Proceedings of the Ninth Conference of the International Society for the Study of Argumentation

Preface

The *Ninth Conference of the International Society for the Study of Argumentation* (ISSA), held in Amsterdam from 3 to 6 July 2018, drew again a substantial amount of submissions for presentations. The 2018 ISSA Conference was, like previous ones, an international meeting place for argumentation scholars from a great variety of academic backgrounds and traditions, representing a wide range of academic disciplines and approaches: (speech) communication, logic (formal and informal), rhetoric (classical and modern), philosophy, linguistics, (critical) discourse analysis, pragmatics, law, political science, psychology, education, religious studies, media studies and artificial intelligence. In the opinion of the editors, the Proceedings of the Ninth ISSA Conference reflect the current richness of the discipline.

For the reader's convenience, in the Proceedings the regular papers are arranged in the alphabetical order of the authors' surnames, preceded by the three keynote speeches. The four ISSA conference directors, Bart Garssen, David Godden, Gordon Mitchell and Jean Wagemans, served as editors of the Proceedings. In addition, we received invaluable assistance in preparing the Proceedings from our assistant Martijn Demollin. We thank him very much for his help in getting the manuscripts ready for publication. For their financial support of the conference, the editors would like to express their gratitude to Springer Academic Publishers, John Benjamins Publishers, and the Sciential International Centre for Scholarship in Argumentation Theory (Sic Sat).

Interpreting argumentation: The insider and outsider points of view

MARIANNE DOURY

Département de Sciences du Langage / Laboratoire EDA
Faculté des Sciences Humaines et Sociales
Université Paris Descartes
France
marianne.doury@parisdescartes.fr

ABSTRACT: As any complex speech production, argumentative discourse needs not only to be decoded, but to be interpreted. The way this interpretation process takes place depends on the discursive role the interpreter takes on as an insider (whether he or she is engaged in the attack or the defence of a viewpoint) or an outsider (typically, the academic analyst's perspective). The insiders' interpretation of an argumentative utterance is determined by their orientation towards the issue at stake. Based on a 2015 speech of Nicolas Sarkozy on 'neutral' packaging for cigarettes, I will make clear the clues on which my interpretation is based; I will examine the way this declaration is interpreted in the comments that were posted on the Web. I will show that these interpretations are commanded by rhetorical concerns.

KEYWORDS: argumentation, argument analysis, argument interpretation, argument from comparison, slippery slope argument, Sarkozy

1. INTRODUCTION

My main concern here will be with interpreting argumentation. More specifically, I will parallel the interpretation of argumentation from the insiders' point of view – that is, that of the participants engaged in an argumentative discussion – with the interpretation from an outsider's point of view (in this case, from my point of view, as an academic analyst of argumentation). I will show what is common to both interpretative viewpoints, and what is specific to one or the other. My reflection will be based on a declaration made by Nicolas Sarkozy in 2006 on the plain packaging of cigarettes.

I will begin by saying a few words about my approach to argumentation. It is possible – and even plausible – that the theoretical and methodological background I rely on may sound at best, puzzling and somewhat exotic to you, and even trivial or pointless. Let me make it clear how big the problem is. In the introduction to the brilliant "bingo" talk he gave in 2014, Frans van Eemeren said, I quote:

> Argumentation scholars are not in full harmony regarding the definition of the term argumentation. There seems to be general agreement however that argumentation always involves trying to convince or persuade others by means of reasoned discourse. Although I think that most argumentation scholars will agree that the study of argumentation has a descriptive as well as a normative dimension, their views on how in actual research the two dimensions are to be approached will diverge. Unanimity comes almost certainly to an end when it has to be decided which theoretical perspective is to be favoured.

I will resort to Charles Willards as a warrant and focus on dissensus rather than on consensus. For it seems that in my case, unanimity collapses a little bit earlier than predicted by Frans van Eemeren, since I do not consider argumentation as a communicative activity devoted, by definition, to persuading or convincing an addressee; nor do I consider that "the study of argumentation has a descriptive as well as a normative dimension" – and more specifically, it's the normative part of the claim that I do not agree with.

