and-her-authors.html.

3.2.1 The argumentation

The text chosen to describe Kopetzki's argumentative inclinations is a longer essay published in 2015, with the title: *Praxis und Theorie des literarischen Übersetzens – neue Perspektiven*.

In the text there is one central proposition at issue: *translators' notes are important for the theory of translation*. The issue involves two different statements or theses, that is, the two key viewpoints that can be divided into a *pro point of view* and a *contra point of view*. The first one is explicit and defended by the translator herself, who considers translators' notes a precondition for theoretical speculations on translation: 'translators' accounts are important for translation theoreticians who can grasp methods and systematize them according to general concepts'. The *contra point of view* is implicit and refers to the majority of translation theoreticians, who do not usually start from translators' notes and implicitly consider them unnecessary: 'most of contemporary translation theoreticians are not interested in translators' accounts and do not take them into consideration for their speculations'.

To resolve the opposition of these two viewpoints, Kopetzki puts forward different types of arguments, also helping her readers follow her reasoning by using *expository questions*, which undoubtedly render her essay more *effective*.

3.2.2 The four dialectical stages

As with Kroeber, it is possible to distinguish the various stages in Kopetzki's argumentation analytically. In the *confrontation stage* two assertive speech acts highlight the problem, namely that Kopetzki's standpoint is accepted only by very few contemporary translation theoreticians. Hereafter, she tries to find out how much relevant common ground she shares with them and starts the *opening stage* with an *appeal to expert opinion*, through which she makes her assertive act reliable:

> Der amerikanische Übersetzungstheoretiker Douglas Robinson hält solche Erfahrungsberichte aus der Praxis für die Quintessenz und Quelle des theoretischen Nachdenkens über Übersetzung. (p. 72)

A further argument is *based on example* and again contains an *appeal to expert opinion*, since Kopetzki refers to the first essays written by famous translators like St. Jerome, "the patron saint of translators":

> Kein Wunder – stammten die ersten Abhandlungen über die übersetzende Tätigkeit doch von Übersetzern selber (z.B. vom Schutzpatron der Übersetzer, dem Kirchenvater und Bibelübersetzer Hieronymus). (p. 72)

At this point two arguments are used, one *from analogy*:

> Will man das Übersetzen als ästhetisch-künstlerische Praxis beschreiben, bietet sich der Vergleich mit anderen interpretierenden Künsten an. (p. 74)

the other one *from position-to-know*:

> Einer der ersten, der den Begriff ‚Übersetzung' metaphorisch auf Formen künstlerischer Bearbeitung ausdehnte, war Roman Jakobson. (p. 74)

Here, unlike in the ideal Pragma-Dialectical model, a second *confrontation stage* is introduced by a first *expository question*, in which Kopetzki highlights the need of all translation theoreticians for a systematic reference to the practical translators' descriptions:

> Noch bleibt die systematische Untersuchung dieser Praxis als einer künstlerischen Tätigkeit jedoch ein Desiderat der Übersetzungstheorie. Warum ist das so? (p. 76)

The answer is given in a series of considerations ("ein paar eigene Überlegungen"), into which an *argument from expert opinion* and a *counter-argument* are inserted. The first one is based on a general reference to critics who are habitually against any typological definitions of the translating process:

> Kritiker wenden gegen die texttypologische Definition von Übersetzung ein, dass jede Art Übersetzung hermeneutische Probleme aufwirft, die bei literarischen Texten nur besonders deutlich werden. (p. 76)

The *rebuttal* is, however, based on the difference between literary and specialized translation or interpreting:

> Das ist zweifellos richtig, *dennoch* unterscheidet sich das Literaturübersetzen vom Dolmetschen oder der Fachübersetzung – und zwar durch die besondere Weise, wie es sein Verstehen des literarischen Originals dokumentiert. (p. 76)

The *argumentation stage* which follows is mostly based on a second and third *expository question*. These are introduced by a double *appeal to authority*, which includes the quotation from the experts Schleiermacher and Wittgenstein:

> Dazu zwei Zitate. Friedrich Schleiermacher bestimmte die „Auslegungs- und die Übertragungskunst" mit analogen Begriffen. Über das Verstehen sagte er […].
> Ähnlich hat Ludwig Wittgenstein die Logik des Übersetzens bestimmt: […] (pp. 76-77)

The answer to the second *expository question* is a more in-depth reply to Kopetzki's initial question (defined by herself as "rhetorical") about the strong correlation between the translators' case descriptions and the theoreticians' speculations:

> Warum lassen sich keine verallgemeinerbaren Lösungsmethoden für Übersetzungsprobleme angeben? Hier liegt die zweite, tiefergehende Antwort auf meine rhetorische Eingangsfrage nach dem Zusammenhang zwischen den Einzelfallbeschreibungen und der Theorie. Die allgemeinen Aussagen der Theorie brauchen den besonderen Einzelfall, weil die Einzigartigkeit jedes Übersetzungsproblems auf den besonderen Charakter ästhetisch gebrauchter Sprache verweist. (p. 77)

The answer to the third *expository question* is, instead, a sort of introduction to her concluding arguments:

> Also lässt sich ästhetisch gebrauchte Sprache auch nicht in eine andere Sprache übersetzen? Der Schluss liegt nah. Dies ist tatsächlich das grundsätzliche Paradox der literarischen Übersetzung, und hier liegt auch die Grenze der wohlfeilen Gleichung zwischen Übersetzen und Interpretieren. (p. 77)

The *concluding stage* is made up of two final remarks, which consider the close connection between theoreticians and translators. In the first remark, Kopetzki uses an *assertive* speech act, according to which theoreticians should study translators' descriptions systematically:

> Die allgemeinen Aussagen der Theorie brauchen den besonderen Einzelfall, weil die Einzigartigkeit jedes Übersetzungsproblems auf den besonderen Charakter ästhetisch gebrauchter Sprache verweist. (p. 77)

Here she uses two arguments, one *from expert opinion* and one *based on example*:

> Die Arbeiten von Rainer Kohlmayer, einem der wenigen Theoretiker, der die konzeptionellen Äußerungen von Übersetzern systematisch berücksichtigt, sind ein Beispiel dafür, dass die Theorie, wenn sie sich konsequent auf die Praxis bezieht, das ästhetische Moment der Übersetzung erfassen kann. (p. 80)

In the second concluding remark, two modal verbs (*müssen/must*, *sollten/should*) are used for two *directive* speech acts:

> […] *müssen* Übersetzer durchaus Strategien und Konzepte entwickeln. […]
> Übersetzer *sollten* in der Lage sein, über ihre Arbeit zu sprechen, ihre Entscheidungen zu erklären, ihre Methoden zu benennen. (p. 80)

The speech acts are directed at translators and aim to highlight the importance of both developing and explaining strategies. As a matter of fact, if translators formulate clear descriptions, they enable theoreticians to better comprehend the secrets of their work.

In line with this reconstruction of Kopetzki's critical discussion, it is now possible to go back to the syllogistic internal organization of the whole argumentation according to two premises and a final conclusion. The first premise conveys the conviction that translators' notes offer good examples of the translation process:

> Die Theorie gewinnt durch detaillierte Fallbeschreibungen der übersetzerischen Arbeit anschauliche Beispiele für unterschiedliche, ja, teilweise entgegengesetzte Methoden des Übersetzens, die sie systematisierend unter allgemeine Begriffe fasst. (p. 72)

The second premise regards the uniqueness of each translation problem in referring to the specific esthetic character of the language:

> […] die Einzigartigkeit jedes Übersetzungsproblems verweist auf den besonderen Charakter ästhetisch gebrauchter Sprache. (p. 77)

In her final conclusion, Kopetzki reiterates not only the importance of translators' notes for the theory of translation, but also the need for translation theoreticians to take translators' notes seriously and to start studying them systematically:

> „Es empfiehlt sich, mit dem Nachwort des Übersetzers zu beginnen" […] Es empfiehlt sich, diesen Rat nicht nur an die Leser von Übersetzungen, an Übersetzungskritiker und -lektoren, sondern auch an die Theoretiker der Literaturübersetzung zu richten. (p. 71)

As a result, the conflict of opinion in Kopetzki's argumentation also cannot be considered resolved in the ideal way, because there is no active counterpart. However, during the course

of her argumentation Kopetzki deepens her understanding of the issue, supporting it clearly, and adding examples, quotations, and expository questions, which successfully articulate her reasons and clarify her divergences from other translators in a *reasonable* way.

4. CONCLUSION

In this paper I set myself the task of approaching argumentation in monologue using the Pragma-Dialectical standpoint. The study was an analysis of the naturally critical attitude of German translators in reaching a reasoned evaluation of their translating experience with Italian literary masterpieces. The analyzed corpus contains translators' notes, that is, preliminary remarks to a new edition, as well as scientific essays, lectures, guest contributions, or speeches at award ceremonies, in which the linguistic and cultural mediation process between a ST and a TT is argumentatively motivated.

The key arguments highlighted in the paper concern the monological character of the collected texts and are closely linked to the interdisciplinarity of *Argumentation Studies*, which have here been integrated with the discipline of *Translation Studies*.

The remarks contained in translators' texts about the strategies used and the viewpoint expressed represent the fundamental component of Translation Studies' theory. However, editors and translation theoreticians still have difficulty in grasping their importance and reveal an incoherent and slight interest in translators' practical descriptions. Furthermore, given that such texts are organized in argumentative moves, the need for a deeper encounter between *Translation Studies* and *Argumentation Studies* arises.

One of the aims of the paper was, therefore, to show that the integration of both disciplines is an important factor for a constructive scientific evaluation of translators' accounts, which—like most types of paratext—have not yet been codified or systematically studied. The 30 collected texts were analyzed as argumentative patterns based on Pragma-Dialectics. Among them, two in particular, by Burkhart Kroeber and Annette Kopetzki, were chosen to highlight their main features. On the basis of the meta-theoretical principles and dialectical stages of Pragma-Dialectics, it was also possible to reconstruct the syllogistic internal organization concerning premises and conclusions.

The analysis of both prototypical texts has shown that, even if the conflict of opinion is not decisively resolved in the ideal way, since an active counterpart is missing, translators' accounts are grounded in a number of speech acts and arguments as in standard argumentations. Translators deepen their understanding of the central issue, adding clarifications, examples, quoted extracts, and expository questions, which articulate the descriptions in a successful way.

In particular, the distinguishing feature of expository questions is to have the speaker himself answer them in order to bring about a deeper reflection on the question at hand. By contrast, in a dialectical dimension the proponent usually expects the respondent to offer a relevant reply, and both interlocutors take part collaboratively in helping the dialogue move forward towards its concluding stage. Consequently, questions in monological texts are used as a rhetorical tool to render the essay more *effective*, thus keeping the reader's attention. Moreover, with the counterpart being not physically present but only critically quoted with regard to their different translation choices, the acceptance of the proposed solutions can only be wished by the translator and eventually verified later. Hence, the analysis of both the texts' structure and the speech acts at their basis brought us close to the notion of "*monological discourse* for non-interactive texts" introduced by Rigotti (2005, p. 94) and extended by Rocci (2005) and later by Greco Morasso into "an inner argumentative discussion oriented towards a model of *reasonable* resolution of disagreement" (2013, p. 62; emphasis in the original).

The analyzed texts confirm that translators naturally adopt an attitude which not only uses rhetorical and argumentative strategies, but also makes "an implicit appeal to reasonableness" (see van Eemeren & Grootendorst, 2004, p. 2). In fact, translators' critical argumentation also compels them to put forward trustworthy and successful arguments, that is, to be *reasonable* and *effective*.

However, the consequence of abandoning the context of debate is that translators do not always follow the logical-chronological sequence of the four stages and that something in their moves can remain unclear or implicit. Consequently, the prospect of analyzing translators' notes as an argumentative pattern is indubitably in need of further exploration both at the practical and the theoretical level. The intention is to deepen not only the similarities and differences in the macro-structure of both dialectical texts and argumentative monologues; the use of questions, whether *critical* or *expository*, can also help highlight the successful way of reaching a solution to a difference of opinion, whether real in a dialogue or imaginary in a monologue.

From technique to tactics: How to teach *dispositio*?

BENOÎT SANS

Langues & Lettres (Langues & littératures anciennes)
Université libre de Bruxelles
Belgium
bsans@ulb.ac.be

ABSTRACT: Based on previous rhetorical teaching experiments in high school and at university, this paper will focus on the difficulties encountered by the learners on the level of *dispositio* (organization and structure of a speech, rhetorical strategy) and explore practical solutions, inspired by Ancient manuals, in order to face this task, develop new skills and improve the training.

KEYWORDS: Ancient rhetoric, arrangement, dispositio, exercises, organization, progymnasmata, skills, strategy, structure, teaching

1. INTRODUCTION

From July 2013 to July 2017, I was involved in a research project ("Training rhetoric: practical reason, creativity, citizenschip"; F.R.S.-FNRS, Université libre de Bruxelles; supervision: Emmanuelle Danblon) which aimed at testing Ancient rhetorical exercises in high school and at observing the effects of this particular training on the pupils in their compositions and oral presentations. During this project, I taught teenagers the bases of argumentation and rhetoric, taking inspiration from Ancient manuals and treatises.

This pedagogical experiment was successful and the results tend to show that thanks to these exercises, pupils could not only learn and acquire technical notions (like paying attention to their *ethos*, trying to evoke emotions, or, for what concerns *logos*, using various *topoi* or argumentation schemes), but also develop cognitive and relational abilities such as flexibility, open-mindeness, creativity or empathy (for more details, see Dainville & Sans, 2016; Sans, 2017). I am currently teaching rhetoric and argumentation at the University of Lille with the same practical approach. However, if pupils and students quickly master the first step of the orator's training, *inuentio*, i.e. finding potential arguments in every situation or genre, I have been struck by recurrent difficulties in both groups, which seemed to be linked to the next orator's task: *dispositio* or arrangement. In this paper, I will first resume these difficulties and then explore potential and practical solutions to approach them.

2. DISPOSITIO: CONTEMPORARY PROBLEMS

It is probably easier to explain the various problems which occurred in the pupils' and students' compositions from a concrete example. In order to teach rhetoric and argumentation, one of my favourite assignment is *controuersia* (Sans 2015; 2018). *Controuersia* is a type of declamation which consisted in a kind of trial simulation, a case on which students were supposed to make a speech to accuse or to defend, or both. This exercise was the culmination of the students' curriculum in Antiquity and was conceived as an application of the theory of *staseis* ("issues"), which categorized the various type of cases, as well as the strategies and arguments available for each of them (see Berry & Heath, 1997; Heath, 1997; Russell, 1983,

pp. 40-73). As the most advanced exercise, *controuersia* allows to use various strategies and techniques, and I like to use it regularly as a way to measure the student's progresses. It is of course possible to adapt the principles of this exercise to everyday life situations (Sans 2015; 2018) or to use real trials (see Braet, 1987; Hohmann, 1989; Hoppmann, 2008; Kock, 2012), like in the following example:

> Marc, 45 years old, 1,91 m and 115 kg, is a former rugby player, who, after years of glory, fell into depression and alcoholism. On August 7th 2004, he and Chantal, his medical secretary and wife for 24 years, were invited at a party by Marc's best friend, Christian, and his wife, Babette. During the dinner, Chantal asked for divorce because of her husband's violence, jealousy and affairs. Marc got angry, grabbed his wife and wanted her to go home with him, but she refused. Asked to leave by his guests, Marc pushed Babette, took his car, went back home and then back to the party, with his 357 Magnum. He fired five shots on his wife, who died. The guests barely managed to control Marc, who shouted: "I have killed her, but I love her! Kill me!". When he was arrested, Marc had 2,65 grams of alcohol in his blood. He is charged of premeditated murder. The prosecution requests 15 years' imprisonment; the defence tries to obtain a more lenient sentence.

This is a simplified version of the case of the former French rugby player Marc Cécillon, who was first sentenced to 20 years' imprisonment for the murder of his wife, but finally to 14 years at the appeal trial, thanks to the defence of the famous French lawyer Éric Dupond-Moretti (see Aron, 2013, pp. 60-65). In class, my students and pupils were asked to argue, as best as they could, for both sides. At that time, they were already trained in *ethos*, *pathos* and *logos*, but I often observed the following problems in their compositions:

1) They did not systematically compose an introduction nor a conclusion, which they might have learnt to do in other classes. Introduction or *exordium* could be of great importance to deal with the audience's attention or sympathy, especially on the defence side. And without conclusion, the composition ends abruptly or flatly.

2) They did not always think to recount or tell the facts in order to put forward interesting aspects that they could use in their argumentation. Sometimes, they simply copied the story at the beginning of their speeches without the slightest change. Many studies have shown the importance of narration or description in Ancient or contemporary speeches (see for instance, Herman, 2008; Webb, 2009).

3) For what concerns the argumentation itself, students and pupils tend to go straight to the main charge, before coming back to the previous facts and developing all the arguments they found without any selection nor organization. This creates a "torrent" of ideas or a "pack" of arguments gathered at the end of the speech, which are not easy to sort out. There often appear ideas which are, or which imply elements that are, contradictory with the previous ones (for instance, on the accusation side, something that implies that the crime was not premeditated or that the accused was not fully aware of what he was doing), creating some "kettle" effect (with reference to the fallacious "kettle logic"). Finally, another correlated phenomenon is that the students do not or badly rank their arguments. In this case, the only and most important charge is premeditated murder; the other elements (possession of a firearm, violence, drunkenness, infidelity) are indirectly relevant and can only be used to aggravate or lighten the deed or, for instance, to make a negative portrait of the accused. But, when they had already treated the main charge and used their best arguments, the students, still trying to manage a progression in their speech, sometimes presented secondary elements as the main ones or the worst of all ("the worst is that he hit his best friend's wife / cheated on his wife").

This – actually common – example shows that argumentation (or *inuentio*) and arrangement (or *dispositio*) are closely connected. The strength of arguments depends on the system in which they are placed and, when one knows all the available means or possible arguments, it is necessary to select and sequence them, in order to achieve at least clarity, and

potentially, efficiency (Quintilian VII, praef.; Pseudo-Longinus 40, 1). As the Greek word for *dispositio*, *taxis*, suggests, the author of the *Rhetorica ad Herrenium* (III, 18) and Quintilian (VII, 13) compare this art to military tactics, when a general needs to hold his troops in order to use them at the right moment. Similarly, on a cognitive level, inhibition is needed to hold creativity and take time to think about the founded ideas and what to do with them. It is not natural and it could require specific attention (Theon, *Progymnasmata* 126, 2 Spengel could suggest that some, unfortunately lost, treatises were devoted to this part of the art) and training. However, this crucial aspect is often left aside in contemporary argumentation manuals and limited to general recommendations (see for instance, van Eemeren, Grootendorst & Snoeck Henkemans, 2002, pp. 157-159; 175-179), because they mainly focus on the criteria of the argumentation itself, which is only a part of a good speech. Therefore, the aim of my current research is to find practical ways and exercises to teach arrangement, in a functional approach (on the various approaches, see Snoeck Henkemans, 2003).

3. DISPOSITIO: EXPLORING ANCIENT SOLUTIONS

As a classical philologist, my first reflex is to go back to the Ancient texts hoping to figure out the way they approached the problems I meet. In Antiquity, the first step of the rhetorical training was the *progymnasmata* ("preparatory exercises"), a relatively homogeneous and progressive set of exercises, mainly known thanks to four manuals (Aelius Theon, Pseudo-Hermogenes, Aphthonius and Nicolaus) from the first centuries BC (Patillon, 2002; 2008; Kennedy, 2003; see also the examples attributed to Libanius in Gibson, 2008). The most extended list, from Aphthonius' manual (IVth c. AD), comprises 14 exercises (Kennedy, 2003):

> *Mythos* ("fable"): fictive narrative
> *Diêgêma* ("narrative"): historical narrative
> *Chreia*: brief recollection, referring to some person in a pointed way
> *Gnômê* ("maxim"): summary statement, in declarative sentences, urging or dissuading something
> *Anaskeuê* ("refutation"): overturning of something at hand (fable, narrative, chreia)
> *Kataskeuê* ("confirmation"): corroboration of something at hand
> *Koinos topos* ("common-place"): amplification of something acknowledged (good or bad)
> *Encomion*: praising someone/something
> Psogos ("invective"): blaming someone/something
> *Synkrisis*: comparison
> *Ethopoeia*: imitation of the character of a proposed speaker
> *Ecphrasis*: description bringing what is shown clearly before the eyes
> *Thesis*: logical examination of a question/action (e.g. whether one should marry)
> *Nomou eisphora* ("introduction of a law"): supporting / attacking a proposed law.

Theon's manual (I[st]-IInd c. AD, according to Patillon, 2002) adds five other exercises to back the main ones: reading, listening, paraphrase, elaboration and contradiction. One of the striking characteristics of this cycle is its completeness: it recovered, on a basic level, almost every part of rhetorical theory and the orator's tasks. It is also true for what concerns arrangement. In this regard, Nicolaus' manual, dating from the fifth century AD (Felten, 1913; Kennedy, 2003), is particularly systematic and instructive.

1) First, on a macro-structural level, it is clear that the aim of this cycle was to be able to write and deliver a complete speech. Nicolaus repeatedly states that "some *progymnasmata* are parts and some are parts and wholes", or that some make a complete *hypothesis* and others do not. Each exercise was connected to a specific part of a classical speech, as it can be understood from this quotation about the "common-place" exercise:

"For since there are five parts of a speech–prooemia, narrations, antitheses, solutions, epilogues –, among which epilogues are the final part, after being exercised in the other forms through what has been said already, and especially after being taught how one should use arguments and how to fight against what seem to be strong objections, which was what we were doing in refutation and confirmation, we quite rightly should take up the progymnasmata exercising us for epilogues, which is the common-place. Chreia and maxim taught how one should work up prooemia; how we should make use of narrations we learned in the progymnasmata called narrative, and, of course, also in refutation and confirmation, we narrated the whole account against which we were contending before arguing our case point by point. Refutation and confirmation provided exercise in antithesis and solutions. Thus there is now left, the epilogue, for which common-place fills the need." (Nicolaus, *Progymnasmata* 7, 35-36 Felten; translation: Kennedy, 2003)

To this quotation, it should be added that the following exercises train some other kinds of argumentations or parts of a speech, like *encomium* or *ekphrasis* ("description"), as it can be seen in the second column of table 1 (below). This quotation also reminds us that refutation and confirmation have not always been separated exercises but were originally conceived as extensions of the narration or the fable (like in Theon's manual). This reveals another property of the cycle – let's call it "combinarity"– and probably the way it was supposed to teach *dispositio*: the exercises could be progressively combined to form a complete speech.

Table 1: *Progymnasmata* according to *dispositio*

Exercises	Related parts of a speech (according to Nicolaus)	Diuisio (various manuals)
Fable / Narrative	narratio	Theon: prooemion, refutation (unclear, implausible, inappropriate, inconsistent,…), confirmation, recapitulation, compression or extension, rearrangement, comment or explanation, gnomic statement, etc.
Chreia / Maxim	prooemion	Theon: restatement, comment, contradiction, compression or extension, refutation and confirmation Aphthonius: praise, paraphrase or comment, cause, contrary, comparison, exemple, testimony, epilogue (Nicolaus: or brief exhortation)
Refutation / Confirmation	argumentatio (forensic)	See Narrative
Common-place	peroratio / conclusio	means of amplification; Aphthonius: opposite, exposition, comparison, intention, digression, rejection of pity, "final" (deliberative) headings, etc.
Encomion / Invective	argumentatio (epideictic)	Aphthonius: prooemion origin/birth/family/nation, upbringing, external/physical goods, virtues and actions, death, comparison, epilogue; sometimes apology (Theon) or antithesis (Nicolaus)
Synkrisis	argumentatio (any genre)	comparison on the same headings than in the encomion

Ethopoeia	argumentatio, inserted speeches, ethos & pathos	Theon: exhortation, dissuasion, consolation, asking for forgiveness. Other manuals: present, past, future
Ekphrasis	description or narrative with *enargeia* ('vividness')	Depending on the listed subjects: before, during, after; head to feet, etc.
Thesis	argumentatio (deliberative & epideictic)	Generally: prooemion, final headings (= deliberative topoi), epilogue; sometimes, examples (Theon), refutations (antithesis and solution in Aphthonius's manual), etc.
Introduction of a law	argumentatio (deliberative & forensic)	Aphthonius: prooemion, contrary, deliberative headings, epilogue

2) Secondly, this principle is also to be found on a micro-structural level: several exercises had their own *dispositio* and could be submitted to abridgment or extension, which generally consisted in specific additional developments or arguments. The *chreia* for instance, which consisted in reporting a memorable saying or action attributed to some famous person, also included, in some manuals, praise of the author, paraphrase or comment of the saying or the deed, cause, contrary, comparison, example, testimony of the ancients, and brief epilogue. This means that the learners were used to compose similar developments with more or less length, but also, if one collects some of these potential extensions in the *progymnasmata* manuals (third column of table 1), that, to do so, they mastered numerous types of developments and arguments, which are, actually, units or items of *dispositio*.

3) Thirdly, this principle is not limited to a classical forensic or deliberative speech. Indeed, confronting these items to some other treatises, it can be observed that they also entered in other combinations to form other speech genres. Let's read, for instance, an extract of Menander's presentation of a funeral speech:

> Thucydides, however, writing a funeral speech for those who fell at Rheitoi at the beginning of the Peloponnesian War, did not simply pronounce an encomium on the men, but made the point that they were capable of meeting death; he was cautious, however, of the topic of lamentation because of the needs of the war– it was not the orator's business <to cause> to weep those whom he was exhorting to fight. He also added the consolatory topic. (Menander Rhetor II, 9, 418, 15-22 Spengel; translation: Russel & Wilson, 1981)

This passage shows that the Ancients understood some other kinds of speeches as combinations of various parts, with definite functions, which could be added or removed freely, according to the circumstances. This approach is also to be found in later rhetorical treatises, particularly from the Renaissance and XVIIth century, to describe different speech types (see for instance, Vossius, *Rhetorices Contractae*, II, 1621 [1660]; Goyet 2013; Noille, 2014; Sans, 2014).

4) Finally, for what concerns hierarchy of the arguments, it probably came later in the curriculum, with the *staseis* theory and when students were confronted to complete and almost real speeches. It can be seen, for instance, in Seneca the Elder's *Controuersiae & Suasoriae* (Winterbottom, 1974), that the students and their master practiced the *diuisio*, with consisted in identifying the issues at stake in the exercise and the order to address them, in a kind of analysis or planning. Similar discussions on the order of the arguments according to their strength can be found in classical treatises, but are brief and scattered: they generally recommended the "Homeric" order (see *Rhetorica Ad Herennium* III, 18; Cicero, *De Oratore*

II, 314; Quintilian V, 12, 14), which consisted in putting a powerful argument in first, in order to satisfy the audience's expectations, and again at the end, to leave a fresh and strong impression before the conclusion; in the middle, should be put the arguments that have some value only in connection with others. This recommendation could be connected with the categorization of premises and argumentations according to the way the conclusion is supported in the pragma-dialectical approach and Informal Logic, but is clearly oriented towards strategy and production.

3. CONCLUSION

To resume, approaching Ancient manuals through the angle of *dispositio* not only reveals what students learned, but also help to reconstruct some pedagogical principles or guidelines:

1) Production: with the objective of making a complete speech, students learned to compose various developments, which were themselves often divided in smaller parts and which could be extended or reduced in order to form a whole or to be included into a larger whole; at the same time and later, they learned various combinations of these elements, or various speech plans, which were themselves variable. Still, if the number of items to learn may seem large at first sight, it is also relatively limited to remain manageable. In other words, they learned the words and letters of an alphabet.

2) Critical and analytical thought: probably simultaneously, as it can be seen in Theon's complementary exercises (only known thanks to the Armenian tradition of Theon's manual, see Patillon, 2002), the same units were also used as critical tools in order to divide famous or contemporary speeches into significant parts or arguments. Students were then asked to imitate or rephrase.

3) Strategy and memory: the model was richer than contemporary approaches, rigorous but also flexible. It stimulated creativity through imitation and original combinations, but also consistency and strategy through the constraint of selection or planning. Moreover, according to Quintilian (X, 2, 36-39), dividing a whole into significant and smaller unities was also the first step to support memory and recollection (Quintilian X, 6), which was supposed to give a natural character to the speech.

What Ancient students were able to do thanks to such a training can of course be read in Ancient oratory, but also, I think, in Ancient historiography, where lots of speeches are attributed to the historical characters, and which have often been neglected because they are mostly unauthentic. But they reveal an impressive art of composition. Here is, as an example, the speech attributed by Livy to Aemilius Paullus after having defeated and captured Perseus, the king of Macedon (probably based on Polybius XXIX, 20; I add the comments between []):

> The first question put was, by what wrong had he been driven to make war on the Roman People with such determined enmity as to bring himself and his kingdom into utmost danger? While all awaited an answer, he gazed silently at the ground for a long time and wept.
> Then the consul asked again: "If you had received the kingdom as a young man, I should indeed be less surprised that you were unaware how powerful the Roman People is as a friend or as an enemy. As it is, since you had a part in the war which your father waged with us, and since you were aware of the peace that followed, which we observed with the utmost faithfulness toward him, what reasoning led you to prefer war rather than peace with men whose power in war, whose good faith in peace, you had alike tested?" [Reproach / Invective]
> When no reply either to the question or the accusation was forthcoming, the consul continued, "However that may be, whether it has occurred through human mistake or chance or law of nature, be of good cheer. The misfortunes of many kings and of many peoples have shown that the mercy of the Roman People offers you not only hope, but an almost positive assurance of safety." [Consolation]
> This the consul said in Greek to Perseus; then he continued in Latin to his staff: "You see before you a notable example of the changefulness of human affairs. I say this especially for you, young men.

Therefore it is proper to offer no insult or violence to anyone, while one is in favourable circumstances, and not to trust to one's present fortune, since no one knows what evening will bring. He will be truly a man, in a word, whose spirit is neither deflected from its course by the breath of prosperity, nor broken by misfortune." [Exhortation] (translation: Schlesinger, Loeb Classical Library, 1951)

Though this speech does not correspond to any specific genre, it is nevertheless made from three recognizable parts: reproach, which is close to blame or invective, consolation and exhortation (Ferrazzi, 1694; Tesmar, 1657). The fact that these secondary kinds of speeches were taught through the *progymnasmata* curriculum is probably not a coincidence. A recent and contemporary example of such well divided and semi-improvised speech is the intervention of Jean-Luc Mélenchon (French left-wing party leader) at the French Assemblée Nationale, after the heroic death of the policeman Arnaud Beltrame (27 March 2018; I add the comments between [])

Mesdames messieurs, collègues,
À Trèbes et à Carcassonne, comme ailleurs auparavant, l'acte terroriste a déployé une abjecte violence. Mais qui était calculée. Son but: subjuguer la raison, imposer la soumission à la peur qui pousse au chacun pour soi. Et, pour finir, abolir la norme humaine. [Invective/condemnation]
Alors que le pire était en place, cependant, j'ose le dire: le mal a été vaincu. Parce que la scène a été inversée. Le lieutenant-colonel Arnaud Beltrame a remis le monde humain en ordre. Il a réaffirmé la primauté de la compassion. Il a assumé la primauté d'un altruisme absolu: celui qui prend pour soi la mort possible de l'autre, illustrant ainsi les valeurs de foi et de philosophie auxquelles il était attaché personnellement. En ce sens, le lieutenant-colonel… (Applause) En ce sens, le lieutenant-colonel Beltrame est un héros de la condition humaine. [Praise]
Certes, son sacrifice n'efface ni la douleur, ni le sang, ni la mort. Mais il nous fait devoir. Devoir impératif et impérieux: à notre tour de refuser à l'ennemi quelque victoire que ce soit. Et d'abord celle de la division, de la confusion et de la polémique qui viendrait à nous déchirer. (Applause) [Exhortation]
Monsieur le Premier ministre, Opposition, nous vous disons: nous sommes certains que vous, vos ministres, et tous les services de l'État avez, dans cette circonstance, fait tout ce qui était en votre pouvoir, du mieux que vous pouviez. (Applause). Monsieur le Premier ministre, Nous sommes disponibles pour l'union autour de la mémoire de ceux qui sont morts et de l'exemple qu'ils nous donnent. Appelez-nous à un deuil national et nous vous répondrons favorablement. (Applause) [Conclusion, with brief exhortation]

This short speech is, on a structural level, quite similar to Livy's example and also recalls Menander Rhetor's analysis of Thucydides' speech. But the Ancients did not believe that this art was the privilege of some naturally gifted orators, but that it could be acquired through a specific training. The real challenge is of course to implement such a training into a regular academic course or seminar (and consequently, into a more limited amount of time), but there is probably much to gain.

ABSTRACT: Field-dependence in argumentation comes about through forms of inference invented by specialized fields. In recent work we introduced the concept of a 'warranting device': (1) an inference license (2) invented for a specialized argumentative purpose and (3) backed by institutional, procedural, and material assurances of the dependability of conclusions generated by the device. Once established, fields employ such devices across many situations without further defense, even as the devices develop in response to newly-noticed problems.

Many new warranting devices have appeared over the past century to solve problems in reasoning about health and medicine, replacing and obsolescing earlier forms of medical reasoning. One such device is the Randomized Clinical Trial. This case study traces its historical evolution and discusses some current movements toward competing device types.

KEYWORDS: field-specific reasoning, medical reasoning, Randomized Clinical Trial, Randomized Controlled Trial, warrant-establishing argument, warranting device

1. INTRODUCTION

How should babies born addicted to opiates be treated for their withdrawal symptoms? A usual treatment is to administer morphine, but Bada et al. (2015) argue that "Clonidine may be a favorable alternative to morphine as a single-drug therapy for NAS," and further, that "A multicenter randomized trial is warranted." The basis for the first of these conclusions is observation of what happened to comparable groups of infants given one treatment or the other:

> *Infants treated with morphine (n = 15) versus clonidine (n = 16) did not differ in birth weight or age at treatment. Treatment duration was significantly longer for morphine (median 39 days) than for clonidine (median 28 days; P = .02). NNNS summary scores improved significantly with clonidine but not with morphine. On subsequent assessment, those receiving clonidine had lower height of arousal and excitability (P < .05). One-year motor, cognitive, and language scores did not differ between groups.* [1] (Bada et al., 2015, p. e383).

---

[1] A protocol for the multicenter randomized trial the authors called for can be found at https://clinicaltrials.gov/ct2/show/NCT03396588.

Arguments very similar to this one appear with great frequency in medical research literature—about 20,000 times yearly in recent years. They are 'tagged' in research databases as RCTs—Randomized Clinical Trials[2], an acknowledged standard for high quality evidence of treatment effects in medicine. Prior to about 1950, though, claims about which treatments work best for particular kinds of patients would have been defended very differently, often using forms of reasoning that are now effectively obsolete. Our purpose in this paper is to examine how this striking change in argument standards came about.

In earlier work (Jackson & Schneider, 2018), we initiated a line of inquiry into the invention of new inference rules, identifying a class of inventions we termed 'warranting devices.' These devices are applied to generate answers to questions and to defend these answers by simply noting how they were generated. This is a significant expansion of Toulmin's (1958) concept of warrant, but we believe it to be consistent with the overall direction of his thought.

We begin by describing how we understand warrants in general and how warranting devices fit into a general account of warrants. Next, we discuss RCTs as a (still) new warranting device that generates and justifies a certain kind of conclusion. Then we analyze the argumentation that was required to establish RCTs as a scientific warrant, using a text from a central figure in modern medical science. Finally, we discuss the importance to argumentation theory of paying more and closer attention to the ongoing inventiveness that characterizes argumentation as a practice.

2. WARRANTS AND WARRANTING DEVICES

Conjecturally, the argument that opens this paper may be diagrammed as shown in Figure 1.

Fig, 1. Toulmin diagram of Bada et al. (2015).

Identifying 'Randomized Clinical Trial' as the warrant for arguments of the kind shown in Figure 1 needs some explanation. Toulmin's theoretical descriptions of warrants (most characteristically as "inference licenses") are often undercut by examples that look like *information* a person needs to have in order to arrive at a conclusion, always appearing in his diagrams as declarative sentences. A very literal-minded reading of *The Uses of Argument* might suggest that the warrant in this argument is something like the following:

---

[2] Also called Randomized Controlled Trials.

Warrant: Observations made in a randomized clinical trial can generally be taken as evidence for a claim about drug effects.

If something of this sort is the warrant, then reasons for trusting the warrant—the body of theory, evidence, and experience that give scientists confidence in RCTs—are the backing for the warrant. But we do not think this is really true to Toulmin's concept of warrant, because it ignores an important reality: For scientists themselves, the RCT is a procedure followed to *produce* a conclusion; the procedure is more than (say) a sign that the observations may be taken as evidence.

To a certain point, our interpretation of the concept of a warrant is fairly mainstream, affirming the following general characterizations:

- *Warrants are inference rules governing how conclusions are drawn, not statements from which conclusions are drawn.* As Hitchcock (2003, p. 71) put this, "The claim is not presented as following from the warrant; rather it is presented as following from the grounds in accordance with the warrant."

- *Warrants do not typically appear as parts of argumentative texts.* We agree here with Freeman (2011, p. 88), that "Arguments instance inference rules, rather than include them as elements." The practice that has developed of diagramming arguments with warrants rendered as statements (modeled on Toulmin's own examples) conceals the rule-like quality of warrants that differentiates them from data, grounds, or information.

- *Warrants generate conclusions as well as justify them.* Toulmin clearly had generativity in mind for his warrants. For example, in discussing legal reasoning, he points out that relevant statute allows for "findings" of guilt or innocence (Toulmin, 1958, p. 99), and he took the use of 'standard equations' generating predictions as an example of warrants in science (Toulmin, 1958, p. 121).

To this fairly mainstream understanding of warrants, we add one more assertion, required for handling the introduction of new inference rules that can command the trust of at least one field:

- *Some warrants are technical objects that expert communities invent, apply, and evolve.* Toulmin had in mind that these inventions have been frequent in the history of science. He discusses them extensively, but without using the term 'warrant', in *Human Understanding* (1972), for example. But he did not give explicit attention to what complex technical assemblies these have become in the last two centuries or so. We have argued (Jackson and Schneider, 2018) that a warrant may be bundled with technical components to produce what we call a warranting device. The backing for a warrant like RCT can include 'assurances' that the devices will perform as expected (producing belief-worthy conclusions), as well as more familiar forms of backing such as evidence that the device has performed well so far.

Figure 2 offers an abstract description of a warranting device, within the context of Toulmin's D-W-C layout. A warranting device, according to Jackson and Schneider (2018, p. 245) is (1) an inference license in Toulmin's sense; (2) invented for a specialized argumentative purpose; and (3) backed by procedural, institutional, and material components that provide assurances of the dependability of conclusions generated by the device. The

warrant itself is a rule or procedure or instruction to follow in order to arrive at a belief-worthy conclusion; the other components of the device are not just reasons to trust the warrant, but actions taken, promises made, and resources assembled to make the warrant dependable in all of its occasions of use. A device may have other kinds of backing as well, such as evidence of a good track record.

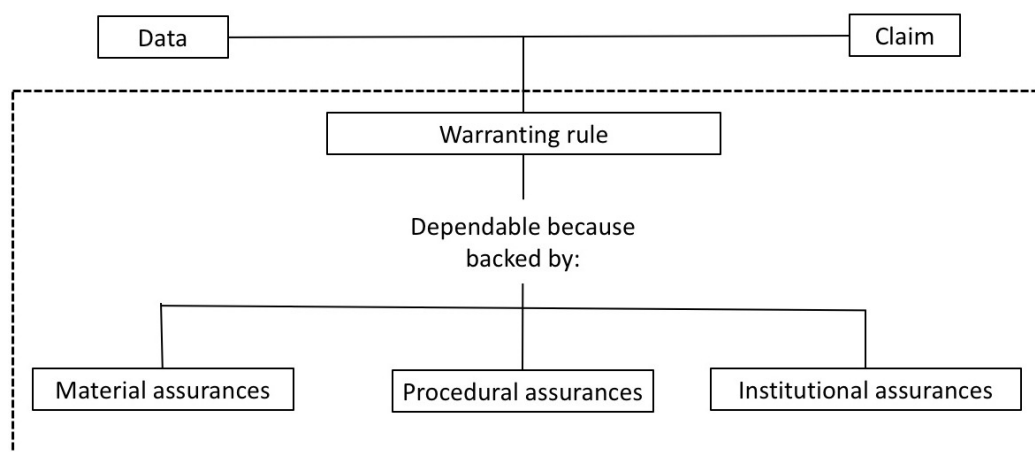

Fig. 2. The complex structure of a warranting device, based on Jackson and Schneider (2018, p. 245).

Jackson and Schneider, analyzing a form of evidence synthesis known as a Cochrane Review, argued that the ability of the device to warrant any particular conclusion is linked not just to actions of the device 'operator' but to prior and ongoing work broadly delegated within the field—to material resources of various kinds required for the device to function, to institutional arrangements that support and regulate the device, and to well-socialized agreements about how one uses the device properly. In the next section, we analyze RCT as an established warranting device, explaining each of these kinds of components. How the device became so well established that it can underwrite 20,000 novel conclusions each year will be discussed in the just-following section.

3. RANDOMIZED CLINICAL TRIAL AS A WARRANTING DEVICE

That Randomized Clinical Trial functions as an inference license is, we think, obvious, and the circumstances surrounding the invention of RCT have been well-documented (see e.g., Chalmers, 2003). To be a bit more precise, RCT incorporates a number of distinguishable inventions, of which the most definitive is random assignment of human subjects to alternative experimental conditions.

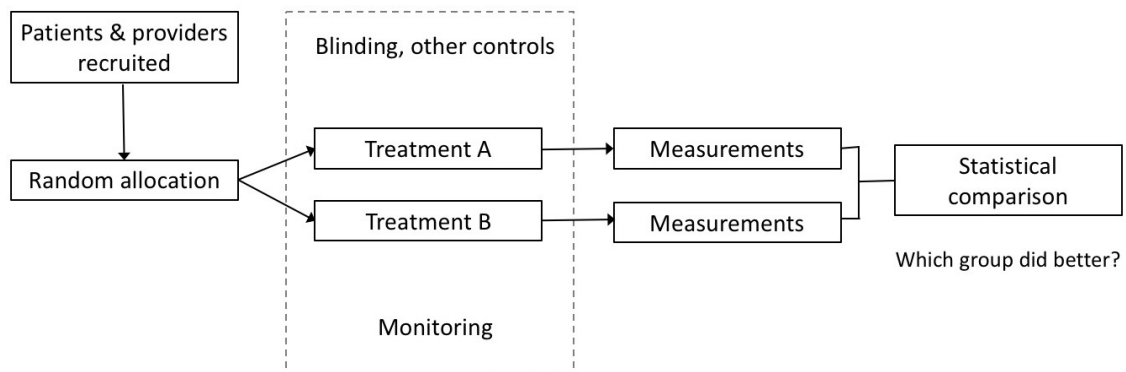
Figure 3 shows a diagram of the structure of RCT as it might appear in a textbook on experimental methods. To conduct a trial, a researcher must have access to patients and physicians, as well as to material components that make up the alternative treatments. To generate a convincing conclusion, the researcher must follow procedures designed to preclude various kinds of bias that might favor one treatment over the other. For example, 'blinding' is used to prevent knowledge of treatment condition from affecting either the patient's expectations or the physician's judgment of how well the patient is responding. To arrive at a convincing conclusion from the RCT, the researcher must depend on statistical procedures such as tests of the significance of a difference between two groups; these procedures too were invented in the twentieth century.


Fig. 3. The structure of a simple Randomized Clinical Trial.

While the logic of the RCT is quite easy to understand, conducting an RCT has become a highly regulated affair that makes it impossible for anyone acting outside complex institutional environments. For example, no one can enroll patients in an experiment of this kind without getting a protocol approved at multiple levels. For a decade or more, researchers have had to register their trials before beginning to recruit, and gradually it has become common for protocols to be published even before any results have been obtained (so that the community can know what things are being tried). Jackson and Schneider (2018) treat arrangements of this kind as 'institutional assurances' attached to a warranting device.

4. ESTABLISHING RCT AS A WARRANT FOR REASONING ABOUT HEALTH

From the point of view of a mid-century clinician (less than a lifetime ago), much about RCT would be counterintuitive, even ethically suspect: Randomly allocating patients to treatments? Concealing the treatment given from the physician responsible for the patient's well-being? Deciding which of two groups did better based on pre-defined measures that might not be the best indicators of patient well-being? Reducing all of the richness of clinical observation to a statistical comparison between two group averages? These have become common and broadly accepted practices, but they were, at first, controversial and in need of argumentative defense. In this section, we analyze a significant text produced as part of this defense.

4.1 Methods

For reasons of space, we can give only a very sketchy description of our methods, focusing on (1) how we locate interesting cases of warrant-establishing argument and (2) how we analyze cases once we have found them.

Locating cases of warrant-establishing argument is partly fortuitous and partly systematic. The warrants with which we have been concerned are complex devices that have long histories of invention built over prior invention, so a good case is *something new* in how a field argues, either internally or with stakeholders beyond the field. Working on health information systems and health controversies, each of us noticed (fortuitously) the very obvious progression of reasoning standards occurring over the past half-century or so. A systematic search for explicit defense of these new practices is a special form of literature search, working backward in time through reference lists in scholarly articles. Published histories of the randomized clinical trial were also helpful, and our task was also simplified by the appearance, in recent years, of 'evidence pyramids' that encapsulate practitioners' assumptions about the relative value of a large number of twentieth-century inventions in medical reasoning. Rhetoric surrounding these pyramids, and especially proposed revisions,

are useful data on the evolution in reasoning and evidence standards within fields and on the spread of particular innovations from field to field.

Having previously chosen to look at defense of the RCT as a package deal (rather than to look at more elemental inventions such as statistical inference), we selected one primary text for detailed examination: a lecture presented by Austin Bradford Hill at Harvard Medical School and subsequently published in *The New England Journal of Medicine*. Bradford Hill first came to our notice as originator of a well-known set of standards for causal reasoning (1965). The 1952 text itself contains ample evidence that RCT was not yet an accepted standard at the time of the lecture, and that, in fact, there was well-articulated resistance to RCTs among medical clinicians.

Analysis of this text involved procedures common in argument reconstruction: identification of the main claim, extraction and examination of each line of supporting argument, and testing conjectures about how the various parts of the text might hang together as a defense of the main claim. Looking at the text holistically, we recognized its overall structure as a possible instantiation of practical reasoning. Working first separately and then together, we reviewed the text paragraph by paragraph, creating brief annotations on what Bradford Hill appeared to be trying to accomplish in that paragraph and how it might fit within a practical reasoning structure. We then created a blank template in the form of a practical reasoning scheme and began populating the components of the scheme with text extracted in the paragraph-by-paragraph analysis. Following a principle common in analytic induction, we continually tested our candidate reconstruction by searching for passages within the text that did not seem to fit or that pointed to a different possible reading. We also attempted to confirm certain conjectural reconstructions by tracking arguments in the lecture back to cited source.

4.2 Results

In overview, we found that most of the content parsed nicely into the components generally understood as required for practical reasoning. We worked from a schematization of practical reasoning provided by Fairclough (2016), because it takes account of the way a single text may incorporate answers to counter-arguments occurring somewhere in the background discourse. As Fairclough points out, in deliberative discussion a practical argument can come under attack both for the adequacy of the rationale offered for the action and for the acceptability of the action considered on its own. These are not equivalent attacks, but they can be completely separate bases for rejecting the proposed action. Figure 4 shows the 'constructive' case for adopting RCTs. (Bradford Hill called them cooperative clinical trials, so phrasing here refers to CCTs rather than RCTs.) Figure 5 shows a dialectified view, with a collapsed version of the constructive case alongside opposing arguments that Bradford Hill addresses refutationally. We add an 'imputed' counterclaim that Bradford Hill treats as the point of the various objections.

4.3 Discussion

Bradford Hill's lecture is meant to persuade his audience that cooperative clinical trials were necessary for improvement of medical knowledge, and further, that they were the best way to discharge the ethical responsibilities of the medical field. His argument seeks to establish RCTs as a routine path to conclusions about what works and what does not in the treatment of patients. By contrast, the argument with which we opened our discussion simply uses the warrant without explicit defense, as most conclusions generated by Randomized Clinical

Trials do today. Once it was understood how random allocation strengthens such conclusions (and how various other forms of allocation weaken them), the case for random assignment need not be repeated in each use; all that is needed is a mention that randomized allocation occurred in such-and-such a way.

Establishing a warrant means getting to the point where it can be used to defend individual conclusions without explicit defense. All of the backing elements are 'boxed up' for repeated taken-for-granted use. Latour (1987, pp. 2-4) has described this process of black boxing generally, not with specific reference to inference rules, but with attention to the marked difference between the period in which the black box is being assembled and the period in which the black box is used by practitioners who feel no need to inspect its inner workings. Jackson (2008) gave an example of such a 'black box argument' being used in a policy debate.

Once a warrant is established as a convincing and coherent way of drawing a conclusion, we may find ways in which it can go wrong, in which case we can revisit conclusions drawn from it in the past. So, black boxes can be re-opened, but they aren't kept open all the time. Although RCT remains the gold standard for causal reasoning today, new competitors can arise at any time.

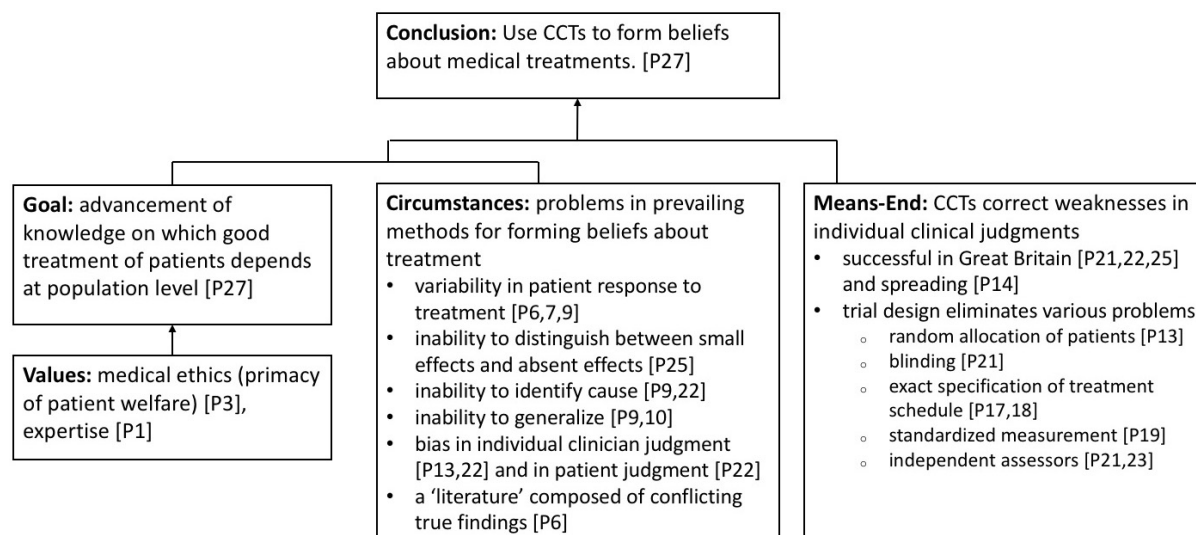

Fig. 4. Reconstruction of Bradford-Hill (1952)'s warrant-establishing argument, adapting the practical argument scheme presented in Fairclough (2014).
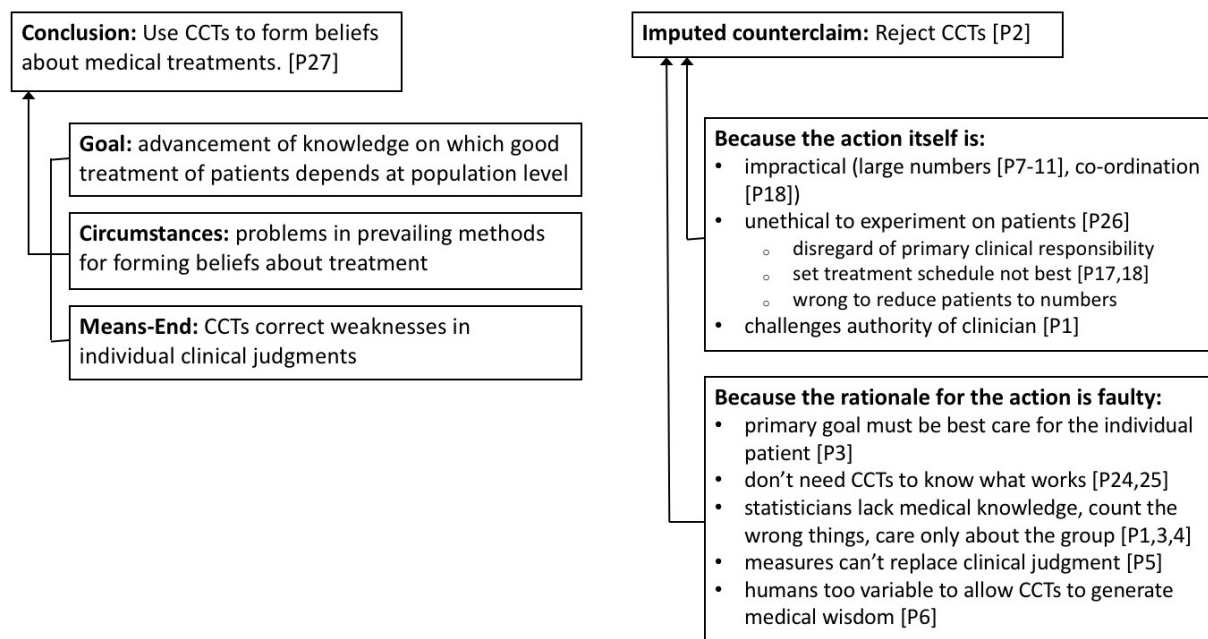

Fig. 5. Reconstruction of Bradford-Hill (1952), adapting the practical argument scheme presented in Fairclough (2014).

5. CONCLUSION

As Toulmin stressed over and over, real argumentation serves practical purposes. In real argumentation, people are far less interested in whether their inferences are valid than in whether their inferences serve practical purposes (such as providing proper health care). These practical purposes drive innovation in reasoning and argument: looking at warrant-establishing arguments through the lens of practical reasoning exposes *why* people invent new inference rules—what we want to do with what we can conclude from a given rule.

Any one of these innovations in reasoning has the same status as an already-cataloged scheme. That means we need scheme definitions for each one, we need to enumerate the critical questions for each one, and we need to show how people work with each one. We also need to study how these schemes develop, how they change over time as people notice their vulnerabilities and try to patch them against common objections. Innovation can be iterative, with a rule 'boxed' as it achieves stability or 'unboxed' as it encounters new challenges.

But what we believe we have shown is that Toulmin was correct in thinking that change in the stock of usable warrants is *normal and necessary*. New things are invented and old things are abandoned, for if a new inference rule can be argued into existence, old ones can be argued out just as well.

On the humanistic essence of science: An argumentative perspective

MENASHE SCHWED

Ashkelon Academic College
Israel
m.schwed@outlook.com

ABSTRACT: This paper proposes yet another answer to the unsolved Popperian question of Demarcation from an argumentative perspective. The thesis is that science should be characterized in terms of the values and norms of Humanism. Science is rooted in politics and ideology, and as a human invention, it presupposes and advances concurrently democratic and humanistic values. The talk analyses three presuppositions which describe three categories of humanistic values and exposits their necessity for and function in the scientific research methods. It explicates how these methods were initially selected as scientific. The argumentative function of these presuppositions is critical in two senses: First, in the 'opening stage' of any scientific endeavour and controversy. Second, as part of the 'rebuttals' component of any scientific argument.

KEYWORDS: humanism, Pragma-dialectics, Toulmin method, philosophy of science, ad verecundiam

1. THE UNSOLVED POPPERIAN QUESTION OF DEMARCATION

This paper proposes yet another answer to the unsolved Popperian question of Demarcation. The demarcation criterion, which marks off scientific beliefs from unscientific ones, is always a part of the more significant issue of determining which beliefs are epistemically acceptable or warranted. There are various ways in which the issue of demarcation can be studied, as Larry Laudan shows in his seminal paper form 1983. What we expect however is an insightful demarcative criterion that will exhibit a reliable epistemic or methodological warrant for science than for non-science.

The predominant candidate for such a demarcative criterion is the scientific methodology, which most characterizes the authentic scientific work. However, no scientific research method was found to guarantee the acceptability of scientific claims. There is not one archetypic method that will stand out such that it will qualify as the one from which all other scientific research methods are derived. Consequently, no such method will enable us to characterize science as a unique culture. Most importantly, this line of reasoning does not solve the problem of how these research methods were selected as scientific in the first place. Laudan concluded that "the [demarcation] question is both uninteresting and, judging by its checkered past, intractable. If we are to stand up and be counted on the side of reason, we ought to drop terms like 'pseudoscience' and 'unscientific' from our vocabulary." (Laudan, 1983, p. 125).