First, the persuasion issue. Defining argumentation as a persuasive endeavour prevents us from saying anything about the many situations in which, although there is little doubt that people do argue, one can hardly assume that they seek to persuade (or convince) anybody. I do not claim that argumentation is never oriented towards persuasion; I just say that in many situations that cannot be considered anecdotal, it is not. This is the case for instance when there is such a deep disagreement between the interlocutors that no agreement, even local, can be reached; nevertheless, it happens that, in such situations, even though the participants are aware of the fact that they will never succeed in convincing the addressee, they argue all the same. It is also the case when the interlocutors already agree on the issue at stake ("Emmanuel Macron's talk was such a mess yesterday, don't you think?" "Oh yes, I do!"). Nevertheless, even though participants are aware of the fact that they don't need to convince the addressee, they argue all the same ("the way he handles the migrant crisis is cynical", "he takes always more from workers to give to employers", …). Not to mention the situations in which the arguers do not support any pre-existing conclusion, and try to work their way to a satisfying common position on the claim under discussion: what would it mean to say that the arguers try to persuade one another, when they simply try to make their mind up collaboratively on a disputable issue?

The second point on which I depart from the alleged consensus within argumentation studies is their normative dimension. Let me be clear, to prevent any misunderstanding. Of course, argumentation, as a discursive, communicative activity, has a normative dimension. When engaged in a dispute, people phrase their argument to make it fit (at least to some extent) with what they consider is the standard operating in this given situation. They also assess their opponent's argument according to standards that are often left implicit, but that can be made explicit when their assessment is challenged. So, argumentation as a communicative activity has a normative dimension.

Now, does it follow that the study of argumentation, seen as an academic paradigm, has to combine a descriptive dimension with a normative dimension? Here, my answer is: not necessarily. This does not in any way mean that I consider that normative approaches to argumentation are pointless: they have an unquestionable social, political, philosophical and pedagogical interest. It only means that one can legitimately decide not to endorse such a normative perspective, and stick to an empirical, descriptive approach to argumentation.

My position is very much determined by the disciplinary area in which I was trained as a student: originally I was trained as a linguist. Linguistics is the study of language. It aims at describing language from various perspectives (language form, language meaning, language in context). It aims at accounting for the way people talk, not at prescribing how they should talk. The results of linguistic research may be helpful for the people concerned, by improving linguistic practices; nevertheless, linguistics cannot be considered as a mere ancillary discipline subordinated to higher level concerns with improving verbal practices.

Similarly, an approach to argumentation aiming at accounting for the way people construct their discourse so that it resists contention better in a situation of actual or virtual disagreement, an approach to argumentation aiming at showing how the linguistic choices they make contribute to this enterprise, aiming at scrutinizing the interactional strategies people resort to in such situations in order to gain allies or to organize the confrontation with opponents, such an approach is legitimate *per se*. It may be useful for people having normative concerns about how to argue reasonably, but it is not its *raison d'être*.

1. INTERPRETING ARGUMENTATION

My talk, today, will be more specifically concerned with the question of the interpretation of argumentation. I suggest that we take Christian Plantin as the point of departure of our reflection

and precisely, the entry "Interpretation, exegesis, hermeneutics" of his *Dictionary of argumentation*. "Hermeneutics, exegesis and interpretation", Plantin (2018) writes, "are the arts involved in the understanding of complex texts".

There is little doubt that argumentative discourses are in many respects complex textual data. Their meaning cannot be fully accounted for by simply understanding the words, or even the sentences they are made of. The full significance of an argumentative text results from its global arrangement. When trying to grasp this global arrangement, the analyst has to take many elements into account: the meaning of the words, their syntagmatic organization within sentences, the way the text articulates and hierarchizes various viewpoints through its enunciative layering, a knowledge of the interdiscourse, and of some elements of the context in which the argument takes place.