2. SCIENCE, HUMANISM, AND DEMOCRACY

Suppose, for the sake of argument, that Laudan's claims are conclusive; still his conclusion is far from warranted. The reason why the demarcation problem is a persistent one is that it is dealt with in either epistemic or methodological terms. There is, however, a third way that will define it in terms of cultural and political values. Accordingly, the proposal is that science is not to be characterized by its theories nor by its research methods. Instead, the proposal is

to redefine the demarcation criterion in terms of the values and norms of humanism and liberalism.

This proposal is based on two theses: First that the historical and philosophical roots of science are in politics and ideology, and not in any objective ideal. Science is a human invention just like art or literature and not for wholly different reasons. Its invention is deeply tied up with the emergence of democracy in the 5th century B.C. Greece and Humanism in the Enlightenment. Second, that science presupposes and advances Humanistic and liberal values, such as the autonomy of the individual to think and decide in a free and uncoerced manner, and the free choice to prefer the way of critical reasoning and skepticism.

The first thesis, developed elsewhere (Schwed, 2013), is arguing that democracy, philosophy, and science of the 5th century B.C. are interconnected, and the upshot is the crucial place of the individual and her critical ability to question everything. Popper is well known for stating this thesis in his 1956 paper *Three views concerning human knowledge*. He sums up this thesis by saying that (Popper, 1956, pp. 136-7):

> The issue, as I see it, is this. One of the most important ingredients of our western civilization is what I may call the 'rationalist tradition', which we have inherited from the Greeks. It is the tradition of critical discussion... in the interests of the search for truth. Greek science, like Greek philosophy, was one of the products of this tradition, and of the urge to understand the world in which we live; and the tradition founded *by* Galileo was its renaissance. Within this rational tradition science is valued... for its ability to free our minds from old beliefs, old prejudices, and old certainties, and to offer us in their stead new conjectures and daring hypotheses. Science is valued for its liberalizing influence - as one of the greatest of the forces that make for human freedom.

While probably committing the fallacy of "begging the question," the claim is that science can flourish only in a democratic environment based on humanistic and liberal values. Greek philosophers were the first to form what in the 18th century came to be known as humanism and secularism. As part of this new cultural worldview, these philosophers disqualified the accepted traditions as a source of knowledge, as part of their general attitude of critical rationality. As a result, we have the first formulation of the distinction between *epistêmê* and mere *doxa*; the distinction between genuine knowledge and merely confirmed belief. This distinction relates to the quality of the justification or evidence the confirmed belief in question is based upon. The formation of science was part of the integration of *doxa* with free critical discussion, seen by the pro-democratic Greek philosophers, such as Protagoras, as the only reliable foundation to knowledge (Schwed, 2013). The question now is how these values of free democracy, critical rationality and skepticism are constitutive to the scientific culture and methodology?

The philosophical idea is that science derives its essence from the fact that since every belief people have is flawed, to begin with, every person can be mistaken, and myself in particular, Popper adds (Popper, 1974). The only way to justify knowledge is in accordance with the ideal of free and public critical inquiry. There is no other way to justify knowledge, which will accord with humanistic values. Fallible knowledge has two senses: (1) Epistemologically speaking, knowledge is an acceptable fact of human history, although it always involves fallibility. It is considered a more realistic conception of knowledge, which is based on tolerance regarding conflicting opinions. (2) Normatively speaking, not only science but culture, politics, ethics and so forth should also reflect this epistemological state of affairs. However, this is not a shortcoming of human knowledge but a moral value of tolerance and autonomy. This is the place where the tight connection between skepticism on the one hand and humanism and liberal democracy on the other is located. The essence of science begins with this tight connection.

3. THREE NORMATIVE BASIC ASSUMPTIONS

How do science, humanism, and liberal democracy come to be connected? Humanism is analyzed in different ways in view of the diversity of contexts in which it is done. The following *normative basic assumptions* conceptualize humanism according to the relevance of liberal democracy in the context of science:

(a) *The basic ontological assumption* (alternative description to *naturalism*): Human reason comes to know nature without any super or extra-natural arbiter(s). Knowledge in any known tradition in human history is always dependent on the existence of at least one super/extra natural arbiter being, whose judgment or knowledge is deemed authoritative. The *humanistic stance* leaves human beings as the sole source of knowledge. Super/extra-natural beings are excluded from the participants relevant to knowledge and, thus, humanizing and naturalizing knowledge. Consequently, knowledge must be based only on human resources. That is, knowledge is in principle only empirical in the sense that it derives primarily from sense experience.

(b) *The basic epistemological assumption* (alternative description to *objective knowledge*): Knowledge should avoid being ethnographic or culturally centered. Yet again, knowledge in any known tradition in human history always tends to project its cultural perspective on nature. The *humanistic stance* aspires to objectivity, at least as a regulative ideal, which should avoid any preconception and prejudices. Furthermore, to achieve this ideal, knowledge must be inter-subjective, public, and open to free and critical discussion.

(c) *The basic ethical-political assumption*: Human reason should be autonomous and unbiased in the sense that human beings are free from external and internal coercion. The *humanistic stance* sees the freedom of thought and expression as universal. Science is a democratic community, in which every participant in a discussion is like everybody else, and no one has authority for deciding debates.

These basic assumptions are not part of science itself nor derived from it in any way; "science" cannot unveil moral or normative facts that are not already known from philosophical reasoning. The dependency direction between science and ethics is crucial from the argumentation point of view, as will become clearer below. As for now, it is important to note that they are part of the political ideology of humanism in general and liberal democracy in particular. They are part of the liberal discourse, which can be understood in different ways, evolved through history (Dembour, 2006). In today politically and economically disturbing times, however, these assumptions are no longer obvious nor given. The warnings are abundant. The former Secretary of State Ms. Madeleine Albright in her recent book *Fascism: A Warning* (Albright, 2018), Professor Michael Cox in his LSE IDEAS column *Understanding the Global Rise of Populism* (Cox, 2018), or Yascha Mounk in his Guardian column *How Populist Uprisings Could Bring Down Liberal Democracy* (Mounk, 2018), to mention only a few.

As they mark the purview of philosophical reasoning, they are not facts of nature nor derivable from scientific research: they are value judgments. The way science describes nature and its concealed laws and patterns does not qualify it to also to describes the norms and values by which people should live, think and reason. Liberal values, like autonomy or freedom, fall outside the realm of *is*, inasmuch the realm of *ought* cannot be part the bulk of scientific statements since they fall outside the purview of empirical research. Science does not entail these basic assumptions due to the Humean "is/ought" divide stating that no

statement regarding the way the world should be can be entailed from facts about the way it is without presupposing additional premises (Dodd & Stern-Gillet, 1995).

Since these basic assumptions are value judgments, they are open to philosophical disagreement and controversy as any other ethical and political stance. However, instead of justifying them, this paper proposes to see them as necessary presuppositions to scientific reasoning. As such, they are ideal construction, functioning in a regulative manner. Nonetheless, these assumptions function as a moving force in the cultural history of knowledge and radicalize it.

Their advantage is in their ability to summarize the necessary components of the humanistic stance, which the following quotation from Richard Rorty may exemplify:

> To say that truth is not out there is simply to say that where there are no sentences there is no truth, that sentences are elements of human languages, and that human languages are human creations. Truth cannot be out there – cannot exist independently of the human mind – because sentences cannot so exist or be out there. The world is out there, but descriptions of the world are not. Only descriptions of the world can be true or false. The world on its own – unaided by describing activities of human beings – cannot. (Rorty, 1989, p. 5)

Rorty saw in the contingency of language and the sciences as a part of advancing towards liberalism. Although Rorty's discussion of liberalism is fundamentally different (as he characterizes liberalism in terms of avoiding cruelty), the above quotation shows how the *basic ontological assumption* is no more than a different way of expressing the same idea. The absence of any super or extra being(s) bound with the contingency of human knowledge necessitates the naturalization of epistemology.

4. THE PLACE OF THE BASIC ASSUMPTIONS IN SCIENTIFIC REASONING

Argumentation theory is in the background all the time, but it becomes more explicit in analyzing the way these basic assumptions function in scientific arguments. They are extensively present at the opening stage of the pragma-dialectical model for critical discussion, without overruling their presence and function in other stages. They function at the opening stage, where the scientific community establishes its common ground for critical discussion. This stage in the scientific practices is in no small extent predetermined communally rather than determined by the participants in mutual deliberation (Krabbe, 2007).

They function more as implicitly enforced regulative rules on legitimate strategic maneuvers in scientific reasoning and research. They are not supposed to be negotiable but given as the common starting point. Moreover, they assumed to exemplify the shared value judgment of the scientific community. Thus, for instance, if one justifies her assertion solely by appeal to authority, her argument will be disqualified already at the opening stage, as it invalidates one or more of the basic assumptions.

To localize the function of these basic assumptions at the level of a single argumentative maneuver, they function as rebuttals in the Toulmin model. They indicate in which circumstances a scientific argument cannot be held warranted and acknowledge its limitations. In this sense, the rebuttal is by far more than just a counter-argument; it reminds the scientific community that there are limits to legitimacy in any scientific argument. Furthermore, the distinction between scientific and non-scientific methods or between science and pseudo-science becomes clearer precisely because of the normative essence of these assumptions.

5. TWO CASE STUDIES AND A CONCLUSION

The first case refers to the controversy surrounding the removal of the word "science" from the American Anthropological Association's long-range plan statement in 2010 by its executive committee (Peregrine, 2010; AAA Statement of Purpose; Lende, 2010). By choosing to drop "science" as the main qualifier of the field of anthropology, the executive committee has kicked up a heated controversy among anthropologists, philosophers, and scientists in general. Briefly, the advocates of this change argue that since current research in anthropology, such as cultural anthropology, uses qualitative methods with fundamental hermeneutical inclinations, it does not fall under the rubric of science anymore. Hardcore science is judged by its adherence to strict quantitative methods.

However, this line of thought is fundamentally wrong. The Humanities are not less scientific than quantum mechanics, not because they share the same research methods since they do not. Nevertheless, they share the three basic assumptions and their fundamental values. The research methods used by science are ever changing and growing, diversifying and multiplying. However, each method entitled to be scientific must satisfy those values, which are incorporated in those three basic assumptions. Those Humanistic values are the criteria by which specific methods are entitled to be called scientific, and since anthropology did not violate these values, it is still scientific.

The second case study refers to the 1996 Sokal hoax, and the claim is that Alan Sokal was right (The Sokal Hoax: The Sham that Shook the Academy, 2000). In its 1996 issue, *Social Text* journal published an article by Alan Sokal, Professor of Physics at New York University, entitled "Transgressing the Boundaries: Towards a Transformative Hermeneutics of Quantum Gravity." However, this article was a hoax, intended to criticize the intellectual and scientific standards of postmodernist and deconstructivist philosophy.

This affair was discussed at length on both sides of the English Channel. One of the leading deconstructivist philosophers, Jacques Derrida, responded to the Sokal Affair by arguing that it was nothing more than a local mistake of the editors and at any rate, does not prove anything. However, others argue that the Sokal hoax is symptomatic. It showed how willing we are to be deceived about matters we believe firmly in. We are likely to be more critical of papers, which attack our position than we are of those that we think to support it. It is not peculiar to the academic discipline of postmodernism, although Sokal thought that postmodernism tends more than other to ignore reasoned criticism from other disciplines. This tendency to confirmation bias is contradictory to the basic epistemological assumption since it shows that the editors of the *Social Text* journal were blind to their preconceptions. This tendency also contradicts the ethical-political basic assumption, since the editors have shown themselves to be coerced by institutional prestige and the authority of leading figures in the academic community.

Humanism as a political ideology or world-view is the key to understand the essence of science and its practices. In this sense, Jacques Derrida is right when he argues that science is a social construction. What he misses is the difference between our theories and reality. The forming of our theories uses a vast variety of research methods, which all succumbed to the humanistic value of the free but critical scientist.

The non-vote vote as anti-legal identity: Catalan independence from the shame of Europe

ABSTRACT: This paper analyzes Catalan arguments surrounding the October 1, 2017 Referendum. The Spanish government's claim that this referendum is unconstitutional counterintuitively provides the basis for a new political subjectivity. The Catalan people have made an argument for their political subjectivity by engaging the referendum's unconstitutionality. This argument from a position of anti-legality reconfigures what it means to be a political subject. This paper focuses on anti/legal argumentation and the implications this has on political participation.

KEYWORDS: anti-legal, Catalan independence, constitutional argumentation, legal argumentation, political participation, political subjectivity

1. INTRODUCTION

This paper argues for an unintuitive position—that there is power in illegality. Despite what we are inundated with in the United States—the evils of illegal immigration, the importance of the rule of law, and dangers of crime–illegality can be a position of power. Of course, legality is promoted everywhere from the police dramas in the United Kingdom to the news broadcasts in China. The issue of legality is all around us, and we work to position ourselves in that discourse as well as resist our positioning in that discourse regularly. We argue that this idea of power in illegality applies in Catalonia where the Catalonian people actually draw power from the Spanish government's insistence that what they do is illegal. Power in illegality is not a standard political position. We certainly do not think that illegality is always a position of power, but rather that it can be.

To put a finer point on it, by way of example, when one was a child, if a particularly bad child, one who was incorrigible, always in trouble, maybe even mean on the playground, called another child 'bad,' that child would respond by embracing the bad label as evidence of their rightness. "If the bad kids think I am bad, then I am actually cool." This illustration happens throughout society. Another popular example is the idea that one's haters give one a reason to live. If you are on social media, you have no doubt seen ideas like this moving through your timeline. If you are making people mad, then you are probably doing something right. There is power in that rabble-rousing, and in the contrast between right and wrong. Being told one is wrong can shift power in positive ways.

To progress through this paper, we consider the history of Catalan nationalism. This study will not be exhaustive, but rather is complete enough to understand how historically based modern national sentiments are. This history also reveals the subtle embracing of anti-

legality. Catalans while opposed to having their language, culture, and dance outlawed, actually draw strength from this. They might be illegal, but they are better than Castile. They might be illegal, but they have a thriving economy that Spain now seems dead set on destroying through poor infrastructure funding.

We also articulate an understanding of power that builds on Foucault's notion of power. Namely, we understand power as both restrictive and empowering, fluid, complicated, and not something someone possesses materially. This means, of course, that Catalonia and Spain constantly affect changing power dynamics.

2. THE TEXT: THE 1 OCTOBER 2017 REFERENDUM

Our text is the 1 October 2017 referendum for Catalan independence and the discourses that surrounded this vote. To be sure, many people have commented on the referendum from Spain, Western and Eastern Europe, and around the world. What we find most interesting is the reaction of the Spanish government, which sought to quell nationalist sentiments, but which has arguably done nothing more than intensify Catalan nationalist sentiments. Here we support our argument about anti-legal identity being powerful with the wide anecdotal evidence available from Catalans. They are, seemingly, more determined that their course is right as a result of Spain's opposition. When one reads the newspapers and webzines that reported on the referendum, it becomes clear that the Catalan support for nationalism is as strong as it ever was.

The vote supported a transfer of power from the Spanish constitutional monarchy to a Catalan independent republic. Roughly 90 percent of Catalans supported the referendum in the vote ("Catalan government says," 2017). Catalonia has long shown distinct cultural, historical, and linguistic traditions. It is not simply a matter of different languages, although Catalan is so distinct from Spanish that even one who knows moderate Spanish may have difficulty understanding conversations or reading signs in stores when in Barcelona. The differences are not regional variations or dialects like those in the United States South, which are recognizable but fundamentally easy to understand, compared with the English spoken in New England or the United States West Coast.

3. A BRIEF HISTORY OF CATALAN NATIONALISM

Historically Catalonia was controlled by Muslims for only 80 years compared with the 800-year rule of Spain by Muslims. These histories shaped different language patterns, to be sure, but also allowed Barcelona to become a cosmopolitan trading port on the Mediterranean that connected it with neighboring populations throughout Africa and Europe. Catalan influence spread throughout Spain and is still spoken in parts of the Italian island Sardinia.

The County of Barcelona joined the Kingdom of Aragon, in 1150 with the marriage of Petronilia (Queen of Aragon) and Ramon Berenguer IV (Count of Barcelona), which eventually lead to the joining of Castile with Aragon, or the precursor to the uniting of Spain and Catalonia. This amalgamation was cemented by the marriage of Ferdinand of Aragon with Isabella of Castile in 1469. The unity of the two regions was not simple however, as both regions existed independently from each other under one monarchy. In 1640, Catalonia rebelled. The Catalonians had reason to be hopeful, as Portugal was able to wrest control from Spain in the same year. But Catalonia did not succeed. It is reasonable, then, to understand 1640 as the beginning of this anti-legal identity. While there were many reasons for Catalonia to construct itself as a separate place with a rich cultural space; Catalonia also constructed its

identity as not-Spain, not its monarchy, and not its people. Although this paper does not deal much with the deep roots of anti-legal identity, it is important to recognize that Catalonia's development as not-Spain is not a creation of 2017 or of the Spanish Civil War of the 1930s. Franco's victory during the Spanish Civil War was but one event in an anti-legal narrative spanning nearly 400 years.

In 1714, Castilian became the official language. The 1800s saw the demise of Spain's colonial empire and constant civil war and economic difficulties. Catalonia thrived, and its people began developing an even more intense pride in their culture and region. During this time the Catalan language blossomed with expanded interests in art and literature. Catalonia seemed very much different from impoverished, conflict-filled Spain.

Franco ruthlessly repressed minorities of all sorts, but his restrictions on Catalan music, language, and dance seem particularly troubling given the long history of Castile and Catalonia working together if not with some tension. Franco sent Spain's poor to Catalonia in an attempt to dilute Catalan ancestry. Catalonia began to be understood as an aberration, an impurity, linguistically and culturally. This discrimination continued until Franco's death in 1975 when not long after, Catalonia received autonomy as part of the constitution of 1978. Such autonomy did not last as Spain's Constitutional Court repealed powers granted in the 1978 constitution and a later 2006 statute. Spain's economic crash of 2008 certainly did not help relations as bitterness, resentment, and nationalism blossomed. It is this give-and-take of autonomy which stems the modern beginnings of Catalan nationalist sentiments. That is, it is where many nationalists order their opposition.

4. POWER

Power is fluid, multimodal, and unstable (Foucault, 2000). Following the work of Aníbal Quijano (2000), we understand Spanish government antagonisms toward Catalans as part of Spain's investment in the coloniality of power which allowed it to devalue its colonial possessions. Despite Catalonia not being a part of Spain's far-flung empire, the people of Catalonia still suffer as a result of Spain's discriminatory practices informed by a colonial ideology. Quijano (2000) argues that race and culture are constructed and reconstructed often to serve the colonizer's vision for whom and what is appropriate, valuable, and right. For example, Van Dijk (2005) proposes the discourse in Spain's media has perpetuated racist rhetoric and ideologies of 'Us' versus 'Them.' Catalonia, then, suffers both the effects of the colonial imaginary and the influence of a discriminatory media.

To be sure, power ebbs and flows, and it manifests not only in colonial struggles but also policing, surveillance, the politics of language, cultural norms, state-sponsored violence, and more. This understanding of power means that Catalans can and do exercise power as they attempt to build a nation-state, challenge Spanish laws, and advocate for their culture. Meanwhile, Spain also exercises power because power does not exist in a vacuum, but is, rather, relational.

The goal is not to trap power, to find it in locations, but rather to understand how people and groups of people exist in a complex changing field of power. Raymie McKerrow (2011) describes Foucault's understanding of power in this way:

> The goal is not to privilege the subject, but to understand how and in what senses the subject becomes constituted within a particular social context or set of relations (p. 257).

This theory of power suggests that scholars must focus on the relationship between Spain and Catalonia rather than focus only on one group as if the other did not exist because to do so would fundamentally misunderstand power. This theory of power also explains why

analyzing confrontations about law and state power are necessary for understanding power. It also explains why the legal/anti-legal distinction is a question at the heart of power.

5. LEGALITY AND ANTI-LEGALITY

We typically think of law as constructing a position of authority, as something providing for ethos, or something used to support an argument. The law-abiding citizen is a respected archetype of the responsible member of society. Police officers act with legal authority. Lawful actions are often supported by the state and in media while unlawful actions are not. Law often adds legitimacy to actions, policies, and arguments which is intuitive. The negative, the law-breaker, is then understood as illegitimate. Illegal aliens or illegal immigrants are the devil de jure in the United States. Increasingly, conservative politicians simply refer to these people as 'illegals.' Following Richard Weaver's (1953) definition of devil terms as those terms that are negative, particular to a certain time period, and necessarily vague with "inherent potency," the term 'illegal' is one of the more prevalent devil terms of this age (p. 212). When Weaver was writing in the 1950s it was, of course, 'communists.' The red scare promoted by politicians and pundits from across the United States and even across party lines invested heavily in a culture of fear. Many do the same with immigration. Weaver's analysis offers a foray into the Spanish argument against Catalan revolutionaries. They were the devil by another name. They were separatists, a term that most nationalists abhor.

To be sure, illegality is often used as a pejorative, a way to prove oneself superior to another. Early in our lives we are taught to follow rules in school, church, and government. We are taught criminals are bad and the police are good. Thankfully, we are divesting ourselves from this hagiography of authority, but these are still central messages in how people in the United States, and we know also Western Europe, grow up. It is so ingrained in our society that it is quite difficult to theorize illegality as anything but bad. Yet, illegality is increasingly an identity of strength, a position designed to challenge the structural inequality of law. Being illegal or criminal is justified when the laws are not.

Roman Catholicism, with which most Catalonian people associate themselves, has adopted the position of defying the government when it passes laws directly in conflict with God's Law and commandments. Likewise, Christians historically have opposed laws they have perceived to be immoral, unjust, wicked, or sinful. Daniel in the Old Testament refused to follow an edict mandating he pray to the king instead of his God which resulted in him getting thrown into a den of lions. Perhaps an even more significant example is that of Jesus himself. Jesus of Nazareth, in the New Testament, constantly produced rhetoric against the religious authorities of his time for their unbiblical, unjust, and legalistic laws, making him a target of their malice.

St. Augustine argued and Thomas Aquinas wrote "an unjust law is no law at all" (West, 2011, p. 17). While such an argument would seem to eschew fidelity to legal argument, it rather, or in contraposition, justifies the anti-legal response. If a law is unjust than disobeying that law must be just. Anti-legality, in this instance, is just.

Gandhi (1962) argued in *Non-Violence in Peace and War, Volume II*:

> An unjust law is itself a species of violence. Arrest for its breach is more so. Now the law of nonviolence says that violence should be resisted not by counter-violence but by nonviolence. This I do by breaking the law and by peacefully submitting to arrest and imprisonment (p. 144).

So then, resisting unjust laws is a reaction against violence. It is a reasonable response, that moment when we take pause to question and resist laws that seem out of place, unreasonable,

or detrimental to society. Gandhi contends that an unjust law is wrong, so wrong that resisting it might be more honorable than obeying it. In this way, or for Gandhi, the law-breaker is more respectable than the law follower of an unjust law. The law follower is the colonizer, the authoritarian, the one who fails to understand culture, which is, in turn, no position to sustain a meaningful legal order.

And, Martin Luther King, Jr. argued in his *Letter from Birmingham Jail*: "One has not only a legal but a moral responsibility to obey just laws. Conversely, one has a moral responsibility to disobey unjust laws" (King, 2018, para. 15). Martin Luther King argues that one has a moral responsibility to disobey laws, following Gandhi. Keep in mind that morality and law were much more intertwined than they are today. So, arguing that morality was separate from law was a radical position that did not get a lot of attention during the lives of Gandhi and MLK. Law was supposed to follow morality, but it does not, and what we consider moral also changes. We come to better understand the world and social relations through appreciating the shifting nature of legal reasoning and morality.

This anti-legal identity, one that embraces its role outside the law, is rhetorically important (Sciullo, 2009). Law is rhetorical, and as such how people position themselves in relation to or in law is also rhetorical (White, 1985). While some will argue that illegality is a position of weakness, we contend that opposition to law is important and necessary. Positioning oneself as anti-legal emphasizes the importance of opposing legal regimes that act illegally. Spoiler alert: laws are not always just. Therefore, what is so bad about opposing a thing that you think is illegal?

Law is difficult. An obedience to law often comes into conflict with one's religious, moral, or other beliefs. Law allows some things that seem quite bad, but also prohibits things, like parking violations, that seem relatively inconsequential. One of the difficulties in thinking about illegality is that it changes. People change, laws change, and as a result relationships change. So, we should not think of opposing a law or doing something illegal as a stable action, something always discernable at first glance. We learn through study and experience that our understanding of what is right, is often quite wrong.

The Catalans begin to work with this anti-legal identity as a position of power, a symbol of their correctness. While the Spanish government called them separatists instead of nationalists, claimed they were acting illegally, and ultimately ruled the referendum illegal, the Catalans collectively argued, "yes, we are opposing a legal system that is anything but legal, and we will always be illegal in that system." Far from overstating it, the Catalans appreciated how their actions would be perceived as illegal and went ahead anyway because that perception empowered their cause. Catalonian perceptions of rightness in the face of illegality only strengthened after Spain's violent reaction to the referendum vote in favor of independence. "The behavior of the [Spanish] police makes people who don't want independence, want independence," asserts Alice, a Catalonian hotel worker (Marx, 2017, para. 12). Like the many instances of police brutality in the Civil Rights Era United States, oppressive authorities violently reacting to legal actions, which only they themselves have claimed are illegal, have only spurred further dedication to those actions and the causes that underlie them.

The best possible position for the non-violent resistance of the Catalans is that of illegality. That position of illegality demonstrates just how oppressive Spain is. And, this maneuver, taking the opposite course of action, both affords them unique argument ground and also intensifies their legal claims. It follows this logic: If we are illegal, it is because Spain is so corrupt and illegal. If we are legal, then Spain's claim that we are illegal is particularly horrible.

Rather than ignore the evolving nature of this conflict, we argue that Catalonia can draw strength from its opposition to Spain not only to challenge Spain's legal determination,

but also to continue to draw power from its status as loveable rebel. It is illegal and defiantly so. So are the spray painters on our buildings demonstrated prominently in Amsterdam's Moco Museum and the mixtapes that sample songs for longer than 8 seconds that we buy in West Hollywood, California. Being anti-legal can be powerful, and it seems that Catalonia's embrace of its illegality is just what it needs to challenge the presumption of Spain's legality.

Catalonian citizens highlight these voices themselves. David, a Catalonian, states:

> We speak Catalan.... I am Catalan only, not Spanish. I would like Catalonia to become independent. That's the only way we will have to make our own decisions.... I feel like Catalonia is not Spain's priority.... We would do better being independent ("Catalonia's bid for independence," 2018).

David exemplifies a common sentiment in Catalonia—discontent with the status quo. Catalonians already feel separate from Spain considering they have their own culture and traditions. Citizens like David take on the illegality label if only to be able to acquire the autonomy they once possessed.

An anonymous Catalonian and resident of Barcelona for the past 15 years argues:

> It's not about whether I want Catalonia to be a separate state or not. It's about my right, as a citizen in a democratic country, to vote. If Spain wants to call itself a democracy, it has to allow its citizens to determine their own future, and respect that vote regardless of the outcome (Michanie, 2018, para. 9).

This citizen articulates the primary concern is not in the results but in the process. It is about regaining a sense of power, autonomy, and democracy; a democracy Spain promised but has failed to provide for those residing in Catalonia. The more Spain retaliates against calls for democracy, the stronger those calls become and the stronger the rallying force behind the Catalonian independent movement—whether or not it is recognized by Spain as legal.

Eduard Márquez (2018), a Catalonian citizen and writer highlights this situation:

> Social movements that, under the banner of non-violence, fight against political and judicial repression and seek new spaces for political and social dialogue, but are nevertheless accused of carrying out acts of terrorism (para. 5).

Márquez asserts it is too late to go back to being an entity under Spain's control due to their blatant demonstration of oppression. Márquez (2018) writes:

> Too much incomprehension, too much repression, too much injustice, too much pain, too many frustrated aspirations... Impossible. We need a new space of coexistence. And Spain, at the moment, is not the right place (para. 6).

Illegality is just another name for freedom in the minds of citizens like Eduard. What Spain has labeled illegal, these Catalonians have drawn strength and power from, knowing this arduous road is necessary to travel to obtain the freedom they desire.

6. CONCLUSION

Argumentation occurs not simply in favor of legality, but also in favor of illegality. Rather than continue to look for power or some sense of the political subject in legal identity, we need to think more broadly about how anti-legality can construct the political subject, and what benefits that construction may have in a given situation.

Yes, Spain declared the referendum illegal, but that does not mean the referendum was worthless, or that it did not have political effects. Rather, this declaration helped shape a

discourse of anti-legality that bolstered the Catalan case. It is easy to conclude that Spain's actions seem legal and reasonable given the government's interest in holding the country together, and that this is the end of the story. But, a more nuanced understanding of people's power comes from appreciating the full breadth of resistance available in anti-legal identities.

Towards defining the relation of attack

MARCIN SELINGER

Department of Logic and Methodology of Sciences
University of Wrocław
Poland
marcisel@uni.wroc.pl

ABSTRACT: The aim of this paper is to define the relation of attack that holds between arguments and (counter)arguments. The definition to be given provides the necessary and sufficient conditions of a successful counterargument, relatively to the previously developed model of representation and numerical evaluation of structured arguments. In the course of the exposition, three traditionally distinguished kinds of defeaters: rebuttals, underminers and undercutters are discussed, however special attention is paid to the latter. In particular, an algorithm to estimate the impact of undercutters on the strength of arguments is proposed.

KEYWORDS: argumentation diagrams, argument evaluation, attack relation, defeasible reasoning, rebuttals, undercutters, underminers

1. INTRODUCTION.

It seems that in argumentation theory at least two logical approaches to the relation of attack can be distinguished in connection with the study of defeasible thinking. The first, classical approach deals with the analysis of structured arguments that can be represented by argumentation diagrams known from informal logic, and can be evaluated on the basis of the RSA-triangle requirements (Johnson, Blair 1977). The second approach is developed within the abstract argumentation theory initiated by Dung (1995), where the notion of attack is regarded as a primitive one, and where the attackers, as well as the objects that are attacked, are unspecified, so that they can be single sentences, propositional structures or indeed any extra-linguistic entities if they only satisfy the theorems of the abstract argumentation theory. The definition to be proposed here is based on the analysis of argument structure, however it is accompanied by the conviction that together with the underlying method of argument evaluation it can serve as a link between the classical and the abstract approach.

There are a few argumentation systems using diagrams of arguments and adopted to consider defeasible reasoning, so that they can serve as a basis for the formulation of the definition in question, e.g. Deflog (Verheij 2003), ASPIC+ (Prakken 2010), Carneades (Walton and Gordon 2015). The system proposed here has its own way of formal representation of argumentation structures, but the key difference affecting the definition of attack is that the underlying model of evaluation allows infinitely many degrees of acceptability. Therefore it allows us to consider an attack as more or less efficient and express its efficiency numerically. Within this model an attack can be unsuccessful, even though the counterargument in question is acceptable, but it is not strong enough to prevail the attacked one. An attack can also be considered as partly successful if it only weakens the attacked argument (in particular when it is aimed at only some of its converging subarguments).

The aim of this paper is to define the relation of attack that holds between arguments and (counter)arguments. There are three traditionally distinguished kinds of attack: *undermining attack* on a premise, *rebutting attack* on a conclusion and *undercutting attack* on the relationship between premises and a conclusion (Pollock 1987, Prakken 2010). Respectively, three kinds of attackers are: *underminers*, *rebuttals* and *undercutters*. The

nature of each of them will be discussed, but special attention will be paid to undercutting defeaters and their relation to the so-called hybrid arguments (Vorobej 1995).

The following Section 2 concerns the propositional structure of arguments given by the standard argumentation diagrams and their dialectical extensions. In Section 3 the associated evaluation method is considered. In Section 4 syntactic relations between arguments and corresponding counterarguments are defined first. Then some procedure serving to evaluate the effectiveness of attack is given, and the definition of successful attack is formulated. Finally, in Section 5 some consequences of the proposed definition are discussed briefly.

2. SYNTAX. ARGUMENTATION DIAGRAMS

The starting point of the exposition are the standard argumentation diagrams (*cf.* Jacquette 2011) that enable us to represent the supportive part of reasoning, i.e. the inferential distribution of the support relation between premises and conclusions that form arguments. Figures 1a-e show the standard diagrams of basic types of arguments. Among them, Figures 1c-e correspond to the elementary syntactic operations on arguments. The atoms of these operations are individual inferences, represented by arrows on diagrams. Since single arrows, and by the same single inferences, are distinctive for simple and linked arguments (Figures 1a-b), these two types can be called *atomic*.

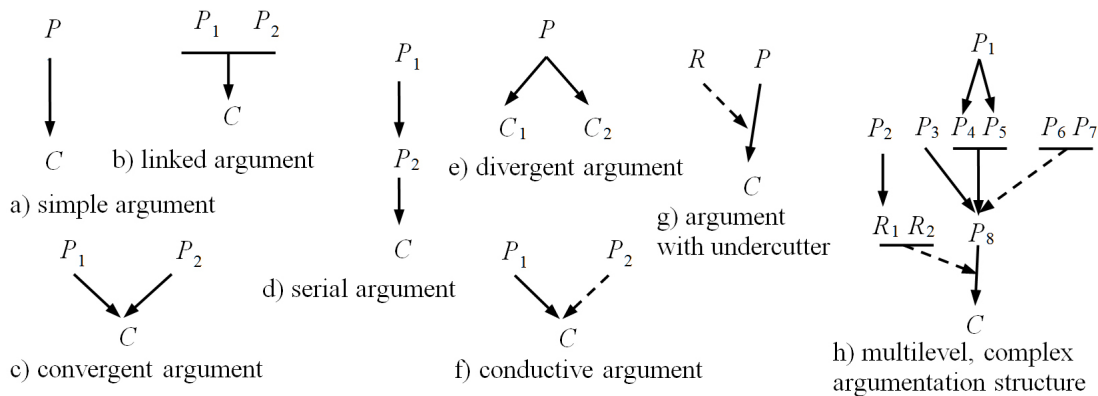

Figure 1. Argumentation diagrams

The standard diagrams can be enhanced in various ways. In order to define the attack relation, it is useful to introduce two dialectical extensions. The first is to add the representations of con-arguments whose premises contradict (or 'deny', or just 'attack') their conclusions. This extension corresponds to probably the genuine way to understand the relation of attack, i.e. as holding between sets (or conjunctions) of sentences and individual sentences. Such a relation can be reduced to the relation of support of the negatives of conclusions, but on diagrams it is convenient to mark it as a primitive one using dashed arrows that lead from single or linked premises to their conclusions. This extension of standard diagrams enables us to represent conductive arguments (Figure 1f) recognized as pro-contra arguments (*cf.* Walton & Gordon 2015, Selinger 2015), i.e. arguments matching the following scheme (or some of its variations), where pros are presented as overcoming cons:

(1) *Since* <pro>, *therefore* <conclusion>, *although* <contra>.

Introducing con-arguments serves us to incorporate the representations of rebutting and undermining defeaters to argumentation schemes. The second extension is to incorporate the representations of undercutting defeaters (Figure 1g). Undercutters are understood as exceptions of inference rules that normally hold. In the original Pollock's example (1987) the argument:

(2) *The object looks red, so it is red*

can be defeated by the sentence:

(3) *The object is illuminated by the red light*

which is an exception of the rule that enables us to accept (2) under normal circumstances. Freeman (2011) considers undercutting defeaters to be dialectic parts of arguments matching the scheme:

(4) *Since* <premises>, *therefore* <conclusion>, *unless* <undercutter >.

However, in the utterances of this form, (e.g. *The object looks red, so it is red, unless it is illuminated by the red light*) undercutters are neither claimed nor disclaimed. Without this information arguments cannot be normally evaluated, and *unless* seems to work rather as a disjunction connective, and if it is to be a propositional connective then the conclusion of (4) is the whole sentence after *therefore* (thus without comma before *unless*). It can occur in a particular reasoning or argumentative dialogue as a result of weakening of the previously intended conclusion of some inference, which has just been realized to have a possible undercutter. If this undercutter will be refuted then the previously intended conclusion can be inferred using *modus tollendo ponens*. Otherwise, i.e. if it will be accepted or remain undecided, the stronger, previous conclusion cannot be inferred, and one has to be satisfied by the lone disjunction.

The same scheme is used by Freeman to represent arguments with rebutting defeaters:

(5) *Since* <premises>, *therefore* <conclusion>, *unless* <rebuttal>,

and almost the same objection can be raised in this case. The only difference is that *unless* is to be interpreted in (5) as an exclusive disjunction connective. Thus, if rebuttal happens to be accepted then the previous, stronger conclusion can be rejected.

Regardless of the interpretation of the schemes (4) and (5), the enhanced argumentation diagrams can capture a fairy rich variety of complex argumentation structures as e.g. the one in Figure 1h. Given a language L, such structures can be represented symbolically as finite, non-empty sets of enhanced sequents, i.e. sets of quadruples of the form <P, c, d, R>, where $P \subseteq L$ is a finite, non-empty set of premises, $c \in L$ is a conclusion, d is a Boolean value indicating the polarity of inference (1 for pro- and 0 for con-arguments), and $R \subseteq L^2$ is a finite set of non-empty, finite sets of undercutters (*cf.* Selinger 2014, 2015). Thus, there can be many sets of linked undercutters that attack as well pro- as con-sequents (if R is empty then such an inference is not being attacked).

3. EVALUATION OF ARGUMENTATION STRUCTURES

In what follows it has to be assumed that all the considered arguments are not circular. Only such arguments can be evaluated using the method proposed here. For simplicity of the exposition it is also assumed that the considered arguments are coherent, and divergences, if any, can occur only locally as in Figure 1h, i.e. all divergent conclusions have to be intermediate and eventually support (or deny) the same further conclusion. Thus, each structure under consideration has exactly one final conclusion (*cf.* Selinger 2014).

Argumentation structures will be evaluated using the scale of rational numbers belonging to the interval [0, 1], where 1 stands for *fully acceptable* (*credible*), 0 for *fully unacceptable* (*incredible*), and ½ for *undecided*. In the starting point of the evaluation process a partial function is given that assigns acceptability values to the elements of some subset of *L*. It is called *evaluation function*, and it plays the role of an audience. The first premises (and undercutters) of an argument in question have to belong to its domain. Arguments are computed 'from bottom up', i.e. acceptability values of the first premises (and undercutters) are transformed to the acceptability of the final conclusion. Formally, the initial (i.e. input) evaluation function is extended step by step using suitable algorithms to eventually include the final conclusion of an examined argument. The acceptability of the final conclusion is taken as the acceptability (or *strength*) of the whole argument. The algorithms have to correspond to syntactic operations on arguments and their premises. Thus, there must be algorithms for computing 1. the overall acceptability of linked premises (the sign '$\odot$' will be used to denote the corresponding arithmetical operation), 2. the acceptability of atomic pro- ($\otimes$) and con-arguments ($\otimes^c$), 3. a modification of this value by possible undercutters ($\copyright$), 4. the overall acceptability of converging atomic pro- ($\oplus$) and con-arguments ($\oplus^c$), and finally 5. the acceptability of conductive arguments ($\oslash$). In order to compute atomic arguments one more factor is needed in addition to the acceptability of premises, namely, a parameter that reflects the strength of inference, i.e. the degree of relevance of the premises of a given sequent to its conclusion. This parameter is to tell us the acceptability of the conclusion under the condition that all the premises are fully acceptable, thus it can be called *conditional acceptability*. Formally, it corresponds to a function assigning acceptability values to ordered pairs – the first element of each pair is a sentence of *L*, i.e. a conclusion, and the second one is a set of sentences of *L*, i.e. a set of premises (the latter element can be also considered to be a single sentence, i.e. the conjunction of premises).

The main idea behind the proposed method is to employ the algorithms satisfying the following principle of proportionality: *the acceptability (strength) of an argument should vary proportionally to the variations in the values assigned to its components.* Since the algorithms for points 1, 2, 4 and 5 have already been discussed in detail (Selinger 2014, 2015), they are only listed below. The algorithm concerning undercutters (point 3) is justified and discussed separately.

Ad 1. Linked premises:
— $x \odot y = xy$, where x, y are the acceptability values of premises.

Ad 2. Atomic pro-arguments:
— $x \otimes y = xy$, where x is the acceptability of (the set of) premises, y is the conditional acceptability (conclusion/premises), and $x, y > ½$.

Atomic con-arguments:
— $x \otimes^c y = 1 - xy$, where x is the acceptability of (the set of) premises, y is the conditional acceptability ($\neg$conclusion/premises), and $x, y > ½$.

Ad 4. Convergent pro-arguments:
— $x \oplus y = 2x + 2y - 2xy - 1$, where x, y are the acceptability values of two converging pro-arguments, and $x, y \geq ½$.

Convergent con-arguments:

— $x \oplus^c y = 2xy$, where x, y are the acceptability values of two converging con-arguments, and $x, y \leq \frac{1}{2}$.

Ad 5. Conductive, i.e. pro-contra arguments:

— $x \oslash y = x + y - \frac{1}{2}$, where x is the overall acceptability of pro- and y is the overall acceptability of con-arguments, and $x \geq \frac{1}{2}$, and $y \leq \frac{1}{2}$, but for conclusive pros or cons the following exceptions apply:

— $1 \oslash y = 1$ for $y > 0$;
— $x \oslash 0 = 0$ for $x < 1$;
— $1 \oslash 1$ is an antinomy and it is incomputable.

Pro-arguments are acceptable if the obtained value is greater than $\frac{1}{2}$. Con-arguments are acceptable if this value is smaller than $\frac{1}{2}$. Since in the scheme (1) pros are presented as overcoming cons, conductive arguments are regarded to be acceptable just in this case, i.e. when the obtained value is greater than $\frac{1}{2}$. If at any stage of evaluation a considered subargument happens to be incomputable, because some component value does not fall within the scope of operation of a suitable algorithm, then for technical reasons its acceptability can be fixed as $\frac{1}{2}$.

Ad 3. The conditional acceptability in an atomic argument with an undercutter has to be equal $\frac{1}{2}$ if the undercutter is fully acceptable. It means that even if the premises are acceptable, the conclusion is undecided. Otherwise, if the undercutter is undecided then it cannot work, and thus it does not affect the inference. Therefore the conditional acceptability remains unreduced in this case. Within the range $[\frac{1}{2}, 1]$ the conditional acceptability should vary proportionally to the acceptability of undercutter, in accordance with the principle of proportionality. These variations are illustrated geometrically in Figure 2a, and the proportion in question can be read thanks to Thales' theorem.

Figure 2. Conditional acceptability with undercutter

The obtained proportion brings us the following algorithm for computing the conditional acceptability in atomic pro-arguments with undercutters:

— $x \copyright y = 2x + y - 2xy - \frac{1}{2}$, where x is the conditional acceptability of an attacked pro-argument (conclusion/premises) or con-argument (¬conclusion/premises), y is the acceptability of its undercutter, and $x, y \geq \frac{1}{2}$.

An interesting property of the operation $\copyright$ is that in the case of many undercutters attacking the same inference, it can be applied consecutively in any order, because the following equation holds for every x, y, z:

$$(6)\ (x \copyright y) \copyright z = (x \copyright z) \copyright y.$$

Moreover, the operation $\copyright$ is interrelated with the operation $\oplus$, since for every x, y, z:

(7) $(x © y) © z = x © (y ⊕ z)$.

The operation ⊕ is commutative and associative, so the algorithm for computing convergent arguments can be used to calculate the overall acceptability of any finite number of different sets of linked undercutters.

Otherwise then in the case of plain premises, whose relevance to their conclusions in sequents is given as the conditional acceptability, a similar parameter has not been assigned to the relevance of undercutters. Therefore, in addition to the proposed algorithm, a separate condition for relevance has to be formulated in order to restrict the use of the operation © only to the real exceptions to the rules of inference in question. The idea of such a condition employs the so-called *hybrid arguments* perceived by Vorobej (1995), who observed that some premises can be neither sufficient to formulate a separate converging argument, nor linked with the other premises, since removing them merely weakens an argumentation in question. The unique role of such non-autonomous premises is to strengthen defeasible arguments. Vorobej gave an example of enumerative induction and a premise speaking that all individual cases are captured by the remaining premises, which makes the induction complete. It seems that the denials of undercutters are just premises of this kind. Thus, Pollock's example (2) corresponds to the following, stronger hybrid argument:

(8) *The object looks red, and it is not illuminated by the red light, so it is red*.

Freeman (2011) claims to the contrary that the refutation of an undercutter merely removes an obstacle to draw the conclusion of an attacked argument, so that it does not increase its strength, but only can restore it. However, such a refutation allows us to exclude a possible exception to the rule of inference in question. The smaller the set of exceptions to the rule, the more reliable the inference seems to be. In the extreme case, if excluding all the possible exceptions to some rule is achievable (as in the example of induction), one can arrive at the deductive inference.

Based on the above consideration, the following relevance condition for undercutters can be formulated in order to supplement the proposed algorithm:
— the conditional acceptability of an attacked argument (conclusion/premises) is smaller than the conditional acceptability of its hybrid counterpart (conclusion/premises&¬undercutter).

If this condition is not satisfied then the conditional acceptability in question remains unchanged. For example, the conditional acceptability in deductive arguments is equal 1. Since this value cannot be strengthen, deductive arguments do not have relevant undercutters.

At the end of this chapter it is worth noting that a more restrictive than ©, alternative operation can be considered (*cf*. Figure 2b), which reduces conditional acceptability even if an undercutter is unacceptable, but not fully unacceptable, i.e. if there is any shadow of doubt about its falsity (the proportion read from Figure 2b determines the following algorithm: $x ©'$ $y = 2x + y - 2xy - ½$, where $x > ½$ is the conditional acceptability of an attacked argument, and y is the acceptability of its undercutter). But if the acceptability of an undercutter belongs to the interval [0, ½), then the acceptability of its negative is greater than ½, so that this negative can be used as a premise of a suitable hybrid argument strengthening the conclusion. The operation ©' within this range, on the contrary, weakens the acceptability of this conclusion, so that the choice of the operation © seems to be more compatible with the observations just discussed, regarding the relationship between hybrid arguments and undercutters.

4. DEFINITION OF ATTACK RELATION

Although some ideas concerning the relation of attack have been already fixed in (Selinger 2015), solely elementary cases of attack, i.e. restricted to atomic arguments, were discussed there, and successful undercutting attack was defined only partially. The definition to be proposed in this paper captures any arbitrary, elementary as well as complex, argumentation structures and thanks to the operation © specifies the impact of undercutters on arguments' strength.

Since some relation that holds in the set of structured arguments is considered, firstly, the appropriate form of attackers has to be defined, respectively to the form of arguments being attacked. Syntactically, attack on a conclusion and attack on a premise are similar, because what is attacked directly is a sentence. In both of these cases two possibilities can be distinguished, depending on whether a) an attacked sentence and the conclusion of an attacker are *contradictory*, in the sense that one of these sentences is the negative of the other, or b) instead of negation, con-arguments have been employed.

Thus, in the case of rebutting attack[1]:

1a) two arguments (either both pro, or both contra, or both conductive, or one pro and one conductive) with contradictory final conclusions can attack each other;

1b) a pro- (or conductive) argument and a con-argument with the same final conclusion can attack each other.

In the case of undermining attack:

2a) an attacker can be any pro- (or conductive) argument if its final conclusion is a sentence contradictory to a premise of an attacked argument;

2b) an attacker can be any con-argument if its final conclusion is a premise of an attacked argument.

What is attacked in the case of undercutting is neither a premise nor a conclusion. Thus, the conclusion of an attacker cannot be any of these individual sentences (or their negatives). What is attacked is precisely a relationship between the premises and the conclusion of some sequent forming one of atomic subarguments of an attacked argument. In order to conclude such an attack usually a meta-sentence is used, which says that the conclusion of an attacked (atomic) argument is not entailed by its premises, etc. Alternatively, a modal operator can be employed, and the conclusion of an attacker can be the sentence, which says that it is possible that the conclusion of an attacked (atomic) argument is not true (resp. 'not false' for con-arguments), while its premises are true. Otherwise, if neither metalanguage nor modalities can be used, the categorial classification of undercutting attackers as structured counterarguments seems to be problematic. Therefore, in the case of *undercutting attack* it will be assumed that:

3a) an attacker can be any (pro-) argument with the final conclusion of the form: *It is possible that ∧P and not C*, where ∧P is the conjunction of the premises of an attacked atomic pro-subargument, and C is its conclusion (or: *It is possible that ∧P and C*, if a con-argument is under attack);

---

[1] Attack on a conclusion often has a form of *reductio ad absurdum*. Including it in the proposed model requires another enhancement of argumentation diagrams, namely introducing a representation of suppositional thinking (*cf.* Freeman 2011, Jacquette 2011, Selinger 2016). Formally, following some scholar's suggestions as Hitchcock (2007) or Freeman (2011), each suppositional derivation can be taken as a kind of premise of an entire argument. The acceptability of such a special premise can be computed as the acceptability of its final conclusion, assuming all its (first) suppositions are fully acceptable.

3b) an attacker can be any (pro-) meta-argument with the final conclusion of the form: *The conclusion of A is not entailed by its premises*, etc., where *A* is an attacked atomic pro-subargument (or: *The conclusion of A is not excluded by its premises*, etc., if *A* is a con-argument).

Attack can be regarded as an essential element of a previously not assessed evaluation. It seems to be the case of Dung's frameworks, where the evaluation consists in the analysis of attack graphs containing an examined argument. But using the method outlined in the previous chapter, the acceptability of arguments can be computed initially, i.e. apart from their possible attackers, so that an approach considering attack as a revision of this preliminary computation seems to be more appropriate. It is necessary, however, to re-evaluate the entire argument under attack, not only its part that is attacked directly. The first reason is the presence of convergent arguments. An attack aimed at one of converging components does not have to affect the remaining ones, and thus can be only partially successful. The second reason is that, on the contrary, some partly successful attack on one element of an argument can happen to be fully successful with respect to the whole argument (e.g. weakening of one premise can make that, taken together with the remaining linked premises, it becomes insufficient to entail the conclusion, although taken separately it is still acceptable).

The process of re-evaluation proceeds in three following steps.

The 1st Step applies only to rebutting and undermining attack, where the conclusion of an attacker can be contradictory to the sentence directly attacked. In order to aggregate the representation of an argument with the representation of its counter on one diagram, such possible contradictories have to be eliminated. Therefore, the attacker's final conclusion is replaced by the attacked sentence, while the polarities of the attacker's final arguments have to be reversed, i.e. pros have to be replaced by cons and vice versa.

In the 2nd Step, the adopted diagram of an attacker and the diagram of an argument under attack are aggregated. The aggregation results in a conductive argument in the case of rebutting attack and in a serial argument in the case of undermining attack. Formally, the obtained diagram represents the set-theoretical sum of two aggregated sets of sequents. In the case of undercutting attack the aggregation is a bit more complicated. Metalinguistic or modal conclusions of attackers only indicate attacked sequents, so they are simply omitted, while sets of their linked premises (i.e. undercutters) are added to the fourth element of the indicated sequents. If undercutters have some further support then the supporting (or possibly denying) arguments are set-theoretically summed up with the rest of sequents forming the arguments under attack.

In the 3rd Step, the entire, aggregated structure, consisting of some argument as well as of its counter, is re-evaluated. The initial evaluation function is the same one, which was used originally to evaluate this argument before attack. All the first premises of the counter must be elements of its domain. A slight modification has to be introduced to the process of evaluation if a first premise is undermined. Since it is assumed that the attacked argument had been previously evaluated, it is presupposed also that all of its first premises belong to the domain of the original evaluation function. So the undermined premise also does, and its original value must be taken into account in the process of re-evaluation. The acceptability of such a first premise is computed using the operations $\oplus$ and $\oslash$ as if its original value would be the acceptability of a separate (pro-) argument supporting it.[2] Thus, while computing the

---

[2] Such a computation can result in double counting if the original value of an attacked first premise was obtained with help of arguments, which are repeated in its attacker. Moreover, the original value could be obtained using pro- as well as con-arguments, and in order to estimate their exact impact on the overall value in question they should be reconstructed in fact, because firstly all the pros' and cons' are to be grouped and summed up

value of some undermined first premise, the function of evaluation is not extended but modified in fact.

An argument can be regarded as defeated if the aggregated argumentation structure is not acceptable. Thus, we eventually arrive at the following definition. An argument *A* *successfully attacks* an argument *B* iff

(i) the attacker *A* has a proper form relatively to the argument *B* under attack (i.e. one of those characterized by the conditions 1a-3b above);

(ii) either the attacked argument *B* is pro or conductive, and the acceptability of the aggregated argumentation structure obtained from A and B is not greater than ½ (i.e. ≤ ½ or incomputable), or it is a con-argument, and the acceptability of the aggregated argumentation structure is not smaller than ½ (i.e. ≥ ½ or incomputable).

If the acceptability of an attacked argument is only reduced then such an attack can be called *partly successful*.

4. CONCLUSIONS

The set of what one wants to call 'structured arguments' can be the set of all the argumentation structures defined in Section 2 or it can be extracted from this collection in many ways, depending on one's intuitions, practical reasons etc. (e.g. as corresponding to the standard diagrams only). Anyway it will be done, the particular application of the proposed definition of successful attack determines a suitable relation in this set, with respect to some given evaluation function. Such a set of arguments together with the corresponding relation can be regarded and analysed as an Abstract Argumentation Framework (perhaps the word 'abstract' is no more relevant in this case). In this sense the proposed definition is the link between informal logic and abstract argumentation theory, mentioned in the introduction.

If the set of arguments will be defined broadly enough to include the discussed dialectical extensions, then an attacked structure may even be strengthened when its subargument under attack is just an attacker of the positive part of the whole (as e.g. a con-subargument in a conductive argument). Although such a case satisfies the syntactic conditions of attack, obviously it cannot be successful with respect to the whole. But when it is successful (or partly successful) with respect to the negative part then it is a kind of *defense*, namely the kind considered in Dung's frameworks as an attack on an attacker. In the proposed model also a direct, supportive defense can be considered when the positive part of argument is expanded using supportive premises.

A counter to an undercutter can result in strengthening of an attacked argument if the undercutting sentence happens to be unacceptable and the corresponding hybrid argument is stronger than the attacked one. Otherwise, counter-rebuttals can only restore the acceptability of an attacked argument to its starting level, i.e. before the attack. However, it can be maintained that each rebuttal also undercuts any inference supporting the rebutted conclusion (*cf.* Freeman (2011) recalling Rescher's argument). If one agrees on this claim then she/he should add consequently all con-premises to all converging pro-arguments as their undercutters. Moreover, if (otherwise then in Freeman's approach) a symmetry between pros and cons is to be maintained then also all pro-premises should be added to all converging con-

---

separately using the operations ⊕ and ⊕ᶜ, respectively, and only then the operation ⊘ can be applied. These difficulties are nothing more than a reflection of a real-life situation, in which a rational change of some view requires a confrontation of a new evidence with all the reasons that formed this view so far. Therefore, if possible, the computation of undermined first premises should be prepared by a thorough analysis of such reasons.

arguments as their undercutters. Obviously, the proposed model would still work, however taking into account all these dependencies among attackers would significantly complicate computations.

A way out of this somewhat troublesome situation can be seen in dialectics by recalling the interpretation of the schemes (4) and (5) given in Section 2. Namely, if some proponent's argument is challenged by any opponent's undercutting or rebutting defeater then the burden of proof rests on the proponent who has to weaken the intended conclusion by adjoining this sentence using an appropriate, either inclusive or exclusive disjunction. If the proponent is able to refute this defeater then she/he can deductively infer the intended conclusion by *modus tollendo ponens*. Otherwise, the conclusion either remains weakened, or — in the case of adjoining a rebuttal by means of the exclusive disjunction — can be deductively refuted by the opponent if she/he is able to justify this rebuttal. However, since the number and order of challenges can impede the final result, such a solution has to be deeply analysed within further work.

ABSTRACT: In this paper we approach medical Shared Decision-Making (SDM) from the perspective of the pragma-dialectical theory of argumentation. We develop an analytical tool for reconstructing the contributions of doctor and patient to the decision-making process, taking into account both the general characteristics of SDM and the different alternatives for the division of labour proposed in the medical literature. The tool can function as a starting point for well-founded evaluations of the reasonableness of these contributions.

KEYWORDS: argumentation, doctor-patient communication, medical consultation, pragma-dialectics, Shared Decision-Making, health communication

1. INTRODUCTION

For medical consultations involving a doctor and a patient, the model of so-called 'Shared Decision-Making' (SDM) is now generally viewed as ideal (Stiggelbout et al., 2015).[1] According to this model, doctor and patient make a joint decision about the best treatment for the patient. This is in contrast to older models for doctor-patient communication such as the 'paternalistic model', in which the doctor decides what is the best treatment for the patient, or the 'informed decision-making model', in which the decision-making about the treatment is left entirely to the patient (Charles et al., 1997, pp. 682-683).

According to the classic description by Charles et al. (1999, p. 652), SDM has at least the characteristics that both doctor and patient are involved in decision-making about the treatment, sharing information with each other, presenting treatment preferences, and jointly agreeing on the final choice for the treatment. In the medical literature one usually finds a characterization of the process of SDM that is in accordance with this general description. At the same time, various proposals are made for the concrete interpretation of the division of labour between doctor and patient in the successive stages of the decision-making process. As a result of this diversity of opinions, in the literature there is little agreement about the assessment of the quality of medical consultations.

In this paper we approach the process of SDM from the perspective of the pragma-dialectical theory of argumentation (van Eemeren & Grootendorst, 1984, 2004). The resulting analytical tool enables the analyst to provide an accurate reconstruction of the various contributions of doctor and patient to the process. Such a reconstruction may then subsequently

---

[1] This paper is an amended translation of a paper presented at the VIOT 2018 Conference at the University of Groningen on January 19, 2018.

serve as a starting point for providing a theoretically justified assessment of the quality of those contributions.

The paper is structured as follows. In Section 2 we describe the general starting points and features of the process of SDM. Next, in Section 3, we give an overview of the different views on the exact division of tasks between doctor and patient. Based on this inventory of the general and specific characteristics of the process of SDM, in Section 4 we translate the possible contributions of the doctor and the patient to the process in terms of the pragma-dialectical ideal model of a critical discussion. In Section 5, we reflect on the usefulness of the resulting analytical tool for the reconstruction and assessment of those contributions.

2. GENERAL STARTING POINTS AND FEATURES OF SDM

The discussion model of SDM is premised on the idea that the patient should be given a large degree of autonomy (Charles et al., 1997). In this respect, SDM differs from the earlier paternalistic model, which assumes that the patient will completely rely on the professionalism of the doctor (see, e.g., Emanuel & Emanuel, 1992, p. 2221; Kaba & Sooriakumaran, 2007).

The idea of the patient's large degree of autonomy is reflected in the model of SDM by giving the patient and not the doctor the ultimate right to make a decision about the treatment. Because the difference so created between the participants in the process is related to an inequality in the rights or duties that are assigned to them, it can be called a 'deontic' asymmetry (see, e.g., Lindström & Weatherall, 2015; Stevanovic, 2013).

Another factor that has influenced the design of the model of SDM is the difference in biomedical expertise that usually exists between doctor and patient. The size of this difference, which can be called an 'epistemic' asymmetry (see, e.g., Raymond, 2014), obviously varies from patient to patient. In recent years, the average level of asymmetry may have been slightly reduced due to the emergence of websites with medical information, which are often consulted by the patient prior to the consultation (van Klaveren, 2017).

While it can thus be assumed that the doctor is most knowledgeable when it comes to biomedical insights, the situation with regard to the knowledge of patient preferences is exactly the opposite. After all, it is the patient, and not the doctor, who is most knowledgeable about his personal preferences for certain treatment methods and his experiences with their effects (Raymond, 2014, p. 39). This difference in knowledge level can be labelled as a second 'epistemic' asymmetry.

Finally, for the division of tasks between doctor and patient it is important to recognize that the process of SDM takes place in the context of the medical consultation. Both the initiative and responsibility for carrying out the various steps of that process will therefore in most cases lie with the doctor.

In the medical literature divergent views exist about the nature, number and sequence of the steps that make up the process of SDM. For the purpose of providing a general description of that process, we follow the so-called 'integrated model of SDM', which was developed by Makoul and Clayman (2006). On the basis of a systematic research into conceptual definitions of SDM put forward in a representative number of articles in the medical literature published to date, they describe a number of 'essential' elements of SDM:

> In order for SDM to occur, patients and providers must first define and/or explain the problem that needs to be addressed. That discussion will likely lead to a presentation of options: Physicians should review options, if options exist, and patients should raise options of which they may be aware. Physicians and patients should discuss the pros

and cons of options raised, particularly because they may have different perspectives on the relative importance of benefits, risks, and costs, including convenience and opportunity cost. These perspectives become evident through explication of patient values and preferences – including ideas, concerns, and outcome expectations – as well as physician knowledge and recommendations in the context of the decision at hand. Discussion of patients' ability, or self-efficacy, to follow through with a plan (e.g., test, medication, procedure, behavior change, referral) […] is a critical – though often overlooked – component of assessing the viability of options. Throughout the process, both parties should periodically check understanding of facts and perspectives, providing further clarification as needed. The importance of checking and clarifying understanding has been reinforced by research on health literacy […]. Of course, decisions are not always ''made'' when problems are first discussed; they may be explicitly deferred for a later time (e.g., pending discussion with members of the family and/or healthcare team) […]. Thus, it is essential that physicians and patients arrange follow-up to track the outcome of decisions that have been made or reach resolution on those that have not. (2006, pp. 305-306).

From this description it is clear that the integrated model of SDM does not record the exact division of tasks between doctor and patient. According to Makoul and Clayman, the extent to which the different steps are shared can be interpreted as a continuum: 'It may be helpful to envision the degree of sharing as a continuum with physicians leading the discussion and making decisions at one end, patients leading the discussion and making decisions at the other, and truly shared discussion and decision-making in the middle' (2006, pp. 306-307). In order to gain more insight into the diversity of opinions about the division of tasks between doctor and patient, we provide in the next section an overview of the most important variants thereof that have been put forward in the medical literature.

3. THE DIVISION OF LABOUR BETWEEN DOCTOR AND PATIENT

Although expressing treatment preferences by both patient and doctor is seen as essential in the original description of SDM given by Charles et al. (1997), some authors point at the danger that doctors may try to steer the patient too much in the direction of a particular treatment option by making it clear what their own preferences are. By influencing the patient too much, the process of SDM might be hindered (Engelhardt et al., 2016, p. 56). Other authors believe that doctors do have the right to express their preferences, since otherwise one cannot really speak of *shared* decision-making (Emanuel & Emanuel, 1992, p. 8).

An important criterion for deciding whether or not doctors are allowed to make their own preferences clear seems to be the nature of the decision. In cases in which there is one treatment that is clearly to be preferred on medical grounds, some authors think that it is even mandatory that the doctor tries to influence the patient to opt for that treatment (Dubov, 2015, p. 501). However, if there is a choice to be made between treatments that are equally acceptable from a medical point of view, then, according to Engelhardt et al. (2016, p. 56), the patient's wishes should be decisive. The doctor should then not attempt to influence the patient to choose for a particular treatment (unless the patient explicitly indicates that he prefers the doctor to make the decision).

Another matter on which opinions differ in the literature on SDM, is the question of whether it is the doctor who should ensure that the patients' preferences become clear by actively stimulating the patients to formulate their preferences or the patients themselves who should make known what their own preferences are. According to Ishikawa et al. (2013, p. 151),

to achieve patient centred communication, 'it is inevitable that both the patient and the physician make concerted efforts in that direction'. They believe that SDM cannot be achieved if patients are unwilling or unable to fulfil their roles. Other authors, such as Emmanuel & Emanuel (1992, p. 5) think that the initiative for obtaining clarity about the patients' values and preferences should lie with the doctor.

A last point of discussion in the literature on SDM is whether or not the division of labour between doctor and patient – and in particular the way in which the decision will be taken – should be explicitly discussed at the outset of the decision-making process. Towle and Godolphin (1999, p. 767) regard it as an essential task of the doctor to establish in advance what role the patients would like to have in making the decision about the best treatment option. Other authors, among whom Charles et al. (1999, p. 656), are of the opinion that doctor and patient can also come to an agreement about this during the decision-making process itself. Stiggelbout et al. (2015, p. 1174) believe it is particularly important that the doctor explicitly makes it clear to the patient before the actual decision-making process starts that there is a real choice to be made and that the patient's preferences will play a major role in the decision.

4. A PRAGMA-DIALECTICAL RECONSTRUCTION OF THE PROCESS OF SDM

It has now become clear what the most important opinions are about the general characteristics of the process of shared decision-making that have been put forward in the medical literature and what kind of proposals have been made for the division of labour between doctor and patient. We will next turn to translating the steps that are involved in SDM in terms of the discussion stages of the pragma-dialectical ideal model of a critical discussion (van Eemeren & Grootendorst, 1984, 2004). For each of the four discussion stages distinguished in the model, we will give a reconstruction of the possible contributions of both the doctor and the patient to the process of SDM. In our reconstruction, we will also take the different views on the division of labour between the discussants into account.

Confrontation stage

According to the ideal model, the first discussion stage is the confrontation stage. In this stage, it becomes clear what the difference of opinion is about and what type of difference it is (van Eemeren & Grootendorst, 2004, pp. 60, 135). As soon as it cannot be taken for granted that one party's standpoint will immediately be acceptable to the other party, one can speak of a difference of opinion. Given the general characteristics of SDM presented in Section 2, and the possible variants in the process discussed in Section 3, the following types of differences of opinion can arise between doctor and patient.

In all views on SDM, the doctor is obliged to defend the standpoints that the different treatment options (T_1-T_n) medically speaking are each an acceptable choice. Since it may be assumed that the patient has not yet taken a stance on any of these standpoints, the difference of opinion is a non-mixed multiple one. The need to defend these standpoints results from the doctor's obligation to inform the patient about which medically acceptable treatments are possible. The doctor has the burden of proof for the fact that in the case of each of the mentioned treatments, seen from a medical perspective, the pros outweigh the cons.

According to some views on SDM, the doctor should not put forward a standpoint on which of the mentioned treatments is the most suitable, but should leave the choice of treatment to the patient. According to other descriptions of SDM, doctors are allowed to indicate which treatment they prefer. In such cases, various types of difference of opinion may arise.

First, in a situation in which the patient has not yet formed an opinion on what would be the best treatment, the difference of opinion that then arises can be characterised as *non-mixed single*. The doctor puts forward the opinion that one of the treatment options is the best choice seen from a medical perspective. That this is the case, should be defended by arguing that the weighing up of pros and cons produces the best result in the case of the treatment at issue. As has become clear from the discussion of the literature on SDM, ideally, the doctor should only put forward such a standpoint if the different treatment options are not equivalent from a medical point of view.[2]

When the patient indicates in response that he or she does not agree with the doctor's standpoint that a certain treatment is to be preferred, the difference of opinion changes from a non-mixed single difference into a *mixed single* one. The doctor then takes a positive stance on a certain treatment choice, whereas the patient takes a negative stance on the treatment choice. If the patient only expresses doubt with respect to the doctor's standpoint, the difference of opinion is again *non-mixed single*. The doubting patient has not put forward a standpoint and therefore does not carry any burden of proof.

On the basis of the given characterization of SDM it must be assumed that in many cases the difference of opinion will change during the decision-making process. This occurs in those cases in which the doctor at first does not express any preference for a treatment, but only indicates that there are a number of medically acceptable treatment options. After having heard the preferences of the patient, the doctor can then defend the standpoint that a certain treatment, in view of the patient's preferences, would be the best choice. In this way the doctor can participate in the discussion without immediately steering the patient in a particular direction ('When I take into account what is important to you, I believe that option T_1 is your best choice'). The difference of opinion then changes from non-mixed multiple to *non-mixed single*. The same thing happens when patients themselves take a stance on what would be the best treatment ('Considering what is important to me, I believe option T_1 is the best choice').

Finally, the difference of opinion may also become a *mixed single* one. This occurs when doctor's and patient's opinions differ on what, in view of the patient's preferences, would be the best option.

Opening stage

In the opening stage of a discussion, the starting points for the discussion and the procedure that is to be followed need to be decided on (van Eemeren & Grootendorst, 2004, pp. 60, 137). An important procedural step is to establish which party has the burden of proof for which standpoint. The division of the burden of proof is dependent on the type of difference of opinion. In a non-mixed difference of opinion, only one of the parties carries the burden of proof: the party who has put forward the standpoint. If the difference of opinion is mixed, both parties carry the burden of proof for their own standpoint.

In the first type of difference of opinion that may arise during SDM, the doctor has the burden of proof for the fact that each of the options is medically speaking an acceptable choice. In the second type of difference of opinion, which may arise when there are no equivalent alternatives, the doctor has the burden of proof for the fact that his own preference is the best option seen from a medical perspective. In the third type of difference of opinion, in which it is either the doctor or the patient who puts forward the standpoint that one of the treatment options is best choice in view of the patient's preferences, the situation is a bit more complicated. In this case, the doctor still has the burden of proof for his own position, but this does not

---

[2] In theory, it can also be the patient who defends the standpoint that a certain treatment is medically speaking the best choice.

necessarily hold true for the patient. Since it is the patient's right to make the final decision on which of the medically acceptable treatments he prefers, he is not obliged to provide support for his standpoint. If he does not provide any support, the consequence is that the difference of opinion is not resolved, but only settled.

In some descriptions of SDM it is stated that, in view of their role as the discussion leader, it is the doctors who should ensure that their patients' preferences become clear. More recently, the patients' responsibility for making their preferences known is emphasized. Argumentatively speaking it makes no difference which procedure is followed in introducing the patient's preferences into the discussion.

Another important procedural starting point for SDM is that, in evaluating the various treatment options, the decision rule should be applied that of all medically acceptable treatments that treatment should be chosen that is most in agreement with the preferences and values of the patient.

It also belongs to the aims of the opening stage to reach agreement on how the decision-making process as a whole should proceed. In the literature, different views can be found on whether such decisions should be made at the start of the consultation, or during the process of SDM itself. Argumentatively speaking, both ways of operating are permissible, provided that it is clear what the procedure is, and that both parties agree with the procedure.

Finally, agreement should be reached on what will be the material starting points for the discussion. On which facts, values and criteria do the parties agree? As we have seen in the literature, it is generally speaking the doctor who determines the starting points in so far as they concern medical facts, whereas the patient determines those starting points that concern their own preferences and values. Both doctor and patient are in principle expected to accept the starting points introduced by the other party. This division of labour is a consequence of the deontic and epistemic asymmetries that we have discussed in Section 2.

Argumentation stage

The aim of the argumentation stage is to test the acceptability of the standpoint at issue by an exchange of arguments and criticism (van Eemeren & Grootendorst, 2004, p. 61). In the process of SDM the aim of this exchange is to make a choice between different treatment options. Below, we shall discuss the elements that play an argumentative role in this decision-making process.

First, making a choice always takes place on the basis of one or more decision criteria. In the process of SDM, these criteria are related to the consequences of carrying out the various treatments. Examples of such criteria are the extent to which the treatment may prolong life and the character and intensity of the side-effects of the treatment. Since the doctor may be expected (more than the patient) to possess the required biomedical knowledge about these consequences, it is an argumentative task of the doctor to bring up those consequences during the consultation.

As discussed above, it is to be expected that the patient will not find all biomedical consequences equally important. A second element that plays a part in the process of SDM is therefore a specific decision rule, which states how the scores of the treatment options regarding the decision criteria should be weighed. Ideally, the decision rule should reflect those values that are most important for the patient. It may, for instance, be the case that the patient finds a substantial prolongation of life more important than particular side effects, or the other way around. Since patients are the only ones who can decide what their own preferences are and how these preferences relate to each other, it is the patients' argumentative task to put forward the decision rule in the consultation, although of course the doctor can help them in making this rule explicit.

In our pragma-dialectical reconstruction of the argumentation stage in the process of SDM, the medical consequences and the decision rule function as arguments in support of the final treatment choice. Put more precisely, the standpoint on what is the best treatment choice is defended by the following argument:

standpoint	Treatment option T_1 is the best choice from the medically acceptable treatment options T_1-T_n
argument	Of the medically acceptable options, treatment option T_1 is most in agreement with the patient's preferences
decision rule	The treatment option that is most in agreement with the patient's preferences is the best choice from the medically acceptable treatment options T_1-T_n

Concluding stage

The aim of the concluding stage is to establish the outcome of the discussion (van Eemeren & Grootendorst, 2004, pp. 61-62, 154). Has the difference of opinion been resolved, and if so, in whose favour? Instead of being resolved, differences of opinion can also be settled. In that case the parties have not reached an agreement on the basis of their arguments, but have chosen a different way to come to a decision.

According to the literature on SDM, ideally, the difference of opinion between doctor and patient should be resolved, not settled. This means that at the end of the process, both doctor and patient should be convinced that a particular treatment is the best choice. Since it is in principle the patient who has the right of making a decision, they can, also in cases where the doctor has a certain preference, decide to opt for a different treatment. When several medically equivalent options are at stake, the doctor should agree with the patient on institutional grounds (the choice for a particular treatment is then subjective, and the patient has the right to make the decision). But even if there is a treatment that, according to the doctor, is clearly to be preferred on medical grounds, the patient still has the right to choose a different treatment option. That would mean that the dispute is settled, or that the doctor pulls out of the discussion and refers the patient to another doctor.

5. CONCLUSION

In this article we have given a pragma-dialectical translation of the process of Shared Decision-Making (SDM) that can serve as an analytical tool for reconstructing the discussion contributions of doctor and patient to the decision-making process in medical consultations. Our reconstruction of the process of SDM basically applies to all medical consultations: Even though the nature of the considerations leading to a final decision may vary per type of consultation, there will always be a combination of medical evidence and preferences of the patient involved. In the literature on SDM, specific contexts are mentioned that pre-eminently ask for SDM, because the views and experiences of the patient are considered to be of decisive importance (as in palliative or chronic care, for example).

By translating the process of SDM, including the different variants of the division of labour between the participants, into pragma-dialectical terms, it becomes clear what the argumentative tasks of doctor and patient are in the different stages of the decision-making process and what kind of variation is possible depending on factors such as the nature of the decision that is up for discussion and the preferences of the patient. More importantly, with such an analysis, the necessary preliminary work has been done for a more precise evaluation

of the decision-making process. Until now, the assessment of the medical decision-making process in the professional literature is limited to the question of whether all 'essential' elements of SDM are present and whether doctors do not act too steering or persuasive. The latter is determined in practice on a case-by-case basis, on the basis of standards that are not entirely or not clearly articulated. By using the code of conduct for reasonable discussants as developed within the pragma-dialectical approach to argumentation, it can be verified in a more detailed and also more theoretically justified way whether in concrete cases the contributions of doctor and patient to the process of SDM are reasonable or fallacious.

ABSTRACT: Despite many attempts to schematize and categorize slippery slope arguments, considerable ambiguity exists between valid and fallacious forms. Often, putative examples of fallacious slippery slope arguments are not formally invalid, but simply unjustified. But all arguments require sufficient evidence; fallacies are fallacious without respect to evidence quality. We review the theory, practice, and historical development of slippery slope arguments and the range of contradictory ways in which they have been conceptualized. We review and reject the concept of slippery slope fallacy. Finally, we propose that the formal validity of slippery slope arguments hinges on the agency of the relevant decision-maker to whom the argument is addressed. We argue that this best conforms to how the metaphor works and is understood in the wild, and is best suited to the most important and difficult to assess arguments that characterize late modernity.

1. INTRODUCTION

Despite many attempts to schematize and categorize slippery slope arguments (SSAs), definitions vary widely and there is considerable ambiguity between putatively valid and fallacious forms (for a good review of the literature, see Walton, 2015). More a metaphor than logical type, slippery slope arguments suggest that a proposed decision, which may appear desirable or at least not catastrophically bad, increases the risk of subsequent decisions which are catastrophically bad. While most critics of SSAs admit that some slopes are in fact slippery, the suggestion that SSA are a 'fallacy' has entered the public consciousness and impugned their reputation. This is amplified by the fact that hearing terrible slippery slope arguments proffered apparently earnestly is a matter of common experience.

When considering constructions of SSA schema, we are interested both in the way argument theorists have defined and categorized SSAs theoretically as well as how they are taken up and used in practice, in the classroom or in textbooks as well as in the wild. We are concerned with whether and how an SSA schema should be constructed theoretically, taking into account the concept's utility in the hands of non-theorists. We have observed students in the classroom and in debate competitions invoking the concept unreasonably—and characterizing it as an informal fallacy—to dismiss reasonable arguments from negative consequences. In individual cases it is usually straightforward to describe the reasoning error behind the misapplication, but it is difficult to invoke general rules from the theoretical literature because of the many inconsistent and mutually exclusive definitions of an SSA, and

a lack of any consensus behind a clear and consistent method of distinguishing fallacious and non-fallacious SSAs.

A "slippery slope" is clearly a metaphor, but is it also an argument scheme? Many studies have started from the premise that it must be, and then proceeded to define it systematically. It is not, however, obvious to us that this is necessary or useful. There are many metaphors that express relationships between events that comprise an argument from consequences that we do not generally regard as unique schemes, e.g., tipping points, linearity, brinks or thresholds, feedback/feedforward processes, gateways, etc.

We take the position that a special category of informal fallacy for certain SSAs is probably not useful or justified. In addition to the usual problems plaguing informal fallacies—i.e., that it is nearly impossible to craft a definition that does not admit counter-examples, or that textbook examples are typically quite obviously terrible arguments even though the only fallacies that are practically dangerous are those that deceptively seem reasonable (See Walton, 1995, for an extensive treatment of the evaluation problem)—there are many different ways that an SSA can be unsound due to the various mechanisms by which the innocuous first decision internally links to the abhorrent subsequent one. Moreover, the SSA is often defined as a special case of arguments from consequences, and in the aggregate do not significantly differ from the larger category in terms of argument quality. Nevertheless, the belief that SSAs are fallacious leads some to dismiss these arguments—often including mislabeled non-slippery slope arguments from consequences uncritically.

2. TEXTBOOK APPROACHES TO THE SSA

We begin by examining how the SSA is defined in texts designed for undergraduate students. Groarke and Tindale (2004) define the SSA scheme explicitly as an argument from consequences, not even necessarily negative consequences: "PREMISE 1: A causes B, B causes C, and so on to X. PREMISE 2: X is undesirable (or X is desirable). CONCLUSION: A is wrong (or right)" (p. 330). Here it seems that the only explicit limitation is that the argument contain at least two intermediate steps, but a subsequent example ("If you add vodka to your life, your sleepy life will be transformed into a life of cosmopolitan excitement") leaving any intermediate steps unstated suggests that even this limitation is irrelevant in practice (p. 332). Later on, they note that the scheme they call "appeals to precedent" is similar to the SSA scheme, although relying on analogical instead of causal reasoning (p. 343).

This definition, like many we came across, does not limit the focus of SSAs to subsequent undesirable *decisions.* The first example of an SSA provided is a political cartoon that visually represents a slippery slope, arguing that if Germany is allowed to invade Czechoslovakia with impunity, it will lead to the fall of Romania and Poland, and then the French Alliance, thereby threatening Anglo-French security. None of the intermediate steps seem to entail decisions made by anyone except Hitler, who presumably has already made up his mind about his territorial aspirations. It seems possible, but unlikely, that the grounds for the claims made in the intermediate steps involve bad decisions made by the Allies as a result of their initial bad decision, particularly because Groarke and Tindale repeatedly distinguish SSAs from arguments about setting bad precedents. This example also calls attention to the difficulties involved in maintaining a strict division between causal and analogical reasoning, since the causal elements of the argument are entirely unstated, communicated exclusively through a single figurative analogy. Should this be considered an SSA? Should it make any difference that, as a meta-argumentative move, the argument itself invokes the slippery slope metaphor to communicate its warrant structure? That is, when conceptualizing the SSA, how

important is it that the criteria manage to include arguments that are self-labeled as SSAs? We shall return to these questions shortly.

Most textbook approaches that characterize an SSA as an argument from consequences tend to restrict those consequences to undesirable ones. After carefully noting that "slippery slope reasoning itself is not inherently fallacious, as earlier textbooks claimed," Tindale (2007) offers a somewhat more limited definition than presented above: "Slippery slope reasoning is a type of negative reasoning from consequences, distinguished by the presence of a causal chain leading from the proposed action to the negative outcome" (p. 185). Herrick (2011) similarly defines an SSA as an "argument from direction urging that the first step in a progression not be taken" (p. 139).

Among the criteria for assessing SSAs, Tindale implies the importance of diminished agency, suggesting that one should consider whether one could "stop and go back, or is the 'slope' clearly slippery?" (p. 187). This is further clarified to mean that each causal step must *necessarily* follow from the previous step, such that the process is "unstoppable or irreversible" (p. 188). But for an earlier remark that non-fallacious SSAs "will present causal links that are plausible (while not guaranteed)," it would be natural to read this as implying that a series of steps that were merely probable or more difficult to stop once set into motion would qualify as a fallacious form – or at least a relatively more fallacious form – of this category of reasoning (p. 186). Walton, at least in his textbook on informal logic, more explicitly seems to exclude the merely probable:

> The slippery slope fallacy occurs when a proposal is criticized, without sufficient evidence, on the grounds that it will lead, by an inevitable sequence of closely linked consequences, to an end result that is catastrophic... This type of argument... proceeds by presuming that there is an inevitable sequence of steps leading down a slippery slope, once you take that first step of accepting a proposal at issue. (p. 23)

This distinction is important because something similar is frequently mentioned in attempts to define an explicit slippery slope fallacy.

Consider the argument that one should never start smoking because it is a slippery slope to addiction and, later, lung cancer, emphysema, or some other frightening health condition. Each step in that chain is merely probable. Certainly it is possible to quit smoking before becoming addicted, or even after becoming addicted, and not every long-term smoker eventually suffers from a tobacco-related health condition. The steps are certainly plausible and indeed empirically supported, but are by no means unstoppable or irreversible before the final consequence occurs. Should this be considered an SSA? If so, is it a fallacious one? Finally, are these classifications, and their associated criteria, analytically useful to someone interested in assessing its strength? We will return to these questions after discussing a brief history of the schema and the theoretical literature.

3. HISTORICAL ARC

To get a sense of the historical arc of the concept outside the disciplinary literature, we searched the LexisNexis and Google Ngram Viewer databases for the phrases "slippery slope" and "slippery slope fallacy." The phrase saw sporadic use during the first half of the 20th century, especially around the rise of Nazi Germany, whether warning about the slippery slope to fascism, or, in Germany, the slippery slope to liberal democracy. After the war, the metaphor was taken up by writers preoccupied with the rise of the USSR and the existential threat it posed to the United States and its allies. The underlying argument structure, however, is much older. Aristotle (1941) makes several proto-slippery slope arguments in the *Politics,* e.g., that children should not be exposed to depraved art, or else it will lead them to be unable

to resist depravity in their own lives as they get older (sec. 1336b 20-35), or that the state must pay special attention to "small matters… for transgression creeps in unperceived and at last ruins the state… In the first place, then, men should guard against the beginning of change" (sec. 1307b 30-40). It appeared frequently in the writings of the American founding fathers; for example, James Madison (1785) famously argued that "it is proper to take alarm at the first experiment on our liberties" (sec. 3).

During the 1950s and 1960s, a few philosophers identified a "slippery slope fallacy," but what they had in mind had little to nothing to do with the kinds of arguments in which the metaphor explicitly is invoked. Rather, their concern was for the sorites paradox, or the paradox of the heap (see, e.g., Bernadete, 1964). This paradox arises from the application of discrete ordinal categories to a continuous variable. If one continues to add grains of sand one at a time, at what precise point do the assembled grains comprise a heap? It seems reasonable to adopt a rule that says if you don't have a heap, adding a single grain will not transform the pile into a heap. Similarly, if you are impoverished, adding a single penny to your net worth will not bring you out of poverty. But then it follows by mathematical induction that there are no heaps and everyone is impoverished, which seem obviously absurd. It is not entirely clear why the metaphor became attached to this referent, but many well-known slippery slope arguments at the time (for example, Madison's warning) emphasized the importance of vigilance because of the difficulty entailed in detecting a transition from liberty to tyranny, and the sorites paradox depends on the difficulty in precisely localizing phase transitions in a fuzzy continuum of very gradual changes.

Although it was not mentioned in Hamblin's (1970) comprehensive treatment of fallacies, later in that decade the term began appearing in argumentation and informal logic textbooks as a type of fallacy. These uses were mostly for bad causal arguments, and bore a closer relationship to the kind of arguments that were made in which the interlocutors themselves invoked the metaphor. It also was taken up in legal scholarship in the context of the role of precedent in the Anglo-American common law tradition. Both expansions and restrictions of rights establish precedents that can serve as stepping stones to further expansions and restrictions. Following these developments, the 1980s saw some academic discussion of the slippery slope fallacy (see, e.g., Govier, 1982). By the end of the decade, however, the concept of a slippery slope fallacy had become part of the public meta-argumentative imaginary, appearing frequently in newspaper and magazine articles without any accompanying explanation, as if the author could take for granted that her audience would understand what the term meant and accept it as a reason to regard some other argument as invalid. It was at this point a public object of knowledge. Systematizing efforts began in the early 1990s, most notably by Douglas Walton.

4. WALTON'S APPROACH

Walton (1992) characterizes the slippery slope argument as "the kind of argument which warns you that, if you take a first step, you will find yourself involved in a sticky sequence of consequences from which you will be unable to extricate yourself, and eventually you will wind up speeding faster and faster toward some disastrous outcome" (p. 1). In Walton's (1992, 1995, 1996, 2015, 2016) conception, all slippery slope argument types employ on gradualistic reasoning. Gradualistic reasoning, making use of Perelman and Olbrechts-Tyteca's (1969) *device of stages*, involves a chained sequence of small internal links to reach its major conclusion.

Walton describes four types of slippery slope argument: Sorites; Causal; Precedent; and Combined. These reflect the various ways the argument had been conceptualized since references began appearing in the middle of the twentieth century.

4.1 Sorites type

This type depends upon the vagueness of a predicate giving rise to a category for which non-arbitrary brightlines of inclusion and exclusion are not possible. A sorites SSA makes use of the paradox to argue that either in every instance it is inappropriate to affirm the predicate in question—if an destroying an embryo is killing a person, then scratching your arm and destroying skin cells is as well—or that it is always inappropriate to deny it. As an example of the latter, if a fetus is not a human person today, then it won't be tomorrow, either, and so infants are not human persons. This kind of SSA interacts with definitional arguments and entails an implicit *reductio ad absurdum* (because only a monster would not consider an infant to be a person). A sorites SSA may also use the fuzziness of transitions to insist upon a brightline—any brightline is going to be arbitrary, but one is necessary, so birth will suffice (or, alternatively, viability or conception). Finally, a sorites SSA may be used to reject the idea of a brightline entirely and demand that the variable be reconceived as gradual and continuous.

4.2 Causal type

Causal SSAs—which, as we've seen, became the default textbook version of the SSA—argue that a proposed course of action will initiate a chain of causes and effects that culminate in an undesirable outcome and that once initiated, the chain will be difficult or impossible to interrupt. For example, if you start smoking cannabis, you could become addicted, move on to harder drugs, and die of an overdose. This kind of SSA interacts with deliberative arguments. The focus is on causal mechanisms like momentum, shifts in public opinion, tolerance to regulatory moves or lifestyles, changes in political power (e.g., a policy that reduces union membership may produce a slippery slope to much larger defeats for labor since an intermediate consequence is that their lobbying power is attenuated), material changes in circumstances, addiction, etc.

4.3 Precedent type

Precedent SSAs suggest that some proposed course of action would establish a more general rule that would authorize undesirable conduct, against which we would be powerless, having already invested the rule with authority. For example, if we were to adopt a regulation that prohibits the possession of a firearm equipped with a bump stock, it would "establish a precedent according to which the federal government (specifically, unelected employees of the ATF) would be empowered to seize property from any individual without affording them any compensation, and rendering anyone who fails to turn in or destroy such property subject to federal criminal penalties" (Barr, 2018, para. 3).

This kind of SSA invokes a hypothetical judicial analogy. In its essence, however, it is almost always causal, because it generally does not argue that fairness would demand we permit the imagined negative consequences, but rather that the precedent creates a regime in which objections to those consequences are unpersuasive and impotent. That is, a dangerous precedent is a mechanism that causes danger.

Like the sorites type, bidirectionality is possible with precedent SSAs. Rather than caution against the adoption of a general rule, one might caution against the violation of a

general rule, implicitly characterizing the proposed course of action as special pleading. For example, a professor might refuse a request to change a student's grade on the grounds that, say, "if I change your grade, I'll have to deal with hundreds of grade change requests every semester." In that case, it is self-focused; it may also be other-focused, as in "if you give him an inch, he'll take a mile."

4.4 Combined/Full type

Full SSAs involve each of the preceding components in a complex argument—that is, by adopting vague (or clear but arbitrary) predicates, we establish a dangerous precedent that will cause a horrific outcome. For example, by codifying a right to access abortion services, "the point has been reached where the most basic care, even nourishment, is denied to babies born with serious handicaps or illnesses. The contemporary scene, moreover, is becoming even more alarming by reason of the proposals, advanced here and there, to justify even infanticide, following the same arguments used to justify the right to abortion. In this way, we revert to a state of barbarism which one hoped had been left behind forever" (John Paul II, 1995, sec. 15). This argument interlaces distinct staging elements, beginning with the personhood of a fetus, which threatens to establish a dangerous precedent according to which infanticide would be justified, and causally lead society down a path toward "a state of barbarism."

4.5 Evaluation

The general thrust of Walton's approach seems to be ecumenical, an attempt to integrate all of the different approaches that preceded him. Walton has very carefully attended to the history of the concept and the literature, and his combined or full type is a very creative synthetic move. But is it ideal? In our judgment, Walton seems to have been led by arbitrary accidents of history to bundle fundamentally dissimilar arguments together, although the existence of the combined type does demonstrate that sometimes the various elements mutually reinforce one another. Walton's scheme seems even more overly inclusive than the textbook versions of the SSA. But at the same time, the opposite problem is that in another sense, the elements are not really sufficiently distinct conceptually. Without a causal element, for example, a pure sorites SSA is just an observation about vagueness and presumption is just a judicial analogy. Ultimately, this approach tends toward including arguments that are not really SSAs (e.g., the heap paradox), but also, insofar as it insists on the consequences having the logical force of necessity, excludes arguments that should not be excluded (e.g, the argument above about the risks of smoking cigarettes). Indeed, in Walton's most recent (2015) essay, he wonders if there are *any* reasonable SSAs.

Hinton (2017) offers many similar criticisms of Walton's approach, though arrives at rather different conclusions. He argues that the SSA scheme has come to encompass every argument from negative consequences, even those that are "very different from each other" (p. 2). He suggests distinguishing SSAs from arguments from material consequences, arguments from precedent, and arguments from consistency. Hinton's alternative is far more narrow than Walton's SSA scheme subtypes or the various textbook versions of the SSA:

> An SSA is an argument which states that 1. Accepting proposal (a) would mean breaking [or establishing] the hitherto accepted [or rejected] principle (p). 2. Upholding [or rejecting] (p) is necessary/important to argue against proposals (b), (c), … (z). 3. Proposal (z) is clearly undesirable. Therefore, (a) should be rejected. (p. 12).

Hinton clarifies further that the scheme only includes arguments involving truly inevitable, logically necessary consequences.

5. VOLOKH'S APPROACH

The literature about SSAs has not been entirely consumed with definition, classification, or whether and to what extent SSAs are fallacious. Some of the most productive scholarship has been concerned with the actual mechanisms by which slippery slopes lead one to slip. Volokh (2003) defines a slippery slope as "all situations where decision A, which you might find appealing, ends up materially increasing the probability that others will bring about decision B, which you oppose" (p. 1030). Rather than focus on the formal validity or logical subtypes of SSA, Volokh focuses on mechanisms by which slippery slopes can occur, with the goal of facilitating the evaluation of slippery slope risk. He is exclusively concerned with public policy contexts, and emphasizes that collective decision-making is an inherent feature of public controversies in democratic societies. This leads him to reject Van der Burg's (1991) argument against SSA that "if we can stop now, we will be able to stop in the future as well, when necessary; therefore we need not stop here yet" (p. 65). Volokh (2003) argues that the 'we' in a democratic society is composed of a multitude of interest groups with different and changing preferences, and so at the very least SSA are not inherently fallacious: "The claim that A's will inevitably lead to B's as a matter of logical compulsion might be mistaken, but the more modest claim that A's may make B's more likely seems plausible" (p. 1134).

Volokh identifies five categories of slippery slope mechanisms. The first are cost-lowering slippery slopes, in which decision B is only not possible now because of its high cost, which will no longer be the case after decision A is implemented. The second are attitude-altering slippery slopes, in which the passage of decision A induces changes in public opinion that favor decision B. The third category are small-changes slippery slopes, in which the magnitude of change from the status quo to decision B is sufficiently large to motivate the opposition to effectively oppose it, while the magnitude of change from decision A to decision B is not. The fourth category are political power slippery slopes, in which decision A increases the relative political power of the group of people advocating for decision B. The fifth category are political momentum slippery slopes, in which passage of decision A emboldens its supporters to pursue decision B, which formerly seemed too unrealistic to justify the expenditure of advocacy resources and political capital necessary to bring it about.

6. CONCLUSION

Why is the SSA concept a useful one? As an object of knowledge, it facilitates the evaluation (and refutation) of arguments by facilitating the application of criteria by students learning to assess, evaluate, and refute arguments. In this sense, it seems more of a failure than a success. This is in part because of the failure of to achieve any sort of consistent consensus about what is included and excluded, driven in part by a significant divergence between definitions given in the scholarly literature and those given in textbooks. However, to the extent that it drives practical studies that focus on mechanisms and help to evaluate the risks of probable but not certain consequences, the SSA concept can be useful. This is especially the case because of how commonly the metaphor for which it is named is invoked both by individuals advancing SSAs as well as their interlocutors.

The notion of an independent "slippery slope fallacy," however, seems indefensible. The criteria for considering SSAs to be fallacious are universally weak and very unlikely to be useful. When SSAs are bad, it is obvious that they are bad. Indeed, this seems to be taken for granted by many descriptions of the fallacy as a fallacy. In Walton's textbook definition above, the thing that makes a SSA into a fallacy is that its criticisms come "without sufficient

evidence" (p. 23). But every claim that comes without "sufficient" evidence is fallacious, and there is nothing special about SSAs in that respect. This line is echoed by Warnick & Inch (1989), who note that when fallacious, an SSA "assumes, without evidence, that a given event is the first in a series of steps that will lead inevitably to some outcome" (p. 142). Other common criteria include being far-fetched, exaggerated, or untrue, which are hardly useful to someone who is not quite sure whether to accept or reject an argument. In some cases, the putative fallacy is conflated with fear appeals, which are inexplicably asserted to be necessarily fallacious in nature (Dowden, 1993; Osborn & Osborn, 1988). Most commonly, logical necessity is the key dividing line between valid and fallacious SSAs. But arguments from consequences are rarely logically necessary.

Indeed, the world of late modernity is a risk society (Beck, 1992; Giddens, 1991; Luhmann, 2005). Our biggest concerns are laced with probability and uncertainty. Our argumentation theory, if it is to be relevant, must be responsive to that. Beyond that, none of the mechanisms discussed in Volokh's masterful study have the force of necessity, but they adhere closely to the metaphor as it is understood by those engaging in public policy argumentation. This kind of study connects basic argumentation research to empirical research in political science, public policy, and law, and seems far more useful than another debate about categories. Not a single one of the examples discussed in this essay have the force of logical necessity. It is far more important to teach our students how to assess probable consequences than merely identify (and reject!) those that are contingent in the first place.

How, then, would should SSA be defined? We suggest that an SSA is an argument that some proposed decision (A), which may be apparently desirable, or at the least innocuous, should be resisted because otherwise there would be an increased risk of a more extreme decision or event (B) that is clearly undesirable. A key component is impaired agency. That is, after A is chosen and executed, the ability of the decision-maker (which may be an individual person or organization, or a more collective 'we') to resist B, relative to the pre-A status quo, is diminished. This approach has a few advantages. First, it is has what social scientists might call construct validity – that is, it captures the kinds of situations in which actual arguers invoke the metaphor. This advantage extends over even Volokh's definition, which excludes arguments in which the final consequence is not brought about by a *decision* (e.g., containment / domino effect arguments during the Cold War or appeasement arguments before World War II), as well as arguments in which the final consequence is not brought about by *others* (e.g., any argument in which addiction is the slippery slope mechanism). Second, it emphasizes probability and risk. Third, it focuses on agency, which encourages interlocutors and argument auditors to consider the degree to which actions can be taken to insulate A from B, what is sometimes known as link intrinsicness in competitive academic debate. Finally, it is well-suited to controversies arising from interacting institutional logics. For example, arguments about the diagnostic criteria for mental illnesses selected and endorsed by the American Psychiatric Association have wide-reaching consequences, many of which are mediated through other technical systems (the legal system, which distinguishes between acts committed by the sane and the insane; the market as regulated by the state, which develops, tests, and markets pharmaceuticals to treat specific recognized disease entities, etc.). Some proposed disorders have been rejected due to fears that they would be a slippery slope to medicalizing normal human variation, that they would lead to uncontrollable medication of children, or that they would facilitate unjustified violations of due process through civil commitment proceedings (Strait, 2014). If the function of categories and theoretical constructs in argumentation theory is to focus attention to the most important and challenging kinds of arguments, while also reflecting the way people actually deploy and think about natural language arguments, our approach seems beneficial.

One trend we have observed in our study of SSAs is that the longer an analysis goes on, the more unreasonable it tends to get. In light of that, we must conclude our essay here, or else sooner or later, we will probably say something incorrect.

Convergent structures in argument: Theoretical-linguistic description

LEV VASILEV

Department of Linguistics and Foreign languages
Kaluga State University

argumentation@mail.ru

ABSTRACT: Convergent arguments are traditionally difficult to flawlessly relate to the multiple or to the co-ordinate type. The difference in question is meaningful not only from the theoretic, but also from the verbal influence point of view: the paper explains why co-ordinate structures have greater suggestive potential. Convergency in argument is viewed here as a phenomenon of semiotic complication of the elementary two-component ('standpoint-plus-premise') argument. Tectonically, convergent arguments are composites, i.e. complications of atomic arguments. To be co-ordinate, premises in convergent arguments must contain homogeneous parts. In general, premise homogeneity results in semantic-syntactic co-ordination in an argument. The paper discusses six homogeneity-based criteria for differentiating between co-ordinate and non-co-ordinate arguments.

KEYWORDS: argument, compound structure, convergency, co-ordinate structure, multiple structure, premise homogeneity

Convergent arguments are phenomena of two principal types – multiple and compound. Multiple structures usually are alternative defenses of one standpoint. Compound structures are re-enforce arguments defending the same Claim. In multiple argument independence of premises is what matters; in compound dependence character is important.

The structural interpretation of the arguments emphasizes the relationship between the premises. Premises are usually treated as propositions, but their components in them are not analysed. Thus, the principle of analysis resembles the one used in sentential logic.

Structuring an argument is a working tool for its analysis, used for explication purposes (Johnson & Blair, 1994, pp. 36-40). The explication is usually carried out introspectively and is generally subordinated to the rationalization of the argumentative activity.

In the special literature on the taxonomy of the structures of argument, types and subtypes of the structure are not numerous. There we find a divergent type (one argument is several protected theses), a convergent one (several arguments are one defended thesis) and a chain argument (successive submission, in which the thesis of one argument is simultaneously the premise for the next one). However, this terminology varies in content. Let's consider some basic structural approaches in two main argumentological schools, pragmadialectics and informal logic.

Pragmadialectic. Here, a goal of analysis and evaluation of the argument is to determine whether the premises are good (deductively necessary or inductively strong) grounds for accepting the conclusion. The unit of analysis is the set of "premise(s) – standpoint". The purpose is to establish how well a critical discussion leads to rational resolution of some controversial issue. In dialectics, the proponent can offer arguments, and then renounce them if they are successfully criticized, and offer other arguments (thereby forming another argument). If there are several participants, the argument offered by the proponent may be acceptable for some participants, but not necessarily for others. If the proponent offers several arguments, then each participant can receive at least one argument

with which he agrees. If each argument is sufficient to justify the standpoint at issue, then, by providing such set of arguments, the proponent seeks a favorable resolution of the dispute, through a series of arguments.

The typology of arguments in pragmadialectics is based on: (1) the nature of the differences in opinions (single unmixed, multiple unmixed, single mixed, multiple mixed varieties of reasoning); (2) the distribution of roles between participants in the discourse (protagonist, antagonist); (3) the assumptions and conclusions that make up the arguments (expressed, not expressed); (4) argumentative structures (single, multiple, compound, compound, subordinate); (5) the scheme of argumentation (based on evidence, similarity, effect) (Eemeren et al., 1996, pp. 288–289).

In pragmadialectics, the division of argumentation into multiple and compound based on the feature of conclusiveness. For multiple arguments, single premises should be regarded as irrefutable defenses of the proponent's point of view (Eemeren & Grootendorst, 1992, p. 79). Thus, the function of "irrefutability" appears to be the separation of arguments in multiple arguments. This term has a modal meaning – it is directly related to the logical necessity in deduction, and the deductive argument in logic has the maximum (absolute, unquestionable) power. If any premise forms a deductive argument, then the remaining premises do not add to the argument force: the power of the deductive argument cannot be increased, no matter how many premises we add. Consequently, an argument having another premise, in fact contains more than one argument: one constitutes a deductive argument, while the others are either non–deductive or deductive, which can be established on a separate basis.

The use of "irrefutability" becomes problematic when it comes to arguments that are correct from a logical point of view, but do not have irrefutable conclusions. Apparently, it would be possible to envisage the existence of multiple arguments for such cases, and at the same time – the existence of a co–ordinate argumentation for cases in which the premises together support, but not incontrovertibly, the conclusion.

In F. Snoek Henkemans's view, the single argument is contrasted with the complex one on the basis of the number of arguments – in a single there is one, in a complex there are several arguments. The composition of the latter is divided into multiple, coordinatively compound, and subordinatively compound (Henkemans, 1997, p. 15).

In our opinion, the author does not notice the level mismatch between them. On the one hand, the multiple argumentation is clearly terminologically different from the composite argument, which is divided into two subtypes. On the other hand, the plural and compositional compound argumentative versions presuppose the presence of arguments lying on one level, and the subordinate component is the presence of an argument of a different level (a built–in argument with a thesis of the second order).

F. Henkemans' distinction between compound (compositional) and multiple reasoning is based on the principle of ±sufficiency: in the multiple argument, according to the author, the premises sufficiently substantiate the standpoint separately, in the composite – only in the aggregate. Therefore, in the multiple argumentation, it is sufficient that at least one of the arguments be acceptable, and while in the compound one – necessarily all. The author sees the solution of the problem in a dialogue principle, arguing that these types of argumentative structures perform different functions in argumentation, and also function differently in the discussion. The mentioned structures have different content. The structures themselves can be established by formulating critical questions that call for argumentation from the proponent in the form of multiple or compound arguments. Such argument helps overcome both doubts and criticism on the part of the opponent.

The dialogue–oriented solution to the problem proposed by F. Henkemans does not, however, lead to a denial of the possibility of considering the monological argumentative

discourse, since the latter is usually an implicit dialogue and is carried out in orientation to possible doubts and disagreements of the absent opponent. Discourse indicators of the type of structures are, according to the F. Henkemans, pragmatic, dialogical and dialectical clues. The first indicator of the structure is the type of the standpoint, the second is the type of criticism that is anticipated and to which the argumentator reacts, the third is the organisation of the argument.

Informal logic. In informal logic, there is no emphasis on the dialogic nature of the argument: the opposition of dialogical and monologic argumentation is assumed to be only manifestational. It means that in fact any argument is internally dialogic, because it is reasoning directed to a real communication partner, therefore, to her possible objections.

The interdependence of arguments can be interpreted in a narrow and broad sense. The narrow interpretation provides that arguments provide some justification for the conclusion, the broad – that besides, the arguments must be interdependent to give a sufficient justification. Independent arguments are treated as individually giving (a) some and (b) sufficient justification for the conclusion. Independence is also treated as relative and as absolute. In the first case, independent arguments are not necessarily sufficient for the conclusion, in the second case they are.

S. Thomas (Thomas, 1981, pp. 51–56) distinguishes four types of arguments: serial (serial), divergent, connected and convergent. The three types of non–divergent reasoning are deductively valid (syllogistic), inductive (statistical generalization), and support of the hypothesis. An example of an inductive argument in S. Thomas is: (a) *I ate chocolate bar # 1 and afterwards my face broke out.* (b) *Likewise, for a chocolate bar # 2 through #N, each time after eating the chocolate bar, my face broke out.* (c) *Therefore, I conclude that after eating a chocolate bar, my face will always break out.* For an example of supporting the hypothesis, the author gives: (a) *His swimming suit is wet.* (b) *His hair is plastered down.* (c) *He's been swimming.*

According to F. Henkemans, in a related (interdependent) reasoning, the premises individually (a) may not support the conclusion at all, but can (b) support it to some extent this type of reasoning (Henkemans, 1997, p. 33) . However, S. Thomas does not have case descriptions (a), so it is an artificial addition to the critic! More sound would be the remark that related reasoning encompasses the linked and cumulative types (cf.: (Pinto, 2001)) and thus requires appropriate refinements. Convergent or independent reasoning is defined as taking place when (a) each individual premise can be sufficient to support inference, and (b) the falsity of any of the premises does not weaken the conclusion (Thomas, 1981, p. 55). For example: (a) *Smoking marijuana is against the law.* (b) *The smoke will be bad for my lungs. Therefore*, (c) *I should not smoke marijuana.*

J. Nolt defines independent (split support) arguments as having two or more independent lines of reasoning ((a), (b)) and leading to the same thesis: (a) There is absolutely no demand for an appliance that converts earthworms into ice cream. Besides, (b) it would be so costly to produce that no one could afford it anyway. So (c) such a device will never be marketable. The signal of the independence of the premises is the word *besides*. Normal arguments are those that are not independent and provide support for the conclusion together: (a) *Either Ophelia is very sick or else she's faking. But* (b) *she's not capable of faking. So* (c) *she must be very sick* (Nolt, 1984, p. 31–33).

In our opinion, this definition needs clarification of the following points (with respective explication of the types of interdependence): (a) for premises that individually do not provide any justification for the conclusion; (b) for premises, each of which gives some justification; (c) for premises, some of which provide some justification, while others do not; (d) for premises that have unequal force of support of the conclusion.

T. Govier gives a relatively narrow definition of interdependent premises, referring to them cases where one premise could not provide any justification for the conclusion in isolation from others (Govier, 1988, p. 126). Independent premises give sufficient support separately, regardless of the truth of other premises. This definition is close to the cumulative type by R. Pinto. According to F. Henkemans, the narrowness of this interpretation leads to the fact that if only relevant premises taken together are considered independent, the case when the independent premises in the aggregate are sufficient for a conclusion is lost sight of – in this case they can be interdependent (Henkemans, 1997, p. 36).

A very detailed schematization of the argument is given by D. Walton. Although the interpretation of the structures of argumentation here is related to the dialogical form of argumentation, the actual dialogical exchange acts as a verifying and guiding procedure that does not touch the semantic-tectonic component of the argument. The central concept in the development of argumentation schemes in D. Walton is *presumption*. This concept is correlated with the concept of the burden of proof. It lies between the *assertion*, needing the burden of proof and the *assumption*, not related to the burden of proof. Accepting some position as a presumption the person also allows for a (possible) refutation of the position: the presumption "shifts" the burden of proof. For D. Walton, argumentation schemes are "forms" of argumentation, which are normatively committing kinds of reasoning; such forms are better to be considered as moves or as speech acts. Normative committing is treated as the duty to accept the conclusion of the argument, if it is built according to the correct scheme, corresponding to the context of the dialogue. The logical correctness of the argumentation schemes depends on the context.

In cumulative arguments, according to D. Walton, each of the premises contributes to the substantiation of the thesis, the more the number of premises, the greater the power of conclusion. The aggregate force of the premises in them is higher than the sum of any premises taken individually or in groups. Their compositional nature is that premises have a topical coherence, i.e. they normally narrate about the same phenomenon, nominating its various markers. Such arguments are usually inductive, since in deduction the number of premises, if it exceeds the nominal, does not in any way affect the strength of the conclusion – it is already 100%. A typical example of cumulative arguments are arguments based on a characteristic, cf .: (a) *He has a temperature*; (b) *His head hurts*; (c) *He has a general weakness*; (d) *His body aches*; (e) *He has a dry cough without a cold*; (f) *He has the flu*.

Some cumulative arguments lie, according to D. Walton, between coherent and convergent. Their co-ordinate nature lies in the fact that the premises have implicit topical coherence ("the properties of the organism"); their convergent nature is that each of them represents a separate line of reasoning and therefore independently gives a certain justification for the conclusion, cf. examples from (Walton, 1996, pp. 131-133): (A) (a) *The gram stain of the organism is gramneg.* (b) *The morphology of the organism is rod.* (c) *The aerobicity of the organism is anaerobic.* (d) *There is suggestive evidence that the identity of the organism is bacteroides.* (B) (a) *Bob was seen at the scene of the crime, holding a smoking gun*; (b) *Bob confessed to the crime*; (c) *Bob committed to the crime.*

The nature of such arguments can be determined if one tries to answer the following questions: (a) if one of the premises is not confirmed, can we assume that the remaining premises support the conclusion? (b) is it sufficient for the legitimacy of inferring the correctness of at least one premise under the insolvency of the others? To solve this problem, one can presume that we have in front of us inductive arguments that do not have a 100% truth value. Then (1) and (2) continue to operate even if the strength (probability) of the conclusion is reduced. However, such a reduction should not be significant. In this sense, the arguments given are not convergent. If we remove the requirement of insignificance, then they are close to convergent.

Such considerations allow Walton (Walton, 1996, p. 134) to consider the dichotomous division of arguments into coherent and convergent ones as inadequate-if the argument is not convergent, this does not mean that it is a coherent and non-coherent argument that is not necessarily convergent. Cumulative arguments are difficult to consider as a form of coherent, therefore R. Pinto and T. Blair refer both to the varieties of dependent arguments.

Summing up, division of arguments into the coordinate and convergent, widely used in modern theory of argumentation, gives a very ambiguous picture.

Kaluga School of linguistic argumentology (cf.: (Vasilyev, 2006; Soushentsova, 2014) has for a number of years been doing research in different spheres of argumentation. Several years ago, myself and T. Soushentsova analysed a number of court decisions in Russian and in English. The analysis showed that arguments used by judges are predominantly compound, not multiple. Since the *ad verecundiam* aspect of court decisions calls for explicit grounds, it has the perlocutionary effect of verbal influence, as well. We hypothesized that the convincing force of arguments having homogenuous premises could be stronger than of those with non-homogeneous grounds because of the seek of people to well-grounding (and not leaving aside factors that obviously matter).

With multiple argument defense resembles deductive arguments where it is not essential how many premises we have – the *scheme (mode of reasoning)* is of primary importance.

Somewhat different is the picture with compound arguments. Here the premises defend the thesis in parallel. Theoretically significant is this question: which compound structures are more and which are less co-ordinate? The question has to do, of course, with the answer to the question: what relations are there between the elements of the argument, namely, between its premises?

Let us look at the relations from two angles: logical and linguistic. In both cases we take that the premises have certain relations between one another.

The logical angle. Relations between 2 coordinate premises can be: (1) Generality – Paricularity (≈ Governing, but ≠Subordination: the *why?* is inapplicable): (a) A dominates (is more general than) B: *(Bill is unbearable:) (A) He gets me to do all the house work; (B) He has me to sweep the floor and do washing up.* (b) B dominates (is more general than) A: *(Bill is unbearable:) (A) He gets me to do all the house work; (B) He does it all the time.* (2) Equality: (a) Non-intersection: *(Bill is unbearable:) (A) He gets me to do all the house work; (B)He makes me supervise (not do myself!) the house expenses.* (b) Intersection: *(Bill is unbearable:) (A) Some of his house work is what I dislike; (B) Some of what I dislike is his house work.*

The linguistic angle. Here, coordination is connected with the problem of homogeneity. Homogeneous parts of the sentence and of the text are relatively independent. Still, their independence is specific. They differ from introductory words, phrases, and sentences, parceling constructions, or addressings. These language structures have no relation to either some member of sentence or the sentence grammatical base. Unlike introductory words, phrases, and sentences, unlike parceling constructions, unlike addressings, homogeneous parts are syntactically connected to some member of sentence. If we climb out of the rigid borders of the simple sentence to the composite sentence (where real arguments live) we can easily observe these relations between the clauses: co-ordinative, half-predicative, explanatory, particularising, connecting.