Interpreting an argumentative discourse also – and perhaps first and foremost – requires grasping the speaker's intention. In an argumentative perspective, the speaker's intention amounts to the conclusion he or she tries to support: « the conclusion is the assertion according to which the discourse is organized; towards which it converges; in which its orientation materializes; the intention which gives the discourse its meaning, and the ultimate core of the text obtained by condensing it" (Plantin 2018). Interpreting an argumentative text amounts to identifying its conclusion, and showing how the various elements of the text contribute, directly or indirectly, to make it more resistant to contention (Doury 2003 : 13). In many cases such a process is not automatic, and requires the interpreter to have a reflexive competence (Macagno & Capone, 2016: 404 ; Grossmann 1999: 153).

Interpreting argumentative data is not exerting a wild hermeneutic. It is constrained by some standards the respect of which warrants its legitimacy. Such standards have to be agreed on within the interpretative community concerned (Plantin 2018 : 326). Let me list the most general of these standards:

- An argumentative text communicates more than the statements that compose it.
- Interpreting an argumentative text amounts to identifying its argumentative orientation, that is the conclusion it supports, and to showing how the propositions in the text contribute to supporting this conclusion.
- The interpretation has to « maximize the argumentativeness of the text »: any sequence that can be understood as argumentative has to be treated as such, writes Plantin (2010); this amounts to considering that the coherence principle that prevails is argumentative.
- The interpretation of an argumentative text must obey, in Trudy Govier's words, a principle of « modest charity», according to which « When other indicators (context, logical pattern, professed intention, indicator words) count equally in favor of several distinct interpretations, we adopt that one which generates the most plausible argument" (Govier 1987 : 148; see also Lumer, 2003)..
- An interpretation should not be content to reiterate otherwise what the data say themselves, but must always bring something more. In this sense, an interpretation is always an overinterpretation. The important thing is to manage to keep this overinterpretation under control, says sociologist Bernard Lahire (2013).
- And to make sure that it is kept at bay, an interpretation has to rely on various clues, which are heterogeneous in nature, but which can be made explicit. Such clues make some interpretations more plausible than others, but no interpretation can be considered as exclusive.

Let us turn now to the case study that will help us identify the common points and the specificities of the insiders' interpretation of an argumentative speech and my own reconstruction of it.

The starting point of this case study is a speech delivered by Nicolas Sarkozy in February, 2016. Nicolas Sarkozy was then President of the rightist Les Républicains Party. A few months later, he declared himself a candidate for the 2017 presidential primaries. The sequence I will focus on took place during a meeting of his party devoted to agriculture and rurality, at the 25th minute of a 44 minute speech. Sarkozy has just advocated a strong European agricultural policy. He then abruptly turns to another issue. In January 2016, a law was voted making plain tobacco packaging mandatory in France (cigarette packets must all have the same size, the same shape, and no logo).

I will first let you listen to the sequence. I will then propose my interpretation of it. I will make the way I proceed as explicit as possible in order to make sense of this speech event, and the clues on which I base my analysis of it, notably in terms of argument scheme. I will then turn to the many comments that could be heard in the days that followed in the mass media (radio and television) and that could be read on the Internet, and I will examine the interpretations of the sequence that these comments display.

> A word on this plain packaging thing. Because, I've heard nonsense in my life, I have seen demagoguery, but this, this plain packaging thing, my dear friends, it's completely related to what we are discussing today... Because, if we accept plain cigarette packets, in six months, you will be offered plain wine bottles. And that will be the end of our controlled designations of origin. And that will be the end of our terroirs. And that will be the end of the protection of our know-how. Why am I telling you this? Just think for a minute. If you accept it today, this plain cigarette packet, tomorrow, some fundamentalists will demand plain wine bottles. And then we'll also have plain cheese. We already had "the normal president"[1]…
> This is a much more important fight than we imagine. It's the fight for our designations of origin. It's the fight for our know-how. It's the fight for our identity. It's the fight for our history. It's the fight for our terroirs. And if we give in on this, we'll give in on everything.