The features of homogeneity of syntactic units are their similarity in composition, in quality, and in origin.

Similarity in composition. It is similar sentence lexico-grammatical structure with similar predicate center, verbal tense, mood, voice, and conjunctions that help to detect the type of relation. P.ex.: *The Tribunal determines that the Respondent is not entitled to*

administration charges for its costs in connection with arrears of ground rent and *is not entitled to charge the costs of these proceedings to the Applicants' service charge account* (HM Courts & Tribunal Service).

<u>Similarity in quality</u>. These are traditional clauses performing one and the same syntactic function – that of an attribute, of a complement, of an adverbial modifier. P.ex.:

Subject clauses: *What I want to do and what I plan to do is to save you and your brother; It was always possible that they might be noticed and that they might be captured; Whether she was determined to bring matters to a crisis, or whether she was prompted by some private sign from Mr. Buff, is more than I can tell* (T.Dreiser).

Predicative clauses: *It seemed as if he were frightened or as if he were at a loss; That is what he loved best and what he appreciated most.*

Attribute: *You could not feel but sympathy for a man who took so much delight in simple things **and** who was so sincere and sympathetic; All that could be done and that could not was readily explained.*

Complement/Object: *But this time, just about sunset, was always what I loved best, what I adored; Time will show whether I was right or whether I was wrong; I insist upon it that you tell me what you mean and that you explain me what you want; He stopped in the hope that she would speak or that she would smile at him.*

Adverbial modifier: *He was getting on better than he had expected or had dreamt of; I am confortable where I am and where my kids are; Should he marry tomorrow or should he go to the front – I don't care.*

<u>Similarity in origin</u>. It has to do with a contextual factor that helps to make closer constructions with different characteristics. The uniting factor is really contextual – it can be a distant common feature, appearance, similarity in effect, or an assessment (cf. *ad verecundiam*). P.ex.: The plea: *(1) This is an application by the landlord for a determination that the tenant is obliged to pay £287.50 by way of administration charges in respect of an application for consent to a letting of the property. (2) The building is recently built block of flats. (3) The flat with which this application is concerned is in the basement.(4) The lease in Schedule 2 contains covenants by the tenant to pay all costs etc of any application by the lessee for a consent or license (para 4.1)* (HM Courts & Tribunal Service). The sentences (2), (3), (4) here are only contextually homogeneous and are united by the plea (1).

I propose these set of linguistic criteria for detecting homogeneity of co-ordinate premises in an argument:

(1) Teleological criterion – intentional unity of the premises given by the same standpoint.

(2) Coherence criterion – a copulative link between the premises.

(3) Semantic criterion – propositional homogeneity of the premises.

(4) Contextual criterion – field sameness of the premises.

(5) Grammatical criterion – syntactic and morphological conformity of the premises.

(6) Lexical criterion – sameness of words and clichés in the premises.

The more criteria can be found in an argument, the more homogeneous its co-ordinatie premises are: here we can speak about maximal, moderate, and minimal homogeneity.

Still, some of the criteria are obligatory minimal (necessity conditions) for homogeneity: they are criteria (1) – (4). Omission of the criterions (5) – (6) is not so difficult to explain: for an argument more important is contentive, but not manifestational characteristics. Content must be common, while form can differ.

Now, let us look at some compound arguments within an argumentative text which is a court decision.

Texts of court decisions which were analyzed demonstrate predominance of convergent co-ordinate structures. The reason for it appears to lie in judges' aspiration to

give a comprehensive and complete analysis of all the premises in the case. Also, priority of such structures can be explained by the fact that the strength of all the premises is supported by all the facts and by their legal force. The grounds in the arguments were contextually homogeneous because the coherence of the text of court decision concerns any textual element. All the premises on any argumentative level of the text are contextually connected with the Claim of all the Macro-Argument. The contextually-homogeneous premises support the Claim collectively.

The syntactic criterion in the court decisions is represented by several types of connection between the homogeneous premises – copulative, adversative, gradual, and disjunctive. The syntactic connection between the premises can be easily established due to contextual concurrence and goal-orientation of the premises. Look at this example analysis:

DECISION OF THE LEASEHOLD VALUATION TRIBUNAL ON AN APPLICATION
UNDER PARAGRAPH 5 of SCHEDULE 11 to COMMONHOLD and LEASEHOLD:
REFORM ACT 2002.
Case Reference: LON/00AE/LVA/2012/0003
Premises: Flat 45 Danes Court, North End Rd, Wembley, Middlesex
Applicant: Mr Robin Davis
Representative: In Person
Respondents: LKB Investments Limited
Representative: Freshwater Group (LK Investments)
Date of hearing: 14 June 2012
Appearance for Applicant: In Person
Appearance for Respondent: Mr Fieldsend of Counsel
Leasehold Valuation Tribunal: Ms E Samupfonda LLB (Hons) Mr KM Cartwright FRICS Mrs R Emblin
Decision of the Tribunal.
(1) The Tribunal determines that (2) the application dated 13 March 2012 be dismissed.
The application.
1.   The Applicant seeks a determination (3) pursuant to paragraph 5 of Schedule 11 to the Commonhold and Leasehold Reform Act 2002 (4) ("the 2002 Act") as to (5) whether legal fees demanded by the Respondent are variable administration charges payable by the Applicant.
2.   (6) The Applicant holds a long lease of the property which (7) requires the landlord to provide services and (8) the tenant to contribute towards their costs by way of a variable service charge.
The hearing.
3.   The Applicant appeared in person at the hearing and Mr Fieldsend of Counsel represented the Respondent. Ms Judd, his instructing solicitor was also in attendance.
4.   Mr Fieldsend set out the history of proceedings clearly and succinctly in his skeleton argument.
The issues.
5.   At the start of the hearing (9) the parties identified the relevant issues for determination as follows:
(i)   (10) The payability and/or reasonableness of variable administration charges relating to legal fees.
(ii)   (11) Whether the application to the Tribunal should be dismissed (12) pursuant to paragraph 5 (4) of Schedule 11 to the Commonhold and Leasehold Reform Act 2002.
6.   (13) Having heard evidence and submissions from the parties and (14) considered all of the documents provided, (15) the Tribunal has made determinations on the various issues as follows.

The Tribunal's decision.

7.   (15) The Tribunal determines that (16) the application be dismissed.

Reasons for the Tribunal's decision.

8.   (17) The Tribunal considered the history of proceedings as set out in the skeleton argument. (18) Mr Fieldsend stated that (19) the legal fees that form the subject matter of these proceedings formed part of the costs that were claimed in the County Court proceedings claim no. 1UD65335. The court heard that claim on 23 March 2012 and (20) the court determined that (21) the Applicant was liable for costs and (22) assessed the amount payable at £2,990.

9.   The Applicant, (23) Mr Davis admitted that (24) he had paid the legal fees that are the subject matter of this application on 18 May 2012. However, (25) he sought to challenge payability on the basis that (26) at the time (27) the amounts were debited from his account (28) there was no liability to pay.

10.   (29) As the Applicant has admitted and paid the costs in issue, (30) the Tribunal does not have jurisdiction to consider matters further (31) pursuant to paragraph 5 (4) to Schedule 11 of the 2002 Act and (32) the application is dismissed.

11.   (33) There was no application for costs and (34) no application made under section 20C of the Landlord and Tenant Act 1985.

Chairman: Evis Samupfonda

The text is composed of 11 Argument Moves (each equaling to a paragraph), each consisting minimally of one simple argument (Argument Step). In the text we found a number of compound-structure Moves. As an example, we give here our analysis of one of them.

The Move-5 reflects the opinion of the court. Its scheme is this: (13) + (14) → (15)

Its Claim (we use R. Crable's (1976) version of the Toulmin model) is Declarative *(15) the Tribunal has made the determination.* Its Evidence are «reports of situations» *(13) Having heard the evidence and submission*, *(14) (Having) considered all the documents provided* and implicit causative Warrants for both (14) → (15) (*having respective documents enables the court to come to making a decision*) and (123) → (15) (*plaintiff's testimony and evidence enables the court to come to making a decision*). The homogeneity is based on the notional criterion verbalized in the Claim (15) as well as on the semantic and on the contextual closeness. The homogeneity of the Evidence is also proved by a copulative syntactic connection *(13) the evidence and submission…* AND *(14) all the documents provided.* We can also mark the lexico-grammatical Evidence homogeneity: *Having heard… and considered* (the perfect form of the participle). So, in this Move the Evidence are of complete homogeneity.

Homogeneous Warrants are implicit, still they are homogeneous: they have a common Claim; they are contextually relevant; they are compoundly connected on the deep level (cf. the inner modal semantization between *allowing* and *giving an opportunity*); of course, their homogeneity is incomplete.

To recapitulate, if all the six criteria are met in an argument, it has absolute homogeneity and the complete co-ordination of structure. If only some are present, there can be:

(a) incomplete co-ordination with the same trajectory of support;

(b) incomplete co-ordination with different trajectories of support;

(c) non-coordinate support (still to be distinguished from multiple grounding).

Minimal homogeneity set of the criteria can be stated and explained for co-ordinate argument structures.

ABSTRACT: We present a corpus comprising the first general election debate between Clinton and Trump (17,190 words) annotated with types of argument on the basis of the Periodic Table of Arguments. This extends the annotation of an existing corpus (97,999 words) of transcripts of television debates and associated reactions on the Reddit social media platform, annotated on the basis of Inference Anchoring Theory with relations of inference, conflict and rephrase, and their illocutionary discourse anchoring.

KEYWORDS: annotation, argument schemes, corpus, Inference Anchoring Theory, Periodic Table of Arguments, political debate, television debate, US presidential elections

1. INTRODUCTION

In this paper we present the US2016G1tvWAGEMANS corpus, a freely available resource of empirical data on argument schemes. The corpus consists of transcripts of television debates leading up to the 2016 presidential elections in the United States, combined with reactions to these debates on the Reddit social media platform. The annotation of the corpus consists of two layers. The whole corpus (97,999 words) was annotated (Visser et al. 2018a) on the basis of Inference Anchoring Theory (Reed & Budzynska, 2011), with argumentative relations of inference, conflict and rephrase, and their dialogical anchoring by means of illocutionary connections (see Section 3). The annotation of a sub-corpus containing the first general election television debate (17,190 words) is extended by classifying the argument schemes on the basis of a factorial approach to argument classification called the *Periodic Table of Arguments* (Wagemans, 2016) (see Section 2).

The Periodic Table of Arguments classification is based on three discriminating properties: first-/second-order arguments; predicate/subject arguments; propositions of fact/value/policy. The individual propositions and inference relations in all arguments are annotated with the three properties (see Section 4). The results on the three distinctions are then combined for each argument and mapped to the Periodic Table of Arguments' technical classifications (such as '1 pre FF', a first-order predicate argument relating two factual propositions) (see Section 5).

The US2016G1tvWAGEMANS corpus serves as an open resource of empirical data on argument schemes (see Section 6). It can inform the identification of isotopes of the 36 systematic characterisations of arguments in the Periodic Table, and be used to review the

appropriateness of the three discriminating properties. The corpus also serves as a resource for argument mining (the automated reconstruction of argumentative discourse). The development of the machine learning techniques that are popular for argument mining is dependent on the availability of large quantities of uniformly annotated data, which US2016G1tvWAGEMANS provides.

2. THE PERIODIC TABLE OF ARGUMENTS

For identifying the types of arguments in the corpus, we made use of a factorial approach to argument classification called the *Periodic Table of Arguments* (Wagemans, 2016). Within this approach, an argument type is conceived as a characterization of an inference relation, i.e., the specific way in which a premise supports a conclusion. The theoretical framework of the table consists of the following three independent, partial characteristics of arguments.

2.1 First-order arguments and second-order arguments

The approach assumes that premises and conclusions of arguments are expressed by categorical propositions consisting of a subject term (S) and a predicate term (P), giving an argument the general form "S_C is P_C, because S_P is P_P". The distinction between first-order and second-order arguments hinges on the possibility of breaking down the subject term of the proposition expressed in the premise of the argument (S_P). If this element cannot be broken down any further, the argument is characterised as a first-order argument ("1"). An example is "The suspect was driving fast, because he left a long trace of rubber on the road", which has "he" as the subject of the premise. If this element can be broken down, for instance because it consists of the categorical proposition expressed in the conclusion (S_C is P_C), the argument is characterized as a second-order argument ("2"). An example is "We only use 10% of our brain, because Einstein said so", which has the conclusion functioning as the subject of the premise and "is said by Einstein" as the predicate of the premise. In this case, the general form is instantiated as "S_C is P_C, because (S_C is P_C) is P_P".

2.2 Predicate arguments and subject arguments

If the subject of the proposition expressed in the premise is identical to that in the conclusion, the underlying mechanism of the argument is based on a relation between the (different) predicates. Such an argument is characterized as a predicate argument ("pre") and has the general form "*a* is *X*, because *a* is *Y*". Both examples mentioned above can be viewed as predicate arguments ("being true" functioning as the unexpressed predicate of the conclusion in the case of the second-order argument). If the predicate of the proposition expressed in the premise is identical to that in the conclusion, the underlying mechanism of the argument is based on a relation between the (different) subjects. In this case, the argument is characterised as a subject argument ("sub") and has as its general form "*a* is *X*, because *b* is *X*". An example is "Biking on the lawn is forbidden, because walking on the lawn is forbidden".

2.3 Types of propositions

Finally, arguments are characterized on the basis of the specific combination of types of propositions they instantiate. For this purpose, the approach distinguishes between propositions of fact (F) such as "Investing in solar energy will diminish CO_2-emission", propositions of value (V) such as "Investing in solar energy is a good idea", and propositions

of policy (P) such as "The UK should invest in solar energy". After determining the type of proposition expressed in the conclusion and the premise, the argument is characterised as a PP, PV, PF, VP, VV, VF, FP, FV, or FF argument.

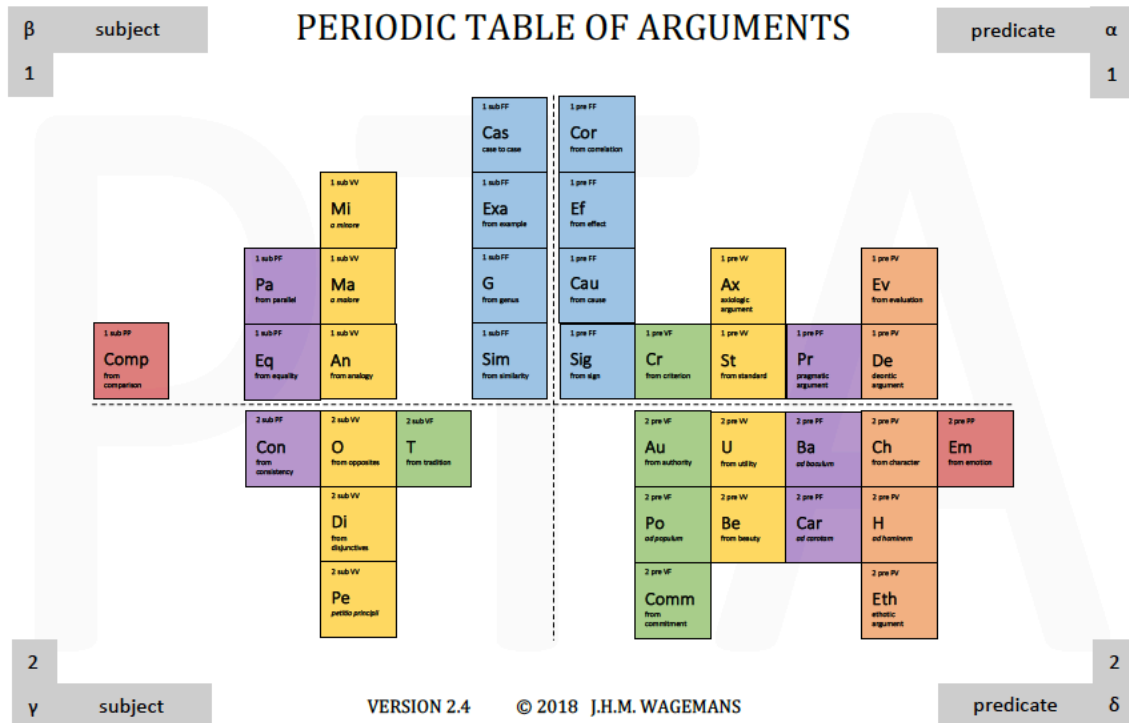

Figure 1. Visualisation of the four quadrants of the Periodic Table of Arguments.

2.4 Factorial full characterisation

After having performed these three analyses, they are combined into a full characterisation of the argument type. The resulting possible characterisations can be visualised in a Periodic Table based on the distinctive partial argument characteristics. Figure 1 shows a subset of argument types classified into four quadrants: the α quadrant groups the first-order predicate argument types ("1 pre"), the β quadrant contains the first-order subject arguments ("1 sub"), the γ quadrant covers the second-order subject arguments ("2 sub"), and the δ quadrant the second-order predicate arguments ("2 pre"). The argument types in the four quadrants are then further subdivided based on the combinations of different types of propositions employed as conclusion or premise. For example, "The suspect was driving fast, because he left a long trace of rubber on the road", would be characterised as a "1 pre FF" argument, i.e. a first-order predicate argument (α quadrant) combining a proposition of fact with another proposition of fact. This approach to argument classification is factorial in that the theoretical framework of the *Periodic Table of Arguments* leads to 2 x 2 x 9 = 36 full characterisations of arguments.[1]

---

3. A CORPUS OF TELEVISED ELECTION DEBATES

3.1 The 2016 US presidential election debates

The US2016 corpus comprises transcripts of televised debates for the 2016 presidential elections in the United States of America. These debates constitute a type of communicative activity within the political domain. The context in which communication takes place influences the argumentative activity, as it determines, e.g., the outcomes aimed for, the roles of the participants involved, and the rules or conventions with respect to the argumentative means available to them (van Eemeren, 2010). The interests and values of the individual participants further shape the practice (Fairclough, 2006): the context of televised election debates is heavily influenced by the candidates' objective to persuade the electorate to vote for them, and the broadcasting networks' aim of providing a fair and well-viewed platform for doing so.

Ever since the first televised election debate between the then US presidential candidates John F. Kennedy and Richard Nixon in 1960, the debates have played an important role in the democratic process in many countries (Kraus, 2013). The general election and the associated television debates between Hillary Clinton and Donald Trump as the candidates for the two dominant political parties in the US (respectively the Democratic Party and the Republican Party) took place in the Autumn of 2016.[2] Prior to the general elections, both main parties held primary elections and caucuses to elect their party's candidate for the presidency. These primaries were also preceded by television debates between the leading prospective candidates in 2015 and 2016.

While the format of each of the debates is slightly different, there are some recurring characteristics. Being television debates, the discourse is spoken, with transcripts available retrospectively through a variety of sources, and video recordings broadcast live and available afterwards. The participants are expected to use language that is appropriate for the occasion. A selection of a limited number of candidates is invited to these events, moderated by anchors and journalists from the television networks that air them (among others, CBS, CNN, Fox News, and NBC).

The television networks' moderators pose questions to the invited candidates, and guide the debate (for example by keeping time and order), while the candidates make opening statements, answer the moderators' (and occasionally the public's) questions, defend their views and challenge those of their political opponents, in an attempt to garner more support among the electorate. For the general elections, three television debates were organised between Democratic candidate Clinton and Republican candidate Trump, and one debate between their candidate vice-presidents. For the primaries, the Republican party held 12 debates for the front-runners and seven so-called `undercard' debates between the next tier of candidates. The Democratic party held 10 primary debates. As time went on and more of the candidates withdrew their candidacy, the number of participants declined over the course of these series of debates.

The argumentation encountered in the debates is not always nicely signalled linguistically, or even and intuitively clear. The television debates are a spoken genre of discourse, such that the history of the dialogue is not entirely available to the participants – depending on their memory, of course – which may lead to repetitions and contradictions of what was said earlier. Furthermore, candidates cannot always rely on their prepared and practised lines and topics, but have to respond to unexpected turns and twists, and to

---

[2] In the current paper, we focus exclusively on the debates between the (prospective) candidates of the two dominant parties in US politics.

interaction with the other candidates and moderators. Because responding well to such dynamic situations is expected to instil the voters' confidence in the candidate, candidates receive support to varying degrees from communication professionals in their preparation and training, and rely on their experience in political debating.

The context of televised election debates fosters a mixture of well-structured and well-presented argumentation that appears to have been prepared in advance, and impromptu argumentation originating from the need to cope with the interactional dynamics. The level of noise in the data – in terms of e.g. crosstalk, unconventional use of discourse markers, and low discourse cohesion – poses a challenge in the analysis of the argumentation. Consider Example (1), advanced by then prospective candidate (now President) Trump.[3] Trump anticipates his claim about the topic of immigration to not be accepted outright. He therefore supports it with multiple statements, but does so in a non-straightforward fashion. Upon closer inspection, Trump's support relies mostly on the rhetorical device of repetition, with several of his assertions constituting a relation of rephrase rather than inference. By relying on varying ways of presenting the same content within a superficially inferential reasoning structure, Trump introduces an element of circularity.

(1)   Donald Trump: *So, if it weren't for me, you wouldn't even be talking about illegal immigration, Chris. You wouldn't even be talking about it. This was not a subject that was on anybody's mind until I brought it up at my announcement. And I said, Mexico is sending. Except the reporters, because they're a very dishonest lot, generally speaking, in the world of politics, they didn't cover my statement the way I said it.*

In addition to the annotated transcripts of the television debates, the US2016 corpus contains annotated social media posts extracted from Reddit. The communicative context of social media posts leads to different conventions and communicative characteristics. Since, in the current paper, we only focus on a television debate sub-corpus of US2016, we will not go into detail on the Reddit sub-corpora – these are reported on elsewhere (Visser et al., 2018a).

3.2 Annotation with Inference Anchoring Theory

Four annotators, trained in the use of Inference Anchoring Theory (IAT) (Reed & Budzynska, 2011), annotated the US2016 corpus that we take as a case in point in the current paper. Building on insights from discourse analysis and argumentation studies, IAT explains argumentative conduct in terms of the anchoring of argumentative reasoning in communicative interaction. Drawing on Speech Act Theory (Austin, 1962; Searle, 1969), the anchoring is theoretically conceptualised as the `illocutionary connection' between locutions in dialogue and their propositional content. IAT then allows the analytical concepts and annotations to be represented in terms of the Argument Interchange Format ontology (Chesñevar et al., 2006), resulting in a graph-based representation that facilitates the computational processing of data and procedures.

The annotation guidelines, summarised below, are based on IAT. The full version of the guidelines (available online at arg.tech/US2016-guidelines) deals with, among others: anaphoric references, epistemic modalities, repetitions, punctuation, discourse indicators, interposed text, reported speech, and how to deal with context-specific peculiarities.

---

[3] The annotation of example (1) – taken from our corpus of the first Republican primaries television debate on 6 August 2015 in Cleveland, Ohio – is available online at aifdb.org/argview/10829.

- *Segments* divide the (transcribed) text into locutions, consisting of a speaker designation and an `argumentative discourse unit' (a text span with discrete argumentative function) (Peldszus & Stede, 2013).

- *Transitions* capture the functional relationships between locutions, reflecting the dialogue protocol – a high level specification of the set of transition types that are available in a particular communicative activity.

- *Illocutionary connections* embody the intended communicative functions of locutions or transitions, such as: *Agreeing*, *Arguing*, *Asserting*, (three sub-types of) *Challenging*, *Disagreeing*, (three sub-types of) *Questioning*, *Restating*, and *Default Illocuting* (when none of the other types suffice). Some types of illocutionary connection lead to the reconstruction of a propositional content.

- *Inferences* are directed relations between propositions, reflecting that a proposition is meant to supply a reason for accepting another proposition. A specific argument scheme (e.g., *Argument from Example* or *Argument from Expert Opinion*) can be specified; failing that, it is labelled as *Default Inference*.

- *Conflicts* are directed relations between propositions, reflecting that a proposition is meant to be incompatible with another proposition or relation. Such incompatibility may depend on, e.g., logical *Contradiction* or pragmatic *Contrariness*, or the annotated relation may default to *Default Conflict*.

- *Rephrases* are directed relations between propositions, reflecting that a proposition is meant to be a reformulation of another proposition. Such reformulation may involve, e.g., *Specialisation*, *Generalisation* or *Instantiation*, or the relation defaults to *Default Rephrase*.

The annotation has been validated by means of calculating the inter-annotator agreement on a 11.3% sample, resulting in a Cohen's (1960) κ of 0.610, and a CASS (Duthie et al., 2016) κ of 0.752 – both indicating substantial agreement according to Landis and Koch's 1977) standard interpretation of the kappa metric. The resulting annotated US2016 corpus is freely available online at corpora.aifdb.org/US2016. We compiled some of the quantitative characteristics of the US2016 corpus in Table 1. Additionally, the table contains the properties of the US2016G1tv sub-corpus, the extended annotation of which we discuss in the current paper. Aside from a basic word count, Table 1 comprises counts of, e.g., locutions (text segments), some illocutions, arguments ('inference'), and counterarguments ('conflict').

Corpus	Word tokens	Locutions	Illocutions	Propositions	Inference	Conflict	Rephrase	Arguing	Disagreeing	Restating
US2016G1tv	17190	1584	2285	1473	505	79	140	507	62	121
US2016	97999	8937	13331	8099	2830	942	764	2788	907	576

Table 1. Quantitative annotation properties of the US2016 and US2016G1tv corpora.

4. ANNOTATION WITH THE PERIODIC TABLE OF ARGUMENTS

The annotation of argument schemes on the basis of the Periodic Table of Arguments is treated as an extension of the existing IAT-annotated argument structure of US2016G1tv. Because the typology of the Periodic Table of Arguments is based on the interplay between three distinguishing characteristics of the arguments, the annotation task has been deconstructed into three partial classification sub-tasks. Two annotators trained in annotation with the Periodic Table of Arguments, each carried out the three classification sub-tasks on 55% of the inferential relations and the related propositions of the US2016G1tv corpus. Based on those partial results an aggregated final classification of the argumentative inferences is produced with one of the 36 possible main types of the Periodic Table of Arguments (e.g. *1 pre FF*). If any of the inference relations or propositions involved in an argument cannot be classified, this leads to a classification as *Default Inference* in the final aggregation step. Similarly, any inference relation involving several premises without a dominant proposition type is labelled *Default Inference*.

4.1 Annotation guidelines

- *First-order and second-order arguments:* An inference relation is classified as *first-order* if it connects two propositions each containing a subject-predicate pair. An inference relation is classified as *second-order* if its premise is a locution (often the result of reported speech), or if the premise is otherwise applying a predicate to the full proposition in the conclusion.

- *Predicate and subject arguments:* An inference relation is classified as a *predicate argument* if the propositions involved share the same subject term to which different predicates are applied, and as a *subject argument* if vice versa. This classification is made more complicated by the fact that natural language generally does not neatly follow the subject-predicate structure of categorical propositions, while the IAT analysis does not mandate such reconstruction of propositions either. This means that the annotator has to make a reconstructive interpretation of the proposition as if it were a categorical proposition, to then categorise it – in order to respect the starting point of not changing the original annotation aside from classifying the types of argumentative inferences, i.e. argument schemes.

- *Propositions of fact, value and policy:* A proposition is classified as a *proposition of fact* if its veracity can be verified through empirical observation, as a *proposition of value* if it contains some evaluation (whether ethical, aesthetical, legal, or logical), and as a *proposition of policy* if it expresses an act or policy to be carried out.

4.2 Validation

The annotation guidelines are validated by calculating the inter-annotator agreement for the three partial classifications, as well as for the final aggregated schemes. For the classification of *first-order* and *second-order* arguments, a random sample of 10.0% was annotated by both annotators, resulting in a Cohen's κ of 0.658. While generally not considered a low κ – still amounting to substantial agreement (Landis & Koch, 1977) – this is the lowest inter-annotator agreement of all three sub-tasks. The lower score is a result of the set of arguments being unbalanced with a preponderance of *first-order* arguments: 481 *first-order* to only 11 *second-*

order arguments). This imbalance throws off the calculation of the Cohen's κ metric, as becomes clear when calculating the corresponding percentage agreement of 98.0% between the two annotators.

Also on a 10.0% sample, the classification of *predicate/subject* arguments results in a Cohen's κ of 0.851. The classification of propositions as *fact/value/policy* yields a Cohen's κ of 0.778 on a 13.4% sample. The inter-annotator agreement for the aggregated argument scheme classification is based on a 10.4% sample, resulting in a Cohen's κ of 0.689. This means that the partial and final annotations all fall within the range of substantial to almost perfect agreement.

5. THE US2016G1tvWAGEMANS CORPUS

The annotation of argument schemes based on the Periodic Table of Arguments is compiled in the US2016G1tvWAGEMANS corpus (available online at corpora.aifdb.org/US2016G1tvWAGEMANS). Each of the previously annotated argumentative inference relations in the US2016G1tv corpus has been labelled on the basis of the three distinguishing characteristics defined by the Periodic Table. For example, Clinton's argument in (2) is classed as a *1 pre PV* argument.[4] Clinton defends a policy proposal (*P*) (people on the terrorist watch list should be restricted from buying a gun), by drawing an analogy to a value statement (*V*) (people on the terrorist watch list are too dangerous to fly). She does so by means of two first-order propositions (*1*), that share a common subject term (*pre*) (people on the terrorist watch list).

(2)   CLINTON: *And we finally need to pass a prohibition on anyone who's on the terrorist watch list from being able to buy a gun in our country. If you're too dangerous to fly, you are too dangerous to buy a gun.*

	Total number	First-order argument	Second-order argument	Subject argument	Predicate argument	Proposition of value	Proposition of policy	Proposition of fact
Inferences	505	481	11	124	308			
Propositions	1473					383	110	289

Table 2. Results for annotation sub-tasks of distinguishing *first-/second-order* and *subject/predicate* arguments, and propositions of *value/policy/fact*

Quantitative metrics of the annotated corpus are compiled in Tables 2 and 3. Table 2 shows the counts for the three sub-annotations, while Table 3 contains the aggregated results. Notably low is the proportion of *second-order arguments*: accounting for only 11 out of a total of 505 inference relations. On the other end of the scale, the number of *default inference* classifications is uncomfortably high: 85 out of 505 inference relations have remained

---

[4] The annotation of example (2) – taken from our corpus of the first General Election television debate on 26 September 2016 in Hempstead, New York – is available online at aifdb.org/argview/10850.

unclassified, amounting to 17% of the corpus. The main reason for the high number of *default inference*s is that a failure to classify a proposition or relation in any of the three annotation sub-tasks will cause the combination of the three sub-tasks to default into an unlabelled classification. In other words, if a proposition cannot be classified in terms of *policy/value/fact*, for example because it is too vague, or if the relation is not clearly *first-* or *second-order*, or if the propositions are incomplete to the extent that it's not clear whether the *subject* or *predicate* is responsible for the transferring of justificatory force, then the aggregated final classification of the argument as a whole fails and defaults.

Argument scheme	Count		Argument scheme	Count		Argument scheme	Count
Default inference	85		1 sub VF	23		1 sub VP	4
1 pre VV	78		1 sub FV	17		1 sub PV	3
1 pre VF	61		1 pre PF	15		2 pre FV	3
1 sub VV	50		1 sub FF	10		2 pre VF	2
1 pre FF	47		1 pre VP	8		2 pre VV	2
1 pre FV	27		1 sub PF	7		2 pre FF	1
1 pre PP	27		1 pre FP	5			
1 pre PV	25		1 sub PP	5

6. IMPLICATIONS AND CONCLUSION

The US2016G1tvWAGEMANS is the first corpus of argumentative discourse annotated on the basis of the Periodic Table of Arguments, and it is one of the largest and most reliably annotated corpora of argument schemes publicly available. We intend the corpus to provide a resource for the quantitative study of argument schemes, and for computational approaches to argumentation in particular. Elsewhere (Visser et al., 2018b), we have reported on the annotation of the same source material (i.e. the US2016G1tv corpus) on the basis of Walton's (Walton, Reed & Macagno, 2008) typology of argument schemes. The dual annotation of the same source material with two distinct typologies of argument schemes makes it possible to do comparative studies. For example, the dual annotation can be used to map the technical names of Wagemans' Periodic Table of Arguments (e.g., *1 pre FF*) to the colloquial names of argument schemes familiar from Walton's typology (e.g., *Argument from sign*). This will expand the range of 'isotopes' in the Periodic Table: identifying the various sub-types of the larger classes delineated by the technical types (thereby creating the individual boxes in the four quadrants of Figure 1). A co-occurrence matrix, such as Table 4, can be used to look for regularities in the annotations based on the two typologies: it shows the number of arguments classified for the more common combination of the two typologies.

Corpus-based studies can provide new insights into the dialogical nature of argument schemes, and how they are employed in different communicative contexts. The frequency of particular schemes can further characterise the argumentative preconditions of the activity type, and feed into the study of which prototypical argumentative patterns are actually stereotypical (van Eemeren, 2017). A closer look at the linguistic surface structure associated with a particular type of argument scheme can lead to a greater insight into the use of discourse markers indicative of argumentation (van Eemeren, Houtlosser & Snoeck Henkemans, 2007); which in turn would be highly valuable for argument mining – the automated reconstruction of argumentative content from a natural language text (Lawrence & Reed, 2015). Also for approaches to argument mining that do not rely on discourse markers,

the availability of a robust annotated dataset is of great value for machine learning purposes (Peldszus & Stede, 2013).

Table 4. Co-occurrence matrix of the most common argument scheme annotations in US2016G1tvWALTON (columns) and US2016G1tvWAGEMANS (rows)

An unavoidable difficulty in annotating argument schemes is posed by the fact that natural-language argumentation is not expressed in terms of categorical propositions or other abstractions. A reconstructive step is required to get from naturally expressed argument to the schematic abstractions that the typologies of argument schemes are based on. While technically possible, IAT annotation (see Section 3.2) ordinarily does not go into that reconstructive depth. The different approaches available to address this issue will be explored in future work.

Maladaptive schemas as impaired internal arguments

RANDEE VOSS

Department of Mechanical Engineering
The University of Texas at Austin
United States of America
vossy64@gmail.com

ABSTRACT: Cognitive behavioral therapy, schema therapy, and other cognitive therapies maintain that maladaptive thoughts, understood as propositions, cause emotional problems. Therapist and patient work together to reconfigure cognitive structures and processes (together called schemas) to achieve healthier beliefs, more logical thinking, happier feelings, and more constructive behavior. Schema theory is a cognitive model that offers a dynamic view of cognition, useful for understanding not only maladaptive beliefs, feelings, and actions in individuals, but perhaps also dysfunctional social and political movements.

KEYWORDS: argumentation, cognitive therapy, nationalism, schema, schema therapy, social movements, rhetoric

1. INTRODUCTION

Whether occurring in a coffee shop or a courtroom, a campaign headquarters, a bedroom, or a car lot, an argument is assumed to require at least two parties. One person may invent or plan, and one may listen or receive, but in general, the interaction of argument is indeed *inter-*, not *intra-*. Perhaps, though, this assumption leaves a vast ocean of symbolic exchange unexplored. Is not a mind a place where claims are made that are based on premises, where reasons and evidence are marshalled in support of claims? Indeed, a single mind is a site noisy with deliberation, negotiation, debate, dialogue, and persuasion. Yet there has not been a systematic study of internal argument.

Jean Nienkamp's innovative historical study of "internal rhetoric" (2001) forges a path inward, reminding us that dialectic and rhetoric were not always distinct from one another: Plato separated thought and speech, and Aristotle split *logos* into dialectic and rhetoric such that the latter was forever associated with public speaking (p. xi). Her project, however, is to trace the neglected thread of internal dialogue through major Western rhetorical theorists to show how each rhetorical theory has imbedded in it a notion of how the mind works. This approach does not offer a specialized vocabulary or theory to describe cognition (or certain kinds of it) as internal argumentation. I propose that therapeutic schema theory provides a useful model, the significance of which is that it re-embodies argumentation, weaving together the mutually reinforcing dimensions of auto-cognitions, feeling states, and actions ("behaviors"). This reintegration is useful for studying certain kinds of internal argumentation, but more apt, I submit, for understanding destructive social movements, since the latter consist of dysfunctional, emotional behaviors rooted in faulty argumentation.

2. THERAPEUTIC SCHEMA THEORY

The cognitive psychotherapies are good place to begin to imagine the mind as an eristic site. First some background: with the publication of his *Depression: Causes and Treatment* in 1967, Aaron Beck spurred a cognitive revolution in psychotherapy, a sea change that in the 1970s engulfed both the behaviorism and Freudian analysis (depth psychology) that had been dominant in the 20th century. His cognitive therapy maintained that the source of many emotional problems is wrong thinking--maladaptive thoughts and cognitive distortions--that is, negative interpretations of self, world, and future that arise spontaneously in response to incoming data (Knapp and Beck, 2008). Now, these negatively charged "automatic thoughts," as they are called, seem true and accurate to the thinker since they are part of an entire style and structure of thought on a particular subject, called a schema (short for maladaptive schema), but they are really based on negative or untrue "core beliefs" that shade the person's thinking about self, world, and future--from what they perceive in the first place all the way up to conscious opinions. A negative core belief might be something like, "I'm fundamentally not loveable" (self) or "people are just rotten" (world) or "things are never going to go my way" (future). Such negative core beliefs reinforce one another, creating a pervasive worldview (Wenzel, 2012, p. 17-18). Likewise--and this is part of what makes the schema model so powerful--dysfunctional thoughts, negative feelings, and maladaptive behaviors all feed one another, creating a cycle that colors perception, organizes new information, and largely determines one's experience (Knapp and Beck, 2008, p. 58). Knapp and Beck describe schemas as having a "variety of properties, such as permeability, flexibility, breadth, density, and also a degree of emotional charge" (2008, p. 58). These subtle and fine distinctions suggest a promising model. Even more determining are clusters of schemas, called modes.

Like an argument, a schema includes propositional content (core beliefs, conditional assumptions, inferences, and automatic thoughts) (Knapp and Beck, p. 57-59), as well as form: cognitive distortions and information processing biases (Wenzel, 2012, p. 19), which are akin to and sometimes identical to logical fallacies. Bokmelder has usefully identified these parallels (2014, Section 2). Indeed, both the understanding of mind and the therapeutic practices in the cognitive therapies are shot through with argumentation. What is interesting is how moving the site of argument inward broadens rather than narrows the scope of argumentation. This is because the therapeutic model is concerned with maladaptive schemas, which are defined as dynamic systems that encompass feelings (both mental and physical), thoughts, and actions (Knapp and Beck, p. 57). The logical-verbal aspect can be extracted, but only artificially. The model really describes being--and it places argumentation at the center.

Beck's schema model is rich in part because cognitive behavioral therapy, or CBT, which is now the umbrella term for several similar therapeutic models, grew out of an eclectic combination of influences. A Freudian psychoanalyst by training, Beck became frustrated with his depressed patients' lack of progress in psychotherapy. Through his conversations with patients, he surmised that their depressed state had to do with their interpretations of events, not, he realized, with repression (Knapp and Beck, 2008, p. 56). He read Stoic philosophy and developed the idea that "human beings are disturbed by the meanings they attach to facts, not by the facts *per se"* (Knapp and Beck, 2008, p. 57). And although he retained the notion that there are depths to consciousness, he maintained that all thoughts can be perceived and evaluated if a person is trained at noticing them (Knapp and Beck, 2008, p. 57). So in CBT, the patient and therapist work together to identify distressing "automatic thoughts" and the dysfunctional core beliefs that give rise to them. The method is essentially argument analysis, in which the therapist (at first) helps the patient to uncover and interrogate

dysfunctional core beliefs through the "Socratic Method" (by which is meant asking guiding questions) (Clark and Egan, 2015). The therapist leads, but the patient discovers. And the "homework" that patients do consists of argumentation strategies like testing a claim (a patient's assumption about herself or the world) against available evidence, but also employs trying and practicing challenging things in the world. For although Beck rejected the way traditional behaviorism discounted feelings, he embraced the importance of doing as part of learning. Intentional actions (comprising the behavioral dimension of the therapy) help people to have better experiences, which encourage new interpretations and beliefs. CBT has a humanistic-phenomenologist bent that values "conscious subjective experience" (Knapp and Beck, 2008, p. 57) and trusts the patient to study himself empirically and reflect upon his experiences. Likewise, there is an Enlightenment faith that if you will painstakingly dismantle the bad arguments within, the truth will set you free. The schemas want to stay hidden though, since unquestioned they have power. A brief dramatization will show the components and mechanisms of a schema system.

3. FABLE OF A MALADAPTIVE SCHEMA

Let us say Elise has a Defectiveness/Shame schema (one of the 18 most common "Early Maladaptive Schemas" identified by Jeffrey Young), with a core self-belief that she "would be unlovable to significant others if exposed" (one of the common beliefs in this schema) (Young, 2012). In other words, if her friends really knew her, they would reject her. Elise doesn't always believe she is unlovable, but the schema is easily activated (triggered) by input that another person might view as neutral. She goes to lunch at 12:30 at one of her department's usual dining spots and sees that two colleagues with whom she is friendly are already there finishing their lunches while rapt in a serious conversation. Elise feels a sudden stab of dismay. The feeling is upon her so quickly that she wouldn't be able to tell you if she felt it in her solar plexus or her mind first. Simultaneously, a thought rises up unbidden: *They've figured me out! Of course they didn't invite me.* The thought has a verbal form, but it flashes through her mind so quickly, she doesn't think of it as a thought. It is just something she suddenly knows. And she "knows" it is true because she believes that *if people like you, they never do anything without inviting you.* (Such a rule is what Judith Beck has dubbed a "conditional assumption") (Knapp and Beck, 2008, 60). She feels more than thinks about the "truth" of her sudden realization. It is familiar, like the proverbial "other shoe" dropping. Now she ducks out of the restaurant, feeling breathless, and turns two corners before she stops at a non-descript shop where she hopes to choke down a sandwich by herself. After this incident, Elise makes sure to leave for lunch early and eat at an unpopular cafe, and this she does, while holding up the daily newspaper in front of her face.

The core belief (unlovability) and its attendant conditional assumption (or intermediate belief) have prepared Elise to be mortified, so the system is easily activated. And "activation" is what puts the schema in motion; the beliefs are latent at other times (Knapp and Beck, 2008, 58). The idea is that most people hold co-existing healthy schemas, as well, and these are in place much of the time (Padesky, 1994, p. 268). Once the trigger happens, though, Elise's cognitive distortions (or "information processing biases") come into play to cause the initial automatic thought ("They didn't invite me because they've figured me out...").

Several cognitive distortions are evident here. Emotional reasoning, which is "thinking that something is true because one has a very strong feeling (actually, a thought) about it"; selective abstraction, which is focusing attention on only "one aspect of a complex situation," and mental reading, assuming one knows what others are thinking (Knapp and

Beck, 2008, p. 56). Along with negative core beliefs, cognitive distortions make the automatic thought seem true. Notice that in syllogistic terms, Elise's core belief acts as the conclusion, something that has now been proven true:

> If you are a loveable person, people will always invite you along.

> They didn't invite me.

> (Therefore) I must not be loveable.

In Stephen Toulmin's enthymematic structure, "I'm not loveable" would be called the claim, "because I didn't get invited to lunch" is the grounds or reason, and the intermediate belief, "if you are loveable…" is the warrant: it remains in the background, connecting the reason to the claim. The Toulmin model is especially apt since the "intermediate belief" or "conditional assumption" is exactly that: an assumption. It achieves its power from lurking in the background. The logical component of the schema cannot exist, though, without being woven together with feelings (sadness, loneliness) and actions (self isolation), which will maintain and even strengthen the core and intermediate beliefs so that the whole schema can easily be activated again.

4. FUNCTIONAL SCHEMAS

The cognitive therapies, as such, have focused on understanding schemas that cause distress, since the main goal of all the different cognitive therapies is to replace the maladaptive schema with a functional one. If Elise believed that she were fundamentally a good person, she would have seen her colleagues at the restaurant, waived hello, and either sat with them or not. It wouldn't matter which. There would be no activation and no temporary loss of reasoning ability. In the therapeutic schema model, functional (positive, healthy) schemas are not where the action is. Functional schemas more closely resemble the earlier use of the schema idea in learning theory, where a schema is simply a conceptual category. Beck's work is based, in fact, on Piaget's use of the word schema to describe category making in normal cognitive development (Padesky, 1994, p. 267). In 1961 Beck defined a schema in these terms, as a "structure for screening, coding, and evaluating the stimuli that impinge on the organism" (quoted in Padesky, 1994, p. 267). A schema was simply a way to process new information by "categoriz[ing] and interpret[ing] … experiences in a meaningful way" (quoted in Padesky, 1994, p. 267). In learning theory schemas are shortcuts for learning and placing new data. Without them we be overwhelmed. To put it another way, to a certain degree, lazy thinking is both normal and necessary, a mechanism for filling in details. Experiments in social psychology from the beginning of the Twentieth Century to the present have shown how people rely on schemas to fill in or create memories. Bartlett (1932) concluded that memory is

> an imaginative reconstruction or construction, built out of the relation of our attitude towards a whole active mass of organised past reactions or experience. . . . It is thus hardly ever really exact, even in the most rudimentary cases of rote recapitulation. . . . The attitude [of "remembering"] is literally an effect of the organism's capacity to turn round upon its own *'schemata'*, and is directly a function of consciousness. (Chapter X, Section 7, my emphasis)

Perhaps because we rely so heavily on schemas we are loathe to change them. In the view of learning theory, schemas are problematic only when they become imbued with negative value, such as in an experiment by Kleider et al. (2008) when subjects were ask to remember a detail from video footage that did not accord with a gender stereotype. Subjects got the detail wrong because the stereotype was stronger than actual recall.

None of this is news, though. The idea of schemas as buckets for sorting information is scarcely different from Aristotle's special *topoi*, or sets of common ideas meant to come in handy to persuade people in certain situations. The new insights for argumentation come from the analysis of maladaptive schemas. These show failures of internal argument, where premises hide themselves because seen clearly, their failure would be obvious, where fear and despair enable false reasoning and encourage self-defeating actions. In this regard, the theory is powerful in how it integrates faulty argumentation into a larger system, *a dynamic dysfunctional being-state, triggered by a stimulus.* This is a powerful model of human symbolic action at its most dangerous.

Just as it works for individuals, this model can work for groups. We have seen maladaptive schemas enacted on massive scales. The system is the same as it is in an individual. Often deeply imbedded negative categories are shared by many, they are harnessed to strong negative emotions, and given terrible life through predictable behaviors. Likewise, such maladaptive are triggered and self-reinforcing. Where an individual schema is activated unconsciously, however, a movement can be manipulated by leaders who use rhetoric and ritual behavior together to spark and to spur.

5. CONCLUSION

I submit that maladaptive schemas are ubiquitous and widely shared across populations. Jeffrey Young posits only 18 schema types, and the styles of cognitive distortion are likewise limited (Beck lists eight) (Knapp and Beck, 2008, p. 57). Cultural specificity of contents should further narrow the field. So there aren't that many ways to feel bad, as many people and many groups share dysfunctional core beliefs and look at the world mostly through the same distorted lenses. The cognitive therapies have used schema to understand and relieve individual suffering, but it takes only a change in orientation to see dysfunctional schemas as negative social phenomena.

A (dysfunctional) social schema might be seen as a large wave of emotionally heightened, distorted reasoning linked to dysfunctional and false core propositions about selves, world, and future--and reinforced with erratic and violent behavior. A mass schema like this sounds both frightening and familiar. It accurately characterizes the movement that put the current U.S. president in power, as well as similar zealous, fear-based movements, especially nationalist ones. This kind of schema seems to be latent all the time, and it just takes a trigger to activate it. Seeing nationalism, racism, and xenophobia as mass maladaptive schemas has the advantage of showing microcosm and macrocosm simultaneously. This view models how the self-fueling nature of mass maladaptive schemas combines propositions (slogans), negative feelings, and actions in a dynamic system. As well, the notion of modes, clusters of similar schemas that are triggered as one, might model in a new way how racism, nationalism, and isolationism crop up together, all deployed through paranoid, suspicious information processing biases and punctuated by violent behaviors.

A danger of medicalizing meanness, cruelty, and selfishness lies in the possibility of failing to hold wrongdoers accountable. This must be avoided, certainly. But we can learn from the idea that the remedy for such mass madness lies in trying to replace the bad schemas with the good ones that have gone dormant.

Rhetorical invention and factual claim as arguable space in cross-cultural argumentation

ABSTRACT: Among presuppositions firmly entrenched in the tradition and practice of Chinese discourse are the discursive axioms that "fact speaks louder than eloquence," which means "facts" exist independently of a specific context and audience. In the current discursive field of intercultural argumentation, what counts as "fact" or "data" for point of departure, has become a "stasis" from which arguers from both sides make great efforts to redirect or readjust their discourse production.

KEYWORDS: objectivity, meaning, rhetoric, audience, belief, context

1. INTRODUCTION

In this so-called "post-truth" era, we are frequently confronted with different incompatible or incommensurable versions of "truth" and "fact," tiny and large, trivial and important, old and new, hard and soft, etc., each of which is presented via different media, realistic ones or virtual ones, and spares no efforts to assert itself as the only true "factual claim" about or "accurate representation" of the reality or physical world. The distinction between truthfulness and falsehood is blurred in such a way as to suggest that gone are such "claims" or accurate "representations" as the only philosophically pursued metaphysical "Truth." In the postmodernist intellectual climate, everything seems capable of being reduced to a "discursive construct." Therefore, in the current discursive field of intercultural argumentation, what counts as "fact" or "data" for point of departure in argumentative practice is of extreme importance (Toulmin, 2013). For instance, people often come across such claims as "The Chinese government is a currency manipulator," "There are rampant abuses of human rights in China," "The rise of China as a geopolitical power is a threat to the current world's political and economic orders," to name just a few. Are these claims well-grounded? Or are they expressing sort of "truthful condition?" Are they accurate "representations" of reality? Are they of truth-value? Are they factual claims? Or rather are they simply arrogant assertions, or groundless accusations? so on and so forth.

However, what is the definition of "human rights?" What is the nature of representations? What is truth? Are they rooted in what is called "deep disagreements" (Fogelin, 1985)? What is the implicit argumentation scheme in these arguments (Macagno et al., 2017)? What is the relation between those implicit argumentation scheme and rhetorical invention? As such, this issue has become a "stasis" from which arguers from both sides make great efforts to redirect or readjust their discourse production. Fact is not something "out there" to be unearthed. Eloquence has an important role to play in the establishment of factual status or claim. Nevertheless, in the current literature on argumentation studies, the close relation between "fact" and "eloquence" has unfortunately been left untended among western theorists of argumentation. The traditionally assumed distinction between fact and eloquence has yet to be

problematized. Few theorists of argumentation have been patient enough to take a hasty look at the relation between fact and eloquence, let alone challenge the presumptively binary opposition between the two in Western thoughts.

2. THEORETICAL HORIZONS

The abovementioned case studies illustrate a key issue in intercultural argumentation. This is the close relationship between fact and eloquence. Since, as has been observed by Paul Ricoeur, "[Argumentation is] a mode of demonstration that situated halfway between the constraints of the necessary and the arbitrariness of contingency" (1997, p. 61). Later on this observation is echoed by Liu in saying that rhetoric operates between the scope of "the in-between region with the absolutely necessary and the totally random as its two outer limits, i.e., the domain of the probable" (Liu, 2005). Facts' rhetorical functions can be summed up as follows: (1) "as carrier of certainty, hence the point of departure in argumentation" [China's defense budget is on the increase annually, which remains a mystery far from transparent]; (2) "as a key element in the establishment of the arguer's credibility/authority" [US defense secretary Donald Rumsfeld: China buildup a threat to Asia] (Rumsfeld, 2005); (3) "as a mechanism for manipulating the audience's emotion" ("The cry that 'there is no excuse for September 11th' has become a means by which to stifle any serious public discussion of how U.S. foreign policy has helped to create a world in which such acts of terror are possible."); (4) a key yet often neglected role in the triggering of a rhetorical process as rhetoric, as far as its definition is concerned, is an interactive "multilateral cooperation," and also a non-coercive symbolic action. If only the rhetor can manage to get the audience, be it an individual, a group, an institution or a community, to join voluntarily the advocated rhetorical relationship and take a part in it, he/she [the rhetor] can thus initiate a real rhetorical process (e.g., for advocates of China Threat, if only they can succeed in persuading the relevant countries in Asia, their leaders and the general public to join voluntarily the rhetorical relationship between the advocates and others like Japanese Foreign Minister Taro Aso (Takahara, 2005), and the New York Times reporters Thom Shanker and David E. Sanger (Shanker & Sanger, 2005); (5) "as a mechanism for creating uncertainty (the strange, the controversial, the undecided) out of certainty" (the familiar, the settled, the decided): the need to address and remove this uncertainty would create a situation both for the speaker to say something and to ensure that whatever he says is of interest to the audience (Liu, 2004a, pp. 57-102). Understanding of facts' key role in laying down the argumentative foundation, establishing the arguer's credibility/authority, manipulating the audience's emotions and also in formulating the rhetorical relationship, initiating the rhetorical process and authorizing rhetorical invention, is surely helpful in deepening our recognition of the Western rhetorical norms, refuting the China Threat argument and engaging the West rhetorically.

Seemingly, our afore-mentioned discussion on facts' role in rhetoric leaves us the impression that facts speaker louder than eloquence, which we Chinese have taken for granted for too long a time. Nonetheless, in Western rhetorical practice, it's not the case. For Western rhetoricians, this seemingly indisputable proposition [facts speak louder than eloquence] is by any means meaningless. As Liu observes, first, any argument neglecting facts is by no means true eloquence, but a chicanery; second, this proposition is itself a misleading distortion of the relationship between fact and eloquence (Liu, 2004, p. 57). Since eloquence requires relevant facts or evidences as its argumentative foundation, argues Liu, the two terms never contradict each other. This proposition not only causes a conceptual mess and vagueness, but is a counterproductive presumption in practical use. In the case of China Threat Theory (CTT), since we assume that China poses a threat for nobody, some people might suggest that no attention be paid to CTT. Should this happen, we would find it too late to rebut the argument

of China Threat since we will shoulder the burden of proof. As has been pointed out, eloquence played a decisive role in creating a rhetorical *casus belli* for the Bush administration to launch the Iraq War. Factual claims are essentially rhetorical. Yes, indeed, within the Western rhetorical framework, though people seldom acknowledge it publicly, it has been widely assumed that facts must be established, "For facts depend on eloquence for its certification or justification. Even in the case of an instant and universal approval of a factual claim, the claim has been certified contextually, i.e., through eloquence embodied in contextual elements" (Liu, 2005). The role of eloquence once again directs our attention to Hermagoras's Stasis Theory, which takes the following three as its basic theoretical assumptions: (1) fact must be the central focus of rhetor, which runs through the whole process of rhetorical invention; (2) fact is not an unchangeable objective existence for the rhetor who can initiatively, from multiple facets, rhetorically intervene the proving process of factual representations that have been or are being advocated; (3) whether the rhetorical effort will turn out to be failure or success is up to the result of the rhetorical intervention (Liu, 2004, p. 64). Liu argues that the rhetorical intervention of eloquence upon the establishment of factual claim can be realized through a direct suspicion or objection of the current factual representation. Or it can be realized through the following three indirect strategies: (1) "renaming the fact"; (2) "invoking special circumstances"; (3) "demanding a radical institutional change" (Liu, 2004, p. 64).

We reject one of the fundamental assumptions in Western thoughts that rhetoric, as what is called in Plato's Gorgias "a habitude or knack of producing persuasion" (LCL1961/453A), is the producer of opinion, whereas what philosophy produces is knowledge or truth. In this sense, what is also unacceptable to us is the presumption among philosophers that rhetoric can be transformed in such a way as to serve as a "useful tool" for the transmission of knowledge or truth, as has been suggested in Plato's Phaedrus. Rather, we adopt as our working definition Aristotle's conception of rhetoric as "the ability to see in each given case the available means of persuasion" (1355b; emphasis added). However, in Kenneth Burke's "dramatistic" approach to language, "to see" here is a "reflection of reality," a "selection of reality," and also a "deflection of reality" as far as the adopted terminology in seeing is concerned (Burke, 1966, pp. 44-45). In this sense, "to see" is definitely not a pure or uncontaminated view of or look at something out there in the world, but rather a partial world in itself to be opened up as a result of "symbolic action" (Burke, 1966, pp. 44-45). "Not only does the nature of our terms affect the nature of our observations, in the sense that the terms direct the attention to one field rather than to another. Also, many of the 'observations' are but implications of the particular terminology in terms of which the observations are made. In brief, much that we take as observations about 'reality' may be but the spinning out of possibility implicit in our particular choice of terms" (Burke, 1966, p. 46).

This Burkean "terministic screen" is echoed years later by North American philosophical icon Richard Rorty, when he ponders on the contingency of language, in saying that "we need to make a distinction between the claim that the world is out there and the claim that truth is out there. To say that the world is out there, that it is not our creation, is to say, with common sense, that most things in space and time are the effects of causes which do not include human mental states. To say that truth is not out there is simply to say that where there are no sentences there is no truth, that sentences are elements of human languages, and that human languages are human creations. Truth cannot be out there---cannot exist independently of the human mind---because sentences cannot so exist, or to be out there. The world is out there, but descriptions of the world are not. Only descriptions of the world can be true or false. The world on its own---unaided by the describing activities of human beings--cannot" (Rorty, 1989, pp. 4-5; emphasis added).

Chaim Perelman and L. Olbrechts-Tyteca make the following comments on the status of scientific facts: "The authors of scientific reports and similar papers often think that if they

merely report certain experiments, mention certain facts, or enunciate a certain number of truths, this is enough of itself to automatically arouse the interest of their hearers or readers. This attitude rests on the illusion, widespread in certain rationalistic and scientific circles, that facts speak for themselves and make such an indelible imprint on any human mind that the latter is forced to give its adherence regardless of its inclination" (Perelman & Olbrechts-Tyteca, 1969, p. 17).

Therefore, our basic stance toward this issue between fact and eloquence is that by drawing upon Hermagoras' Stasis Theory, "fact" as a disputed space is what Hermagoras calls "stasis," which functions as a "strategic point of rhetorical invention," or a discursive field as a site of symbolic contention, or as a public sphere as has been defined by Jurgen Habermas. In such a site of symbolic interaction, to use Christopher Tindale's words in his recent interview with the Chinese academic journal Contemporary Rhetoric, "we encounter the prospects of argumentation wherever ideas are in question and there is an occasion for reasons to be given and evaluated" (Wang &Tindale, 2018, pp. 34-41).

3. INCOMMENSURABILITY, ARGUMENTATION SCHEME AND RHETORICAL INVENTION

The abovementioned perspectives point to the importance of "fact" in any kind of argumentation. Or to put it in Fogelin's words, "…to the extent that the argumentative context becomes less normal, argument, to that extent, become impossible". "The possibility of arguments, the possibility of a genuine argumentative exchange, depends, I am suggesting, on the fact that together we accept many things." What Fogelin means by "normal" or "abnormal" might be subjected to different understandings, nonetheless, as is rightly observed by Fogelin, the possibility of genuine dialogue or argument is doubtful "when the context is neither normal nor nearly normal." (Fogelin, 1985, p. 4) Stephen Toulmin emphasizes the importance of "facts" as point of departure in argumentation: "Let it be supposed that we make an assertion, and commit ourselves thereby to the claim which any assertion necessarily involves. If this claim is challenged, we must be able to establish it—that is, make it good, and show that it was justifiable. How is this to be done? Unless the assertion was made quite wildly and irresponsibly, we shall normally have some facts to which we can point in its support: if the claim is challenged, it is up to us to appeal to these facts, and present them as the foundation upon which our claim is based. Of course, we may not get the challenger even to agree about the correctness of these facts, and in that case we have to clear his objection out of the way by a preliminary argument: only when this prior issue or 'lemma', as geometers would call it, has been dealt with, are we in a position to return to the original argument" (Toulmin, 2003, p.90).

As what has been pointed out rightly by Perry Weddle, "the distinction between fact and opinion is not simple. Opinion, as contrasted with fact, is not always false nor is it always controversial. Nor is what is believed, what is identified, what is advocated, or what is judged" (Weddle, 1988, p. 55). What Weddle means here is that there is no difference between belief, identification, advocacy and judgment. For Perry Weddle, what really matters is not a "general way of distinguishing fact from opinion," but "the quality of the evidence or reasons for our beliefs" (Weddle, 1988, p. 55).

Diane F. Halpern in her *Thought and Knowledge*, tries to distinguish between "opinion, reasoned judgment and facts." Opinion is what is called "a simple assertion of a preference. I like it; I think it is best. No reasons were given to support the evaluation. Opinion reflects how an individual or group has assessed a position or product." Reasoned judgment is "the preference is supported a reason." Facts are "statement concerns factual claims" which "have a verifiable truth value" (Halpern, 2014, p. 280).

The abovementioned perspectives point to the intracultural dimension of "facts." Let's take the recent "S***hole" vs. "S***house" Controversy as an Intracultural case. Recently while offering his commentary on this controversy, CNN Anchor Jake Tapper said: "You're perfectly entitled to your own opinions, not your own facts." He made these reminders to all politicians "out there" in the Capitol Hill and the White House in refuting the Republican claim that Senator Durbin has a "history of misrepresenting White House meetings." "You are entitled to your own opinions, but not your own facts." This sounds a strong argument the way it looks to be, but here is a no-less-sounder-and-stronger counterargument. The New York Times columnist Paul Krugman, in offering his comments on this latest controversy, has made some insightful observations: "There are two central facts about 21st-century U.S. politics. First, we suffer from asymmetric polarization: the Republican Party has become an extremist institution with little respect for traditional norms of any kind. Second, mainstream media – still the source of most political information for the great majority of Americans – haven't been able to come to grips with this reality." Here comes his conclusion "Facts Have a Well-Known Liberal Bias" (Tapper, 2018).

What does he mean by facts with a liberal bias? In an article he wrote almost thirty years ago, J. Anthony Blair classifies "bias" into three categories: that of "an unfair slanting of material, violating a norm of fair representation" which is "harmful and avoidable"; that of "selection of facts and aspects of reality from some particular point of view" which is "inevitable," but "neither avoidable nor harmful"; and that of "being biased toward the good or toward truth" (Blair, 1988, pp. 93-103; emphasis added). Blair concludes this piece of "bias" discussion by saying: "[B]ias means a kind of leaning, or an inclination, or a predisposition. When this results in bad thinking---as when it consists of prejudice or pre-judgment, when it causes closemindedness, or when it leads to distortion, misrepresentation, or unfairness---then it is bad. When it is an unavoidable feature of our thinking processes, or of our methods of communication, then it is potentially dangerous but not necessarily harmful. When the influence of contingent bias is cause for neither praise nor condemnation, we regard it as innocent and value-neutral. And when it disposes us to right-mindedness, we regard it as good" (Blair, 1988, pp. 93-103; emphasis added).

4. ARISTOTELIAN TOPOI AND ARGUER'S POSITION: ARGUMENTATION SCHEMES AS CULTURAL BINDING

Not only do facts have their intracultural dimension, but also they are proved to have their intercultural dimension. A typical case in question is the Wang v. Connolly controversy. Amanda Connolly [Canadian Journalist]: Hi Minister Dion, I am Amanda Connolly with IPolitics.ca, thanks for taking our questions today. There are no shortages of concerns about China's treatment of human rights advocates such as the Hong Kong booksellers and its detention of the Garratts, not to mention the destabilising effects of its territorial ambitions in the South China Sea. Given these concerns, why is Canada pursuing closer ties with China, how do you plan to use that relationship to improve human rights and security in the region, and did you specifically raise the case of the Garratts during your talks?"

("[Amanda Connolly] followed up with another question, which had been agreed upon by several news media." "The IPolitics question was agreed to by a number of journalists representing several news organizations at the event, including The Canadian Press.") It's an agreed-upon belief among western media that there are "abuses" of human rights in China and that western countries should take this issue very seriously before forging a closer tie with this "authoritarian" country.

There are at least two assumptions in the question. One is that because of China's accused treatment of human rights advocates, and also because of "the destabilising effects of its territorial ambitions in the South China Sea," Western countries such as Canada should not seek to develop closer ties with China. The other one is that a relationship with China should be used as an opportunity or even precondition to urge the improvement of the human rights records in China.

Wang Yi [via Interpreter]: "I want to make a response to the questions asked by this journalist about China. I have to say that your question is full of prejudice against China, and arrogance, where, I don't know, where that comes from. And this is totally unacceptable. I have to ask whether you understand China. Have you been to China? Do you know that China has lifted more than 600 million people out of poverty? And do you know that China is now the second largest economy in the world from a very low foundation? Do you think development is possible for China without protection of human rights? And do you know that China has written protection and promotion of human rights into our constitution? And other people don't know better than the Chinese people about the human rights condition in China. And it's the Chinese people who are in the best situation, in the best position to have a say about China's human rights situation. So, I would like to suggest to you that please don't ask questions in such an irresponsible manner and we welcome good-will suggestions, but we reject groundless or unwarranted accusations.")

In Wang's responsive remarks to Connolly's question, there are three implicit assumptions, i.e. "Facts Speaker Louder Than Eloquence" (事实胜于雄辩); "Seeing Is Believing" (百闻不如一见) (The translation literally means to see something once is better than to hear about it a hundred times) in the sense that the best judges of China's human rights are Chinese people themselves; and "Action Speaks Louder Than Words." (行胜于言). Therefore, according to Wang, Connolly's question is "irresponsible," "full of prejudices," and "totally unacceptable."

According to a commentary carried in The Globe and Mail, China's foreign ministry spokeswoman Hua Chunying "sought to strike a gentler tone on Thursday at a daily briefing" by urging reporters present to "ask yourself whether reporters are fair to China, whether you are objective and fair in your knowledge of China, whether you are accurately transmitting or describing China's current situation to readers, whether you are telling a correct story about China." "We also welcome more friends in the media to live and work in China, and use their own eyes and hearts to feel the development and progress China is making" (Nathan VanderKlippe, emphasis added).

Who knows better about the "true" situation or picture of "human rights" in China? Or who has the more accurate access to the "facts" of human rights in China? What's the nature of human rights issue from a perspective of cross-cultural argumentation? All these questions point to an important issue in argumentation studies, i.e. the arguer's position and his or her relevant propositions (Walton, 1985).

As an original idea put forward by Arthur Hastings, Argumentation Scheme is interpreted by Douglas Walton as "a formal pragmatic structure of arguments that is the counterpart to logical forms of inference in semantics" (Walton, 1996, p. x). Later, Walton points out that argumentation scheme is kind of presumptive reasoning, which is meant to be closed off for the audience's consent in epistemology (Walton, 1996). A similar view is expressed in the quote by C. L. Hamblin: "Presumptions are a conservative force: there is a Presumption in favor of existing institutions and established doctrines, and against anything paradoxical, that is 'contrary to the prevailing opinion.' By calling any person, institution or book an 'Authority' we are according it a Presumption" (Hamblin, 1998, p. 172).

For some Western media, Wang's Remarks are counterproductive in the sense that they play right into the hands of western media as site of rhetorical invention that engendered counterproductive discourse. The same commentary in The Globe and Mail interpreted Wang's remarks as "a sign of China's unwillingness to brook any discussion of the way it treats its own people, a record that includes jailing critics, barring Muslims in certain areas from wearing beards and heavily censoring speech, particularly online" and as an "outburst" which "marked a striking departure, his anger underscoring China's refusal to accept criticism, particularly as its economic might give it the ability to penalize other countries for speaking out against it"(Nathan VanderKlippe).

Tony Clement, the Conservative foreign affairs critic, while saying he was "absolutely shocked and outraged" by Wang's scolding of Connolly, called on Dion and the Liberal government to formally respond to the incident and urged them to "make it clear that Canadians believe in human rights and journalistic freedoms," along with his strong argument that "to have a foreign minister invited onto our soil to publicly berate a journalist who asked a perfectly legitimate question is absolutely unacceptable" ("Canadian Reporter Berated by China's Foreign Minister Speaks Out, " CTV News, Thursday, June 2, 2016).

5. CONCLUSION

Crucial to our approach are two basic assumptions. We emphasize that facts do not really speak louder than eloquence, and that we emphasize one possible perspective at addressing the relationship between fact and eloquence, i.e. the perspective of rhetorical invention. But before whatever will come up in our concluding remarks, here's a reminder for our audience. I must clarify that I am not denying that facts do not exist. Therefore, I am not targeting the existence of "facts." Rather my target is the kind of binary opposition inherent in metaphysical thinking which is implicated in the juxtaposed relation between fact and eloquence. On the one hand, "fact" and "opinion" are juxtaposed in such a way as to suggest that they are in an oppositional relation, neither of two are interdependent. On the other hand, in this juxtaposition "fact" and "opinion" are rendered in an axiological order with the former necessarily being superior to the latter.

Why a theory of warrant strength is a necessity for argument assessment

MARK WEINSTEIN

Educational Foundations
Montclair State University
Montclair, NJ 07028, United States of America
weinsteinm@mail.montclair.edu

ABSTRACT: The strength of the warrants, whether offered or tacitly available, underlies the adequacy of arguments of all sorts. Obvious for arguments whose merit is epistemological, this paper focuses on the role of warrant strength in persuasion dialogues. The analysis of bias in arguments about educational policy supports the centrality of warrant strength. Recent work in cognitive science shows the psychological basis for the role of warrants that serve as cognitive networks that support commitments.

KEYWORDS: argument assessment, bias, brain, cognitive science, commitment, public policy, warrants

1. INTRODUCTION

Whether argument is seen as a vehicle for persuasion, as striving towards epistemological adequacy or as a contest with winners and losers, more than a recitation of the reasons given is required if the adequacy of an argument is to be assessed. My position is that the strength of the warrants, whether offered or tacitly available, underlies the adequacy of arguments of all sorts. I believe that this is obvious for arguments whose merit is epistemological and will focus on the role of warrant strength in areas relevant to persuasion using the analysis of bias and the example of educational policy to support the centrality of warrant strength. Recent work in cognitive neuroscience offers the psychological basis for the role of warrants that serve as cognitive networks that support commitments.

But first a word about warrants. Standard models of argument structure, for example, warrants, grounds and claims, reflect the classic deductive logical structure, major, minor premises and conclusion. This has proved to be a powerful organizing image. But the basic architecture must be elaborated if it is to account for the preponderance of practical and theoretical arguments off all sorts. The substantive warrants in such arguments, as in Aristotle's trenchant phrase, hold "mainly and for the most part." This creates a challenge to the common construal of warrants as generalizations seen as universal propositions in the classical logical sense. If we are to understand such inferences, a logical account of mainly for the most part that captures the nuance of warranted generalizations in substantive arguments must move beyond Boolean interpretations and offer a model theoretic basis that permits of gradation. Logical theory must identify the normative structure that supports such inferences, indicating how the force of the warrant supports commitment and illuminate the dialectically central role of counterarguments in light of conflicting reasons (Weinstein, 2012).

I see warrants as generalizations that link grounds to claims serving to license inferences by showing the relevance of the reasons offered in light of a pattern of similar arguments. I will argue that the key feature of such warranting generalizations is their place in a network of related generalizations and that the strength of a warrant is a function of the adequacy, depth and breadth of the supporting network. I will briefly indicate my solution to the problem of warrant strength based on the history of argumentation in physical science and in relation to the developing study of cognitive neuroscience.

2. WHY COGNITIVE NEUROCIENCE?

The basis of cognitive neuroscience is neurophysiology, a natural science that offers the potential for a level of warrant that is characteristic of the most deeply entrenched theories that inquiry has produced, the branching structure of interlocking explanations grounded in physical chemistry that connects, through explanatory relationships, scientific understanding that ranges from micro-physics to organic chemistry, from the material sciences through which we build our bridges to the micro-chemistry through which we biopsy suspicious moles. The physical and chemical understanding of the living brain offers a foundation for psychology that has enormous potential for explanatory power, even if confronting the formidable complexity of the bio-chemical structures that the current understanding of the nervous system increasingly exposes. The explanatory power of a physicalist account of the mind is apparent in the epistemological structures upon which physical chemistry is based. I have attempted to capture an image of that power in a model of emerging truth based on the structure of physical chemistry (Weinstein, 2016). This is a departure from the standard analysis of scientific method in terms of deductive or inductive logic, an analysis that I believe has consequences for understanding the central role of warrant strength in argument evaluation.

Physical chemistry exhibits an explanatory structure that includes three highly intuitive epistemological properties: consilience breadth and depth. These three are the core of the epistemological power of scientific theorizing. Viewed over time, their satisfaction marks a theoretic enterprise as progressive, and in the physical science may be seen as productive of emerging truth. (Weinstein, 2013b). The first, consilience, requires that theories are increasingly adequate, supported by a body of evidence that is improving in scope and detail. Breadth requires that a theory explains an increasing number of diverse phenomena, and depth requires that a theory is reinterpreted in terms of higher-order explanatory frameworks that connect it to other theories of increasing breadth and increasing evidentiary adequacy. These epistemological characteristics, were first exemplified by physical chemistry in the mid 1800's. And despite a history of false starts, misleading empirical data and over-stated arguments, with the elaboration of the periodic table of elements in the 20th century, physical chemists were able to offer an emerging, increasingly unified and increasingly coherent body of branching explanatory structures, that ranges from micro-physics to cosmology, from the basic properties of matter to the complexity of the living cell (Sceri, 2007). Such progress over time in achieving disciplinary goals marks physical chemistry as, arguably, the most progressive inquiry in human history. Cognitive science, viewed through the epistemological perspective that looks to consilience, breadth and depth seems, even in its infancy, may be seen to exhibit similar potential for explanatory power (Weinstein, 2015).

Cognitive science begins with a level of theoretic articulation exemplified by Chomsky (1957) and called on the resources of logic and computer science. This mirrors the epistemological context of early atomic theory. Cognitive scientists, like early chemists had a basic theoretic perspective that permitted mathematical articulation. Rather than look at behavior alone. Cognitive scientists built theoretic models that accounted for the behavior in terms of functional models based on theoretic constructs (Gardner, 1987). This placed cognitive science in a position of indefinite growth. And the promise of increasingly sophisticated computer simulations of mind offered possibilities for the description of the complex theoretic structures put forward. Complex descriptions that require computer modeling for their articulation offers a test of consilience unlike anything in the prior history of psychology. Computer simulations of interactions employed theoretic constructs based on a vastly increased knowledge of the structure of the brain, available through powerful advances in instrumentation, brain scans of various sorts enable the analysis of a range of cognitive behaviors and their functional substrate.

We do not know which theories in cognitive science are correct, but if they can be developed consistent with the available evidence they have the potential to grow in scope and detail as the theoretic predictions of ever-finer models of complex systems can be ascertained through computer simulations corresponding to the increasingly detailed experimental knowledge of the brain (Thagard, 2012). We will look at the details of two attempts to develop potentially consilient models of brain function in the next section. These are highly speculative and limited by both our current knowledge of the brain and the availability of sophisticated computer programs that can model the growing body of information that must be included in the theory if it is to have empirical validity. Like early physical chemistry, we don't know which theories in cognitive science will turn out to be progressive, but if a theory continues to yield important explanations, the potential for growth and an all-encompassing theoretic structure adequate to the range of cognitive behaviors seems more plausible.

In the history of physical chemistry, consilience, the increasing degree of articulation in the details that chemical theories explained, was combined with breadth, that is, with the scope of a theory. Cognitive science is, if nothing else, exceptionally broad in the scope of its concerns. The *Cambridge Handbook of Cognitive Science* (Ramsey and Frankish, 2012) lists eight related research areas that reflect different aspects of cognition, including perception, action, learning and memory, reasoning and decision making, concepts, language, emotion and consciousness. In addition, they list four broad area that extend the reach of cognitive science from human cognition standardly construed to include animal cognition, evolutionary psychology, the relation of cognition to social entities and artifacts, and most essential, the bridge between cognitive science and the rest of physical science: cognitive neuroscience. Each of these is a going concern, and none of them is free of difficulties. Yet in all cases there is a sense of advance, of wider and more thoughtful articulation of theoretical perspectives that address a growing range of cognitive concerns. But as compelling as these characteristics are, it is depth that cognitive science shares with physical science, as both structures enable micro-explanation that can be seen to yield an over-arching ontology (Weinstein, 2002).

The key to the epistemological power of cognitive science is its foundation in neuro-science. Speculations of instantiated neural mechanisms have systemic power much greater than their evidentiary weights. Such speculations offer an image of enormous potential warrant. For their enterprise, bridging between fundamental pre-cognitive processes such as physiological control and emotions to build the functional potential for memory and cognition, reflects deep structural accounts, warrants supported by reliable evidence and accepted theories of brain and neurological structure and function (Thagard and Aubie, 2008, Damasio, 2010) and accounting for cognitive capacity common to both animal and human behavior (Panksepp, 2005). Materialist assumptions permit a deep reduction to physiology, neurobiology, biochemistry and electrochemistry, which any adequate theory of brain function must ultimately depend on. This is despite the enormous gap between the simple models of neurological activity proffered and the brute facts of the living brain: 30 billion neurons making countless trillions of connections and sensitive to a wide array of known biochemical agents, with more perhaps to come (Weinstein, 2015). Such a picture of cognition has consequences for the argument theory.

3. COGNITION AND ARGUMENT

The connection between cognition and argument rests on the relation between reasoning and emotions, especially as it pertains to belief preservation in the face of contrary evidence. Research indicates that our past associations affect our ability to alter all beliefs (Jacoby, et. al, 1989). A study of political beliefs showed resistance to argument that challenge our memories

and commitments: "the persistence of misinformation might better be understood as characteristic of human thinking" (Lewandowsky et al., 2012, p. 114). Much of the available research relevant to the role of emotions in cognition focuses on bias and stereotyping. For example, the studies of unacknowledged bias indicate "influence of implicit stereotypes on judgment and behavior." (Blair, Ma, & Lenton 2001, p. 828). Unacknowledged, such attitudes may remain disconnected from a person's avowed beliefs: "Dissociations [between implicit and explicit attitudes] are commonly observed in attitudes toward stigmatized groups, including groups defined by race, age, ethnicity, disability, and sexual orientation." (Greenwald & Krieger 2006, p. 949). Such implicit biases create emotional disturbance when in the face of social pressure such views are put into question. "When one denies a personal prejudice (explicit bias) that co-exists with underlying unconscious negative feelings and beliefs (implicit bias] leading to diffuse negative feelings of anxiety and uneasiness." (Dovidio and Gaertner 2005, p. 42).

There are neural mechanisms that account for such phenomena. The prefrontal cortex which processes conscious thought and the so-called "executive functions," planning, goal setting, evaluation, and cognitive control is connected to other parts of the brain organizing input together into a coherent whole. Under the prefrontal cortex is the orbitofrontal cortex, which broadly supports self-regulation: physical, cognitive, emotional and social. These regions combine inputs to create the image of our physical body as well as perceptions of the external world and mental constructs (Dehaene, 2014). An interesting detail relevant for social cognition are so called "mirror neurons," neurons that fire both when you act and when you perceive another performing the same action and which allow us to infer or predict others' intentions (Iacoboni, et. al. 2005). Research indicates that mirroring of emotions, the degree of empathy we show others, is modifiable by real or perceived social relationships supporting ethnic or gender stereotypes (Amodio & Devine, 2006). There is evidence that biasing emotions reach deep into our biographies and are expressed in implicit biases. Evidence indicates that "early and affective experiences may influence automatic evaluations more than explicit attitudes. In addition, there is growing evidence that systemic, culturally held attitudes can bias people's automatic evaluations" regardless of their expressed personal opinion. (Rudman, 2004, p. 81). Childhood based biases cause strong reaction such as fear of unfamiliar others, which has been correlated with activation in the amygdala (Dunham, Baron, & Banaji 2008).

Biases interferes, on a neural level, with the ability to experience others. When "European-American subjects looked at the face of another European-American, there was a larger neural response than when they looked at African-American faces (Lebrecht, et. al., 2009, p. 3). The result: "people do not mentally simulate the actions of [members of] outgroups. Their mirror-neuronsystems are less responsive to outgroup members than to ingroup members" (Gutsell and Inzlicht 2010, p. 844). Such results have been generalized in a theory of the "automaticity" of higher mental functions sees ordinary cognition as dependent on environmental and social factors (Bargh & Ferguson, 2000). Evans (2008) offers a complex image of the interaction between what he terms unconscious and conscious cognition, seeing a variety of distinct and possibly incompatible systems. The work continues with the development of computer generated neural models that attempt to capture the integration of cognition and emotion. We turn to two such accounts, the ambitious attempts of Thagard and Aubie, (2008) and Damasio (2010) to bridge the gap between abstract structure and available physiological knowledge.

Thagard and Aubie draw upon both neurophysiology and computer modeling. This enables both theoretic depth and the possibility of assessing increasing adequacy, even if the latter is no more than increasingly adequate computer simulations of simplified cognitive tasks. They cite ANDREA, a model which "involves the interaction of at least seven major brain areas that contribute to evaluation of potential actions: the amygdala, orbitofrontal cortex, anterior

cingulate cortex, dorsolateral pre-frontal cortex, the ventral striatum, midbrain dopaminergic neurons, and serotonergic neurons centered in the dorsal raphe nucleus of the brainstem" (Thagard and Aubie, 2008, p. 815). With ANDREA as the empirical basis, they construct EMOCON, which models emotional appraisals, based on a model of explanatory coherence, in terms of 5 key dimensions that determine responses: valance, intensity, change, integration and differentiation (pp. 816ff.). EMOCON employs parallel constraint satisfaction based on a program, NECO, which provide elements needed to construct systems of artificial neural populations that can perform complex functions (p. 824ff., see pp. 831ff. for the mathematical details). This points to the potential power of their approach. Computer models, even if gross simplifications, permit of ramping up. A logical basis with a clear mathematical articulation has enormous potential descriptive power as evidenced by the history of physical science.

Damasio (2012) has a similarly ambitious program. He begins with the brain's ability to monitor primordial states of the body, for example, the presence of chemical molecules (interoceptive), physiological awareness, such as the position of the limbs (proprioceptive), and the external world based on perceptual input (extroceptive). He construes this as the ability to construct maps and connects these functions with areas of the brain based on current research (pp. 74ff.). This becomes the basis for his association of maps with images defined in neural terms, which will ground his theory of the conscious brain.

Given that much he gives an account of emotions elaborating on his earlier work, but now connecting emotions with perceived feelings. As with the association of maps and images, Damasio associates emotions with feeling and offers the following account: "Feeling of emotions are composite perceptions of (1) a particular state of the body, during actual or simulated emotion, and (2) a state of altered cognitive resources and the deployment of certain mental scripts" (p. 124). As before he draws upon available knowledge of the physiology of emotional states but the purpose of the discussion is not an account of emotions *per se*, but rather to ground the discussion of memory, which becomes the core of his attempt at a cognitive architecture (pp. 339ff.). The main task is to construct a system of information transfer within the brain and from the body to the brain. The model is, again, mediated by available physiological fact and theory about brain function and structure. The main theoretic construct in his discussion of memory is the postulation of 'convergence-divergence zones' (CDZs), which store 'mental scripts' (pp. 151ff.). Mental scripts are the basis of the core notion of stored 'dispositions,' which he construes as 'know-how' that enables the 'reconstruction of explicit representation when they are needed" (p. 150). Like maps (images) and emotions (feelings) memory requires the ability of parts of the brain to store procedures that reactivate prior internal states when triggered by other parts of the brain or states of the body. Dispositions, unlike images and feelings are unconscious, 'abstract records of potentialities' (p. 154) that enable retrieval of prior images, feelings and words through a process of reconstruction based in CDZs, what he calls 'time-locked retroactivation' (p. 155). CDZs form feedforward loops with, e.g. sensory information and feedback to the place of origination in accordance with coordinated input from other CDZs via convergence-divergence regions (CDRegions) by analogy with airport hubs (pp. 154ff.). Damasio indicates empirical evidence in primate brains for such regions and zones (p. 155) and offers examples of how the architecture works in understanding visual imagery and recall (pp. 158ff.).

Damasio like Thagard and Aubie offer speculative models that reference current physiological knowledge, rely on concepts from computer science and information theory and bypass the deep philosophical issues that are seen by many to create an unbridgeable gap between the mental and the physical short of deep metaphysical reorientation (Chalmers, 1996). Yet, whatever the ultimate verdict on these two authors, the rich program in cognitive science persists and has a strong appeal. The reason is the potential strength of the warrants, that is to say, if such models prove to be correct the epistemic force of the warrants that support them

will be enormous, swamping the force of alternative approaches that rely on, for example, psychological evidence alone. But issues of normativity remain.

4. COGNITIVE NEUROSCIENCE AND NORMATIVITY

Argument theory must address the values inherent in reasoned practices if argumentation is to be more than persuasive. Some commitment to normativity is required and the *is* of networks of commitments must be weighed against the *ought* of any disciplined argument practice that uses normatively compelling procedures to achieve normatively sanctioned ends. How then to bridge between the logical and epistemological intuitions that govern normatively constrained discourse and the brute fact of emotional entanglement. This is a challenge to any naturalistic account of thinking, if only because it tends towards relativism and Harvey Siegel (1987) an advocate of normatively driven critical thinking has, to my mind, shown the incoherence of such a view. Siegel's arguments are simple, any argument for relativism is either merely relatively true or incoherent, since if the argument for relativism is more than merely relatively true than not all arguments are merely relatively true. The point for argument theory is that we must struggle towards some objective reasonable standpoint, one for which giving reasons is required (Siegel, 1988). But how is this possible if all cognitive functions associated with reasoning are conditioned by emotional weights, if the very cognitive mechanisms that support our functions are distorting and biasing the evidence as we collect it, qualifying our memories and information processing, determining the weight of our commitments through organizing schema with which the brains encodes, stores and selectively retrieves? All of this impinges on the executive functions that drive our reasoning. Our arguments express who we are in the most profound sense.

I find a solution in a better understanding of how successful inquiry works. Despite the vagaries of the individuals involved, their jealousies, their cultural and professional prejudices, the limits on individual's knowledge and competence, and despite the biases manifested in institutional policy and practice, and the litany of emotional barriers to reasoning, scientists, seen in aggregate as communities of inquiry, form institutions that modulate individual differences through a focus on the evolving ideas and practices.

Given the idiosyncrasy with which our evidence is obtained and stored the most our arguments can be taken for are suggestions, possible avenues for the continuing inquiry. They enter into the dialogues as points of view, contributions that claim relevance to the ongoing inquiry. This is exemplified in the history of chemistry, where passionate dialogues over time and distance slowly evolved as key ideas were transported and modified into new configurations and more productive inquiry. Like science, standpoints within argument exchanges should be seen as suggestions, opportunities for engagement, and so along with logical or epistemological flaws we must look for the location from which a dialogical move is made. Dialogue seen as contrasting points of view presented for consideration enable responses across the range of speech acts and in so doing create modify or remove cognitive/emotive constructions by the participants as the dialogue moves forward. As the group forms and reforms perspectives the scope of the dialogue expends, offering examples and making analogies, explaining and challenging assumptions, making connections with other issues, exploring new information, and inventing now modes of explanation. The analogue to breadth and depth in scientific inquiry is the variety of opinion and its configuration and reconfiguration as people through dialogue see in each other's perspectives something worth considering and the value of striving for deeper understanding of themselves and the issues they embrace.

5. EDUCATIONAL POLICY AND WARRANTING NETWORKS

There are few places were the need for an analysis on terms of networks of commitment and the concomitant strength of warrants is as obvious as in the arguments put forward in respect of educational policy. Policy disputes are multi-dimensional including such topics as the relative centrality of goals, such as, citizenship, workplace readiness, cultural literacy, critical thinking, college readiness and many more. Policy disputes includes a number of central questions, including who should teach, what should be taught, where and how students should be educated, how to determine the level of expenditure and who should pay for it, and most essentially in recent years, what standards should be used for assessment and how do we remediate in light of evidence of failure. Arguments for particular policies are embedded in moral and cultural perspectives and most notoriously in political positions (Banack, 2015, Gerber, et al, 2010). They are entangled with larger social and economic issues (Furlong, 2013, Zembaylas, 2009)) such as resource allocation and in light of competing social expenditures and the self-interest of primary stake holders, educators, parents and politicians. And all these factors interact in a changing social environment (Fusarelli & Bass, 2015, Reich & Mendoza, 2008).

In addition, recent policy debate includes a focus on methodology, questioning the standard use of statistical and other positivist methodologies as inadequate to the rich human dimension in educational policy. Hidden factors supporting positions in educational policy are seen to be obscured by leveling methodologies, such as statistical evidence. Alternative approaches to analysis, including feminist and race theory are increasingly found in the literature (Diem, et al, 2015) as well as phenomenological approaches such as Basil Bernstein's notion of recontextualization or Burdieu's concept of relational epistemology (Loughland & Sriprakash, 2016; McGuire, 2016). Such approaches move beyond apparent meanings in speech acts to explore the deeper power relations and language codes that make the discourse in which an argument is housed resistant to easy analysis. Rather than look at the surface of utterances, we need to explore the deep conceptual apparatus upon which they rely. And it is the network of such an apparatus, the connections of warrants that make the arguments intelligible and open to evaluation. But how are we to obtain a clear and coherent logical process for appraisal? The analysis of scientific discourse offers the clue.

Looking at physical chemistry over its history we identify three salient criteria that support a hierarchy of warrant strength. A warrant is strong to the extent that it reflects, increasing consilience over time, increasing breadth of scope and increase depth of connection to underlying networks of concepts that serve as support by offering foundational theoretic accounts of potential breadth. These can be applied to the warrants offered or assumed in arguments about social policy. Take as an example, the generalization that smaller class size leads to academic advance. This is a warrant that subsumes statistical arguments in support of policy choices in particular cases. Consilience requires that there be increasing sequence, in general, of empirical confirmation, over time and in greater detail, for the relation between class size and academic achievement, measured in some acceptable way. Breadth requires that accounts of increasing success on measures of academic achievement, for example standardized tests, can be correlated with achieving other educational goals, such as improved attendance or a decrease in the need for disciplinary procedures. Most importantly depth is indicated by situating the claim and its support in terms of broader and more consequential considerations, for example, that decreased class size has psychological and social resonance. Can we show how smaller class size connects with other social and moral goals for education, such as deeper appreciation of learning, critical thinking, tolerance of diversity? The greater a warrant scores across a network of relevant considerations, the more strength it has and the more credibility it

lends to specific arguments that use it as an organizing principle for research or policy recommendation.

Although the example is a simple one, it points to the reality of competing perspectives, each with its own evidence, theoretic background and ideological filters. This makes comparative evaluation by direct contrast impossible, where not question-begging. But each perspective can be evaluated internally in terms of the demands of progressivity, mirroring the essential elements that mark physical science as the paradigm for correct understanding. We look to consilience, depth and breadth. My research agenda is to move past the physical sciences, from which the criteria were derived, to look more closely at socially significant arguments. I have applied the three criteria to the debate over scientific racism (Weinstein, 2013a) and I have indicated possibilities for applying the criteria in legal and political arguments (Weinstein, 2013b).

My position moves the assessment of argument into the weeds. If the strength of the warrant is of essential concern, there is no quick and easy way to evaluate an argument. Evaluating arguments requires at least the degree of complexity found in formal debate. Evaluating the argument requires an analysis of how evidence is marshalled and challenged. In debates in the press or in academic journals, engaging substantive arguments about significant social concerns, the evidence evolves and challenges are redrawn in response. An argument points to its context and so the analysis of an argument requires space and perspective. What does this mean for those of us who want to rationally evaluate the complex arguments within social policy debates? As in all serious inquiry, including the history of chemistry, we look at the internal epistemological structure of competing points of view, the evidence as it evolves in the light of the most reliable theories, and then we place our cognitive bets. But such considerations require a shift in the perspective or argument theorists, if they want to be able to evaluate substantive arguments outside of the artificial contexts and isolated examples of the sort that are all too common in discussions of argument theory.

6. CONCLUSION

Argumentation theorists must learn to live with complexity. Psychologists tell us part of the reason why this is the case and the history of inquiry shows its inevitability. Even the most successful inquiry, physical chemistry, shows the unescapable fact of local inadequacy. False steps abound as each scientist reflects his or her local situation, her opportunities, his competence, her experiences, his or her commitments. Truth is not there to be seen in particular positions (Weinstein, 2018). Prout's hypothesis, which correctly saw hydrogen as the unit basis of the periodic table of elements was rejected on the available evidence as 'pure illusion' (Scerri, p. 41). The evidence was sound, but its analysis was faulty since the understanding of the evidence was lacking. The existence of isotopes and the theory of atomic number was needed before experimental evidence could be correctly understood (Scerri, pp. 41-42; pp. 58ff.). Would that things were so simple in areas of social concern. If the history of chemistry is our exemplar, truth emerges slowly even in the most successful inquiry. So, if we are to participate in reasoned argument about significant issues, each available perspective demands to be considered, whether accepted, modified, challenged, reevaluated, remembered for later or temporarily forgotten. The value of the model of scientific inquiry for understanding argument is in the process and its outcomes. Local inadequacy is the rule not the exception. Argument theorists must look at arguments in the large, how competing perspectives are brought forward for challenge and assessment. This requires argument theorists to reject the appeal of specificity; that following standard logic, sees argument as recursive, as based on the evaluation of micro-arguments. My perspective is thus extremely radical: to stop looking at argument as a

chain and to conceptualize it as a network of commitments subject to dialogical advance and retreat. This requires us to see an argument not as weak as its weakest components, but rather, as strong as the constant readjustment of a network of considerations permits.

ABSTRACT: Argumentative dialogue systems can provide human-oriented interaction mechanisms between people and artificially intelligent machines. Questions remain about how normative systems of argument and dialogue fare when exposed to real-world arguers. It's often assumed that the truth should always be told, but even when achievable, can be counterproductive. We shed light on some gray areas concerning truth telling, or lack thereof, in relation to human dialogical interaction with AI systems.

KEYWORDS: argumentative dialogue, persuasion, lying, deception, behaviour change, artificial intelligence

1. INTRODUCTION

With the increasing prevalence of artificially intelligent machines in everyday life, a trend that threatens not only to continue but to accelerate, the need to examine how people interact with these machines intensifies. Whilst the basis for much of the increased interest and utility of Artificial Intelligence (AI) has been rooted in machine learning and neural network based systems, there are also areas of particular concern for argumentation theorists. For example, regardless of how an AI decision is made internally, should that decision be called into question, then the system should be able to explain itself, and perhaps even defend itself, furthermore, the system should be able to work with people to improve decisions, should they be found wanting.

This is in line with recent trends stemming from various regulatory and professional bodies, which have independently proposed that AI systems be capable of explaining their decisions. This trend is found at the supranational regulatory level, in recommendations from the European Commission (2015/2103(INL), 2016), at the national level in the 2017-18 French parliamentary mission (Villani *et al.* 2018), as well as at the industrial professional level, in British standards for intelligent and autonomous robots [BS 8611:2016].

It would appear that many years of research into formal argumentative dialogue systems may soon result in real-world payoffs. However, thorny questions remain in relation to how our ideal, normative systems of argument and dialogue will fair when exposed to real-world motivations.

Whilst it is often assumed that the truth should, or will, always be told, this can be easier said than done, and even when achievable, can be counterproductive. In this paper we attempt to shed light on some gray areas concerning truth telling, or lack thereof, in relation

to human dialogical interaction with AI systems. From this investigation, we make recommendations for the design of future, real world, applied dialectical argumentation systems.

The remainder of this paper proceeds as follows: A number of socio-technical trends and consequent issues that arise are investigated. The use of dialogue as a humane interface between people and intelligent machines is discussed and a number of contexts of interaction are identified that could lead to deceptive behaviours by machines. Finally some elements of an ethics of lying and deception are proposed.

2. CAPABILITIES AND DELEGATION

Amongst a plethora of socio-technical trends that mark the history of computing, see the introduction to Wooldridge (2002) for a useful discussion, two particularly important ones that have a bearing upon this research are the trend towards increasingly capable intelligent machines and the trend towards increased delegation of decision making by humans to machines. AI is a research topic that has made huge recent advances. These advances have been concentrated largely in the domain of Machine Learning (ML), focussed on algorithms that can both recognise patterns within data, and, in some cases, also learn to recognise those patterns without explicit training. [EXAMPLES OF ML ADVANCES]

Against this background of increased machine capability, there has been a societal shift in which people increasingly delegate decision making tasks to machines. This has been occurring for quite some time, for example algorithms have been used increasingly in banking and insurance to help manage risk, however they are now being deployed in medicine, shopping, advertising, news, and social-media contexts. These algorithms can affect which purchases a person makes, the brands that they are exposed, the balance of political reportage that they witness, and the social interactions that they engage in. A good, non-technical discussion of the meeting between society and algorithms can be found in O'Neill (2016). Where previously algorithms were used in regulated sectors, where the ultimate burden of legal responsibility was usually clear, the deployment of algorithms more widely brings human society into increasingly intimate contact with autonomous machine made decision during interactions that are not thus far protected or regulated by law or professional practise. The algorithms themselves are becoming increasingly sophisticated and it is not always clear at which point a particular system should be termed AI or whether it is actually meaningful to distinguish between computational systems that make decisions and AI systems (which are also computational systems) that make decisions. This inflection point, from non-intelligent to intelligent has been termed an 'ethical crossroads' by Andras *et al.* (2018) in relation to how people build relationships of trust with intelligent machines, recognising that as a person uses a technology, so the technology, in return, can influence the user.

Regardless, the increased capabilities of AI systems have lead to their rapid deployment in situations where the decisions that the machines make can directly affect peoples lives. For example, there has already been one unfortunate death which involved a self-driving vehicle (NTSB, 2018).

There are several directions in which human-AI interactions might develop. Some take inspiration from existing human practise. For example, when a person acts within human society, that person can be called to account for their actions, this can be informal, for

example, a parent chastising their child for crossing the road with insufficient awareness of other road users, or more formal, such as when a person is charged with a crime and appears in a court of law to defend themselves. In both cases there is an opportunity for explanation, there may be mitigating circumstances that are not immediately known and which could explain the observed behaviour. Society thus often requires explanation. It seems reasonable to assume that when machines act within human society, a principle of parity of treatment should hold. If a person must explain their behaviour then so should a machine. Other directions involve setting legal standards for interactions. For example, existing legal mandates in regulated sectors such as banking and insurance might be extended to account for more everyday interactions. This is exemplified by the drive towards scrutinisation, interpretation, and explanation of AI decisions, as research goal (Wells, 2018), as professional standard (BS 8611:2016) and as legal mandate (2015/2103(INL), 2016).

It seems safe to conclude that AI systems, of increasing capability will interact with people in society to a variety of positive and negative effects. Some of these interactions will be regulated by legal means whilst others will remain outside the purview of law enforcement, subject instead to societal mores and the personal disposition of individuals. The aforementioned confluence of trends suggests an opportunity to cogently explore how machines and people interact in order to make informed decisions about their future development.

3. EXPLANATIONS, JUSTIFICATIONS, AND DIALOGUES

One area of human machine interaction that is relevant is that of explainable AI (XAI). The increasing opacity of modern AI systems has lead to the suggestion that an AI that can explain it's reasoning, that provides access to its reasoning process in a manner that enables scrutinisation, and whose decisions are structured so as to facilitate human interpretation, can help address some of the problems that might arise (Gregor and Benbasat, 1999). The underpinning concept is that a reasoning process can be made inspectable and knowable, data can be rendered understandable, and a path from data to decisions can thus be made intelligible. For example, after a poor decision has been made, the machine that made the decision may be engaged, perhaps via some form of critical dialogue, with the expectation that the machine provides relevant information to support the decisions made. The use of dialogue would enable users to focus on those aspects of the explanation that were deemed important and glossing over those aspects that were less so. Of course such an approach might not be restricted only to those circumstances when things have gone wrong. Interaction with an AI could lead to better understanding of how it operates, with a resultant increase in trust between human and machine.

The developers of AI systems are independently reinventing some notions of explanation for their own purposes and characterising AI systems in terms of explainability. For example, Doran (2018) identifies AI systems that are *opaque*, AI systems that are *interpretable*, and AI systems that are *comprehensible*. In this hierarchy, users can gain little insight into how opaque systems reach their decisions. However interpretable systems are those whose algorithms can be described and analysed mathematically. For the argumentation community however it is the final layer, the systems that emit symbols and support user-driven explanatory dialogue leading to increased comprehensibility, that are most interesting. A number of approaches to constructing explainable AIs are being explored,

for example, Samek *et al.* (2017) approach explainability of image recognition algorithms through the mechanism of focus, by indicating to the user which parts of an image contributed to the resultant decision.

Two points that are pertinent to the concept of engaging with XAI systems are that explanations are contextual, and explanations can quickly segue into justificatory interactions. The person to whom an explanation is directed can require that explanation to be rendered differently dependent upon the relationship between the person and the XAI system. For example, the system designer or engineer may have a more intimate and detailed technical understanding of the systems functionality to that of the systems owner, manager, or controller. The end-user may have yet a different perspective. This suggests that an XAI must be able to construct explanations that satisfy a variety of scenarios and to account for the situation in which the explanation that is sufficient in one scenario is insufficient in another. Furthermore, when an XAI acts within human society it will come into contact with legislative, licensing, and legal regimes, to which the explanatory function should be extended. Many of these contexts of explanation could potentially give rise to, however inadvert, deceptive interactions. One can easily conceive of the machine giving regulators one explanation of behaviour, designed to pass regulatory requirements, whilst utilising separate explanations for other categories of user. An, admittedly non-AI, version of this scenario was reported in 2015 during what became known as the Volkswagen emissions scandal, in which software used in Volkswagen vehicles detected the presence of testing equipment, and reported fictitious data in order to meet legislative requirements on harmful emissions. When an explanation is not accepted by it's target, there is the opportunity for the interaction to shift from an explanatory mode to a justificatory mode. In trying to justify a position, the AI may select to communicate utterances in order to persuade.

The core concept in XAI via dialogue is that dialogue provides a natural interface when a machine interacts with humans. This interaction can be tuned to accommodate different circumstances, contexts, and relationships. An advantage is that that this can lead to increased human understanding and trust of the resulting systems because we understand and build trust by exploring and explaining. Furthermore we build confidence and resolve conflict by justifying. Given the human tendency towards mistrust of anything different, and AI thought is certainly likely to be different, there is a need for such trust building mechanisms if machines are to act effectively within society However, those same trust building mechanisms provide opportunities for deceptive practise.

4. CONTEXTS OF DIALOGUE THAT GIVE RISE TO DECEPTION

Presupposing that an AI system can be constructed that is capable of explaining the reasoning underpinning it's decisions, then there are likely to be a variety of ways in which those explanations can be presented to account for variety in the context of interaction. This means that the AI system has a choice about what to say and must select between competing or equivalent utterances. It could be suggested that where there is a choice to made there is also the opportunity for strategy. Unfortunately the opportunity for strategy also presents the opportunity for deception. Deceptive practises can incorporate seemingly innocuous practises, such as framing utterances to appeal to the recipient, or other fit with the targets pre-existing disposition. Similarly, when justifying a position, the omission of information that weakens your own case can be strategically useful, and is common in human society, but

the practise is still referred to negatively, it is a *lie* of omission.

The notion that a machine can deceive raises questions about how such machines should be handled within society. For example, when should a machine lie or otherwise deceive? Multiple approaches are required that can together work to limit deceptive behaviour, and provide a framework in which people can reason about those behaviours, and make informed decisions about their responses. Four approaches that might provide tools to handle machine deception are mechanical, educational, legal, and ethical.

The mechanical approach captures the idea that systems that can potentially deceive humans are simply either not built or have internal mechanisms devised to prohibit or otherwise limit such behaviour. On the surface this seems like a nice solution. To avoid the problem, don't build systems that allow the problem to occur. However, even were it straightforward to recognise such circumstances, it is problematic to prohibit the design and implementation of such systems, or to enforce the presence or absence of particular software features. The educational approach builds upon existing and long- standing trends in informal logic and argumentation. Rather than introduce mechanical solutions within the machine, instead, people should be trained to argue better, to develop and deploy improved critical thinking skills that they apply when interacting with AI systems. This is a good goal, however the achievement of the goal is proving to be difficult. Law, regulation, and legislation provide boundaries for those who act within society, enabling different groups to interact whilst having those interactions regulated. The formulation of such legal approaches can take years to perfect. In the case of AI this must be achieved whilst simultaneously not undermining the current rate of progress. The global nature of AI research also means that the only result of prohibiting certain aspects is to stop them from occurring in that locale, the rest of the world may continue to develop those aspects. A parallel might be drawn between AI research and research into genetically modified crops or human gene editing. In both cases many countries have enacted legislation but this has served only to restrict research within specific geographic areas. Ultimately, the likelihood is that there will be a legal approach which structures interactions between people and machines, and that this approach is likely to be guided by, and in turn influence, the educational and mechanical approaches. However, this will take time. Until then, considering the ethics of human-machine interaction might be a good starting place.

Whilst there have been some efforts to define limitations on what machines should be designed and implemented to do, for example, through mechanism design, education, law, and ethics, no single approach is sufficient. In the cases of mechanism design, education, and law, it can be argued that all solutions are underpinned by a system of ethics. Ethics that guide professional practise, ethics that inform evaluation of educational principles, and societal ethics that laws are designed to enshrine.

5. PERMISSIBLE MACHINE DECEPTIONS

The most straightforward way to handle the potentially harmful implications of machine deception of human users would be an outright ban. However, it is not clear that this would be a desirable measure. There seem to be plausible scenarios, both hypothetical and current, where machine deception strikes us as not only harmless, but in some cases morally praiseworthy. Isaac and Bridewell (2017) have recently suggested a few such cases[1], and we

present three additional ones here.

5.1 Deceptive recommender systems

My Netflix account shows several 'recommended' shows that I can watch, 'based on my watch history'. I am not privy to all the ways in which the recommender system decides what to offer me as a recommendation, but if the system draws on things other than what shows are similar in genre, tone, style etc. to things which I have watched in the past (which shows Netflix must pay the least amount in royalties to show me, for instance), then this is plausibly a case of an AI engaging in a deception; it is presenting an option to me as based entirely on my preferences, when in fact it is not. However, even though this behaviour is plausibly deceptive, it also seems like a kind of deception that we might not be too concerned about, certainly in line with the kind of deceptions we routinely accept as permissible in various kinds of human commercial activities.

5.2 Caring deceptions

Robots are increasingly being developed for use in caring roles. As companions, health monitors, and even to carry out basic medical duties such as safely moving patients around. In such roles, it is often the case that we are tempted to think that certain deceptions are forgivable, and perhaps even mandatory. For example, if a patient near the end of their life asks their companion robot whether their death will be painful, or a recovering burns victim asks their companion robot whether they are beautiful, or in any number of similar instances (see Matthias 2015 for more), we could very plausibly think that a cold honesty is far from the best way for the companion in question to respond. If robots are to work in caring roles, an amount of kind deception is almost certainly going to be morally warranted.

5.3 Deceptions to preserve confidentiality

AIs acting as personal assistants, or as facilitators of information retrieval, might frequently find themselves in a situation where deception is morally warranted. If I am unavailable to make my day's appointments because of a sensitive medical emergency, or similar personal problem that I would not wish shared with my clients or colleagues, an AI probably ought to deceive those people on my behalf, lying about the reason for my unavailability, and so preserving the confidentiality of my personal affairs.

It seems, then, that we have some reasons to stop short of an outright ban on deceptive machines. Some robot deceptions seem almost harmless, and some even seem obligatory. If some deceptions by machines are morally permissible, then, it remains to try to delineate those instances of machine deception which are permissible from those which are not.

---

1 We present additional cases firstly because having more cases by itself makes the idea that benign machine deception is possible more plausible, but also because there are specific issues with the examples given by Isaac and Bridewell which may make their cases less persuasive than necessary (i.e. they argue that robots ought to be able to engage in idle office banter, and that that is a form of 'bullshit' – however it is not clear that such banter is at all deceptive.

6. MACHINE DECEPTION AND TRUST

In the contemporary philosophical literature on the ethics of lying and deception, views about the wrongness of lying and deception are varied in focus and in particularities, but in general follow the sentiment of the great Bernard Williams, that "In our own time we find it particularly natural to think deceiving people (or at least some people, in some circumstances) is an example of using or manipulating them, and that that is what is wrong with it." (Williams 2002, p.93). In what follows we will briefly show that the wrongness of *machine* deception must be treated very differently to the wrongness of human deception.

Because not all lies or deceptions are manipulative, locating the wrongness of deception in its manipulative elements can help to delimit those deceptions which are permissible from those which aren't. However, in the majority of cases of machine deception, including those listed above, it appears that they are at least *prima facie* manipulative (meaning that they seem intended to get their human interlocutor to act or believe in a way other than they would if they were acting on the best information and on the basis of their own values and desires). So, if we have a good reason to think that the above cases of deception are *not* manipulative, or at least not manipulative in a morally impermissible fashion, then we should investigate why *manipulation* is wrong, and whether the cases we are interested in count as permissible or not on that basis.

In short, when deception is wrong because it is manipulative, it is wrong because it breaches a particular kind of *trust* (Faulkner 2007, Strudler 2010). The kind of trust which makes deception wrong is a kind which lends an assurance to a listener that a speaker's words deserve their belief; that the belief in a speaker's words are *warranted* in the listener. Interestingly, this kind of trust can come in kindred forms, which are especially relevant in the case of human-machine interaction: we may trust a speaker's words on a *predictive* basis, or on an *affective* basis (Faulkner 2007).

When I trust on a *predictive* basis, I am trusting that some object or person will perform some action because I have a good reason to think that they are the kind of object or person that can or will reliably perform that action. As I type this, knowing that the software I am using is designed to facilitate word processing, I can *predictively trust* that the words I type will be accurately reflected in the outputted file. Formally, A has predictive trust in S when:

(1) A knowingly depends on S φ-ing and
(2) A expects S to φ (where A expects this in the sense that A predicts that S will φ).
(Faulkner 2007)

Importantly for our purposes, predictive trust is *not* the kind which, when broken, necessarily constitutes a moral wrong. Whether the object of predictive trust is a person or a machine, my expectations have been confounded, but my trust is not due to any explicit or implied obligation on the part of S to satisfy that trust.

If, on the other hand, my trust is of the *Affective* variety, then my trust is not just based on what I expect that the object of my trust will do, but on what *motivates* the object of my trust. If I ask a colleague what time the staff meeting is that day, I trust that she will answer me truthfully not just because she has been a reliable source of such information in the past, but because I expect that my dependence (in however weak a sense) on her giving me

accurate information is what motivates her to answer me. Again, formally, A has affective trust in S when:

(1) A knowingly depends on S φ-ing and
(2) A expects S's knowing that he depends on S φ-ing to motivate S to φ
(Faulkner 2007)

This is the kind of trust which is morally operative in distinguishing permissible from impermissible deceptions. In deciding whether the putative cases of benign machine deception we outlined above are permissible or not, we must decide whether in each case we would expect that the machine in question is acting partly on the basis that we are depending on their acting honestly. Plausibly, we are not: in each case we might either understand or expect there to be other motivations for the machine's speech.

However, there is a deeper problem which this analysis points us towards, and it is this: can artificial intelligences, of the kind which currently exist and are likely to be developed in the short to medium term, ever be suitable targets of affective trust?

When I get angry with my printer because it fails to print my paper, we have no hesitance in saying that I have made some kind of mistake. With the preceding in mind, we might say that I have mistakenly imbued it with *affective* trust, when I really was only warranted to grant it *predictive* trust. I am free to predict that it will print as it always has done, but I cannot reasonably think that my dependence on it printing is a part of its motivational structure. If my printer does not print, it has not *betrayed* me, it has simply confounded my expectations.

As things stand, can we say that even the most sophisticated artificial intelligences are capable of valuing human interests in a way which motivates their actions, so making them suitable targets of our affective trust? If they can't, which I believe to be the case, then how can we ever hold them blameworthy for their deceptions? Especially if, as seems likely, their human interlocutors will often mistakenly trust AIs as if they *were* motivated by the fact that humans depend on them, rather than only causally, by way of satisfying their programmed goals. Perhaps, then, this is a new and more compelling reason for AIs to not be permitted deceptive capacities – not because those capacities will invariably be harmful, but because holding those machines blameworthy for impermissible deceptions depends on their betraying a trust which it is not reasonable to hold in them to begin with.

7. CONCLUSION

Mechanical solutions to the problem of handling deception are challenging. Educational solutions are long term, not a complete solution in isolation, and challenging. Meanwhile, the law is progressing rapidly, to account for and regulate what machines are allowed to do and how people can interact with them.

This paper has presented some preliminaries for an ethical framework regarding machines, people, and deception. Such a framework would inform the process of law-making, as well as the design of intelligent systems, and would provide normative expectations for interactions and behavioural standards between people and machines.

In summary, this area is developing rapidly, spurred by advances in research, progress

in law, and the growth of socio-technical interactions. Whilst this paper has outlined some preliminary ideas, there is much work to complete to bridge the remaining theoretical and applied gaps.

ABSTRACT: We examine the emergence and shifts in definitional arguments for Russian 'democracy' from the establishment of the Russian Federation to the present. For the Putin and Medvedev years, we analyze definitional arguments about 'democracy' as expressed in Russia Day Addresses from 2000 – 2018. The meaning of 'democracy' and its relationship to Russia were ever-changing. After events in Crimea, this once prevalent argument waned to virtual absence.