2. THE ACADEMIC ANALYST'S INTERPRETATION OF THE SEQUENCE

So, let's turn to the academic analyst's interpretation of the sequence – the "academic analyst's interpretation" standing for my interpretation.

Contextual elements

If one wants to fully understand this sequence, one has to take some elements of the context into consideration.

First, in such meetings, participants have to make many points regarding different issues. Nevertheless, they have to display a form of coherence in their speech. In the present case, *a priori*, there is a wide thematic gap, between the theme of the day (agriculture and rurality) and the plain packet measure. Sarkozy's argumentation permits him to bridge the two topics, via the evocation of the defence of the products from 'terroirs', in other words products from French regions.

But why is Sarkozy eager to bring in this plain packet topic, whereas its connection with the meeting is not clear? In this regard, the primaries to come (and, beyond, the presidential elections) are a significant contextual element when analysing the speech of a potential candidate canvassing for votes.

Advocating the cause of wine, cheese and 'terroirs' flatters the participants in the meeting and more broadly, thanks to the media dissemination of Sarkozy's speech, the corresponding part of the electorate.

---

[1] This is an allusion to François Hollande, who was at that time the French President. During the previous presidential campaign, in 2012, Holland claimed he would be a "normal President" as a reason to vote for him, in contrast to Nicolas Sarkozy, who was accused of being excessively "bling bling" (that is, showy, ostentatious).

Beyond the rural electorate, the allusion to a possible endangerment of "our history" and of "our identity" can be read as a discreet appeal to the right (or even extreme right) fringe of the electorate of Republicans. In February 2016, French public opinion was still very much marked by the terrorist attacks that had struck Paris in January and November 2015. The use of the term "intégriste" [*fundamentalist*] in French echoes the characterization massively applied to the Islamist terrorists responsible for the 2015 massacres; hence using this adjective can be considered as a strategy playing on the audience's fears, and targeting more specifically the extreme-right part of the electorate (which was rightly accused of stigmatizing the whole Muslim community). The mention of the risk of corrupting French identity targets the same part of the electorate.

In addition, since the manufacturers and sellers of cigarettes are opposed to plain packaging, the virulent position of Sarkozy against this measure is likely to gain their support.

When I underline the electoral interest that Sarkozy may have in asserting what he says, I do not mean that his position is not to be taken seriously: a speech may serve the speaker's interest while being sincere and intelligent (it may also be the case that the qualities of the speech are limited to its strategic interest).

Finally, in application of the principle according to which there is no better way to muster the troops than to direct their attention towards a common enemy, Sarkozy takes a sideswipe at François Hollande ("we already had the 'normal' president"). He also attacks the socialist Minister of health, Marisol Touraine, when he describes the measure she supported as a manifestation of "demagoguery" or as "nonsense".

In brief, even before paying attention to its argumentative structure, when considering various contextual elements, one can see Nicolas Sarkozy's speech as an attempt to found a community of interests and values between the future candidate in the primaries and three electoral "targets" (the rural world, the tobacco lobby, the extreme-right fringe of the electorate) on the back of a common opponent (the socialists in power).

A slippery slope argument

Now, when I try to characterize Nicolas Sarkozy's speech in terms of the argument scheme he uses, I would describe it as a case of slippery slope argument, or an argument of direction according to Perelman's terms. I propose that we define the slippery slope argument as an argument of which the conclusion is the rejection of a course of action. The reason why this conclusion should be rejected is not that the course of action is unacceptable in itself, but because its acceptance would constitute the first step towards other measures or decisions which, contrary to the course of action at stake, are unacceptable. Such an argument implies that one admits the existence of a chain of events some kind of gearing starting from the first decision and resulting in later highly challengeable subsequent decisions through an inescapable process. The reason why the first decision should modify the way the later decisions are considered is often an *a pari* reasoning: if we apply measure M to all X, then we cannot refuse to apply it to all Y, since X and Y belong to the same category.