KEYWORDS: civil liberties, definitional argument, democracy, freedom, Medvedev, Putin, Rule of Law, Russia Day speeches, Russian Federation, Yeltsin

1. INTRODUCTION

Our on-going study of Russian political and Presidential argument began in 1992; over time, the project evolved into a longitudinal examination of Russian political (mainly Presidential) argumentation. The overall study is focused on arguments concerning national identity, democracy / democratization, citizen / citizenship, and similar ideographs.

In this paper we offer a longitudinal analysis of definitional arguments about 'democracy' expressed in Presidential Russia Day Addresses from 2000 – 2018 as a microcosm of broader argumentative tendencies. Our overarching claim is that definitional arguments linking Russia and 'democracy' played prominent roles in Presidential discourse during the Yeltsin and early Putin years, although the meaning of 'democracy' and its precise relationship with Russia were ever-changing; however, by Putin's third term, and certainly after events in Crimea, this once prevalent argument virtually disappeared. We proceed by describing our approach to definitional argument, then tracing shifts in the definitional arguments advanced about Russian democracy. We conclude by exploring some implications of the effacement of democracy in Presidential addresses, notably a concomitant shift from understanding Russia as

a nation based on a national idea (*e.g.,* democracy; communism) to a country defined by land and history (and myth).

2. APPROACHES TO DEFINITIONAL ARGUMENT

Definitional argument functions to shape our understanding of situations, and as such definitions shape the meanings that we assign those situations. Accordingly, definitional argumentation has high stakes, because, as J. Robert Cox reminds us, "Human behavior is based upon the *meaning* the person attaches to objects, events, relationships, or activities of other individuals" (Cox, 1981, pp. 198-199. Emphasis added).

Zarefsky has maintained that definitional argument may take multiple forms, which he identified as argument *from* definition, *about* definition, and *by* definition. Our focus has been on arguments *about* definition during the formative period of the Russian transition (*e.g.,* Should Russia incorporate Western-style democracy? Should it find a special path? Should it modify 'democracy' – literally, with adjectives – to find a comfortable indigenous definition?).

More recently, however, we have concentrated on argument *by* definition, whereby "[t]he key definitional move is simply stipulated, as if it were a natural step along the way of justifying some other claim" (Zarefsky, 1998, p. 7). In this sense, the key argumentative step of defining one's terms is taken by moves that are not themselves argumentative at all; they are not claims supported by reasons intended to justify adherence by critical listeners. Instead they are simply proclaimed as if they were indisputable facts (Zarefsky, 1998, p. 5). As we have noted elsewhere, "arguments *by* definition are critical moves that are often deployed in the construction of broader situational definitions" (Williams, Young & Launer, 2015). In the examples of argument by definition that Zarefsky discusses, he suggests that "what is really being defined is not a term but a situation or frame of reference" (1998, p. 5).

From this orientation, it follows that once arguments about definition find resolution, the favored definition may come to be simply stipulated or taken as a given. Thus, argument *about* definition transforms into argument *by* definition: in a very real sense, the definition shifts from being an argumentative claim into a premise supporting another claim.

This is an illuminating perspective from which to chart transformations in the treatment of 'democracy' in Russian Presidential address: statements regarding the definition and meaning of 'democracy' in Russia during the Yeltsin years – when Russia declared itself in transition to democracy – may be categorized as definitional arguments *about* democracy. Once 'transition' gave way to 'stability' and a sense of 'staying the course,' this shifted to argument *by* definition. After 2014 and events in Crimea and Ukraine, however, Presidential argumentation concerning the status of Russian democracy essentially disappears.

The historical development of what we are generically referring to as "Russia Day" speeches reveal changes and shifts in purpose, structure, and format. We start by charting the history of the celebration and its relationship to democracy. We then analyze Putin's Russia Day speeches, focusing closely on definitional shifts in 'democracy' and related terms. The longitudinal changes in definitional argumentation about democracy are particularly telling because Russia Day is "an effective microcosm for Russia as a whole" (SRAS, 2018).

3. CHANGES IN "RUSSIA DAY"

Each June 12 is celebrated in Russia as "Russia Day.' The tradition began in 1990, when

> the First Congress of People's Deputies of the Russian Soviet Federative Socialist Republic (RSFSR) adopted the Declaration of State Sovereignty of the Russian Soviet Federative Socialist Republic, which declared the supremacy of the Russian Constitution and its laws (Litovkin, 2014).[1]

This declaration of Russian constitutional supremacy was conceived as a form of sovereign independence from legal subservience to the Soviet Union. Indeed, the holiday

> was originally named "Russian Independence Day," marking both the day when the Russian Republic declared its independent sovereignty from the Soviet Union and the day when, exactly one year later, Boris Yeltsin was elected the first president of the Russian Federation (SRAS).[2]

However, despite the formal designation of June 12 as "Independence Day" it was not celebrated in any significant manner (Litovkin, 2014).

After the dissolution of the Soviet Union in 1991, the name of the holiday was changed by the Supreme Soviet of the Russian Federation to the "Day of the Declaration of Russian State Sovereignty."[3] It still did not gain popular traction, although it was during this period that the President began issuing an annual short statement to commemorate the day. June 12 became a public holiday in 1994 (Iaccino, 2014), and in 1997 Yeltsin "suggested renaming it Russia Day" in order to better "promote this day as a patriotic holiday" (Iaccino). However, the renaming did not formally take place until 2002 when the Russian Parliament changed the name of the holiday to Russia Day (Iaccino). Russia Day grew as an annual celebration, but its focus drifted, then shifted entirely. It slowly became a celebration of Russia and of Russian history across time, without reference to political systems or constitutional order. Along the way, it became linked to other agendas, such as the National Awards Ceremony.

Nevertheless, Russia Day remains a day when the President might be expected to mention progress towards democracy. As Oleg Rumyantsev, Executive Secretary of the 1993 Constitutional Commission, who oversaw the drafting of the Declaration of Sovereignty, noted, "This is the day of the foundation of the constitutional order….The Declaration forged the principles of national sovereignty" (SRAS, 2018). Boris Yeltsin expressed a similar view, saying the dissolution of the USSR "put Russia on another, democratic, market-oriented path of development."

4. DEFINITIONAL SHIFTS IN 'DEMOCRACY'

The word 'democracy,' as with other symbols, contains no meaning in itself; it is only when meaning is ascribed to it, and as definitions of it arise in the context of use and human interaction, that it gains significance. Definitions, whether ascribed or arising from usage, are not singular: they are always contestable, even mutable. The term 'democracy' and its meaning(s) represent an example of this, especially in the context of recent Russian usage.

[3] Decree № 2981-I (issued 11 June 1992). О праздничном дне 12 июня. Retrieved from http://www.innovbusiness.ru/pravo/DocumShow_DocumID_40882.html

An instance of this definitional malleability is embedded even in the very early declarations of democracy in both the RSFSR and then in the Russian Federation, where 'democracy' is represented metaphorically as a path. In his Inaugural Address as the first elected President of the Republic of Russia on July 10, 1991, Boris Yeltsin, referencing "the adoption of the declaration of state sovereignty" and his own election as its first President, declared that

> …citizens of Russia for the first time made their choice. They have chosen . . . the path this country would follow. It is the path of democracy, reform, and revival of human dignity (*Foreign Policy Bulletin*, 1991).

Putin also embraces this metaphorical construction: in his 2001 Address, Putin says that with the Declaration of Russian State Sovereignty, Russia "embarked on the path toward a new country."≈[4] In his 2002 speech, Putin speaks of Russia's "difficult and uncharted path"* toward development of "democracy and market relationships,"* and later in the same Address he emphasizes that "Russia does not seek a special path"* but rather one in which Russia's "place in the world,"* along with "the world's attitude toward us,"* "is consistent with our rich history"* (2002).

The metaphor of a 'path' ambiguously intermingles elements of a terminus and an agency, an ambiguity that facilitates easy definitional shifts in 'democracy' between being understood as a terminal value – an end-in-itself – and an instrumental value – a means toward achieving other (more material or tangible) goals; that is, between democracy as a destination and democracy as a mode of conduct, a means of progressing toward that which is more desirable in-itself. The implications of this definitional ambiguity and the elasticity it facilitates are manifest in the shifts that emerge in the Russia Day addresses.

As this example suggests, we find multiple lines of definitional shifts in the meanings ascribed to 'democracy' over the course of the Russia Day Addresses. These definitional shifts occur along four relatively distinct axes:

4.1 Democracy as an ideal, a destination of value in-itself, the end of the path, a terminus. This definitional orientation is featured in what we refer to as in-text encomiums to democracy. Becoming or being 'democratic' both as a state and a people is presented as the *telos* of the new Russia, although over time the democratic transformation of the whole body of Russian political culture is supplanted by a democratic pose, by a familiar body with a new 'democratic face.' There are encomiums to democracy (along with freedom, rule of law, civil society) scattered among these Russia Day addresses.

4.2 Democracy as an instrumental value that should lead to material outcomes: success, prosperity, well-being. But, as emphasized in the texts, primarily it should strengthen the state. Thus, democracy is not an end-in-itself; its value lies in other outcome measures. And since the over-arching goal is strengthening the state, the outcome measures must be understood in relation to the state, not to individuals. Even vague outcome goals such as "well-being" must be understood from this perspective.

4.3 Democracy must reinforce national unity. Consistent – often insistent – calls for unity, understood as an absence of dissent, play important roles in virtually all of the Addresses. The tension between robust democracy, with its inherent multi-vocalities, and unity as projected by Putin is never addressed directly. Implicitly, the tension is 'managed' by the executive.

---

[4] English language translations of quotations in this study derive from three sources, each designated by a unique symbol: verbatim from the Kremlin.ru website (∞); from the Kremlin.ru website, but slightly edited by Michael Launer (≈); or directly translated by Michael Launer (*).

4.4 Democracy is just a blip in the thousand-year history of Russia; its meaning and significance must be contextualized within the full conspectus of that history. Whereas in 2001 Putin represented the Declaration as marking "the beginning of our new history, the history of a democratic state based on civil liberties and the rule of law"∞, by his third term the "new history"∞ seems forgotten. Mother Russia is mythologized, historically immutable, and wed to the territory of Russia. While 'Russia' may be contemporaneously synonymous with 'the state,' it is diachronically transcendent of any particular state. There is always a presence of land and history in the Addresses, but as the encomiums to democracy fade and eventually cease, the references to land, Fatherland, Motherland, and history, all increase. The association of mythic 'Russia' with land – 'land' beyond equally mythic Fatherland [Отечество], Motherland [Родина] or perhaps even homeland [Отчизна] to contemporaneously inhabited, very material 'land'-- anchors a new Russian nationalism based not on a national idea (*e.g.,* 'democratic' nation) but rather on history and land themselves. It emerges with perhaps ominous clarity in Putin's Russia Day 2014 injunction: "Our ancestors instructed us to be patriots of our Motherland."*

5. CHART SUMMARIZING OCCURRENCES OF 'DEMOCRACY' AND 'FREEDOM' IN RUSSIA DAY SPEECHES, 2000-2018

For the first 5 years, through 2005, references to democracy and democratic institutions occur routinely in the Russia Day addresses, even though the frequency in individual speeches begins to wane. For example, there are 6 instances of references to democracy in the 2001 speech and 4 in 2002 (plus a statement about free economic development). But by 2003, the frequency had dropped to one or two references per speech, and after 2005 there were several years where the term democracy was hardly mentioned at all, most notably from 2015 to 2018, when there was only 1 reference to democratic institutions over those 4 years.

From this point, we focus on those Russia Day speeches that highlight references to democracy and freedom, with special emphasis on the Russia Day addresses given by Putin in his first two years as President as a precursor to the definitional shifts that manifest in subsequent years.[5]

Below is a chart that summarizes the occurrence of references to 'democracy,' 'freedom,' and other terms associated with democratic forms of government:

---

[5] To be sure, during the Yeltsin years, the term 'democracy' fell out of favor, and during his 1996 re-election campaign, Yeltsin preferred to talk about 'freedom' rather than democracy. See: Ishiyama, *et al.* (1997), p. 98.

Summary of Russia Day Speeches - Russian Texts

Year	President	№ of Russian Words	демократи-democracy	демократическ-democratic	ИТОГО Total		свобод-freedom	свободн-free/freely	ИТОГО Total
2000	Putin	237	0	1	1		1	0	1
2001	Putin	350	4	2	6		2	0	2

2018	Putin	276	0	0	0		0	0	0

6. JUNE 12, 2000

Vladimir Putin delivered his first address commemorating the Day of the Declaration of Russian State Sovereignty during his first year as President. It appears to be the first of the formal annual addresses to be delivered at a public ceremony; it also marked the ten-year anniversary of the Declaration. Putin begins by recognizing the significance of the Declaration and its decisive effect on Russia:

> Adoption of the "Declaration of State Sovereignty" was an event that ended an era. The very essence of Russian statehood and political system changed. The country received a new direction. A multi-party system and laws on [private] property and freedom of the press appeared. The institution of the presidency was established. Constitutional changes to the structure of government were instituted.*

Although seemingly descriptive, this opening passage, presented without salutations, is significant in number of ways: it defines the Declaration as the punctuation point "that ended an era,"∞ not as the opening of a new era; it declares that the "very essence" ∞ of the state changed; and it lists several areas of institutional and legal changes, all aligned with a new [implicitly democratic] direction. But what is remarkable about this passage is that it is all in passive voice: the passage of the Declaration "was a landmark event;"∞ the system "changed;"∞ the country's "new direction"∞ was "received;"∞ the presidency "was established;"∞ and the "new system received constitutional changes."∞ The lone exceptions to the passive construction are a "multi-party system"* and "laws on private property and freedom of the press"* – which, collectively, simply "appeared."∞ In no case is an agent of change identified, either individually or collectively. Yet the use of passive voice marks the State as the *acted-upon*.

The text then abruptly shifts to a salutation ("Dear friends!"∞, and the tone changes as well:

> Ten years ago we were more romantic [than now], even naïve. We thought that building a new nation would be quick and easy. We have had to part with these illusions. Instead, we now have gained experience – however hard, even bitter, but experience nonetheless. Now we know how difficult it is to reform the economy and society and to create democratic institutions.*

Via the inclusive collective "we,"* Putin broadly identifies both his audience and himself with the "romantic"* and "naïve"* reformers who shaped the new nation, and via that identification he takes them together through their "hard, even bitter"* experiences under the initial reforms, to a presumably shared, situationally required abandonment of the "illusions"* of the easy reforms – most directly that "building a new nation would be quick and easy."* There is a faint, corollary implication that visions of complete democratic transformation were themselves illusory and should be parted with: experience has taught them "how difficult it is to reform the economy and society and to create democratic institutions."* Notably, there is no pledge or indication from Putin that efforts for complete transformation would continue despite difficulties. Instead, there is a need for unity and dedication of effort among the Russian people of a magnitude akin to that of the Great Patriotic War. The stage has been set for the definitional shifts to come in subsequent Russia Day Speeches.

The "hard"* and "bitter"* experiences of the early years of transformation threatened the stability, perhaps even the survival, of the new Russian state; nevertheless, Russia survived because of an underlying unity and resolve in the Russian people, a people defined by and dedicated to the mythos of greater Russia, to Mother Russia: "We have had many setbacks. Left in the past, it would seem, are the burst of inspiration and the excitement that helped us address the most difficult challenges, that helped as we tried to overcome them."*

This analogical invocation of Russia's triumphant victory in The Great Patriotic War and the country's subsequent resurgence recalls Soviet patriotic unity (albeit now metonymically reduced to Russian) and the ultimate victory over Nazi Germany, while simultaneously asserting that the same response is now required to overcome the tumultuous changes and hardships that were seemingly imposed on a vulnerable nation. Putin offers eyewitness testimony to bolster his assertion that the same social potion of unity and patriotism that propelled Soviet victory in The Great Patriotic War can be galvanized anew to resuscitate modern day Russia:

> I travel a great deal around Russia and meet with many people. Some of them are disillusioned, confused, and dismayed. Many, however, are brimming with energy and stamina, and full of creative drive. That means we have every chance of building a better life for ourselves, of improving the economy and reviving production.∞

This is not about the reclamation of ideals (illusions), but rather about achieving material outcomes relative to the economy, (military) strength, and international status. Moreover, the disillusioned are not cast as potential change agents, nor even as among the patriotically united: those with the energy, "creative drive,"∞ and endurance to help Putin in "building a better life for ourselves"∞ are <u>other than</u> the disillusioned, confused, and dismayed. Even the invitingly open phrase "a better life for ourselves"∞ becomes constricted as it becomes clear that Putin's envisioned resurgence is the resurgence of the Russian state – and the revived state (rather than democratic self-governance by the people) is now the glittering ideal: "Together we must make Russia united, strong, and respected"≈ (2000).

According to Putin, the first ten years of Russia's separate sovereignty "were spent under the slogan of building genuine federalism."≈ A 'slogan'≈ presents a surface representation of an advised mode of action (perhaps even a code of behavior). As with other condensation symbols, slogans have at best loose connections with actual actions. They represent ideals or illusions. And just as "hard"∞ and "bitter"∞ experiences during the 1990s required parting with certain illusions, so too is something required beyond a slogan: "Now we understand that developing a new system of government requires constant attention and a tremendous sense of responsibility"* (2000). And further development of the state is the over-riding objective: "That is a duty we all share – the President, the Government, members of parliament, and regional leaders."∞   Although at one level this is directed to the constituencies of his immediate audience, it is nonetheless striking that on the day to celebrate Russia's separate sovereignty and its first major steps on the path of democratic reform, Putin does not include the people in his delineation of duty and responsibility in building the new state. The exclusion of the people becomes more striking as Putin immediately follows his description of duty by assuring his audience, "I believe we are united in this."≈ The "we" here includes the Government, members of parliament, and regional leaders: it does not include the people. Indeed, referencing the same "we," Putin proceeds, "The people support us, and that means we will succeed."* It was becoming evident that managing the resurgence of Russia also meant managing the democracy.

7. JUNE 12, 2001

In contrast, in his 2001 Russia Day Address Putin depicts the democratic transition as essentially completed. Following a brief salutation, Putin begins:

> Today we mark an anniversary of the Declaration of the State Sovereignty of Russia. That document marked the beginning of our new history, the history of a democratic state based on civil liberties and the rule of law. Its main purpose is the success, prosperity, and well-being of Russian citizens. Eleven years

ago, we embarked on the path toward a new country, a new country above all in its relationship to society and to the individual.≈

The anniversary is now depicted as marking "the beginning of our new history,"∞ not "the end of an era"∞ as in 2000, and it is a journey with direction taken by agents with at least implicit choice: "we embarked on the path toward a new country."≈ The purpose of the "democratic state"∞ is explicitly defined in terms of outcomes, mostly material (economic) in nature, that accrue to the citizens: "success, prosperity, and well-being."∞ The featuring of material benefits to the citizen as the purpose of the democratic state is, on the one hand, seemingly laudatory toward democracy while, on the other, suggesting that the measure of democracy's success will be those material standards. Democratic values ("civil liberties and the rule of law"≈) are implicitly instrumental: rather than being ends in themselves, they must be measured relative to their effectiveness in producing success, prosperity, and well-being.

After the Declaration, a "gigantic turnaround took place. Today we live in a different country."∞ In that regard, "the very nature of Russian government and statehood has changed, as has its constitutional system."≈ Putin's declaration that "today"∞ Russians "live in a different country"∞ suggests they have arrived at the end of their "path toward a new country."≈ Aside from this act of living, agency again retreats into the passive voice: change "took place,"∞ and government, statehood, and the constitutional system have changed. No change agents are identified. And Putin concludes this section with a remarkable declaration: "The government has a new democratic face."∞

Looking at these two speeches together, one sees that Putin views the democratic reforms of the 1990s has having been imposed on the newly independent country; hence, the passive voice. By 2002, he has envisioned a different course that will refine Russian democracy as a means to strengthen the state and the state apparatus. The definition of 'democracy' has begun to change.

8. RUSSIA DAY SPEECHES FROM 2002 THROUGH 2018

8.1 June 12, 2002

By 2002, the instrumental interpretation of democracy had taken hold, yet the transitional nature of Russia's task had returned. In this speech, Putin elaborates on what Russia has accomplished: "With each passing year we improve the space for democracy and market relationships."* "In a short span of time we have created functioning democratic institutions. We have left behind our previous ideological and political conformity."* "[W]e have laid the foundations of an essentially different governmental and social structure."* "[W]e have established the conditions for the free economic development of the nation."*

Now it is time for all of this work to pay off: "[T]he changes we have suffered through must begin to yield results; they must work for society and for the people."* "We simply must strive to achieve real results from the reforms that have been established over these years."*

8.2 June 12, 2003

In 2003, Putin introduces the notion of the Russian Homeland, with its "thousand-year history and unique heritage."∞ This history is the fulcrum for national unity – the unity necessary to make Russia "an economically powerful, democratic country…."∞

8.3 June 12, 2004

Again, the theme is unity and prosperity: "By taking this path, we have chosen the values of patriotism, freedom and democracy. And for us it is clear that the more active people's initiative is, the richer the country will be."∞ Furthermore, "[t]he more reliably citizens' rights are ensured, the stronger the Russian state system will be."≈

8.4 June 12, 2005

Unlike the previous two years, the 2005 speech contains numerous references to democracy or elements intrinsic to democracy, such as freedom and civil society. This is also the year in which the focus of Russia Day changed somewhat, to an occasion for the presentation of the Russian Federation National Awards for service to the state and the people. This notion of service to the state began to appear in the 2004 address and culminates in 2005 with the addition of the awards to the Russia Day celebration.

Putin has begun to focus on the twin themes of unity and service as the path to real democracy: "Our task is to develop a political system and the institutions of a true democracy … a just and open society, a government based on the rule of law and accountable to her citizens…."* Yet, in Putin's view, democracy belongs to the state, not to the people.

8.5 June 12, 2006

The emphasis in this speech is service to the state, and for the first time the national awards ceremony assumes prominence, as the President begins his remarks by recognizing the awardees:

> It is a great pleasure and honour for me to congratulate our laureates and to award them the State Prize. This is the second time that this award ceremony is taking place on June 12, Russia Day.∞

Putin again emphasizes the importance of Russia's history in the present day: "Today, as we celebrate Russian statehood, we should look back on its thousand-year history and on the unique path our state has followed."≈ History, it seems, is the wellspring of today's civic values: "Above all, these are the values of democracy, justice, spiritual freedom and civic spirit."∞

8.6 June 12, 2007

In the last Russia Day appearance of his second term as President, Putin scarcely mentions the reason for the holiday. Although the speech is approximately twice as long as the average of his preceding six addresses, the only mention of anything resembling civil society is a nod in the direction of "the free exchange of ideas."∞ Again, the major theme is "national unity in the name of the free, civilized development of the country and a better life for all of its citizens."∞

8.7 June 12, 2012

Following a four-year hiatus, with Dmitri Medvedev serving as President, Vladimir Putin again assumes the reins of government. Not surprisingly, his 2012 Russia Day address underscores Russian exceptionalism and the importance of history and unity for the present day:

> Happy Russia Day! This national holiday reflects not only the major democratic and economic transformations that began over twenty years ago, but also the entire historical path of the Russian state which is constantly developing and has already existed for over eleven centuries.[∞]

Once again, the values of a free society are described in purely transactional terms: "Today, we are all responsible for properly implementing this choice, so that Russia is powerful and prosperous, so that people here live comfortably, happily and safely."[∞]

8.8 June 12, 2013

These themes, and a continued transactional understanding of democracy, are repeated the next year: "Each generation has a duty to make their contribution to their great country's history."[∞] The goal of society is to provide a "better quality of life to the millions of our compatriots"[∞] – and the country's "democratic values… must work towards this priority goal today. Change makes sense when people actually see that their lives are getting better."[∞]

8.9 Russia Day speeches 2014-2018

In 2014, Russia annexed the Crimean peninsula and sponsored an insurrection in Eastern Ukraine. Obviously, democracy and the sovereignty of nations were not in the forefront of Russian policy. So, as Russia attempted to recapture elements of Soviet territory from Ukraine and to undermine Ukrainian independence, it is not surprising that Putin would re-emphasize history in his Russia Day address:

> Year after year, this holiday has been gradually acquiring a special meaning. Today it signifies not only radical democratic and economic transformations, not only events in the recent history of Russia, but also the entire powerful age-long history of our nation.[≈]

Thus, the long history of Russia becomes the justification for "events in the recent history of Russia."[∞]

There is only this one mention of democracy in the 2014 address. Moreover, from 2015 through 2018 Putin mentions democratic principles only once in a Russia Day address, in 2017, in the context of affirming Russian nationalism as the highest value:
"Year by year, as democratic institutions developed and society opened up, there was a growing understanding of the importance of our roots and traditions."[∞]

Equally unsurprising, except for the toast to "a free and prosperous Russia and to the well-being of our citizens"[∞] with which Putin usually ended his addresses, 'freedom' has vanished from his understanding of post-Soviet society.

9. CONCLUSION

'Democracy' was a fraught term in Russia well before Putin took office: in his 1996 re-election campaign, Yeltsin abandoned the word in favor of the more palatable 'freedom' (Ishiyama, *et al.*, 1997, p. 98). So perhaps it should be more surprising that Putin resurrected the term at all, before he reconstructed it and re-defined it to suit his larger purposes. Russia Day, the day of Russian independence, is a day of patriotism, when praise for an ideal such as democracy and its concomitant elements can be expected. Examining all of Putin's Russia Day speeches reveals the progression of re-definition from an ideal that is a destination of value in-itself, to an instrumental value that should lead to material prosperity and well-being, to a means of

reinforcing national unity in order to strengthen the state, culminating in the understanding of democracy as one point in the thousand-year history of Russia.

Lenin famously promised Russians bread and land if the Bolshevik Revolution succeeded; Putin promises only land, and often blames the process of reform and democracy for shortfalls in 'bread' (or economic prosperity). What was conceived as a day of celebration for a new-born Russia, on a new democratic path away from its authoritarian history – the celebration of a "new history"[∞] – becomes instead a national day of reflecting both "on its thousand-year history and on the unique path our state has followed"[≈](2006) and on "the entire historical path of the Russian state which is constantly developing and has already existed for over eleven centuries"[∞] (2012). The new path has merged into the old: it has come full circle.

The three levels of argument

HARALD R. WOHLRAPP

Philosophisches Seminar
Universität Hamburg
Germany
wohlrapp@uni-hamburg.de

ABSTRACT: The task of this paper is the clarification of the relations between everyday argumentation and other forms like juridical, political, rhetorical etc. argument. Usually these various forms are understood as different species sharing some structural qualities which allow us to recognize them all as "arguments". Against this view it is here proposed to emphasize argumentation's inherent potential of self-enhancement. It can be represented in three different reflective levels, called here: "natural"-, "scientific"-, and "philosophical" argumentation.

KEYWORDS: communication, everyday argumentation, knowledge, philosophical argumentation, private language, scientific argumentation, self-distance, Semmelweis, theoretical basis, Wittgenstein

1. INTRODUCTION

The aim of the following paper is to contribute to the awareness of the general potential of argument viz. of the relations between argumentation theory and argumentative practice. In my opinion that awareness is low, the field is large and confused, the established arrangements are not sufficient. (indication: Conference organizers have put this paper under "argumentation schemes").

I will distinguish three levels of argument, which I call "natural argumentation", "scientific argumentation", and "philosophical argumentation". These titles do not primarily refer to different sections or fields of argumentative practice, but to different levels of its reflective stylizing with regard to intensity and differentiation in aims and means.

Natural argumentation is what naturally occurs in communication under specific conditions. Scientific argumentation is what is done, when we aim at knowledge, so that we really care for the epistemic validity of theses, and philosophical argumentation is what can emerge when the theoretical preconditions of knowledge, validity and even of any meaningful utterance appear to be blurred.

The second level, "scientific argumentation", should be taken as the default case of all argument. "Natural argumentation" is but a vague pre-form of it, and "Philosophical argumentation" is the safeguarding, not only of arguing but of any serious theoretical work.

2. NATURAL ARGUMENTATION: AN EXAMPLE

(Scenery taken from Kienpointner (1992), 318.):
A couple (Siegfried and Martha) gets into a fight because the woman has watered flower pots in the bathroom sink, which makes it difficult for the man to wash his hands.

M: *The flowers need it, because otherwise they'll be ruined. And by the way, a flowering plant costs 10 Euros.*

S: *Well, then you shouldn't have bought such an expensive plant in the first place.*

M: *The flowers were a gift.*

S: *Ah! First they cost 10 Euros, now they are a gift.*

M: *If someone gives you a gift, then you can't let it go to ruin.*

3. OBSERVATIONS - MISTAKES

Question:
What at all is going on here? (Kienpointner indicates: argumentation with opposition schemes)
What I can see is mainly failing communication. With regard to the argumentative aspect I would point to three defects:

(3a) Lack of focus on a thesis
(3b) Lack of theoretical basis
(3c) Lack of self-distance

(3a) Lack of focus on a thesis
It is unclear if the issue is really a claim. If so, it might be something like this:
It is right (or not right) that those plants be now in the bathroom sink.
However, the utterances do not serve to make that (possible) thesis explicit – let alone to justify it as epistemically valid. Instead they seem to emphasize that the respective speaker is right and that the other one has to accept this.

(3b) Lack of theoretical basis
("Theoretical basis" stands for those parts of argumentation that make use of defined concepts and established theorems as inference schemes.)
Can we see any theory which demands that flowers have to stand in the sink in order to stay alive? – or a theory that determines how much money one should pay for plants? Is the information about a price implying that the informant has paid it herself?
This lack of established theoretical basis is not per se a mistake. But if questions like the above mentioned are not posed, let alone answered, this kind of quasi-argumentative exchanges remains rather hopeless.

(3c) Lack of self-distance
Communication here follows a brutish stimulus-response pattern, where the "relationship level" clearly trumps the "content level". A problem has arisen, but there is no genuine claiming of a thesis and/or a counter-thesis. Instead the speakers expose an identification with their opinions. In consequence there is no attempt to justify a proposition. Instead a person is trying to defend herself against a reproach. Also criticism seems to function not as objecting to a thesis but as rejecting a person.

4. CHARACTERIZATION OF "NATURAL ARGUMENTATION"

Why should we take this kind of verbal exchange as "argumentation" (usually seen not as a level, but as a genuine type - named "everyday argumentation" or "ordinary argumentation")?

This kind of verbal practice arises naturally under certain conditions: People want to stress that they are right even if this is not self-evident. Then they tend to strengthen things, and look for a larger context from which their views appear more obvious. To this they urge the other to agree. If, instead instead of assent, a doubt or a contradicting view appears, one risks to get into a fight (this is then "argument" in the adversarial sense).

Still, this kind of communication seems to contain two important "germs":
(a) the will to get acceptance for an autonomous judgement
(b) the reference to inferential structures.
These two elements form a potential which can be stylized to serious argumentation; i.e. to a medium of reflective examination of the epistemic validity of theses. This means, however, to advance to the second level: to "Scientific argumentation".

The extant Argumentation theories are mostly concerned about this level of "Natural argumentation"[1] and intend to improve it by developing procedures for overcoming opinion differences, resolving controversies or persuading an audience in a way which is characterized by some "rationality criteria".
But:
Would that couple really be better off if they would look out for cogent argumentation schemes, if they would be attentive to not commit any fallacies etc.?

I think not. I think they would be better off if e.g. she would say: "Sure, they are disturbing, but could you please wait for 20 minutes, then I will take them out"; and if e.g. he would say: "You are certainly right in caring for those precious items, but couldn't we take some bucket to water them?"

5. SCIENTIFIC ARGUMENTATION: AN EXAMPLE

Let me again start with an example:
1844 the young Hungarian doctor Ignaz Philipp Semmelweis got a position as an assistant at the maternity clinic of Vienna's General Hospital. At that time women after their delivery were in risk of dying by a disease called "puerperal fever" (childbed fever). All over Europe there were considerable mortality rates, even up to 30%.
In Vienna's clinic they had two maternity wards, K1 and K2; and the stunning fact was, that in K2 the mortality rate used to be between 1 and 3%, whereas in K1 it was between 6 and 15%.
Semmelweis could not come to terms with the vague explanations that the professors of the clinic had for that spectacular difference (bad air, bad climate, overcrowding etc.).

Thus, he started a research in which he sought for differences in the conditions of the two clinic wards that could be responsible for the different mortality rates. After several months he found the solution. The doctors in K1 used to work also in the autopsy section which was just adjacent to K1. So their hands could be contaminated with what he then called "Cadaverous

---

[1] There are very few exceptions like Weinstein's and maybe Lumer's theories (Cf. Lumer, Ch. (1990); Weinstein, M. (1994))

substance". This proved fatal when it was transmitted to the women in childbed. After he had urged the doctors to wash their hands in chlorinated lime the mortality rates sank dramatically.

The problem with this marvelous finding was, however, that it allowed only a know-how in the lowering of the rates and contained no real explanation: Nobody knew what "cadaverous substance" was (a little uncleanliness of hands).
Therefore – and because of grave interpersonal and political irregularities Semmelweis was nearly not acknowledged. He got mad about this and died in a mental institution at the age of 47.

6. SKETCH OF SEMMELWEIS' RESEARCH PROCESS:

S. began to meticulously observe the circumstances in the two clinic wards.
When he found a difference between K1 and K2 he formed a thesis, which linked that difference to the difference in their mortality rates.
Then he tried to justify his thesis by leveling out the difference and see if this lowered the mortality rate in K1.
So, e.g. he found that the the women delivered in different positions. In K1 they laid on their backs, in K2 they took a lateral position. He managed to equalize the delivery-positions in both wards. But as the mortality rates remained unchanged he had to look for further differences in the clinic conditions.
Like this he passed through several rounds of the following five-steps-shape:

- Thesis
- Justification of the thesis (an observed difference in circumstances as being a possible cause for the difference in mortality rates); incl., if necessary, the settling of objections
- Realization of the thesis (adjustment of difference in the conditions of K1 and K2)
- Evaluation (incl. lookout for new arguments)
- If necessary: Successor thesis

His breakthrough came when a colleague died on a tiny wound that he had received from a scalpel in the dissection ward. What alarmed Semmelweis was the pathological evidence: It was similar to that of the childbed fever deaths!

All of a sudden he became aware of the decisive difference between the two clinic wards: K1 was next door to the autopsy ward and doctors used to come over from there to examine the women in the clinic. The realization of the respective thesis then brought the solution: The thesis, that the "cadaverous substance" caused the higher mortality rate proved epistemically valid.

7. CHARACTERIZATION OF "SCIENTIFIC ARGUMENTATION"

At first a remark concerning the wording of "scientific" at this place. This is my translation of "wissenschaftlich" – but I am well aware that there is a problem. The German word "Wissenschaft" signifies any enterprise that can generate knowledge (Wissen). It needs not even be an academic discipline. Moreover, in the Anglo-Saxon world "science" implies a preponderance of natural science over other disciplines. Also this is not so in "Wissenschaft"

and as well it is not intended in my naming of the second level.

The characteristics of this level of argumentation are prominently the ones that were missing in the "Natural argumentation" example. These are:

- Focus on the epistemic validity of a thesis
- Use of some theoretical basis (defined terms, established inference rules) for the construction of justifying and/ or criticizing arguments
- Self-distanciation, viz. an attitude that keeps a balance between engagement for the thesis and distance from identification with it.

As to the third item one should see that for Semmelweis it was particularly difficult to keep that balance. After experiencing, that women's lives could really be saved with such a simple measurement as hand-washing in chlorinated lime, he could not refrain from producing a considerable aggressiveness against the medical establishment that ridiculed his findings.

8. WHY TAKE SCIENTIFIC ARGUMENTATION AS PARADIGMATIC?

Argumentation in this level is concerned about overcoming gaps in knowledge and general orientation. Sometimes, but not necessarily these gaps lead to controversies or disputes.

The serious endeavor of settling an orientation gap in whatever field is research. In research we can distinguish a theoretical and a practical side. The practical side are the test activities and the theoretical side is argumentation. It unfolds with building theses, selecting the promising ones by arguing for and against them, realizing them and evaluating the results.
Research in this broad sense is the motor of human development. Argument, in a stylized form is its indispensable ingredient.
We have to accept that its true potential cannot unroll in everyday disputes. There communication is so complex that arguments are hardly perceived, let alone respected.

Therefore, in order to reasonably steer our argumentative endeavors, we need a paradigmatic model that can function as an ideal at which we can look for the exemplary manner of the growth of knowledge. Very probably such an ideal has to be stronger than a regime of linguistic behavior (like e.g. the one of van Eemeren & Grootendoorst [2]) can ever be. It amounts to something like what I have called here "Scientific argumentation".

9. CHARACTERISTICS OF PHILOSOPHICAL ARGUMENTATION

The third level emerges as we meet gaps in our understanding of the basic theoretical foundations of any theory. There we are concerned with the meaning and the range of concepts, the epistemological constitution of objects, and the possibilities of clarity, knowledge and truth in any discipline.

Philosophical argumentation shares its main characteristics with scientific argumentation. With regard to the "theoretical basis", however, there is a crucial difference: Scientific argument needs for its advancement a solid theoretical basis, i.e. concepts and theorems have to be proven and established.

---

[2] Cf. Van Eemeren, F.H. / Grootendorst, R. (1992) – it is here, that the authors had begun to name their approach „Pragma-dialectics". In Wohlrapp, H. (2014), pp liii-lviii, a concise critique of the approach is deployed, culminating in the exposure of a lack of both pragmatist and dialectic thinking.

Philosophy starts exactly when an element of an established theoretical basis proves unclear or unreliable. Therefore, we are arguing here under extraordinary conditions: Nothing is firm and constant any more. In principle, anything can be questioned.

With this definition it appears, that originally there are no theses or arguments with a genuine philosophical content. Meanwhile we certainly have those, but only as a result of the fact, that philosophy has become a specific academic discipline, in which numerous questions were split off from their origin and went independent.

10. PHILOSOPHICAL ARGUMENTATION: AN EXAMPLE

Wittgenstein had an inventive position about "Private Language". He claimed that the "philosophical grammar" of propositions about inner states (I am in pain.) is completely different from the grammar of propositions about mundane affairs (I have a car.)

To show this he provided several lines of argument (PU §§ 243-309). I will present one of them here (mainly in § 258). The argument unfolds in five steps:

(10a) If S signifies a certain sensation of mine to which I alone have access, then I alone can know what S means.

(10b) If I want to keep a diary about the recurrence of S I have to safely recognize S.

(10c) For safe recognition I need a criterion for S.

(10d) As S signifies an inner state of mine my only criterion is my memory of S.

(10e) As I cannot make sure that my memory is correct, there is no difference between a correct and an incorrect use of the sign S in my language.

Conclusion: A "private language", designating inner states, cannot exist.

11. CONCLUSION OF THE PAPER

The presented view about argumentation (for a closer view cf. Wohlrapp, H. (2014), Chap. 9) is somewhat uncommon. It offers a vertical organization of the field, where we usually have a horizontal arrangement as we talk of technical, juridical, ethical etc. argumentation; and even if we distinguish between rhetorical, logical, dialectical, topical argumentation.

A vertical arrangement does not necessarily conflict with the horizontal ones.

Only the characteristics of "Natural argumentation" and the downgrading of that level is apparently not in line with a lot of work in argumentation theory. Yet, I am hopeful that my hints to the mixed conditions of the use of arguments in everyday communication and the problems to accomplish reliable results there can generate some interest in this view.

ABSTRACT: The Mongolian Clinical Reasoning (MCR) is the research subject in the study of the logic of, and the rational foundation of, Mongolian medicine. In MCR, traditional Mongolian medicine clinicians identify their patients' symptoms by means of "consultation by observation, inquiry and touch", ascertain the pathogenesis according to the pathological principles of Mongolian medicine, implement therapeutic programs of Mongolian medicine and medication, and finally verify the effect of the treatment to see whether the symptoms have been eliminated. As a practical reasoning, it also has its own distinctive features typical of Mongolian pharmacology: subjectivity, dynamicity, interactivity and non-monotonicity. These features have to be fully considered in the study of logic in MCR. Although both deductive and inductive logic can be applied to the study of MCR, neither can sufficiently process these features of MCR as a practical reasoning. In this paper, we will develop an informal logic approach to discuss the pattern of MCR.

KEYWORDS: Mongolian clinical reasoning (MCR), deductive logic, scientific logic, informal logic, conductive reasoning

1. INTRODUCTION

Mongolian medicine, or traditional Mongolian medicine, also known as Mongolian medicine and pharmacology, is a major component of Mongolian studies and an important branch of Chinese medicine. As the fruition of medical wisdom of ethnic Mongolians, it has formed its own unique pathological system, with the assimilation of some theories and practices of Tibetan, Han and ancient Indian medicines (A-Gu-La, pp.1-2). Mongolian medicine is closely related to the living characteristics of the Mongolian. It is produced by the combined effects of ethnic minorities in the north, especially the customs, natural environment, seasonality, and physical fitness of the people in the region. The Mongolian medicine's way of thinking and reasoning methods are based on the unity of the human body's harmonious existence in the natural world and the internal functional balance of the human body, combined with Mongolian medicine's own unique theoretical system to carry out the patient's life, illness, and possible causes. Combating and analyzing, through the long-term accumulation of cases in Mongolian medical treatment, using the Mongolian's unique concept of the unity of heaven and earth and human beings to summarize and sort out, and then integrate Mongolian medicine "observation, inquiry and touch". The diagnosis was used repeatedly to diagnose and treat the disease. With Mongolian medicine being an important branch of Chinese medicine, there is need to distinguish its branches of ethnic Han, Mongolian, Tibetan, Zhuang, Uygur, and Miao medicines, among others. The criteria for the distinctions should be pathological, pharmacological and therapeutic standards. In fact, the Chinese medicine science is a vague

concept, referring sometimes to all the traditional Chinese medicines including all its ethnic branches in its broad sense, and sometimes to the ethnic Han medicine, in its narrow sense. To avoid confusion in terminology in this paper, we shall adopt the broad concept for Chinese medicine, and term the narrow concept as Han medicine.

2. DEFINITION OF MCR

MCR is the object of study of Mongolian medical logic and also the rational foundation of Mongolian medicine, a thinking process through which clinicians understand the disease and symptoms by diagnosis with inquiry, observation and touch, identify the pathogenesis according to Mongolian medical principles, implement the therapeutic plans, and eventually check the therapeutic effect to see whether the symptoms have been eradicated. MCR is a subcategory of clinical reasoning, which is a process of drawing diagnostic conclusions (the name of a certain disease) and making therapeutic decisions based on the clinical and checkup results of the specified cases (briefly referred here to as "data"). Clinical reasoning differs from scientific reasoning in the following: the object of CR is an individual instead of a class, approximating engineering or detective reasoning; the purpose of CR is not to derive a universal theory but to reach a practical therapeutic treatment (Qiu, 1984a). MCR has the following features.

First, MCR is reasoning for actual practice. Its basic feature is its actual practice, which determines the following characteristics: subjectivity, interactivity, dynamicity, and non-monotonicity. On the one hand, clinical diagnosis and therapy are a sophisticated social activity requiring the synergy and cooperation between doctors and patients to reach the therapeutic effect, thus MCR acquiring its subjectivity and interactivity. On the other hand, symptoms may change as time goes by and as the therapeutic program is implemented, and the change may not necessarily be favorable. The doctor studies the case and its symptoms dynamically, identifies the pathogenesis, implements the therapeutic plans and tests the therapeutic effect, thus MCR acquiring its features of dynamicity and non-monotonicity. The logical programs of MCR have to be able to tackle the above four characteristics.

Secondly, MCR is a causal reasoning, identifying the causal relationship between the pathogenesis and the symptoms. For the purpose of our discussion, we call this the cause-symptom relationship. With the diversity of causal relationships, we classify the cause-symptom relationship into four types: one-cause–one-symptom, one-cause–many-symptom, many-cause–one-symptom, and many-cause-many-symptom types. Clinical reasoning would be simple with the first two types, and the diagnosis and therapy are relatively easy. Clinical reasoning would be complicated with the last two types, whose diagnosis and therapy are relatively difficult. The cause-symptom relationships of what people term intractable diseases are of the last two types, although it is not always the case, as in the outbreak of SARS.

Thirdly, MCR is a dynamic process of four steps: understanding of the symptoms, determination of pathogenesis, implementation of therapy, and testing of therapeutic effect. In fact, all schools of clinical reasoning fall into those same four steps, but their differences lie in the approaches to the understanding of the symptoms, the pathological mechanism for determining the causes, the schemes for implementing the therapy, and the methods for testing the therapeutic effect (see fig. 1)
Fig. 1 The MCR Map

2.1 Grasping the symptoms

Accurate understanding of symptoms is the first step and starting point of Clinical reasoning. Otherwise, the clinician most probably arrives at a wrong pathogenesis. Indeed, even when the pathogenesis determined is correct, it may have been a coincidence, or the victory of the immunity power of the patient, not attributed to the pathological mechanisms. In the first and third types of cause-symptom relationships, understanding of the symptoms is easy, as there is only one symptom, which is an ideal situation. In the second and fourth types of cause-symptom relationships, understanding of the symptoms might be difficult, with the existence of several symptoms at the same time. As long as any one of the symptoms is ignored, the major pathogenesis may escape from a correct diagnosis. For example, either amblyopia or hypophysoma may be a pathogenesis for visual impairment. In fact, neither of the two can be a sufficient or necessary condition for visual impairment. They can only be an important condition. Furthermore, when a pathogenesis results in the symptoms, it has to be a process from quantitative to qualitative change. Only with qualitative change can a pathogenesis become the sufficient condition for the symptoms, like the relation between hepatitis B viruses and hepatitis B.

In different medical traditions, the doctor resorts to very different methods to understand symptoms. In western medicine, the doctor does physical tests with the help of medical equipment, supplemented by various other tests, to understand them. In Han medicine, the doctor understands the symptoms by looking, smelling, asking and pulse-taking. In Mongolian Medicine, however, the doctor does it through observation, inquiry and touch (collectively referred to as "three consultations"). "Observation" really means observation of the abnormalities in the changes in the patient's overall observe, color, body shape, posture, and certain parts of the body, in order to infer about the disease. "Inquiry" means consultation by direct or indirect inquiry with the patient or family members in order to learn about the disease. "Touch" means diagnosis from the sense of touch with the doctor's hands, to further determine issues that have not been revealed from observation and inquiry, such as the pulse manifestations, temperature, tenderness, position, size, outline, mobility, superficial nature and hardness. An important difference between an experienced and an inexperienced clinician of Mongolian medicine lies in their ability to understand symptoms with the help of the three-step diagnosis.

2.2 Finding the pathogenesis

This is the second step in clinical reasoning, or even the most important step, for, if a wrong pathogenesis is given, the result would be disastrous. Certainly, this has to be vague in our discussion, for its importance is relative, as, after all, we have to admit that each of the four clinical reasoning steps is important.

Identifying the pathogenesis is a process of causal reasoning for inferring the pathogenesis based on the symptoms. In the basic theories of different medical traditions, for the same symptoms, very different explanations are offered as to the cause-symptom relationships. For example, western medicine uses the theory of four liquids, Han medicine uses the theory of yin

and yang, and Mongolian medicine uses the theory of three roots. In the first two cause-symptom relations, it is fairly easy to identify the pathogenesis, while in the latter two types of relations, it is fairly difficult, where even when one has identified a certain cause or the real cause, and the therapeutic plan has been given, and the symptoms may have been temporarily eliminated or eased, but not ultimately eradicated, the best therapeutic plan may fail to have been established, thus missing the most opportune moment for treatment.

Besides, due to different pathological mechanisms, different medical traditions may use very different approaches to explain pathogenesis. Mongolian medicine adopts the theory of three roots: Heyi, Xila and Badagan. It classifies the nature of diseases into two kinds, cold and heat, and the conditions for the onset of diseases include internal and external kinds: the internal conditions being three roots and seven elements, and the external conditions being disease-inducing factors. These theories clearly differ from those of both western and ethnic Han medicine.

2.3 Implementing therapeutic treatment

Formulating the corresponding therapeutic plan according to the pathologic cause, and implementing the therapeutic treatment procedures are the third step of clinical reasoning. The pathogenesis is the root of the disease. The purpose of medical treatment is to eliminate the cause, not the symptoms. As the human body is an organic mechanism, as long as the pathogenesis is eliminated, the symptoms will naturally disappear. In different medical traditions with different pathological and pharmaceutical principles at work, their doctors resort to very different therapeutic schemes. Western medicine practices drug therapy, chemical therapy, radiation therapy, operational therapy, and physical therapy. Han medicine practices drug therapy, operation therapy, acupuncture and massage, scraping and cupping, pricking and bloodletting, and physical therapy. Mongolian medicine, on the other hand, practices drug therapy, bloodletting therapy, cupping and pricking therapy, moxibustion therapy, therapy of sour mare milk, and bone-setting orthopedics. Superficially, although different medical traditions may have similar names or even identical names for certain therapies, there are vast differences in their therapeutic tools and methods when it comes to actual treatment. For example, western, Han and Mongolian medicines all have physical therapy, but vast differences exist in the tools and methods adopted. Drug therapy, the basic therapy in all medical traditions, is another example, although the three medical traditions differ drastically in their pharmaceutical principles and drugs. Western medicine is rooted in pharmacodynamics and pharmacokinetics, while Han and Mongolian medicines are grounded respectively in the theory of four elements and five odors and that of five elements and six odors. Certainly, in pharmaceutical manufacture, the three medical traditions differ from each other vastly as well. Western drugs are chemically synthesized, while Han and Mongolian medicines mainly practice physical synthesis.

2.4 Checking curative effects

When the therapeutic program starts to be implemented, testing of the therapeutic effect is the fourth step in clinical reasoning. The means to be adopted are roughly the same as those for understanding the symptoms. The purpose is to see whether, after the implementation of the therapy, the symptoms have been mitigated or disappeared, which might indicate that the previous three steps have been correct or appropriate. Here, the author uses the auxiliary word "might", because clinical reasoning is not an indispensible reasoning, but a probable reasoning. As a causal relationship, the cause-symptom relationship is complicated, and the development of pathological conditions is usually a dynamic process that keeps updating. If the symptoms

have not disappeared or have even aggravated, there are several possibilities: first, the condition of the patient is incurable; second, the symptoms have not been understood accurately and comprehensively; third, the real cause for the symptoms of the disease has not been identified; fourth, the therapeutic program has not been appropriate. For the first scenario, the Critical Condition Notice can be issued to the patient. For the other three scenarios, we shall need to revert to the first step of clinical reasoning and start all over again. This fully demonstrates the dynamicity and non-monotonicity of clinical reasoning.

Any logical plans of practical reasoning must be based on a certain logical category, and usually a contemporary major logical category. MCR is no exception. In its historical development, logic has evolved into three types. First, formal logic, which is so named because the appreciation of argumentation that it is concerned with, is only relevant to the form of reasoning, otherwise known as deductive reasoning, as it emphasizes that the conclusions are definitely deduced from the premises, forming a mutually supplementary and complementary pair of logical categories. According to Rudolf Carnap, it is not their concern to decide on the truthfulness of premises, which is a pragmatic issue (Horvitz, p.19). Second, inductive reasoning, which emphasizes that when the premises are true, the conclusions may be true as well, and that the quality of argumentation is directly related to experiential evidence. Its core section is its causal reasoning, which in turn is a basic reasoning type of scientific logic, where Francis Bacon's theory of three tables and John Stuart Mill's five inductive methods of causal connections were proposed to accommodate the logic for investigation of causal relations in studies of natural science. Therefore, scientific logic is the fruition of the applications of inductive logic. Third, informal logic, a logic category mutually complementary and supplementary with formal logic, originated in ancient times as the latter. As a branch of logic, it thrived in the latter half of the 20th century, a return of the orientation towards practices in logic (Xiong, 2016). The fundamental difference between informal and formal logic in terms of appraisal is this. The former only focuses on logical semantics and logical grammatical analysis, but the latter not only focuses on logical semantics and logical linguistic dimension that formal logicians are concerned about, but also the logical pragmatic dimension of reasoning. The analysis and appraisal of clinical reasoning clearly have to be closely connected with pragmatic factors, and in this sense, informal logic better suits the kind of logical study that works well with clinical reasoning.

3. A DEDUCTIVE LOGIC APPROACH

Before informal logic was established as a discipline, traditional logic was classified into two types: deductive and inductive logic. Deductive logic studies deductive reasoning and appraisal, and includes traditional and modern deductive logic. The former includes Aristotle's syllogism and stoicists' propositional logic, and the latter mainly includes Boolean logic, Frege's first-order predicate logic, and the various logical systems that are developed on their basis. In other words, traditional deductive logic is concerned with the human mind, while modern deductive logic is oriented towards the computer. The criteria for appraisal of deductive reasoning are the effectiveness of the deduction. It follows that the necessary and sufficient condition for effective reasoning is this: the situation does not exist in which all the premises are true and yet the conclusion is false. Also, according to formal logic, the judgment of deduction effectiveness is only related to the form of reasoning, not the content of reasoning.

The earliest system of deductive logic was Aristotle's syllogism. Undoubtedly, we can use this as the tool of appraisal for MCR. For example,

Argument 1
Major premise: Poor sleep is the result of the overflow of Heyi.
Minor premise: Jack experiences poor sleep.
Conclusion: Therefore, Jack suffers from an overflow of Heyi.

A critically important step in clinical reasoning is the deducing of the pathogenesis (conclusion) from pathology (major premise) and symptoms (minor premise) and thus we may term the reasoning pattern of this step "clinical syllogism". In Argumentation 1, S stands for Jack, P stands for an overflow of Heyi, and M represents poor sleep. According to Aristotle's syllogism, we may formalize Argumentation 1 as the following: MAP, SAM, ∴SAP. This is the AAA form of the first figure of syllogism, and in terms of formal validity, it is clearly valid.

Deductive validity focuses on the scenario in which all the premises are true and the conclusion is false, i.e. if the premises are true and the conclusion has to be true. However, deductive validity does not pass judgment on the truthfulness of premises. According to the validity criteria, when all the premises of an argumentation are false and the conclusion is true, this argumentation is not necessarily invalid, and thus the inference valid. But this clearly violates our intuition. Therefore, logicians present their criteria for the dependability of reasoning. i.e. an inference has to satisfy two conditions: first, all the premises are true, and second, the form of reasoning is valid. According to these criteria, the following forms of valid reasoning can be excluded: "the premises are false and the conclusion is true" and "the premises are false and the conclusion is false." When it comes to Argumentation 1, although the second condition is satisfied, i.e. the form of reasoning is valid, the first condition has not been met, as how to judge the truthfulness of the major premise is still a big issue. Specifically, from the perspective of Mongolian medicine, the symptom of "poor sleep" may have been incurred by one cause or several causes at the same time, a one-cause-one-symptom, many-cause-one-symptom, or many-cause-many-symptom relationship. Pathologically, poor sleep may not be the necessary result of an overflow of Heyi, which is neither a sufficient, nor a necessary, condition, although an important condition. Indeed, the relationships between the majority of pathogenesis and symptoms are neither sufficient nor necessary, only important. However, in Argumentation 1, only when it is assumed that "an overflow of Heyi" is the sufficient, or sufficient and necessary, condition of "poor sleep", can we deduce without doubt that "Jack suffers from an overflow of Heyi". This assumption is clearly in conflict with Mongolian medicine pathology. A probable scheme to eliminate the conflict is this: the major premise is revised as "An overflow of Heyi may result in poor sleep." Thus Argumentation 1 is revised as follows:

Argument 2
Major premise: An overflow of Heyi may result in poor sleep.
Minor premise: Jack suffers from poor sleep.
Conclusion: Therefore, Jack may be suffering from an overflow of Heyi.

Compared with Argumentation 1, there seems to be more integration of ideas from MCR. However, it should be noted that if we are to evaluate this clinical reasoning with Aristotle's syllogism, we shall find that the form of this argumentation does not satisfy the second condition of a dependable argumentation, i.e. its form of reasoning is invalid, for we can only obtain an abstract form of "PAM, SAM, ∴SAP", where the fallacy of the undistributed middle term is committed. Consequently, in terms of formal logic, even when the major and minor premises are true, there is no guarantee that the deduced conclusion is necessarily true.

Regarding the assurance of validity of Argumentation 2, two possible schemes are: first, propositional logic can be adopted to realize the logical justification; second, first-order

predicate logic is adopted to realize the logical justification. According to the propositional logic scheme, Argumentation 2 could be formalized as "H→S, S, ∴H", where "H" represents an overflow of Heyi, "S" stands for good sleep, and "!" serves as the logical connector "not". But according to propositional logic, this form of reasoning is invalid, because this is affirming the consequent in hypothetical reasoning from sufficient conditions. In fact, this formalization of inference is problematic. Specifically, Argumentation 2 only asserts that that the conclusion may be true, but not necessarily true. But in this formalization, the conclusion is treated as necessarily true. We can also formalize Argumentation 2 according to predicate logic as "(x)(Hx→Sx), Sw, ∴Hj ", where "H" stands for "an overflow of Heyi", "S" for "good sleep", and the individual "j" for "Jack". Based on first-order predicate logic, it is easy to check the invalidity of the argumentation. Indeed, in this argumentation, the formalization of the major premise is problematic, for it has the determiner "often", which only indicates that in most cases, "an overflow of Heyi" may lead to "poor sleep", but does not assert that the former necessarily leads to the latter. As discussed earlier, the former is only an important condition of the latter, being neither sufficient nor necessary. In this sense, Argumentation 2 does not satisfy any of the criteria for dependability.

However, in MCR, Argumentation 2 is more acceptable than Argumentation 1. Fundamentally, MCR is practical reasoning, whose most prominent feature is its non-monotonicity. The basic feature of deductive reasoning is its monotonicity. The monotonicity of reasoning is this: once a reasoning is valid, whatever its premise, even when problematic premises are added to the set of premises, the reasoning is still valid, i.e. the conclusion enjoys a fidelity. The non-monotonicity of reasoning refers to this: while a reasoning is valid, if one more premise is added to its set of premises, the truth value of the conclusion will change. According to Nute (2003), man's reasoning is not, and should not be, monotonic. Clearly, what he means by man's reasoning is practical reasoning. As a type of practical reasoning, MCR is undoubtedly non-monotonic. The four steps of MCR are a good manifestation of the non-monotonicity, for after understanding the symptoms, determining the pathologic cause, implementing the therapy, and testing the therapeutic effect, if the symptoms have not been mitigated or disappeared, one has to come back to the first step and goes through the process of clinical reasoning from the beginning. Besides, we also find that in Argumentation 2, although its form of reasoning is invalid, and the truthfulness of its major premise is challenged, it is more acceptable than Argumentation 1. This is ultimately attributed to the fact and MCR is a non-monotonic reasoning. Since its set of premises is open-ended, and its conclusion is rescindable, it is not an easy matter to refute this type of reasoning.

As far as we know, monotonicity is the distinctive feature of deductive logic. It is obviously impossible to use deductive logic of monotonicity, in Aristotle's syllogism, in propositional logic, or in first-order predicate logic, to capture MCR of a non-monotonic nature, although it does not mean that deductive logic does not contribute to MCR. In fact, deductive logic is helpful in the teaching of Mongolian medicine as an analytical tool. Now that deductive logic is not the solution, then the logical defense for MCR should find a new route. A possible logical route would be the scientific logic route based on inductive logic, as the latter certainly does not take on monotonicity, although people normally do not talk about the non-monotonicity of inductive reasoning.

4. A SCIENTIFIC LOGIC APPROACH

As a route based on inductive logic, the scientific logic route might be a good alternative, which does not completely exclude the deductive logic method, as its basic reasoning method is the hypothesis-deduction method. It is built on integration between deductive logic route and inductive logic route. Scientific logic was evolved at the first turn of logic – the scientific turn. The development of logic goes through four stages: origin in practice, scientific turn, mathematic turn, and return to practice (Xiong, 2016).

The route cause for the scientific turn in the development of logic lies in the fact that Aristotle's syllogism and Stoic propositional logic could not process the causal reasoning in natural science studies. Before the appearance of inductive logic, the other two had dominated the world of logic. The motivation for the scientific turn of logic was to seek the cause-effect logical method. With the rise of natural science after the Renaissance, people discerned that Aristotle's syllogism could not be used to process the cause-effect logical issues in the study of natural science, thus came the first major turn in logic, the scientific turn, which led to the birth of inductive logic. Its indication was the publication of The Novum Organum (New Method) by Francis Bacon in 1620. Bacon compared his work with Aristotle's syllogism, although his objective was to seek a logic oriented towards natural science.

Like deductive logic, inductive logic is similarly classified into traditional and modern types. Francis Bacon was the founder of induction. He defined his logic as the art of explaining nature, resolved to reform logic as the method in scientific discovery (Ma, p.230). his major contribution to logic was his proposal of the method of three tables: Table of Essence and Presence, Table of Absence in Proximity, and Table of Degrees (ibid, pp. 230-239), which was advanced by John Mill to Mill's five methods of induction: direct method of agreement, method of difference, joint method of agreement and difference, method of residue, and method of concomitant variations (ibid, pp. 292-239). These five methods are the core concepts in inductive methods in contemporary textbooks of logic. After the probability method was introduced into inductive reasoning and appraisal, induction stepped into its modern era.

In MCR, three inductive methods could be resorted to in the identification of pathogenesis: Mill's method, abductive reasoning, and hypothesis-deduction method.

First of all, the Mill's method is a most important logical method for identifying the pathologic cause. As classical methods in traditional inductive logic, they came into being in the discussion of causal connections with the development of natural science. These methods have been spontaneously used in MCR. In the pastures of Inner Mongolia, a local disease has the symptoms of long-term fever, excessive perspiration, swollen and sore joints. For some patients, their only clinical manifestations are only swollen and sore joints or fever. It is known as the Heruhu disease, an infectious disease of fever caused by Heruhu armyworms, i.e. known as brucellosis in modern medicine. As the clinical manifestations of this disease are usually simple, misdiagnosis is a frequent occurrence. Here is a genuine case from the Mongolian medicine department in the hospital affiliated to Inner Mongolia Medical University.

On October 13, 2016, a patient came to seek medical consultation. Her clinical symptoms were fever and swollen and sore joints, misdiagnosed first as "grasserie(yellow water disease)". The consequent therapy resulted in no obvious improvement. Upon further inquiry of the condition, it was learned that the patient and her husband had been staying for a month with a relative in East Ujimqin Banner, XilinGol League, and that the symptoms developed soon after their return home, although her husband did not contract this. More inquiry revealed that the living

conditions, environment and diet of her husband had been quite similar to hers during their stay. The only difference had been the milk. She had used the milk freshly obtained in the other house every day in accordance with local custom, while her husband did not have any due to his different preference of taste. The inference was then made regarding brucellosis, a disease acquired by humans and animals alike, which can be transmitted to humans through their direct touch of animals, their secretion, milk, or dairy products. Since the pathogenesis was located, the patient recovered very soon. Here, the doctor determined the cause through the method of difference and conducted the therapy according to this causal relationship.

Second, abductive inference is another logical method which can be adopted for determining the pathogenesis. This reasoning was first raised by Charles S. Peirce (1839-1914), who believed that it is a third type of reasoning other than deduction and induction. Its basic reasoning pattern is:

> Premise 1: The surprising fact, C, is observed;
> Premise 2: But if A were true, C would be a matter of course,
> Conclusion: Hence, there is reason to suspect that A is true. (Douven, 2017)

This inference pattern is very much similar to affirming the consequent in hypothetical reasoning from sufficient conditions: "If A, then, C, C, therefore, A." If we do not consider the specific content of the argumentation, but only subtract its formal structure in a propositional logic approach, it is clearly invalid. But to Peirce, this pattern of inference is a basic pattern of scientific reasoning. Since the conclusion may be a probable causal hypothesis, it is named abduction. Compared with deduction, it does not have with it fidelity and inevitability. Meanwhile, it is also quite different from the traditional inductive inference, Mill's method, and is not deemed as belonging to induction by Peirce. In fact, this kind of reasoning somewhat integrates deduction and induction, and therefore, it is very similar to the third logical method for identifying the pathogenesis to be discussed next.

Such an inference is very much like the actual diagnosis of clinicians. The first step "understanding the symptoms" is equivalent to the determination of Premise 1 in abduction. Once the premise is determined, the subsequent work is to work out the pathology, key to the identification of the pathogenesis. If the pathology is wrong, the pathogenesis cannot be authentically identified. The identification of the symptoms and the pathology does not mean that the pathogenesis has been determined. The last step in the identification of the pathogenesis is the logical inference of the cause. We can examine such a case of Heyi with this method. First, the symptoms have been observed that "the patient's mouth is skewed"; second, the pathological mechanism is pursued: "since the patient suffers from the Heyi disease, it will surely lead to skew of the mouth"; and finally, it can be inferred that we have reason to speculate that the patient has the Heyi disease.

Abductive reasoning can be used to allow the physician to look at his patient as thoroughly as possible, because there are many possible pathogenesis for every symptom he observes. However, we tend to abduct a single pathogenesis for this symptom alone, which would be better to our diagnosis and treatment, although this is almost impossible. Because a symptom may be abduct to multiple pathogenesis, or multiple pathogenesis are abduct to more symptoms, we can only choose the best pathogenesis among these possibilities. Following the above example, we try to analyze the reasoning process:

> Positive data: The patient's mouth is skewed and only observed this one symptom.

Hypothesis: The patient has this symptom due to the Heyi disease
Negative data: No other pathogenesis can be used as a reasonable pathogenesis to explain the symptoms of this patient.

Here we notice that the explanation of the skewness of the mouth with the aid of the Heyi disease is only a guess or hypothesis, which may be overturned by another new disease. It is only here that, given the discovery and unobserved of the disease, this cause is the best guess, or the most convincing assumption of the disease. But this also tells us that abductive reasoning is a defeasible reasoning. If a better explanation is found in the next unordered " observation, inquiry and touch " three consultations, the original conclusion will be abolished.

Third, the hypothesis-deduction method is the third logical method that can be used in MCR. Like other types of clinical reasoning, MCR does not reject deductive logical method. However, an integration of deduction and induction in clinical reasoning might be a more dependable method, known as the hypothesis-deduction method. Using this basic scientific logic method, Qiu (1984b) came up with a logic for clinical inference which he termed "diagnosis hypothesis theory", which includes two steps, the presentation and evaluation of the diagnosis hypothesis, making use of analogy inference in induction, and abductive inference, as well as deductive inference. He believes that the theory is an inferential mechanism used in the computer modeling programs of diagnosis. He also treats clinical reasoning as an inferential process from the doctor's first communication with the patient to the arrival at the definite diagnosis of the patient's condition. This knowledge-acquisition process includes four phases: obtaining the clues, presenting the hypothesis, explaining the clues, and evaluating the hypothesis (Qiu, 1984a). From the above four steps of clinical reasoning, it can be seen that the aim of understanding the symptoms is to acquire the clues, and the aim of identifying the pathogenesis is to present the hypothesis, explain the clues and evaluate the hypothesis. Regarding his clinical reasoning approaches, Qiu is not too much concerned with the other two steps: therapeutic implementation and test of therapeutic effect. However, these two steps are apparently indispensible to clinical reasoning.

Qiu (1984a) summarizes two basic models in clinical reasoning: Bacon's inductive model and the hypothesis-deduction model. In his clinical reasoning schemes, deduction, induction, and abduction have been organically integrated. This is undoubtedly a big revolutionary step in the study of medical logic. However, in clinical reasoning, symptoms are often uncertain. This uncertainty determines the difficulty of understanding the symptoms. Sometimes, they are misunderstood, which leads to mistakes regarding the pathogenesis.

On the other hand, the hypothesis-deduction route has two fatal weaknesses. First, it is within the confines of the first two steps of MCR. How to depict the third and fourth steps of MCR is beyond its scope. Second, it treats reasoning as a monotonic reasoning that is static and monotonic reasoning, while MCR itself is a type of subjective, dynamic, and interactive non-monotonic reasoning. To capture and describe these features of MCR, we have to seek alternative logical routes.

5. AN INFORMAL LOGIC APPROACH

We have three reasons to present an informal logical route, also known as conductive reasoning scheme, in the study of MCR. First, deductive logical route castes aside the pragmatic factors in reasoning, and analyses and evaluates and argumentation only in the logical semantic and linguistic dimensions, so that the study disregards the features of subjectivity, dynamicity,

interactivity and non-monotonicity of MCR as a practical reasoning. Second, the scientific logical route only focuses on the first two steps of MCR. In the hypothesis-deduction theory, the pathogenesis is the conclusion of the inference, while the premise of the inference is the pathological symptoms and mechanisms. In other words, the pathological condition is the starting point; the pathogenesis is the endpoint. Therefore, a diagnosis hypothesis theory needs only to cover the first two steps of clinical reasoning. However, in our clinical reasoning models, the pathogenesis is the starting point, and the elimination of the pathological condition is the endpoint. Thirdly, like other types of clinical reasoning, MCR needs to minimize the risks of errors. In the study of natural science, we may obtain the best explanations through large numbers of trials and errors, without much time constraint, with a low risk of error, the gravest error being no more than failure of investment in scientific experiments. The advantage of the diagnosis-hypothesis scheme is that one can carry out trial and error repeatedly, but the disadvantage is that it misses the best therapeutic timing. In clinical reasoning, the risk of error has to be minimized, for after all, a failure of clinical reasoning may result in loss of human life. If abductive reasoning is an inference for best explanations, then clinical reasoning should be regarded as an inference with lowest risk, where conductive reasoning theories favored by non-formal logicians could be utilized beneficially.

Conductive reasoning, or conductive argumentation, is a major frontline research fruit of contemporary informal logic. The terms "conduction", "conductive argument" or "conductive reasoning" basically mean the same. To Wilman, conduction has four distinctive features. First, the conclusion is concerned with an individual. Second, the conclusion is inconclusive. Third, the conclusion is inferred from one or more premises related to the same situation. Fourth, no other situations could be resorted to (Blair & Johnson, 2011, p. 1). This type of argumentation has three models. (1) One justification is given regarding the conclusion. (2) There are several considerations which are independent of each other but also related, and these several considerations can be put together in one integrated argumentation to infer a certain conclusion. (3) A certain conclusion is derived from considerations of two opposite directions, which includes both the reasons for refutation, and the justification. Although the first model has only one reason, it is almost always built on some relevant considerations that can be mentioned (ibid, p.3). Only those considerations having to do with the linguistic context have been omitted from the inference model.

Although an understanding of the pathological condition is the starting point and the first step of MCR, the pathological condition is both the premise and the conclusion of the inference. In abduction, the condition is the premise; but in the entire clinical reasoning, it is part of conclusion. Like the aims of other clinical therapies, Mongolian clinical therapies also aim to eliminate the pathological conditions. However, the determination of the pathogenesis has to be built upon the pathological mechanisms and principles of Mongolian medicine.

Like clinical therapies in ethnic Han medicine but unlike those in western medicine, clinical therapy in Mongolian medicine is a synthetic therapy. Han medicine emphasizes the balance between yin and yang in the human body, but Mongolian medicine emphasizes the balance of the three roots in the body: Heyi, Xila and Badagan. A predominance or decline of any of the three may result in certain diseases. For example, an overflow of all three will result in dizziness, and consequently, doctors of Mongolian medicine will distinguish dizziness into that of an overflow of Heyi, that of an overflow of Xila, or that of an overflow of Badagan. Since each type of disease may exhibit some similarities and dissimilarities, clinicians may resort to consultation by observation, inquiry and touch, in order to determine the kind of dizziness in the case in question.

First, dizziness from an overflow of Heyi has the following symptoms: 1) listlessness; 2) blackness of facial texture and eye sockets; 3) thinning and whitening of tongue coating; 4) urine turning light blue and clear with excessive bubbling; 5) dizziness; 6) giddiness; 7) drumming in the ears; 8) sleeplessness; 9) palpitation; 10) aggravation of dizziness once one moves; 11) emptiness and hollowness of pulse manifestations. Among these, symptoms 1-4 could be learned about by resorting to observational consultation, symptoms 5-10 could be understood by inquiry consultation, and for symptom 11, touch consultation could be adopted.

Second, dizziness from an overflow of Xila has the following symptoms: 1) acceptable mood; 2) a fat figure; 3) redness in the face and eyes; 4) yellowish tongue coating; 5) yellow urine; 6) dizziness; 7) headache; 8) bitterness in the mouth; 9) heat in the face; 10) aggravation when angry; 11) thinning and prominence of pulse manifestation. Among these, symptoms 1-5 could be learned about by observational consultation, symptoms 6-10 could be understood by inquiry consultation, and for symptom 11, touch consultation could be adopted.

Third, dizziness from an overflow of Badagan has the following symptoms. 1) mood merely acceptable; 2) paleness and dropsy of face; 3) thickness of tongue, whitening, stickiness and softness of tongue coating; 4) light urine odor, little gas, bubble adhesion; 5) dizziness and heavy; 6) astringent; 7) aggravate the cold condition; 8) heavy and slow of pulse manifestation; Among these, symptoms 1-4 could be learned about by observational consultation, symptoms 5-7 could be understood by inquiry consultation, and for symptom 8, touch consultation could be adopted.

A good command of the pathological mechanisms and principles like these is the first step to MCR, for only in this way can one understand the pathological condition accurately, as the latter is the necessary outcome of the pathogenesis.

Suppose that a patient comes to see a clinical doctor of Mongolian medicine, claiming he feels dizzy. Undoubtedly, dizziness is one symptom, one that the patient is clearly aware of himself. First of all, his dizziness has to be attributed to a pathogenesis. For a clinician in Mongolian medicine, dizziness is definitely caused by some imbalance within the body. This is equivalent to conduction model 1 discussed earlier. Second, the dizziness might be the result of an overflow of Heyi, Xila or Badagan-this is equivalent to the conductive reasoning model 2 as discussed earlier. Third, the most optimum pathogenesis that leads to the pathological condition is to be identified. The doctor understands more of the pathological conditions through consultation by observation, inquiry and touch, excludes the impossible pathogenesis, and zooms in onto the best possible causes. In other words, all possible causes have to be investigated, including both those in support of, and those in rejection of, the pathological symptoms. Then can we, based on the adoption of the negation of disjunctive reasoning, necessarily infer that the patient suffers from an overflow of Xila? The answer is no. On the one hand, the doctor needs to understand more about the pathological condition through consultation by observation, inquiry and touch, in order to confirm the diagnosis hypothesis about the pathogenesis; on the other hand, as discussed earlier, the pathogenesis leading to the pathological condition is a process from quantitative to qualitative change, and there exists a many-pathogenesis-one-symptom relationship. Therefore, theoretically, the dizziness may be the co-effect of an overflow of any two, among Heyi, Xila and Badagan. Besides, pathological theories are only a summary of experiences, and these theories and knowledge are open-ended and dynamic in nature, and keep updating themselves.

Clearly, MCR satisfies all four features of conductive reasoning: first, the conclusion of inference is the pathological condition of a patient, involved only with an individual; second,

the subjectivity, dynamicity and non-monotonicity of the conclusion determine its inconclusiveness; third, since no cooperation between Mongolian and western medicine is considered here, the premises in our discussions are only involved with the pathological mechanism, symptoms and therapeutic programs in Mongolian medicine, i.e. concerned with only one situation; fourth, since we are discussing clinical reasoning in traditional Mongolian medicine, it will not concern itself with resorting to other situations. Furthermore, we shall also find that all three conductive reasoning models are manifested in MCR, and the second and third models are observed even more.

Let us look at a case in Mongolian medical clinic first: Jack, male, 50 years old, came to the Affiliated Hospital of Inner Mongolia Medical University for dizziness and nausea. Symptoms are paleness of face, tired, cold extremities; white tongue coating; urine blue and with excessive bubbling, emptiness of pulse manifestations; Mongolian medical diagnosis: dizziness from an overflow of Heyi. Treatment to guard the Heyi and dredge the pulse manifestation. After one week of treatment, the patient's dizziness improved and there was no apparent nausea and vomiting. After three weeks of treatment, the patient's dizzy symptoms almost disappeared.

This is a very common case in Mongolian medical clinics. Through a large number of empirical analyses and interviews with Mongolian medical experts from various regions of the Inner Mongolia Autonomous Region, we have summarized the diagnostic procedures and diagram of MCR.

The diagnostic process of MCR can be divided into three stages. The first stage is a process similar to abductive reasoning. Based on the patient's known symptom p, find the pathogenesis C that may have developed the symptom. P is a set of symptoms and it's not empty sets, which is based on the patient's situation at the time, and may be one or more. One and more divisions here are caused by pathogenesis. One-cause-one-effect in causality just like one-pathogenesis-one- symptom, of course, this situation is extremely rare. Many-cause-many-effect just like many- pathogenesis-many-symptoms. And the last situation is the most common in medicine, One-cause-many-effect just like one-pathogenesis-many-symptoms. The symptoms here are generally very simple, that doctors can directly observe or patients can describe (express) it directly, such as dizziness, cough, and fever. The process of this stage is often found in three directions, Heyi, Xila, and Badagan. Because Mongolian physicians are always based on the theory of Mongolian medicine. If people have some symptoms, it must be that the internal balance is broken, and the balance within the human body is based on the theory called "three roots" of Mongolian medicine. When the Mongolian physicians see one or more of the patient's symptoms, then they will think that one of the three roots is overflow or lack. Therefore, there are three situations for the three roots of pathogenesis C, C1,C2 and C3. From the above case, the patient had the main symptom P that it's dizziness. According to the basic theory of Mongolian medicine, overflow of Heyi C1, overflow of Xila C2, overflow of Badagan C3 can cause dizziness, this is the first stage of MCR. So what kind of pathogenesis is it? Let's look at the second and third stages.

The second stage aims to provide more evidence for the above three types of pathogenesis. Of course, it does not focus on any type. It collects and analyzes all the conditions. The process of collecting and analyzing is also divided into three directions: "observation", "inquiry", and "touch". When Mongolian medical diagnosis of diseases, the use of "observation, inquiry and touch " three basic methods to collect the patient's signs and symptoms as a data to determine the disease. "Three consultations" must closely cooperate with each other to observe and understand in many aspects, and at the same time, combine the external and internal pathogenesis of disease, location, seasonal and other subjective and objective data, combined

with immediate encounters, situation, conduct a comprehensive analysis, and make specific diagnoses. In the diagnosis of diseases, Modern Mongolian Medicine first considered the whole concept, used "three consultations" to conduct rigorous examinations, and then analyzed the obtained materials according to the requirements of "diagnosis + essentials". We still follow these cases. The rules here are still the basic theories of the three medical clinics.

Dizziness from an overflow of Heyi C1 is analyzed and validated by all symptoms of the observation(p1), all symptoms of the inquiry p2, all symptoms of the touch p3; Dizziness from an overflow of Xila C2 passes all the symptoms of the observation p1', all symptoms of the inquiry p2', all symptoms of touch p3' were analyzed and validated; Dizziness from an overflow of Badagan C3 passed all the symptoms of the observation p1", all symptoms of the inquiry p2", all symptoms of the touch p3" were analyzed and verified. When the patient does not have the symptom or the symptom does not match in any of the consultations, a "×" is drawn to indicate that the type of diagnosis cannot support the pathogenesis, that means, the pathogenesis of this disease should have some symptoms, but the symptoms are not appear. In this way, this type of pathogenesis is not the best. This is the second stage.

The third stage is through the analysis of the first stage and the second stage, then we only need to conductive the analyzed contents and finally diagnose it. The key to conductive them is to find out which type of dizziness through the three consultations has gained more support. Dizziness from an overflow of Xila C2 gains more support than dizziness from an overflow of Badagan C3, so C2 is better than C3; dizziness from an overflow of Heyi C1 gets the most support, so it must be better than C2 and C3. This stage may be similar to the conductive reasoning. In the end, we diagnosed this patient as dizziness from an overflow of Heyi C1. These three stages are the diagnostic process of MCR, and its model is as follows:

Fig. 2 the Process of MCR

Here we need to point out that the "×" next to C2 and C3 means that they are not the pathogenesis of the symptom P.
MCR must be a defeasible reasoning, as mentioned in the previous article, so it is no longer an overstatement here. Of course, the model also has its own rules to support its operation. Its rules are: a) The overall concept of Mongolian medicine and the concept of balance as the guiding ideology; b) Grasping all the basic theories of Mongolian medicine (especially the "three roots" of Mongolian medicine); and c) Skillful use of the "three consultations".

6. CONCLUSION

The study of the logical route of MCR falls within the scope of the study of Mongolian medicine logic, also an exploratory study of medical logic. As a discipline, logic evolved in ancient Greece, founded by Aristotle. His syllogism has a very clear motivation for actual application, i.e. to be distinguished from sophistry that was being taught to people at that time to present public speeches and to win court cases. But after Aristotle, as logic study turned more and more towards formalized work, and as the desire to pursue universal reason became infinitely inflated, the need to seek practical reason was marginalized, and formal logic became more and more dominant in logic: the practical orientation of logic was actually driven out of the camp of logic by formal logicians. After the Renaissance, although the scientific turn of logic led to the advent of scientific logic based on induction, the appearance of symbolic logic did not contribute too much to the practice and revival of logic study until the rise of informal logic in the later half of the 20th century. A study of any practical inference cannot do without a theory of logic. For example, scientific reasoning that studies causal relationships cannot do without inductive logic. Broadly speaking, clinical reasoning is both a scientific reasoning and a causal inference, and thus it cannot do without induction. The advantage of studying MCR with inductive methods is that appraisal of inductive reasoning is closely related to experiential evidence, but its disadvantage is that it cannot deal with its subjectivity, dynamicity or interactivity. The method of conductive reasoning as presented by informal logicians nicely bridges the gap left by induction.

ABSTRACT: In this study, we conduct ethnographic observations in outpatient clinics of a public hospital in China, in order to better appreciate naturally occurring argument of Chinese medical encounters. We examine and explore three cases of medical consultation. In these: Arguments become derailed. Differences extend. Opposition occurs. In spite of the failure to maneuver issues successfully, interlocutors manage to express or covertly assert disagreement while sustaining a relationship. Matters become asserted, contested, situated and resolved. These interactions illustrate how strategic maneuvering can generate, address, and move past antagonism in medical consultations.

1. INTRODUCTION

In recent years, tension-ridden provider-patient interactions in China have attracted alarming attention in global media and academia[1].Extreme cases of patient-initiated violence against medical professionals are reported. Journalists highlight the stresses that the transitioning Chinese health care system produces. In this study, we attend to antagonistic argumentations in everyday Chinese medical encounters. Consultation is under stress due to transition in medical practice, varied expectations, and uncertain outcomes of care. Antagonism arises as affect that translates acts of disagreement into expressions of objection, refusal, difference, counter-assertion, and covert acts. Propositions are asserted, advice declined, directions contested, and actions taken.

We weave our exploration of antagonistic argumentations with studies of medical discourse. From a conversational standpoint, the doctor works within argument types that inform rules and protocols of valid exchange. However, argument practices are vetted by the state, open to the market, and attached to the health norms of patient populations. A patient brings various levels of personal experiences, family history, and resources into the discussion. Doctor and patient alike occupy spaces with resources for testing, treatment, and billing. In medical consultations, disagreements are common, and the stakes of argument are high: on the one hand, the doctor may blend persuasion and reason into enactments of argument that meet state-of-the-art expectations of practice. On the other, the patient or a

patient's spokesperson may assert (overtly or covertly) their own ideas, as well as ask for explanation, pose questions, or request/demand health-related services.

The "shared decision-making model" stands as the gold standard of doctor patient communication. Deliberative argumentation is important to satisfactory decisions by doctors and patients. This aspirational norm situates as problematic the power asymmetry between providers and patients. Accordingly, argumentation scholars propose deliberation and informed judgment as a goal for institutional practices. The doctor proposes, the patient disposes (Goodnight, 2006). Thus, ideally a medical consultation accomplishes concordance. In this process, context matters. Ideal argumentations ask that a set of preconditions guide exchange. Communicative competence, disinterestedness, and mutual respect are presupposed in order for politeness rules to reign among participants. From a pragma-dialectic standpoint, strategic maneuvering (van Eemeren, 2010; van Eemeren and Houtlosser, 2002) can coordinate valid and persuasive argumentation within such constraints to reach agreement on a resolution or points in contention.

Conversational argument can lead to consensus and concord through strategic maneuvering. In some cases, strategic maneuvering can spread rather than reduce disagreement, however. When one assertion-objection pair follows another, a rhythm of discord unfolds. In such cases, antagonism exhibits two markings: Argumentation multiplies disagreements. Interaction veers into confrontation or withdrawal. Thus, antagonism simultaneously widens and narrows disagreement space. During a medical encounter strategic maneuvering may start to derail serially particular arguments. The general rule of medical consultation is this: for consultations to prosper doctor training in deliberation, enhanced communicative competence, and patient understanding are necessary (Rubinelli and Zanini, 2012). This we support; but, we also add that the conditions of antagonism, spirals of derailment, and contestation invite inquiry so as to educate expectations of doctors and patients alike. Stresses upon institutions informs the contexts for argumentation interactions.

We turn to examine cases of doctor-patient consultation in the institutional context of China medical practice. The context for medical consultations in China is a network of stress: marketization of China's healthcare system since the 1980s and the inadequate coverage of health insurance make medical service a substantial burden for many ordinary Chinese people (Blumenthal and Hsiao, 2005; Eggleston, 2012; Yip and Hsiao, 2009; Zheng, Faunce and Johnston, 2006); an increase of inflammatory reporting contributes to a widely shared sense of mistrust and injustice among both the providers and the patients (Zhang, Stone and Zhang, 2017). Without a proper referral system, and because quality medical resources exceedingly concentrate in a few big cities, people with minor issues often travel far, spend much and compete among themselves to see specialists in major hospitals, only to be dismissed quickly after a rushed medical encounter characterized by indifference and disrespect (Hesketh et. al., 2012). At the same time, medical providers in these hospitals complained about having overworked and underpaid, while low-moral and burnout are even more common (Wu et. al, 2008). When medical disputes occur, aggrieved patients often take matters into their hands, while formal institutional mechanisms are often absent (Tu, 2014). Such a network of stresses is understandably inductive to the production and escalation of antagonism and confrontations, but the ways in which the contexts and the communication interact are underexplored and have not been made clear.

The Chinese examples speak to larger issues of antagonism facing doctors and patients across societies. For example, statistics of violence suggest conversational encounters are under pressure and potentially volatile: 21% of emergency medicine doctors in the US, 11% Chinese medical professionals and 10% of British primary care doctors have reported experience with physical violence at workplace (Pan et. al, 2015, p. 115). In the cases below,

we follow three encounters that manifest objection, opposition, contestation, and difference; antagonistic exchange was observed, but we also map how these interactions generated productive outcomes.

What is medical encounter like when there are serial disagreements? What are the argumentative practices that keep an exchange going, even with several derailments? What do cases reveal about the ways different reasons are accommodated? How can argumentation theory help us address antagonism as a real challenge in medical encounters? Sally Jackson and Scott Jacobs' (1981) direct us to the study of naturally occurring argument. So in conversations, exchanges exhibit "disagreement-relevance" and "expansion of basic sequences of speech acts" (Jacobs and Jackson, 1980, p. 118). Jackson (2017, p. 5) observes that studying naturally arguments "can overturn even our most closely held assumptions about argumentation nature, its function, and even its normative standards." Modification of understanding may be the outcome of paying attention to "the details", too. Thus, we align with Jackson's (2017) observation, that arguments evolve and vary across time and space, and we need to observe naturally occurring arguments to better address real-life challenges and explore opportunities to modify and develop theory. In the following, we shall briefly describe our processes of data collection and then proceed to present three cases.

2. DATA COLLECTION AND ANALYSES

Yue Yang shadowed six outpatient doctors of three different departments (ENT, pediatrics and gynecology) at a public hospital in Southern China for 28 days in the summer of 2016. The hospital is in an immigration city, where most patients and doctors encountered each other as strangers rather than friends or acquaintances. Yang documented provider-patient communication with consent. This hospital, like many other basic hospitals in China, offer walk-in service in semi-public outpatient clinics. In some clinics, there are two doctors working at the same time. Patients in the hallway can enter, exit and observe any medical encounters as they wish. After some encounters, Yang also had casual conversations with some of the physicians in order to better understand their perspectives and lines of reasoning.

In the following, we select three cases where antagonistic arguments are observed during the medical communication. To prelude our arguments, these three cases and their analyses illuminate a variation of "strategic maneuvering" where interlocutors strive--not so much to resolve a particular disagreement and issue--as to continue a needed relationship, in spite of expressed or covertly held differences. Strategic maneuvering resolved differences in opinion from time to time; however, arguments work in spite of and through antagonistic or challenging expressions, thereby both doctor and patient were able to continue in a consultative endeavor.

2.1 Case one: Penny's first visit

A young female patient named Penny (P in the transcript) walked into Dr. X's office in the outpatient obstetric department. Dr. X (D in the transcript) prescribed the patient various exams for her 38-week-old baby. While most of Penny's test results turn out fine, her report of the fetal monitoring test shows a close-to-flat line. Dr. X was startled and tried to persuade over and over again Penny to become hospitalized. Penny refused each time. Turn 1 in the following transcript marks the second time Penny turned down Dr. X's suggestion.

1 P: It's alright (meaning, nothing serious).
2 D (slightly agitated): But we have encountered serious cases that did not turn out al:ri:ght [prolonging the sound of this word]! Some baby's heart rate stops after a night. You have already carried this baby for 38 weeks. You don't want any accident. If anything happens it would be really heartbreaking. No one wants that. Now nothing should be more important than this (pointing to Penny's belly). Your daughter is already 6 or 7 years now, it's not that she can't take care of yourself for a night. You should really prioritize this.
3 P's husband: Stay then. Stay in the hospital. No big deal.
4 Penny turned around and scolded her husband loudly in a dialect. Penny's husband did not respond. He took their young daughter out of the clinic.
5 P (to Dr. X): It's alright.
6 D (frowning while handing Penny several pieces of paper): You really want to insist, don't you? Sign. All of these papers. Also write down her phone number here and write down the four (Chinese) words: "(I) refuse to stay hospitalized." and "I take responsibility for all the consequences". This is what the rules demand…. (Dr. X filled some forms, handed them to Penny and Penny signed as Dr. X indicated.)
7 D: Ai (Helas)…Stay. Why don't you stay in hospital? I don't want to keep you here, but your results are indicating something bad. If I don't ask you to stay in the hospital, I am not being responsible to you, neither am I being responsible to myself. (Penny continued signing the papers while the doctor was talking.
8 D (collecting Penny's signed papers): But I can't let you go now. You still have to go to the 4th floor, take some oxygen, and do a fetal monitoring test again. If doctors there say you are doing okay, that's great; but if they see the same thing, they would also say the same thing and they would not let you go either. It is a good thing if the result shows that you do better. It is not that (I) the doctor is trying to scare you. If the results are not good, then we need to welcome your baby out into the world immediately.
   Dr. X then told Penny that she needs to pay around 40 yuan on the third floor and then go to the fourth floor.
9 P: Okay. No problem.

Analyses: The patient scolded her husband harshly at Turn 4, but such display of antagonism may influence other people in the room as well. At Turn 5, the doctor frowned and appeared agitated with the patient, asking the latter an unpalatable, rhetorical question ("You really want to insist, don't you?"). The doctor also used short, imperative sentences to instruct the patient to sign the waivers. The instructions' wordings were blunt and the delivery forceful. These speech acts were "warnings" to the patient that the provider had become frustrated. They were also "threats" that the waivers would work against the patient's own interest. What is implied is that the patient need to retract from her insistence.

Nonetheless, the patient did not submit but proceeded to sign the waivers (Turn 6). It seems that the patient helped to accomplish one "antagonist dance move" that the doctor initiated. Nonetheless, the consequences the doctor warned did not materialize, as the doctor back down, expressing regret, concessions, and re-associating the doctor's responsibility and work ethics with the patient's health, even if the waivers have been signed (Turn 7). At Turn 8, the doctor gave out suggestions/prescriptions using imperative sentences without asking for the patient's opinion. She also used a pre-sequence to pre-empt the patient's possible mistrust towards doctors. Interestingly, despite the doctor's being authoritarian, and the patient was not given much autonomy this time, the previously assertive patient agreed and followed the doctor's suggestion.

How come is antagonism possible in the context? To what extent is expression of difference appropriate? During the interactions, we did not find any sign of "breaching" after the occurrence of antagonism, suggesting local tolerance for antagonism to some degree. Importantly, antagonism did not end the medical encounter. Rather, the doctor used antagonism to express her discontent and to pressure the patient to accept her suggestion. When the patient resisted and proceeded to sign the waivers, the doctor quickly retracted from the "antagonist play" and appealed to another kind of speech activities, which seemed to influence with more display of care and more efforts to build rapport. Therefore, medical communication in this case was elastic and resilient, and antagonism seemed another tactic of strategic maneuvering at the doctor's disposal to accomplish medical encounters with the patient, along with argumentation, display of care, appeal of identification, and construction of rapport.

How do we evaluate medical encounters with antagonism? In this case, we find impoliteness and paternalism that disrupts "shared decision making", "concordance" and equality. Nonetheless, the doctor's "communication package" that includes antagonism was effective to some extent, as the patient accepted the second proposition. This is a significant accomplishment for a high-risk case, because after the test, the patient may engage with another doctor in another discussion about staying in the hospital. While the second proposition may be suboptimal, it is still better than merely having the patient to sign the waivers.

2.2 Case two: Penny's second visit

Penny entered Dr. X's office where there were several other female patients. Penny signaled a test report to the doctor, who responded with slight nodding but continued to see two more patients. When it was Penny's turn, she threw her medical booklet loudly upon the doctor's working table.

1   D: What's going on with you? (talking in a controlled manner)
2   P: Nothing.
3   D (taking up the booklet and starting to read the reports): The graph is much better. This is good news, not bad news. Did you go to the 4th floor yesterday?
4   P: Hmm.
5   D: What did they say?
6   P: Nothing serious.
7   D: You took the test when you are inhaling oxygen, right?
8   P: Hmm.
9   D: Then give you another fetal monitoring test when you are inhaling oxygen today? Only when you don't take oxygen you are getting the realistic report of your situation.
10 P: Hmm.
11 D: Penny, why are your emotions so bad?
12 P: I got here early! (quickly and loudly)
13 D: You are here early, but the other patient is having a bellyache. She's been holding her belly for a while. You come over and made a fuss about it! (frowning and raising her voice)
14 P: I am just like this. There is nothing I can do about it. Just like this.
15 D: You should be more peaceful when you are carrying a baby. Wait when there is someone else.
16 D: I will prescribe you another fetal monitoring test with oxygen. Previously we had a patient who got here but has her baby ceased its heartbeat. It is better to monitor the baby in the hospital. The baby has higher risks in the womb than outside. You have

bravery. You say, "I could count the baby's heartbeat myself at home". Fine. But I am a doctor. If I don't inform you (the risks), I am not being responsible to you.

17 P: I don't particularly like staying in the hospital.

18 D: No one likes to stay in the hospital. But if you have any issue, we will all be in trouble (impatiently).

19 P: Do I have to stay in the hospital? Can I take drugs?

20 D: Take drugs, take fluids, take oxygen, do monitoring, stay in the hospital. Do all of the above. What do you think?

21 P: I don't know.

22 D: Stay in the hospital. Stay. Don't say that you don't know. (obviously agitated)

23 P: Then let me make a phone call.

24 D: Tell (that person over the phone) that "the test did not show good results *again*. The doc still asks me to stay in the hospital." Don't sign waivers again.

P took the prescription and then left the clinic office. "Ai(sign), one patient that costs so much energy!" the doctor complained.

Analyses: Penny confronted the doctor by throwing her booklet onto the doctor's table. Even if the doctor asked her directly, it was not until Turn 12 that Penny revealed her reason: she thought the doctor deliberately postponed seeing her. In other words, she assumed the doctor's negativity towards her, and she reciprocated. Turn 3-10 appeared to be ordinary medical communication about bio-technical matters, where the doctor took the lead and the patient answered in a self-constrained manner. In fact, both parties have been suppressing their emotions. At Turn 11, the doctor raised an unpalatable question by presupposing Penny's negativity ("Why are your emotions so bad?") (Culpeper, 2011, p. 135). The patient burst out her answer in the form of a complaint, with more force and in higher volume than her previous articulations, as if she has been suppressing the short answer (and its associated emotions). She pouted and looked at the table. She did not look straight at the doctor to further provoke her. The doctor confronted the complaint at Turn 13 with refutation and justification ("I see the other patient first because she has been having a bellyache"), and she directly criticized the patient about "making a fuss" and being inappropriate. Penny confronted again, repeating "I am just like this (and there is nothing I can change)." Nonetheless, this confrontational move gives off signs of withdrawal, as Penny directed attention and responsibility away from the doctor's doing but to her own personality (which might admittedly need to change but could not change, as the patient implied). In the following, the doctor "educated" Penny to control her behavior during pregnancy, thus (re)associating the current contestation (over Penny's complaint about being jumped the queue) with the main concern of the medical visit (Penny's pregnancy). The doctor also prescribed another test and then justified it, citing a negative example very briefly for a positive suggestion. In order to pre-empt the patient's possible oppositions, the doctor also explicitly presupposed them (e.g. the patient may assert her "bravery" and ask to count her baby's heartbeat at home as an alternative) and argued against them. This move resembles "presequence" in Jackson and Jacobs' discussion about argumentative conversation (1980, pp. 258-259). Note, the doctor's pre-sequenced counter-arguments are multi-layered in its meaning: the doctor cannot force the patient to change her mind, but she has an institutionalized role to play, and this role requires informing the patient as to be responsible for the patient. While the doctor's arguments appear somewhat abrupt and fragmented (containing gaps among its sub-arguments), they were intended to not only put the conversation back to a track on the patient's medical risks, but also to assert the doctor's role and re-associate her institutional responsibility with the patient's interests, thus repairing the relational division created in the previous contestations.

These moves are effective to some extent, for the patient again refused to stay hospitalized, but this time in a less definitive, taciturn/guarded manner (Turn 17). The reason the patient offered enabled the doctor to counter-argue against it: while staying in the hospital is unpleasant, the consequences of not staying is graver (Turn 18). The patient then asked about the possibility of not staying and about an alternative at Turn 19, thus obviously softening her stance. Her stance became softer and more ambivalent at Turn 21, while the doctor responded in an authoritative and impatient manner, using short imperative phrases and negative orders (Turn 20 and Turn 22). The patient seemly retracted from opposition at Turn 23, telling the doctor that she need to make a phone call. Will the phone call convey the doctor's suggestion and elicit agreement with it? Not necessarily, but that's the scenario the doctor presupposed and expressed at Turn 24, as she provided the patient a script that stated firmly the decision of staying in the hospital, a script that interestingly attributed all the agency and authority to the doctor and the test result, leaving no space for the patient to discuss her autonomy.

In this medical encounter, we see that the patient started with antagonism but gradually became more cooperative, whereas the doctor became irritated after a few turns of interactions and remained so till the end. Again, there is unresolved difference and emotional negativity in the medical visit, and yet they did not lead to communication breakdown. Instead, it persisted and evolved as a sub-style of communication concerned with the relational order, interacting and entangled with the arguments concerned with biomedical matters. The communication dynamics around antagonism is not necessarily dysfunctional, as we see the doctor remedy her authority and relation vis-à-vis the patient by confronting the patient's resistance. Nonetheless, such communicative practices work to find ways to live with derailments rather than build from the ethos of "shared decision-making" of medical consultation.

2.3 Case three

A female caregiver (C in the following transcript) brought her sick son to see a mid-aged, male pediatrician (D in the transcript) in an outpatient office, where there were several other patients and caregivers chatting while consultations took place.

1   D: What's the matter?
2   C: How come he has got the fluids for so long and he still coughed so badly?
3   D: Oh.
4   C: He coughed really badly--it hurts his body. He has infection in his windpipe. How come it's the same after so many fluids? No progress at all. (not aggressive, slightly slowing down the speaking)
5   D: Yes. Right. (checking out the patient's profile on his computer) He has taken three days of fluids.
6   C: When he sleeps at night, his tracheitis gets really bad. How come it's the same after so many fluids? It's getting even worse…
7   D: Yes. Right. (Still working on the computer) Do a scanning test of the (boy's) lung then. Test the blood too.
8   C: What?
9   D: Do a lung scanning.
10 C: Do another scanning of the lung?
11 D: When have you done one?
12 C: He has a lung test done here before (raising her voice).

13 D: Then do a blood test. The report will tell whether he needs to be hospitalized. (We) can't use the same fluids any more. He might be having a fever and pneumonia.

14 Mother: His pneumonia has been cured.

15 D: Cured? He coughed again within such a short time, meaning that his pneumonia has not fully be cured. That's why I want to do a lung scanning and a blood test this afternoon. You did not listen to me previously. Look the illness is back again…

16 C: We get the reports in the afternoon?

17 D: Let's do a test for mycoplasma infection…Do the blood test in the afternoon…

18 C: Blood test is fine. Why don't you change your previous prescriptions and let him try some other medicine now? He's coughing so hard (frowning).

19 D: After he takes the blood test, I will understand what causes his cough and then prescribe him other drugs.

20 C: We have to wait for so long, till the afternoon! He's coughing really hard. Can you change to another medication?

21 D: Then I'll give him some fluids and then let him do the blood test. Okay?

22 C: Can you change your medication (not using the same fluids prescribed before)?

23 D (raising his voice suddenly and then dropping and softening his tone): What I want to do is to have him do the blood test so that we can change the medication!

24 Mother: N: o. You can change the medication now and give him a try. It's fine to do the blood test in the afternoon. But he's coughing really hard now. The fluids you prescribed did not work at all; they are making things worse!

25 D: Changing medication is a waste of money. Waste of money. Waste of money. What you are trying to do is to waste money. I will try…

26 C (interrupting the doctor): The fluids you have him had everyday do not work at all!

27 D: But I can only change the medication after the blood test.

28 C: Do you have to wait till the afternoon to get the blood test report? In the afternoon…

29 D (interrupting the caregiver, raising his voice again): Do the blood test now, the reports come out this afternoon.

30 C: Yes, I know (loudly).

31 D: Okay. Right (soften and lower his voice).

32 C: But you have to wait till the afternoon, and he's coughing so hard now.

33 D: Hmm I'll give you some medications to alleviate it, okay? (In lower, softer voice)

34 C: He's coughing so hard now… (frowning)

Analyses: Expressed disagreement is observable at Turn 4, as the caregiver simultaneously complained about her son's illness and about the doctor's lack of success in treating him. This complaint may also be a challenge and a request, pushing the doctor to apologize, to explain, or/and to comfort. Whatever the caregiver's intention, the provider responded with an ambivalent, minimal acknowledgement ("Oh" at Turn 5 and "Yes, right" at Turn 7). Apparently, these answers did not satisfy the caregiver, who repeated the complaints and made exclamations with intensified negative emotions (e.g. Turn 6, 8, 14, 20, 22, 24, 26, 28, 30). To these the doctor repeated the minimal response or did not respond at all. The oppositional complaints of the patient therefore spiral, and medical encounter therefore took the form of "nagging" and "not responding".

Relatedly, derailment of issues spirals into sustained disagreement (Turn 19 - Turn 36), which took the form of "quarreling" and "primitive arguments" (Piaget, 1959, pp. 65-70). The doctor and the caregiver did not do much other than simply recycling, escalating and aggravating opposing turns (Jackson and Jacob, 1980, p. 254). The caregiver insists on "having the provider to prescribe another medication now to alleviate her son's coughing",

while provider insists on "not changing the medication until the blood test report comes out in the afternoon". While there is obvious overlap in these two propositions, and it is potential for the participants to build upon their common ground, negotiate and find balance through deliberation (for instance, the provider could have elaborated why changing medication now is a waste of money, and the patient could have asked for the doctor's justification), these potentials did not materialize. The encounter ended up being a prolonged exchange with a limited number of collaborative or productive arguments. That being said, though antagonism has spiraled through serial contestations, the medical encounter still did not break down. As the patient revealed, seeing another doctor is a lot of trouble. Institutional settings and procedures bind the participants and contribute the stickiness of communication, even if such stickiness is more forced and less organic in this case.

3. DISCUSSION

Sara Rubinelli and A. Francisca Snoeck Henkemans (2014) direct attention to the study of health communication in institutional contexts. They extend Rubinelli's compelling insight (2003) that argumentative exchange in medical settings enacts "rational persuasion" which generates productive deliberation. The study of health communication as argument can be conducted from a pragma-dialectical orientation. For example, Pilgram (2009) directs us to investigate medical communication as consultation and "collaborative conversational exchanges", where the participants' shared concern for politeness forestalls "face-threatening acts." Medical consultation does illustrate cooperative activity in many, perhaps most cases. But, disagreement over urgent matters of health and illness, morbidity and mortality, particularly within an institution under stress, may generate objection, opposition, contestation and antagonism. In our cases drawn from China, strategic maneuvering acted not only to persuade and inform but also to assert objections, express difference, and gesture toward dismissal or compliance. Strategic maneuvering moved to derail conversational gambits, from time to time. Nevertheless, our cases show how doctors and patients find ways to punctuate, bypass, or overcome difference. It is in this sense, we propose more generally the study of argumentation within the networks of stress.

The outcomes of our China cases are mixed. Sometimes antagonisms diminish as communication evolved, at others, emotional negativity persisted--even after the patient left the clinic office. In addition, we find antagonism perceived marks of breaching that attempt to construct and illuminate "what is appropriate" in these medical encounters. For instance, in case one, the doctor's agitation warned the patient as well as the observer of the interaction that a limit has been reached. Nonetheless, the definition of appropriateness is in the monopoly of the doctor, even if she appears more authoritative. As the patient signed the waivers despite the warnings, the doctor had to withdraw her antagonistic gestures, trying to re-build rapport with the patient (as the warnings and waivers worked to severe their associations) with a second proposition. Therefore, the doctor's attempt to remedy relationship cancelled her previous attempt to mark boundary with antagonism. Together, these interactions, including initiating, confronting and cancelling antagonism, make the medical encounter more tolerant of the patient's resistance, and pushed the doctor to attune her later argumentations to the re-negotiated rules of appropriateness.

Argumentation within the context of doctor-patient consultation in China offers important opportunities for inquiry. Three cases are a start. Globally, medical systems are in transition and each manifest cross-pressures in similar and distinctive ways. Time, resources, and knowledge is limited; medical decisions are complicated; health literacies are complex, and humans are culturally immersed, biotic beings who must reach decisions in the face of

uncertainty. The goals of productive doctoral-patient deliberation are served by research that generates deliberative norms and demonstrates both the risks of exchange and ways people interact to assert difference and manage disagreement.

Some critical thoughts on critical thinking: If 'ands' or 'buts' should be indicators

ABSTRACT: In this paper we explore the nature and limits of 'indicator language' as an analytic and pedagogical tool. After canvassing the literature, we begin to formulate a new philosophically robust framework of the 'apparent signal expression search heuristic' informed by a rich concept of argumentation. Consequently, we argue that there is good reason to believe that 'and' or 'but' do function as premise indicators.

KEYWORDS: argumentation, critical thinking, heuristics, indicator, natural language, pedagogy, philosophy, reasoning skills, rhetoric

1. INTRODUCTION

The ambit of this paper is to examine whether it is appropriate to include 'and' or 'but' among the set of words commonly taught as 'premise indicators.' We argue that the accounts found in the critical thinking and informal logic literature are somewhat lacking in clarity, rigour and philosophically-robust substance. 'Indicator' is the term commonly deployed for those words that ostensibly help us locate premises and conclusions, but we believe this word choice miscalibrates our expectations. By developing a richer account of how 'searching for indicator language' is ever a useful tool of argument analysis, it becomes apparent that there are good reasons for counting 'and' or 'but' among the words that may help students in parsing natural language discourse. Once we as theorists understand the nature and limits of these analytical methods, we can improve their use in practice and enrich their place in pedagogy. We argue that indicator language is better understood as an 'apparent signal expression search heuristic.' We conclude by exploring some ways in which argumentation theory – understood here as the study of a rich communicative interaction in which arguers attempt to ameliorate the cognitive attitudes of an audience by giving and constructing reasons – can illuminate the difficulties orbiting indicator language.

2. IN THE LITERATURE

If we wish to teach students how to responsibly parse natural language for reasons and arguments – rather than merely analyze pre-packaged, contrived, overly-simplified examples – then a balance of considerations from multiple perspectives may be the best approach. For that reason, we shall draw attention to some accounts of indicator language in texts that are not obviously part of the philosophical or informal logic traditions.

The first book we examine is Groarke and Tindale's *Good Reasoning Matters!* On this account, the term 'inference indicators' covers both premises and conclusions. They write:

Inference indicators are words and phrases that tell us that particular statements are premises or conclusions . . . When you come across these and other words and phrases that function in a similar way, it *usually* means that the statement that follows them is the conclusion of an argument (Groarke & Tindale, 2013, p. 84-85, emphasis added).

The treatment of premise indicators is the same, so we find it safe to broadly assume that premise indicator language 'indicates' in the same way that conclusion indicators do.

We found similar treatments in Pinto *et al*. (1993), Fogelin (2010), Johnson and Blair (2013), and Halpern (2014). To summarize our findings: first, indicator language is loose and rough – authors couch them in a framework of uncertainty by using words such as "usually" and "probably." Second, the lists of indicator language do not pretend to be complete; they have some, but not all, of the words that can function as indicator language. Thirdly, 'and' or 'but' do not appear on these incomplete lists. Fourthly, there is widespread agreement that premises and conclusions can occur without any indicator words.

Halpern's treatment contained an element worth further scrutiny. In other respects, Halpern's list is largely representative and includes familiar words such as: because; for; if; as shown by; given that; it follows from; etc. But her list or premise indicators also includes '*secondly*.' We can imagine encountering this word in a student essay: "Firstly, I argue *x.* Secondly, *y*; therefore *z*." We find that 'secondly' is meant to show that there is an additional point for consideration. "Secondly" functions like "and" in this regard. Imagine again a student writing instead that: "I argue *x* is the case; and I argue *y* is the case; so *z*." Consider alternatively: "I argue *x* is the case; but I argue that *y* is not the case; so *z*." Insofar as "secondly" is flagging a point to be considered alongside another, it shares a striking familial resemblance with 'and.'

Before leaving the first section of our literature perusal behind, it bears mentioning that we did find one book that gave a treatment of 'and' and 'but' as they relate to the language of indication. However, it too merits special attention. In Van Eemeren et al.'s book *Argumentative Indicators in Discourse: A Pragma-Dialectical Study* they list 'and' and 'but' amongst other conjunctives that indicate cumulative coordinated argumentation (p. 214-215). On its own, 'but' is treated like the speech act of one aiming to convey the relational status of a proposition. This is subtly different from merely indicating the fact *that* a proposition follows. For instance, consider the sentence, "Naturally, Mr. Wijnschenk [. . .] can't spend this money a second time. I consider him exceptionally creative, *but* even he can't spend a penny twice." (p. 126, emphasis original). We are inclined to refer to this use of 'but' as an instance of 'propositional vector language' that indicates the direction of support for a statement in relation to another[1].

We are encouraged that 'and' and 'but' were recognized at all. When we delve into this pragma-dialectical account, we find that the words 'and' and 'but' play dual roles in certain situations. They alert the interlocutor to the existence of a premise; and they also indicate the relationship between these premises. *That* this bit of language can indicate the direction of *a*

---

[1] We will leave aside whether or not a 'balance of considerations argument' is properly analyzed as a single 'conductive argument' or two separate arguments – one in support of the claim and another that undercuts it.

premise suggests that there is indeed a separate premise here whose direction is being indicated. 'Propositional vector language' is *de facto* premise indicator language. Most germane to our purposes here, 'and' or 'but' seem to be counted among the words that can fulfill this function.

3. REASONS FOR RESISTENCE

In our canvassing of the literature for lists of indicator words and explanations for why these words and not others counted, we came across several notions that may indirectly explain why 'and' or 'but' are not included on the lists. Of course, as the subject is never explicitly broached, this is much speculation and extrapolation on our part. It could also very well be that there is no significant reflective justification for the exclusion or inclusion of words on these lists; they could simply be inherited from past practices.

We begin with a seminal text from the realm of formal logic. Copi's ubiquitous *Symbolic Logic* (1967) presumes that students already have the ability to identify premises; so it does not have a treatment of indicators. It does have a treatment of 'and' as a *conjunction* as used in both simple and compound statements. There is a key difference between the sentences "Castor and Pollux are twins" and "roses are red and violets are blue." The former is a simple statement and the latter is compound (Copi, p. 9-10). The former statement asserts a single two-place predicate relation – the twin-ness of Caster AND Pollux. The latter statement is analyzed as the assertion of two separate one-place predicate relations: 1) Violets are blue; AND 2) Roses are red.

In another textbook, *Introduction to Logic*, indicator language is treated in the following way. It remarks, "this little word, *since*, is not properly part of the premises . . . it is serving as a **premise indicator**, defined as any word that, in the context of an argument, indicates or flags a premise" (Herrick, p. 17, emphasis in original). While indicators are recognized, they are *not properly part of the premise*. If one circumscribes the province of 'logic' as the enterprise dealing with the relations between *premises* and *conclusion*s, then premise indicator words are not properly part of logic as far as Herrick and others are concerned. Whether this is a fruitful account of 'logic' is a subject beyond the scope of our purposes here. But this relegation of 'indicator words' as something separate from or irrelevant to 'logic' might explain why there is a dearth of philosophically-robust treatments of the subject.

For better or worse, several teaching texts go one step further and do not make use of indicator language at all. Two such textbooks of note are Bailin and Battersby's *Reason in the Balance* (2016), and Govier's *A Practical Study of Argument* (2013). They forego indicator language entirely and skip directly to reconstructing or 'standardizing' natural language arguments. As introductory textbooks, they do not provide reasons for these choices; but it is interesting to consider the possibility that some scholars might have reason to *not* teach students indicator language. Speculatively, perhaps Bailin and Battersby, and Govier do not include indicator language because they are not properly (logical) parts of premises. Perhaps once a piece of discourse has been reconstructed or "standardized" such that they include 'only the logical substance' of the premises, indicator language is to fall to the wayside. Indicators, according to this speculative view, are to be separated from the logical substance of the propositions and discarded at the onset. Even though it may be helpful or good form to always include indicator language when constructing a passage in natural language, curiously that language is always extraneous for logical purposes.

At least part of the rationale for this elision could be that the rhetorical organization of the argument passage can be handled through notational procedures upon reconstruction. Once the argument's elements have been re-cast in a new format that explicitly labels its elements

as {*P1, P2 . . . Pn, C*}, natural language indicators become redundant in the presence of notation that itself constitutes organizational structure. One might think that the case for 'and' or 'but' is weakened by the observation that these words occur in natural language but are scrubbed from reconstructions. More correctly, the indicator words have been converted from prose into notation – but this precisely means that they played an important role. The form of the words themselves may have gone, but the function that those words played remains in other forms.

To bring together the insights and speculations of this section into a tangible form, consider this illustrative example from Bailin and Battersby's *Reason in the Balance*. It will show both the insight into compound propositions from Copi and our own insight into the conversion of rhetorical indicator language into formal notation. The example argument: "*Sorrow is merely a state of mind and may not be warranted by the circumstance. Hence whether or not you feel sad over something is all in the mind.*" As a standard Beardsley diagram, the natural language argument would be recast in Figure 1 thusly:
Figure 1

P1: Sorrow is merely a state of mind
P2: Sorrow may not be warranted by the circumstance.
C: Whether or not you feel sad over something is all in the mind.

In this style of argument reconstruction, the 'and' in the first sentence is translated into a notational symbol most of us will associate with addition. Further, the first sentence was analyzed into two separate premises that are nevertheless conjoined or linked to one another. P1 and P2 do not independently support the conclusion; only when you consider P1 AND P2 together as a unit do they provide inferential support for the claim. Of course, it bears mentioning that learning how to read and parse natural language so that one can see these kinds of distinctions in the underlying logical structure is precisely the pedagogical task that indicator language was supposed to assist.

4. GOOD RHETORIC MATTERS

At this juncture, we would like to consider the questionable rhetorical features that follow a term such as 'indicator language.' We do not mean rhetorical in a colloquial, pejorative sense as 'mere adornment.' By rhetorical we mean the aspects concerning how information or content is communicated. Among other things, the prosodic profile, the connotative baggage, the order of presentation and diction/word-choice all count as rhetorical features of communication. Some might consider it peculiar out of hand that the rhetorical is a consideration at all in our analysis; but we would be remiss to so quickly dismiss it.

When viewed from a rhetorical perspective, several features become salient in our treatment thus far. Firstly, indicator language is a feature of natural language arguments that appears only in prose, if at all. This is to say, they are part of a rhetorical dimension that aims at making real communication effective, understandable and successful. When used correctly,

indicator words make it easier to understand the author's intent and harder for the audience to miss it. But those 'rhetorical niceties' that are valuable in natural language prose can be replaced by notational conventions in logical reconstructions that show rather than tell the audience the relations between elements.

Secondly, we can finally reconsider our collection of words and phrases that were used to suggest 'uncertainty' in the indicativeness of indicator language. While some texts stuck with 'indicator' but weakened it with qualifiers such as 'usually,' other texts made use of words that connote differently from 'indicator.' Is there a significant and important difference in shifting the term from 'indicator' to 'markers, flags, guides, clues, or signals?' What exactly would one expect out of something that claims to be an 'indicator?' What is suggested by the rhetorical choice of framing these words as 'indicators?'

When we correctly say of some X that it is an indicator for Y, what would we expect intuitively? Let us consider some examples. When the engine light turns on in my car's dashboard, it indicates that I would be well-served to get off the road and to a garage as quickly as possible. When a smoke detector goes off, I presume for my own safety that the piercing sound is a reliable indicator that there is smoke. But the presence of smoke may not be a good indicator of fire since there are several other ways that things can appear to 'be smoking' that do not involve an open flame. When I see a barn from the road, this is a good indicator of a barn being over there. Of course, as certain philosophers delight in reminding us, certainty and guarantees in many corners of life is mythical. It is logically possible that there is no barn in the distance and there is only a clever barn-façade meant to trick travelers.

Natural language is notoriously imprecise. Perhaps someday a perfectly unambiguous language in which certain kinds of communicative failure are impossible will be realized, but for now we must content ourselves with the messy and precarious work of discerning meaning through existing natural languages. While this should come as no surprise, it bears emphasizing: the spectre of uncertainty is more or less omnipresent when it comes to interpreting natural language. We can take steps to manage and mitigate that uncertainty, but this still does not mean that we reach the level of certainty. It is unsurprising that we observed the common current of 'qualified uncertainty' present in the various rhetorical framing devices used to describe indicator language.

Setting aside what the word 'indicator' denotes or connotes for the moment, we should revisit what function these words supposedly play; pinning down that aspect is what will eventually allow us to recalibrate our rhetoric. These so-called 'indicator words' do something fallible in principle but are reliable enough that we can feel sufficient confidence in making use of them in some way as analytic tools. A reliable 'indicator' functions somewhere between the spectrum ends of 'almost always' and 'basically never'. How much and what kind of confidence we must feel for something to be considered a 'reliable indicator' is the next question to address.

As previously noted, some of the descriptions of indicators already seem to involve uncertainty and some degree of unreliability. They attempt to hedge by saying that there is no guarantee that identifying these words will necessarily have a premise or conclusion nearby; they say that the presence of these words (certainly) indicates that one will 'probably' follow. However, this amendment seems no better. 'Probably' seems just as misleading and unhelpful as our first, overly-strong naïve version of 'indicator-as-guarantee.'

Consider the following sentence to motivate this concern about probability: *She dropped both her drink and the ball in the kitchen*. This sentence is ambiguous – there are at least two clear, definite and different scenarios being described here. When attempting to interpret this sentence, is probability an appropriate and relevant modeling tool for this situation? Let us presume for the sake of example that – as a matter of empirical fact – 99.9% of all uses of the English word 'kitchen' refer to the place in which food preparation occurs.

0.1% of the uses refer to the area behind the break line of a table on which cue sports, such as billiards and snooker, are played. Is there a 99.9% chance that our example sentence describes an easy clean-up in a place where food is usually prepared? Or is there a 100% chance that it describes a very expensive procedure to replace the felt on a pool table since that was actually what the speaker intended?[2]

In the absence of any other information, we may be forced to default to a guess based on mathematical models of probability. However, one of the core tenets of critical thinking is, we presume, the importance of scouring the discourse for contextual clues, taking into account knowledge of the arguer and audience, and making a *reasoned judgment* about what someone meant a sentence to mean. That is to say, if we were in such an epistemic position where we were forced to default to that kind of abstract mathematical guessing, the responsible course of action might instead be to suspend judgment. Analogously, if we were in such a situation where the function of a so-called 'indicator word' was so ambiguous that we had to default to probabilistic reasoning, perhaps that is an indication that we had better stop.

Probability – at least when understood as abstract mathematical modelling – is the wrong way to understand the kind of 'uncertainty' these authors are roughly and intuitively assigning to 'indicators.' Of course, if we are being charitable, it is likely not the case that these authors had statistics and extrapolation in mind when using the word 'probably.' Perhaps computer scientists or psycholinguists interested in the empirical frequency of words and meanings might have that sense of 'probably' in mind, but we will presume that that is an exception rather than the rule. The point is that if 'probably' is suggestive of 'mathematical probability,' this invites us to make problematic expectations about the nature and role of 'indicators' as well.

A different, more promising, approach to fleshing out this sense of 'uncertainty' is revealed when "indicator" is sometimes interchanged with other seemingly-synonymous language such as 'signal', 'flag', or 'premise marker'. Like the qualification of 'probably' on 'indicator,' this is another rhetorical framing strategy that lowers our expectations. Using 'signal' or 'flag' is an acknowledgement that what follows is *not always* a premise. The three texts in which we found this language are Rudninow *et al*. (2008), Lawless (2014), and Halpern (2014). None is explicit about justifying their word choice, but they each implicitly calibrate the language in this way. And this appears to be better calibration than what we get with 'indicator.'

Continuing in this direction set by 'flags' and 'signals,' we would suggest that searching through natural language is a process of interpreting signs similar to the "venatic method". Carlo Ginzburg's 1990 paper "Roots of an Evidential Paradigm" details this process. The venatic method was cultivated by ancient human hunters pursuing prey. They would be alert to picking up on the appearance of footprints, tufts of hair, and broken tree branches to locate their target. Although Ginzburg is concerned with how this method is used in medical practice, we argue that interpreting natural language in argumentative contexts follows a similar method. While it would be a wild leap to conclude that the venatic method was the reason for this choice, we *did* find the language of 'clues' in at least one text. Bassham et al. (2008) define indicator words as "words or phrases that provide clues that premises or conclusions are being put forward" (p. 34).

When we teach students to identify premises and conclusions, we are teaching them the arte of parsing through natural language to identify clues that an argument is present. In the same way that a broken branch is *not always* a sign that prey is present, an 'and' or 'but' is *not always* a sign that a premise is present. However, a hunter will have been taught to look for

---

[2] The statistics are made-up for the purposes of this example, but 'kitchen' really does refer to the area behind the line from which a player breaks in cue sports.

branches that are broken in particular ways – and to look for many other signs and absences that together are reliable in the right kind of ways – for tracking prey. The apprentice hunter must learn to distinguish between relevant and not-relevant cases of broken sticks the same way that the apprentice critical thinker must learn to distinguish between the 'ands' or 'buts' that are relevant to identifying premises and those that are not. Just as the master hunter cannot be so easily thrown off the trail by potentially-confounding information, so too should the competent critical thinker be able to recognize when an 'and' is indicating a premise and when it is not.

5. TOWARDS A NEW FRAME

With our expectations now enriched, informed and recalibrated, we argue that we would be better-served to move away from the language of 'indicator' entirely. We propose that we can better understand the lists of so-called 'indicator language' as "Apparent Signal Expressions," hereafter ASE. They are *expressions* because they can be isolated words, multi-word phrases, or other rhetorical figurations appropriate to particular communicative contexts. They are *signals* because they demand our attention yet focus it towards something else of significance. They are *apparent* because at first glance, a particular set of words has appeared; but appearances can be deceiving just as easily as they can be accurate.

Instead of framing ASE as 'reasoning skills' unto themselves, we would be even better-served to think of an "Apparent Signal Expression Search Heuristic". While there are a variety of different definitions and meanings for the word 'heuristic' in various fields, for simplicity we will be adopting the version found in Daniel Kahneman's landmark *Thinking, Fast and Slow* (2011). He writes, the "technical definition of *heuristic* is a simple procedure that helps find adequate, though often imperfect, answers to difficult questions." (p. 98). Heuristics need not be non-conscious, automatic or unreflective; so 'heuristic' perfectly captures how we should conceptualize our employment of ASE when parsing natural language arguments.

The act of 'searching for certain phrases of words' is a quick, fallible procedure that is often helpful enough in answering the question 'is there a premise or conclusion around here?' The action we take upon spotting such a phrase is not always to conclude 'yes' or 'no'. Rather, the prudent response is sometimes 'Let's take a closer look and see!' Of course, knowing *that* we should take a closer look is one thing; knowing *what* to look for and *how* to look for it is quite another thing entirely. As noted earlier, if we are searching for *apparent* signal expressions, we must understand how to pause and determine whether our initial appraisal was warranted or if these words are performing some other function in the discourse. It may seem banal and Wittgensteinian, but it merits stating clearly: A *premise signal* is only a *premise signal* when it is actually signalling the presence of a premise. The same is true of conclusion signal expressions.

Yes, the words 'and' or 'but' are *sometimes* words that express the logical features of a compound proposition. In such cases, they are not functioning as signal expressions, despite initial appearances. Conversely, yes, the words 'and' or 'but' can *sometime*s perform the function of expressing the introduction of a new premise despite an initial appearance. As we have seen from our examples, words do many things – and it is not always immediately clear what they are doing; sometimes they are even doing more than one thing at a time. An astute and sophisticated critical thinker should not be fooled by the surface appearance of phrases; they should seek to uncover the underlying pragmatic functions that are actually being fulfilled in that particular context. After all, the *form* of some bit of language is not quite important; it is the *function* or role it plays in our natural language practices that matters.

We presume that a competent critical thinker worthy of the name would not only know of the ASE search heuristic; they would be able to use it *well*. As a heuristic – a general rule of thumb in our reasoning, analyzing and arguing practices – it should not be forgotten that there are specific situations in which it can go wrong even if it is generally right. But to know when a heuristic is going wrong, one must be aware of the ways in which it can fail as well as why it is often successful. Dealing with apparent signal expressions is not an exercise in probability but one of interpretation. Yet, if one is only aware of half of the things that words can do, it is overwhelmingly difficult to be mindful of the possibility that the situation might be otherwise.

If one of the goals of critical thinking is to enhance the capacity to deal with the messiness and ambiguousness of non-clinical, real-world, natural language arguments, then as educators and scholars from various fields we need not shy away from exposing students to the difficulties in delivering and receiving ideas through words. One dimension of critical thinking is precisely the capacity to manage and tolerate ambiguity and uncertainty. To co-opt an excellent quote from Stephen Toulmin's seminal work, *The Uses of Argument*:

the real problem of rational assessment – telling sound arguments from untrustworthy ones, rather than consistent from inconsistent ones – requires experience, insight and judgement, and [Apparent Signal Expression Search Heuristics] can never be more than one tool among others of use in this task (p. 173, original modified to include our own phraseology).

So long as proper guidance is provided along the way, 'and' or 'but' can serve as illuminating exemplars of the complexities of parsing and interpreting a language capable of ambiguous and multiplex construction. Even though we are imperfect, social, situated animals we still manage to do many things with words – even though they can sometimes too tricky and confusing. It just so happens that the words 'and' and 'but' are some of the most used and multi-use.

If the reluctance in using or teaching so-called 'indicator language' is that heuristics are dangerous when you only know part of the story, then the solution may be to teach students the whole story – or at least a better story. As we have seen hinted in our study, 'indicator language' seems to lie at an intersection of rhetorical effectiveness, dialectical procedurality and logical substance in some very interesting ways. 'Indicator words' at various times guide the focus of the audience (rhetorical), facilitate the smoothness of co-operative communication (dialectical), or express the semantic contents of a thought (logical). But if this is so, then the story we educators need to tell our students – as well as ourselves – may need to be just as rich and complex as the subject we are explaining. If 'indicator language' does straddle the boundary lines between the three perspectives, then it is perhaps no surprise that the existing textbooks we canvassed did not or could not provide the robust account we had been seeking.

To give a proper account of 'indicator language' would require a framework that transcends the traditional boundaries of rhetorical, dialectical or logical approaches. In other words, there is need of a rich argumentation theory that has the ambition of rendering a similarly rich, high-fidelity treatment of the complex communicative interaction in which real arguers attempt to ameliorate the cognitive attitudes of an audience by giving and constructing reasons. Our account may not yet be complete as a story, but we believe it a good place to start.

6. CONCLUSION

In this paper, we searched the literature for the justification of excluding 'and' or 'but' from the lists of 'indicator words' used to help identify premises and conclusions in natural language arguments. While we could not find a definitive answer as to 'why' or 'why not,' we did uncover a patchwork of clues and insights from a variety of sources that allowed us to develop and supply our own answer. Inspired by the venatic method deployed by ancient hunters who masterfully searched for and interpreted clues, we developed the beginnings of a framework to help understand how, why and what 'indicator language' really is. We argued that what we previously called 'indicator language' was better described as an 'apparent signal expression search heuristic.' Once we understood the limits and nature of what we were dealing with, we saw every reason to believe that the appearance of 'and' or 'but' in natural language can signal the presence of a premise. Just because the words do not *always* indicate a new premise does not mean that they *never* do so. But we contend that acquiring the discernment to tell the difference is precisely part of the pedagogy of critical thinking. Apparent signal expressions – or 'indicator language' – are not merely an imperfect pedagogical ladder to be thrown away once one has climbed up beyond it. We think it is a viable and valuable tool of analysis that any discerning critical thinker would be well-served to have at their disposal – no ifs, ands, or buts.

ABSTRACT: Though argument evaluation remains central for argumentation theory, there is no consensus on what a complete evaluation might be. This paper offers a basis for a complete evaluation. Distinguishing different levels of an argument scheme, our paper identifies the meta-level as the best foundation for this endeavor. We relate this level to a logical account of argument schemes that represents all argument components explicitly, specify the account's 'if-then' premise as a pragmatic relation, and finally combine both accounts at the meta-level.

KEYWORDS: argument scheme, evaluation, logical account, pragmatic account

1. INTRODUCTION

Argument schemes and their associated critical questions (CQs) remain central to contemporary argumentation theory (Walton, Reed, Macagno, 2008). While Hastings (1962) probably first used 'critical question' in today's technical sense, and though the main modern source for 'argument scheme' is Perelman & Olbrechts-Tyteca (1969), many scholars (rightly) refer to the topoi (Greek: places, Latin loci) as historical ancestors. (See Garssen's (2001) historical overview and Rubinelli (2009) on Aristotle's and Ciceros' topoi.) Specifically, the topoi serve in argument construction, whereas the CQs serve in argument evaluation (e.g., Garssen, 2001). Restricting ourselves to the latter aspect, we address the conditions under which an evaluation is complete.

Even thus restricted, however, a unified understanding of argumentation schemes and CQs is absent. Pragma-dialecticians, for instance, treat argument schemes rather generally, as "[t]he way in which arguments and points of view are related in argumentation" (van Eemeren & Kruiger, 2015, 704). By contrast, informal logicians and scholars in AI & law view schemes as "forms of argument (structures of inference) that represent structures of common types of arguments used in everyday discourse," structures that apply "in special contexts like those of legal argumentation and scientific argumentation" (Walton, Reed & Macagno, 2008, 1). Virtually all scholars, moreover, let 'argument(ation) scheme' denote a linguistic structure; moreover, some few take this structure to externalize an (internal) reasoning scheme (Blair, 2001; Hitchcock, 2006, 218). We commit to the former use.[1]

---

[1] We view argumentation as differing from reasoning with respect to its directions. Argumentation runs typically

Our inquiry into the conditions of evaluating an argument completely advocates a meta-level logical account (Sect. 2), one that a pragmatic account completes (Sect. 3). We conclude in Sect. 4.

2. WHY WE NEED A LOGICAL ACCOUNT OF ARGUMENT SCHEME?

2.1 Overview

Identifying distinct levels of an argument scheme in the literature (2.2), we treat an argument scheme as a logical concept, discuss an extant logical account (2.3), and further develop this (2.4). Sect. 3 shows how a pragmatic account complements a logical account.

2.2 An argument scheme's levels

We may associate CQs either to an argument scheme or to the specific argument saturating it. We call the former level theoretical, for here we abstract from specific content; the latter we call applied. Accordingly, we distinguish theoretical from applied CQs, where the latter specify the former by saturating their placeholders.

First turning to schemes, consider as an example three versions of the 'argument from position to know'-scheme at the theoretical level (1a-c)[2], and compare three of its instances at the applied level (1a'-c'), where material (as opposed to logical) information saturates the placeholders a and A.

(1a)   Argument scheme 'from position to know'; theoretical level, instance 1
a is in the position to know whether A is true.
a asserts that A is true.
A is true.

(1b)   Argument scheme 'from position to know'; theoretical level, instance 2
a is in the position to know whether A is true.
a asserts that A is true.
If a is in the position to know whether A is true, and a asserts A, then A is true.
A is true.

(1c)   Argument scheme 'from position to know'; theoretical level, instance 3
a is in the position to know whether A is true.
a asserts that A is true.
a is an honest (trustworthy, reliable) source.
A is true.

(though not exclusively) from a claim to its supporting reason(s); while reasoning runs from the premise(s) to a conclusion. In assuming that a claim is yet in need of reasoned support, we thus address the first direction.

[2] See Prakken (2010) and our Sect. 2.3 for alternative scheme-versions, the wording of which remains a matter of choice. For instance, Walton, Reed & Macagno (2008, 309; *their italics*) present the focal scheme as "*Major Premise*: Source *a* is in position to know about things in a certain subject domain *S* containing proposition *A*. *Minor Premise*: *a* asserts that *A* is true (false). *Conclusion*: *A* is true (false)."

(1a') Argument scheme 'from position to know'; application level, instance 1
Harry is in the position to know whether 'Marry is the murder' is true.
Harry asserts "'Marry is the murder' is true."[3]
"Marry is the murder" is true.

(1b') Argument scheme 'from position to know'; application level, instance 2
Harry is in the position to know whether 'Marry is the murder' is true.
Harry asserts, "Marry is the murder" is true.
If Harry is in the position to know whether 'Marry is the murder' is true, and Harry asserts 'Marry is the murder', then Marry is the murder.
        Marry is the murder is true.

(1c') Argument scheme 'from position to know'; application level, instance 3
Harry is in the position to know whether 'Marry is the murder' is true.
Harry asserts "Marry is the murder" is true.
Harry is an honest (trustworthy, reliable) source.
Marry is the murder.

These examples show that, at the application level 'a' is simply replaced by 'Harry,' and 'A' by "Marry is the murder." At the theoretical level, moreover, 1(b) externalizes the inference rule underlying 1(a). Finally, 1(c) states information that, if it is false, amounts to exceptions to 1(a), as do 1a'-1c'. (We return to this in Sect. 2.3).
        Evaluating any such scheme-instance presupposes a normative yardstick. Only if the theoretical level provides a general normativity (i.e., a form of reasonableness not limited to specific schemes) can we readily transfer normativity from the theoretical to the application level. This generality constraint, we submit, forces us to recognize yet a third level, namely the meta-level, whose instances are (1a''-c''). Yet more abstract than the theoretical level, (1a''-c'') thus transfer reasonableness from the meta-level to the theoretical level.

(1a'') Argument scheme 'from position to know'; meta-level, instance 1
Premise(s)
Conclusion

(1b'') Argument scheme 'from position to know'; meta-level, instance 2
Premise(s)
If premise(s), then conclusion
Conclusion

(1c'') Argument scheme 'from position to know'; meta-level, instance 3
Premise(s)
Absence of exceptions
Conclusion

---

[3] At the application level, we may alternatively find: "Harry asserts 'Marry is the murder,'" which omits 'is true' as per deflationary theories of truth (e.g., Daniel & Nic, 2014). Both versions, of course, are pragmatically equivalent. In (1a-c), we merely give those forms that strictly follow the theoretical level.

This meta-level is a logical construction. Indeed, we treat argument scheme as a logical notion, a notion we can study independently of dialectical or rhetorical considerations. For the latter considerations affect not a scheme's structure or its components, but rather the criteria under which we evaluate a scheme instance (e.g., as being audience-accepted and dialectical rule-complicit instance, or not).

Our logical account follows work by Prakken's, to which we now turn.

2.3 Prakken's logical accounts

Like Walton (1996), Prakken (2005, 305) holds that "argument schemes technically have the form of an inference rule." Indeed, he observes (correctly) that all schemes "can be transformed into instances of logical inference rules by adding the connection between premises and conclusion as a conditional premise" (ibid., 307). It follows that, as "logical constructs, [...] a procedure for evaluating arguments primarily takes the form of a [non-monotonic] logic" (Prakken, 2010, 1). For instance, the inference rule in (2)—containing 'usually'—is the defeasible modus ponens rule (Prakken, 2005, 307).

(2)   Defeasible modus ponens rule
              P
If P then usually Q
Therefore (presumably), Q

If we saturate (2) to the argument scheme 'from position to know', we can either use (3)—containing a defeasible inference rule—or (4)—containing a generalised conditional premise (Prakken, 2010, 7f.). For this latter conditional premise itself to be defeasible, of course, it must again adhere to "the logical nature of defeasible conditionals" (ibid., 8). Therefore, the choice between (3) and (4), below, is one of taste rather than substance.

(3)   Argument scheme 'from position to know'; defeasible inference rule
        a is in the position to know whether A is true.
        a asserts that A is true.
        A is true.

(4)   Argument scheme 'from position to know'; generalised conditional premise
        a is in the position to know whether A is true.
        a asserts that A is true.
If a is in the position to know whether A is true, and a asserts that A is true, then A is true.
A is true.

Indeed, Prakken's own preference (for (3) over (4)) is "more a matter of pragmatic convenience than of logical correctness" (ibid., 8), because (3) is "closer to natural language" (ibid., 9). Another matter of choice is whether, or not, we formulate the inference-rule such that "the absence of exceptions is added as additional premises" (ibid., 8), as per (5).

(5)   Argument scheme 'from position to know'; inference-rule account with exception-premise(s)

　　　a is in the position to know whether A is true.
　　　a asserts that A is true.
　　　a is an honest (trustworthy, reliable) source.
　　　A is true.

By adding inference-invalidating exceptions as premises, "undercutting attacks [directed at the inference in (3)] are reduced to premise attacks [in (5)]" (ibid., 9). Again, the "two methods are logically equivalent" (ibid., 9), but differ in pragmatic convenience. Prakken (2010) particularly explains that argument schemes can not only include "defeasible inference rules, i.e., elements of a reasoning method" (Prakken, 2010, 5). Rather, the scheme can be "a reasoning method in itself" (ibid.), namely if it features "abstractions of more complex lines of reasoning, which may not always be naturally reduced to reasoning with defeasible inference rules" (ibid., 13).

This exhausts the required features a logical account can draw from, namely: (i) an inference rule, (ii) exceptions to it, and (iii) reasoning method-elements. We proceed to distinguish Prakken's account from ours.

2.4 Our own logical account

We refrain from identifying an argument scheme with a reasoning method, which Prakken illustrates for abductive reasoning (but see Yu & Zenker, 2017). For this identification would force upon us questions such as "how many kinds of reasoning methods are there?" or "what separates one method from another," questions Prakken himself does not address.

More importantly, evaluating an argument completely presupposes that all parts of the argument are explicit (Ennis, 1982, 66; Gough & Tindale, 1985, 99; van Eemeren & Grootendorst, 1992, 141; Yu & Zenker, 2018). It is doubtful, however, that we can list all (actual and possible) exceptions to a defeasible inference at the application level (Zenker, 2006). In (5), for instance, so long as a might lie, then even if all premises of (5) are true, we could nevertheless not safely infer "A is true." Similarly, "a is a reliable source" need not imply "a speaks the truth now." For a reliable source does report the truth regularly rather than exclusively.[4] The gap between "regularly" and "now," as it were, thus implies (implicit) argument components such as exceptions, components we must make yet overt.

We therefore opt for the conditional premise account, which easily provides a logical account for all argument schemes, as per (6).[5]

(6) General logical structure of any argument scheme
Premise(s)
If premise(s), then conclusion

---

[4] Besides, if the focal inference held, then we could deduce "*A* is true" from "*a* is a reliable source" and "*a* asserts that *A*" *alone*. But this sidesteps the first premise—"*a* is in the position to know whether *A* is true"—and so makes it doubtful that we still treat the 'from position to know'-scheme.

[5] Though our meta-level logical account (as per 6) abstracts from (2), we omit the 'if-then' conditional's 'usually'-qualification. For, as Prakken observes, the 'if-then' conditional can be defeasible. But if so, then qualifications like 'usually' are simply redundant. (In (4), which exemplifies (2), Prakken too omits 'usually'.)

Therefore, conclusion

This logical structure now looks deductive. But this obscures (rather than clarifies) the defeasible character of the conditional that the 'if then'-premise expresses. To remedy this, we complement our logical account with a pragmatic account (Sect. 3).

3. WHY A PRAGMATIC ACCOUNT OF ARGUMENT SCHEME?

3.1 Overview

This section introduces the pragma-dialectical approach to argument schemes (3.2), adopts it as a pragmatic account, and briefly explains the benefits (3.3).

3.2 Argument schemes in the pragma-dialectical approach[5]

Pragma-dialecticians view argumentation as "as a complex speech act, the purpose of which is to contribute to the resolution of a difference of opinion, or dispute" (van Eemeren & Grootendorst, 1992, 10). Unlike Prakken, they hold that "logic has not much to offer" towards transferring "the acceptability of the premises […] to the conclusion" (ibid., 96). Rather, for any such transfer "to achieve the interactional effect that the listener accept[s] [the speaker's] standpoint," the latter should "rel[y] on a ready-made argumentation scheme," which is "a more or less conventionalized way of representing the relation between what is stated in the argument and what is stated in the standpoint" (ibid., 96; their italics).

Argument schemes thus represent kinds of relations between arguments (or reasons) and a standpoint (or claim), and Pragma-dialecticians regularly distinguish "three main categories of argumentation schemes" (ibid., 96) based on the relations of symptomaticity, similarity, and causality, respectively. For instance, if "someone tries to convince [an] interlocutor by pointing out that something is symptomatic of something else," then acceptability is transferred by "a relation of concomitance" (van Eemeren and Grootendorst, 1992, 96f.; their italics). Thus, "[t]he argumentation is presented as if it is an expression, a phenomenon, a sign or some other kind of symptom of what is stated in the standpoint." (ibid., 97)[6]

3.3 Benefits

Pragmatic relations such as the above three we can now understand as specifications of the 'if then'-premise[7]. Suitably replacing this in (6), we obtain:

(7) Combined account of argument schemes at the meta-level

---

[5] For a more systematic approach on pragma-dialectical argument scheme, see Garssen (1997).

[6] To quote a specific example, "[a]s Daniel is an American (and Americans are inclined to care a lot about money), he is sure to be concerned about the costs" (ibid., 97). Here, acceptability is transferred from "Daniel is an American" to "he is sure to be concerned about the costs" by way of a symptomatic, or typical relation between being American and being inclined to care a lot about money.

[7] Alternatively to our own proposal, we could treat the 'if then'-premise as a logical rule (e.g., *modus ponens*, *modus tollens*, disjunctive exploitation, etc.). Compared with pragmatic rules, logical rules state deductive (i.e., necessary) inferences, and mainly apply in formal (mathematical) logic. In real life, however, logical rules make for but an important limiting case of actual argumentation forms (Zenker, 2017). Moreover, if rules are understood, arguers generally agree to them readily.

Premise(s)

A relation R holds between premise(s) and conclusion

Therefore, conclusion

This not only specifies what the 'if then'-premise means. Like the logical account, moreover, our pragmatic account again distinguishes various levels of an argument scheme. At the applied level, for instance, we may find:

(8a) Example, similarity relation, applied level

The method I propose worked last year (and this problem is similar to last year's), so the method will work again.

(8b) Example, similarity relation, theoretical level

"For [the case] X, [the claim] Y is valid because of [another case] Z, Y is valid and X is comparable [because it is similar] to Z." (van Eemeren and Kruiger, 2015, 706)

(8c) Example, similarity relation, meta-level

For X, Y is valid because for Z, Y is valid, and the pragmatic relation R connects X and Z.

As with the meta-level treatment of the 'argument from position to know'- scheme (1a''-c''), we now let (8c) abstract from the 'similarity' relation, so that it instead applies to all types of relations.

Having thus represented argument schemes structurally, we have constructed a basis for evaluating them completely, a task we take up in a future paper.

4. CONCLUSION

We laid the basis for evaluating argument schemes completely. Not to mix multiple concepts of argument scheme, we distinguished three levels: application-level, theoretical level, and meta-level. The latter provided the safest context for our approach. In locating a logical account at this meta-level, we represented all components of an argument scheme explicitly, supplemented this with a pragmatic account, and finally combined both accounts.

Beneficial violations of the language use rule: The case of Lyndon Johnson, 50 years later

ABSTRACT: Although most argumentation textbooks urge maximum clarity, there are times when argumentation is better served by strategic ambiguity – for example, when the audience is heterogeneous, or when arguers might agree on a course of action without agreeing on the reasons for it. The values of strategic ambiguity are illustrated in a 1968 speech by President Lyndon B. Johnson, in which he made major policy announcements about Vietnam and revealed his decision not to seek another presidential term.

KEYWORDS: ambiguity, bombing halt, condensation symbols, gold crisis—1968, Lyndon B. Johnson, presidential election—1968, San Antonio formula, surtax, troop deployment—Vietnam, Vietnam war

1. INTRODUCTION

Ambiguity refers to a condition in which a word can have two or more different uses and it is not clear which use is being employed in a given argument. Because this is not clear, it is quite possible that the protagonist and antagonist will have different uses in mind, even as they employ the same term. They may even both imbue it with a positive or negative evaluation, even as it becomes clear that they are giving the same name to different ideas. Their apparent consensus, dispute resolution, or agreement about what to do may turn out to be no consensus at all.

For these reasons, ambiguity is often identified as a fallacy – usually as a fallacy of language, along with uses such as amphiboly, vagueness, or equivocation. Within pragma-dialectics, ambiguity is considered a violation of the language use rule, which states, "Discussants may not use any formulations that are insufficiently clear or confusingly ambiguous, and they may not deliberately misinterpret the other party's formulations" (van Eemeren and Grootendorst, 2004).Other theories of argumentation have similar expectations, and on their face they seem generally sensible and applicable. Certainly it will be difficult for a protagonist and antagonist to resolve their disagreements on the merits if they do not understand the terms in the same way.

But the critical interpersonal discussion is not the paradigm for all cases of argumentation. Sometimes debate is a more appropriate model, when the arguers are not trying to convince each other but are directing their appeals to a disinterested third party. And sometimes the more appropriate model is the public address, in which a single speaker attempts to gain the assent of an audience that is large, heterogeneous, and divided (Zarefsky, forthcoming). Especially in this latter case, the goal may not be to resolve a difference of opinion among the parties but, rather, to reach a mutually acceptable conclusion without resolving the underlying difference. In such a case, ambiguity may be a valid strategic resource and not a fallacy at all. It is this view that I would like to explore by selecting, as rhetoricians tend to do, a specific case.

2. THE CASE STUDY

My case was not chosen at random. It is the byproduct of a major project on which I've been working the past year, a study of President Lyndon Johnson's address to the American people on March 31, 1968, fifty years ago (Zarefsky, in preparation). The speech was significant to international as well as domestic audiences because it concerned Vietnam, about which America's European allies, in particular, were increasingly parting company with the prevailing U.S. policy. In addition to that problem, President Johnson faced a deeply divided American public, attitudes and beliefs that were in flux, major economic constraints on what he could do, allies and adversaries around the globe, and the beginnings of a difficult and divisive election campaign centered in large part on Vietnam and in which the president was under severe challenge even within his own party. This is an atypical case, and justifying ambiguity in such a case may not generalize very far. But then again, it might suggest some broader criteria for determining whether to judge ambiguity harshly or gently in other particular cases.

Let us consider the context briefly. A major North Vietnamese and Viet Cong military attack was launched on the occasion of Tet, the Vietnamese New Year, at the end of January, 1968. Simultaneous attacks were launched against most of the provincial capitals and several of the major cities in South Vietnam. The apparent goals were to capture several key cities and to inspire a widespread revolt of the people of South Vietnam against their government. After an initial burst of success, it was a dramatic failure militarily. Most of the cities were recaptured within a few days; all were retaken within three weeks; and the expected general revolt did not occur. But the Tet offensive was a major psychological victory. It shattered the belief that the Communists were on their last legs, a belief that had been deliberately encouraged by an "optimism campaign" undertaken by the U.S. government in the fall of 1967. It fueled the belief that the war was a stalemate that neither side seemed able to overcome. It fostered a sharp divide among the American public between those who thought the U.S. should "pour it on" with a dramatic escalation of the war and those who came to believe that the war was not worth its cost in blood and treasure. President Johnson was under growing pressure to announce and defend a post-Tet Vietnam policy, but there was nothing approaching consensus about what that policy would be.

The president had scheduled a speech for March 31, 1968 for such announcement. Unbeknownst to all but a very few of his aides, he would also use the speech to announce that he would not run for another term. As I have studied this speech, I've become impressed that one can find in it what one seeks. It can be read as a recognition of the need for change or as a celebration of continuity, as an acknowledgment of failure or a proclamation of success, as a move toward a wider war or a move toward peace, as a vindication of his earlier decisions or as distancing himself from them. How could a major presidential address be so multivocal, and what did it accomplish by being so? With that question in mind, I delved into the text. The speech consists more of announcements than of complete arguments. Yet the announcements are conclusions of implicit arguments about what we should do.

3. THE AMBIGUITIES

There were at least five significant ambiguities in Johnson's speech, concerning a bombing halt, sending additional troops to Vietnam, relying more heavily on the armed forces of the South Vietnamese, urging Congress to approve a tax increase, and even the announcement that the president would not run for re-election.

First, Johnson announced a halt in the bombing over a portion of the territory of North Vietnam – north of the 20th parallel, encompassing most of the land area and several major population centers. In the first several of the eleven drafts of the speech, that is precisely what he would have said. But in the final version he announced, "Tonight, I have ordered our aircraft and our naval vessels to make no attacks on North Vietnam, except in the area north of the demilitarized zone where the continuing enemy buildup threatens allied forward positions and where the movements of their troops and supplies are clearly related to that threat" (Johnson, 1968 [1969]). This version is more ambiguous about the area covered. It makes no reference to a specific northern limit to the bombing, a change made to emphasize function rather than geography, and also to avoid a public-relations problem if an occasional bomber plane strayed north of the invisible line.

But that was not all that was ambiguous. Johnson announced the bombing halt and called on Ho Chi Minh "to respond positively, and favorably" to his initiative, but he never said what would count as a positive and favorable response. This left the power to characterize whatever Ho did entirely in Johnson's hands. Additionally, the president was torn between those advisers wanting a bombing halt as a peace gesture and those who wanted to put any bombing halt in a different light, deferring any discussion of peace moves until the Communists had accepted the San Antonio formula of September 1967. This stated that the U.S. would stop the bombing of North Vietnam if peace talks would follow immediately and the North would not take advantage of those talks to increase infiltration into the South. Moreover, Johnson announced the area of the bombing halt not in positive terms but in exclusionary ones. Instead of saying, "I am stopping the bombing within area X," he said that he is stopping it "everywhere except area Y." This makes the scope of the bombing halt seem larger and the area where the bombing continues to seem like the exception.

Furthermore, when Dean Rusk first proposed the bombing halt, at a meeting of Johnson's key advisers on March 4, he noted that the area north of the 20th parallel had few targets of military value left to bomb. And the coming rainy season would make it difficult, if not impossible, to launch planes to conduct bombing rains in any case. This raises the question of whether what was presented as a conciliatory offer was in fact an empty gesture. If it were accepted it would not make much difference, and if rejected, the rejection could be used to justify further escalation of the war. Although there was nothing in the text to acknowledge them, these sinister motivations for the halt cannot be excluded from possibility.

All these ambiguities served not so much to mask Johnson's true intentions as to keep his options open, depending on the North Vietnamese response and subsequent developments. He was trying to change the context, or in Burkean terms the scene, by introducing a new act, the bombing halt. Presumably, this new scene would call for a new act from Hanoi, and then that act would permit Johnson to choose from a range of next steps, including the possibility of a complete bombing halt. The presidential ambiguity also allowed different groups to emphasize different aspects of the text. For example, those opposed to a bombing halt could take note of the fact that the halt did not extend to the area where allied forward positions were threatened.

There were yet additional ambiguities in the bombing halt announcement. For one thing, the president referred to it as "the first step to deescalate the conflict." But he mentioned it right after reaffirming the San Antonio formula, which required immediate talks following a complete bombing halt. In contrast, Johnson's announcement did not require any specific response. In fact, Rusk cited as a virtue of the bombing halt that it would permit us to sit back and see what Hanoi would do. So was the bombing halt a first step to implement the San Antonio formula or a first step to peace independently of the San Antonio formula? Is Johnson loosening up what he earlier had regarded as his "rock bottom" position on bombing halts and

peace negotiations? He was wise not to say, because had he openly signaled to North Vietnam that he was softening his terms, they might have chosen to hold out for even better terms. Leaving the question unanswered allowed the text to be read either way, which meant that an adversary could not be certain.

3.2 *The troop announcement*

A second ambiguity involves the announcement of the dispatch of 13,500 additional U.S. troops to Vietnam. This seems on its face to be a major escalation of the war, especially to those who are more familiar with recent high-tech, low-manpower wars such as those in Iraq and Afghanistan. But in the context of Johnson's speech it is not so clear. Is this troop increase a move toward escalation or de-escalation?

Consider first what Johnson does not say. In the aftermath of the Tet offensive, which had been proclaimed a military disaster for the Communists, U.S. Commanding General William Westmoreland had requested a "surge" of 206,000 additional troops – nearly a 50 percent increase. Johnson repeatedly had said that he would send Westmoreland whatever he needed. Few people knew that in the past the president had sent Defense Secretary Robert McNamara to meet with Westmoreland to bargain down the troop request to a number thought to be politically acceptable, have Westmoreland request that number, and only then announce that Johnson would meet the general's needs. We now know that the president never intended to send 206,000 more troops. In fact, upon receiving the request he convened a task force to consider alternatives to it. Three weeks before March 31, however, the New York Times leaked the story of the requested 206,000, and leading up to the speech a widespread expectation was that Johnson would meet the request. (I remember that as one of the possible 206,000 new troops, I personally felt quite apprehensive.) In the speech, Johnson never mentioned that he had received a request for 206,000 troops, much less that he was turning it down. But knowledge of this context powerfully influenced people's perception of what he did say. After all, while 13,500 is significantly more than zero, it is a lot closer to zero than it is to 206,000.

Moreover, Johnson was careful to describe the additional 13,500 troops as support troops to back up a contingent of about 11,000 troops that already had been deployed. Those 11,000 were sent immediately after the Tet offensive in anticipation of continued enemy attacks and a major siege on the isolated outpost at Khesanh in northern South Vietnam. The 13,500 support troops were not sent at that time, the president suggested, because they "could not accompany them by air on that short notice." On this reading, sending the support troops was not an escalation of the war but simply a completion of a deployment already partially undertaken.

Indeed, Johnson never said explicitly that he was going to send the additional men, just that the Joint Chiefs of Staff had recommended that he do so. (But his intention was clearly implicit in the speech when he indicated the sources from which the troop increment would come.) Finally, absent from the speech was a statement that Johnson had made repeatedly on earlier occasions, that Westmoreland might need additional troops in the future and that, if so, the president would send them. He said nothing directly to the contrary either, but compared to his previous statements this one seemed to suggest that he was placing a cap on the level of American troop commitment. In fact, that turned out to be the case.

So while it is obvious how the sending of 13,500 troops could be seen as an escalatory move, it should now be clear that it also could be read as a de-escalatory move. This ambiguity in interpretation was particularly valuable because of the volatile nature of American public opinion. Opposition to the president's handling of the war crossed 50 percent in March, but that figure included about equal numbers of people who opposed it because they thought we should be more aggressive in bringing North Vietnam to heel, and people who opposed the war itself

and favored American de-escalation (or even, in a small number of cases, outright withdrawal). In the New Hampshire primary three weeks before the speech, antiwar candidate Eugene McCarthy had come within 230 votes of defeating the president. But 60 percent of McCarthy's support came from those who thought current U.S. policy was not aggressive enough. They were using his candidacy to express their opposition not to the war but to Johnson's handling of it. The way in which the president announced the troop increase could satisfy both of these segments of public opinion, and each segment was very much in flux.

3.3 Greater reliance on South Vietnam

How could sending such a relatively small number of new troops be justified when much larger numbers had been requested? The answer relates to the third major ambiguity in the speech. The president stated, "The main burden of preserving their freedom must be carried out by them – by the South Vietnamese themselves." America and her allies could only "help to provide a shield behind which the people of South Vietnam can survive and can grow and develop," but success or failure in the end would depend on their own efforts. The rationale for the involvement of American troops starting in 1965 in the first place was that it was necessary in order to prevent the collapse of South Vietnam. Now the assumption was that the South Vietnamese capacity for self-defense had improved sufficiently that the U.S. could slow down its troop increases. This was the first step toward the U.S. policy that President Richard Nixon would label "Vietnamization."

In the speech, Johnson noted the size of the South Vietnamese army as a proportion of its population, the fact that the government survived the Tet offensive, the South's mobilization of additional men and increase in its draft calls, and President Nguyen van Thieu's call to root out corruption. These facts provide, as President Johnson said, "evidence of determination on the part of South Vietnam." Unstated but clearly implied is that "determination" is a sign of effectiveness – in other words, that the South Vietnamese efforts now permit the United States to add only a small number of support troops and yet the fight against Communist forces nonetheless would be effective. The evidence does not unequivocally support this. President Johnson overlooked such matters as the military desertion rate, the continuing and growing problem of corruption (notwithstanding President Thieu's pledges), the weak state of civil liberties (as evidenced by the summary execution of a suspected Viet Cong terrorist on a Saigon street by the head of the national police, a scene photographed by Eddie Adams of the Associated Press and shared around the world), and Walter Cronkite's famous proclamation that the Vietnam war would end in stalemate. And earlier in their internal deliberations, administration officials were much less sanguine about South Vietnam's ability to prevail without a major increase in American support.

The meaning of the "evidence of South Vietnamese determination," after all, was not clear. It might have been independent of effectiveness, or it might have been a sign of effectiveness. It was in President Johnson's interest to encourage the latter interpretation because that would permit him to limit future increases in American forces sharply while still maintaining that things were going well even after Tet. The former interpretation seemingly would lead to increases in U.S. troops to achieve the magnitude requested by General Westmoreland. The state of the South Vietnamese army, in short, served as a deus ex machina to justify whatever number of additional troops President Johnson had chosen to send.

3.4 The gold crisis and the plea for the surtax

The fourth major ambiguity came up with the discussion about financing the war. Put briefly, the costs of the war aggravated both the deficit in the balance of payments and the deficit in the federal government's operating budget. The problem with the balance of payments deficit was that it challenged the ability of the U.S. dollar to serve as the international reserve currency and also challenged the U.S. ability to maintain its pledge to redeem dollars for gold at the fixed price of $35 per ounce. The problem with the budget deficit was that it confounded the credibility of the government's commitment to stabilize prices and to restrain inflation. The two economic threats were related.

In 1967, President Johnson belatedly had requested a tax increase to help fund the war, in the form of a 10 percent surcharge on existing taxes. Congress, though controlled by Johnson's own party, balked at this request, instead proposing that Johnson cut domestic spending (by about $10 billion annually) that had been approved in the budget earlier in the year, before requesting any tax increase. The president did not want to make cuts because doing so would harm his cherished Great Society programs, many of which were just getting underway. So an impasse developed and the economic threats grew worse. Johnson repeated his pleas for the surtax in early 1968, but without results. Inflationary fires were stoked and there was a serious threat of a run on the dollar by foreign holders fearful that devaluation was imminent, no matter the U.S. official pledges to the contrary.

In his March 31 speech, the president determined to break this impasse. Acknowledging that he lacked the power or influence to compel Congress to do his bidding, he offered a significant concession. The tax surcharge was so important that he would be willing to cut spending in order to achieve it. He announced, "As part of a program of fiscal restraint that includes the tax surcharge, I shall approve appropriate reductions in the January budget when and if Congress decides that that should be done." That sounds like a straightforward surrender from Johnson's desire to obtain the necessary revenue from tax increases alone. But upon inspection, it is a more ambiguous statement than it appears to be. Notice first that Johnson inserts the hedging adjective "appropriate," reserving to himself the ultimate judgment about which spending cuts were appropriate. And indeed, Johnson lobbied forcefully with the Congress to protect the most valuable of the Great Society programs from the budget ax.

Even more important was the last clause of Johnson's statement, ". . . when and if Congress decides that that should be done." Whereas usually the president proposed the budget measures he wants Congress to pass, Johnson here places the onus on Congress to decide which programs should be cut. He did not identify his motive for doing so, but he might reasonably have thought that giving Congress the responsibility would make it less likely that any significant spending cuts actually would be made. The reason is that any expenditure in the budget is important to some member or members of Congress who will defend it vigorously. In this regard Congress operates on the principle of "logrolling," meaning that members tend to respect one another's pet projects.

Johnson's "concession" turned out to be much less significant than it appeared. He did not succeed in breaking the impasse right away. It was not until late June that Congress finally passed the surtax. It paired it with spending cuts, as it had insisted. But it cut spending by only about $4 billion, and it spared most of the key Great Society programs. The "concession" was ambiguous. Was Johnson offering the reality or only the trappings of expenditure reduction? The fact that he could be understood either way was useful. The president could maintain both that he had protected the Great Society programs and that he had met Congress at least halfway on spending cuts. For their part, members of Congress who were unsympathetic to Johnson acknowledged that they voted for the surtax to pay for the war but could reassure their constituents that they first extracted meaningful spending cuts from the president. An adjective

like "meaningful" could be left undefined since it was in both the president's and the Congress's interest to regard the measures that had been adopted as "meaningful." No one wants to contend that he or she has been committed to an outcome that is meaningless or trivial.

3.5 The withdrawal statement

The final significant ambiguity in Johnson's March 31 speech, oddly enough, occurs in his closing statement that he is withdrawing from the 1968 presidential race. On its face, there is probably no more definitive statement in the entire speech. At its end, Johnson stunned the nation with the statement that "I shall not seek, and I will not accept, the nomination of my party for another term as your President." What could be clearer? Like all those who had become president through another's death or resignation, Johnson was deciding to forego a campaign for a second consecutive elected term. But no one was expecting him to do so. His seemingly direct statement was the object of considerable discussion among the small group of aides who knew about it in advance. The statement was arguably ambiguous about whether Johnson would run again. The standard for such statements was a "Sherman statement," named after Civil War General William Tecumseh Sherman, who, being considered a presidential possibility in the 1884 elections, telegraphed the chairman of the Republican National Committee, "I will not accept if nominated, and will not serve if elected" (Safire, 1968). There was daylight between Johnson's statement and Sherman's, the latter of which seemed to admit of no exceptions.

But how could Johnson possibly run in 1968 if he would neither seek nor accept the nomination? Theoretically there was a way. Johnson might be "drafted" for the office by the Democratic National Convention. A draft would occur if the convention nominated him for another term supposedly without consulting him or seeking his approval. Just like a military draft, a convention draft would not give the president any choice about whether to serve; his service would be compulsory. There was a model for such a proceeding, and it was Johnson's political hero, Franklin D. Roosevelt.

In 1940 FDR steadfastly maintained that he was not seeking and did not want the Democratic nomination for a third term. Meanwhile, quietly and behind the scenes, he was working with party leaders, encouraging their efforts to "draft" him at the convention. There were many who believed in 1968 (and I confess I was among them) that Johnson's declination was not sincere but was a political stunt whereby he might avoid an embarrassing loss in the upcoming Wisconsin presidential primary and then get back into the race. In fact, after the death of Robert Kennedy in June, Johnson did briefly consider re-entering the race.

Johnson's withdrawal statement, then, was more ambiguous than it seemed. Those who believed him sincere regarded his withdrawal from the race as a noble sacrifice. It gave credibility to his announcements about Vietnam, making it more likely that they would be taken seriously since he had no partisan political stake in the outcome. But for those who regarded the withdrawal statement cynically and saw it as a political stunt, the effect would be just the opposite: If Johnson could not be sincere in talking about his personal political future, then why should he be taken seriously for what he said about Vietnam? Rather than contribute to the national unity he was hoping to foster, the ambiguity of the withdrawal statement could have aggravated the national divisiveness against which he fought so hard. Fortunately for him, the public memory of the speech that quickly took hold was that Johnson indeed had made a great and noble sacrifice by abandoning his own political career for the sake of the greater good. This meaning was "frozen" by subsequent events, especially Hanoi's agreement on April 3 to start talks, and the assassination of Martin Luther King on April 4. The early critics found that their doubts about Johnson's authenticity were not taken seriously by the public at large.

4. CONCLUSIONS AND IMPLICATIONS

To review, then, President Johnson's public address to the nation on March 31, 1968, contained ambiguities from beginning to end. It was ambiguous whether the bombing halt was a real gesture toward peace. It was ambiguous whether the troop increase was a step toward escalation or de-escalation. It was ambiguous whether or not the increased dedication of the South Vietnamese was a sign of increased effectiveness. It was ambiguous whether the concessions made to Congress on spending were only apparent or whether they were real. And most surprisingly, it was ambiguous whether or not Johnson was really withdrawing from the 1968 presidential race when he said he would neither seek nor accept his party's nomination. Some of these were ambiguities concerning fact; some, concerning meaning or interpretation; and some, concerning evaluation.

What does this excursion into the granularity of a U.S. president's speech have to say about the treatment of ambiguity in argumentation theory? First, we cannot accept the assumption that ambiguity is necessarily a fallacy. It may be, but so far from always being a misuse of language, it sometimes may be a very creative and constructive use of language that enhances the interest of all participants and contributes to resolving a disagreement.

Second, the language-use rule in the pragma-dialectical system (and possibly other rules as well) should be qualified with the statement that the rules presuppose critical discussion between two people as the paradigm case of argumentation. That was implicit in the formulation of the original (standard) version of pragma-dialectics. In such a dyadic encounter, it obviously is important that, when a word can have multiple meanings, the antagonist employs the same meaning that the protagonist intends. But when we consider other paradigms of argumentation (such as the debate or the public address) and, even more, when we consider argumentation in specific contexts, as the extended pragma-dialectical theory does, it is not so clear that the language-use rule always governs. In some situations, such as the one I have analyzed here, decision-making and disagreement-resolution may actually be enhanced when different members in a heterogeneous audience understand the term in different ways. To use a recent example, the opening of discussions between the United States and North Korea in June 2018 clearly was helped by the fact that the two leaders understood the term "denuclearization" differently. The United States demanded a commitment to denuclearization as a precondition to holding the talks. North Korea could make such a commitment without buying into all the American implications of the term, some of which seem more like desired outcomes of a discussion than prerequisites for beginning one. Of course, if serious discussions ensue (which is unclear at this writing), some of these differences in interpretation will need to be resolved in the course of developing practical proposals, but that will be a different situation from the one that Donald Trump and Kim Jong Un confronted in Singapore.

Third, as this last observation suggests, the concept of context requires further thought. It tends to be engaged either to suggest general domains of argumentation (political argumentation, legal argumentation, medical argumentation, etc.) or to refer to recurrent activities of arguing (negotiation, persuasion, coalition-building, etc.). But perhaps we should conceive of context in a more individualistic sense – even perhaps a radically individualistic sense. In some respects, each instance of argumentation takes place in a unique context. For example, "presidential addresses" is too broad a category for the speech I examined, because it is in several ways unlike the prototypical presidential address. Nor would "farewell address" do, for Johnson does not say farewell and only a small part of the speech deals with his withdrawal from the presidential race. Nor does a category like apologia fit what is going on here; while there are some elements of self-defense, that is far from the dominant emphasis of the speech. Likewise, the combination of external factors impinging on the speech, ranging from the volatility of public opinion to the international currency crisis to the emerging

presidential campaign, are unique. To emphasize the uniqueness of the specific case is to nod to the rhetorical dimension of argumentation. It was Aristotle who defined rhetoric as the faculty of discovering the available means of persuasion in the given case. If rhetorical perspectives on argumentation can be criticized because they do not easily yield generalizable theories, the flip side is that they are especially potent at coming to terms with the uniqueness of each case.

Fourth and finally, the category of "fallacies of language" needs renovation. Some of the often-listed language moves, such as equivocation and circular reasoning, may indeed be fallacious; the former because it violates the consistency principle and the latter because it contains no inference. But the same is not true of ambiguity, amphiboly, or vagueness, which – as in this analysis – are highly situation-specific. A single troublesome case, such as the one I have examined, does not by itself discredit a more general theory or category system, but it does suggest the value of re-examining our thinking on the subject.

President Lyndon Johnson faced a particularly difficult set of constraints, both domestic and international, as he prepared to speak to the American people on the evening of March 31, 1968. His employment of strategic ambiguity in each of the major sections of the speech helped him to address these complexities. How he did so is worth our examination even 50 years later and in the face of different but at least equally difficult constraints of our own time.