Various clues are in favour of the interpretation of Sarkozy's speech as an argument of direction.
-       In this excerpt, Nicolas Sarkozy does not criticize the measure of plain packets in itself. He rather rejects it on the basis of the unacceptability, which he takes for granted, of other measures the adoption of which this first step would lead to ("plain" bottle of wine, then plain cheese packaging).
-       The progression, from the adoption of the first potentially innocuous measure, to subsequent unacceptable measures, is presented as inescapable,

- by the use of a conditional construction ("if we accept the plain packet of cigarettes, in six months, you will be offered the plain bottle of wine "),
- by the specification of the period at the end of which the new measures will be put in place ("in six months", and later on, "tomorrow")
- by the use of the future indicative ("you will be offered", "that will be the end", "you will (also) have") which depicts the future as certain,

- Finally, the process evoked is a slippery slope that includes several stages (from cigarettes to bottles of wine, then cheese, and finally French identity and French history).

So long for my interpretation of this excerpt from Nicolas Sarkozy's speech: I propose to see it as an attempt to win over various electoral "targets" on the back of a common opponent; the backbone of this attempt is an argument of direction, which starts from the acceptance of plain packets for cigarettes and ends with the loss of "everything".

3. THE COMMENTATORS' INTERPRETATIONS OF THE SEQUENCE

Let us now have a look at the way this sequence is interpreted – or at least, at the interpretations that are displayed – by the part of the audience which reacted in the mass media or on the internet right after Sarkozy's speech.

The reactions to an argument give the analyst access to the interpretation which was selected by the person who reacts to it, and which determines the way he or she assesses it. It reveals the elements of the context on which he or she draws in order to attribute intentions to Sarkozy. It also reveals the argument scheme he or she considers Sarkozy used in his speech.

Indeed many authors in argument studies have shown that the notion of argument scheme, which is an important analytical category for experts in argumentation, also makes sense for ordinary speakers (Garssen 2002, Doury 2004). The latter connect the specific argumentative sequence addressed to them to a more general argumentative pattern, which they are usually unable to name precisely, but which conditions the way they discuss it.

Such a categorizing process can easily be grasped when commentators use "meta-argumentative" terms in order to label the moves used by the arguer they react to. Of course, you must not expect to find claims like "Sarkozy used a slippery slope argument", "a *tu quoque ad hominem* attack" or "an *argumentum ad ignorantiam*". However, comments such as "this comparison is quite illuminating", "this generalization is highly disputable", testify to the relevance of the notion of argument schemes for ordinary speakers.

This categorizing process may also be observed through the way commentators criticize or refute an argument, or support it by anticipating objections that might plausibly be addressed to it. We know that the critical questions to which an argument may be subjected vary according to the argument scheme it belongs to. This is true for the academic analyst of argumentation who attempts to assess the acceptability of an argumentative move. The same goes for ordinary speakers: consequently, the propositions that they put forward in support of or in opposition to an argument are clues to the way they have interpreted this argument in terms of argument schemes (or to be more cautious, clues to the interpretation they choose to display) (Anthony & Kim 2015 : 94, Garssen 2002).

First, let's turn to the context as a basis for reconstructing the arguer's intention. In the analysis I have proposed of Sarkozy's speech, I connected some elements from the context with some discursive choices in order to access their meaning, beyond their literal signification. More often than not, the contextual elements I drew on are also mentioned by the commentators as information likely to help one to better understand Sarkozy's talk. Such a convergence is not surprising as, following Kerbrat-Orecchioni (1980), the mechanisms which underlie the interpretation of the "learned" analyst as well as that of the "ordinary commentators" "generally

incorporate a hypothesis, implicitly formulated by the receiver, concerning the semantic-pragmatic project of the speaker", in other words, his " signifying intention" (p. 181, my translation). This hypothesis resorts to three kinds of considerations: what is known of the speaker, the speech itself, and the circumstances in which it is produced.

In the present case, Sarkozy's willingness to go "fishing for votes" is frequently pointed out as a central element for a proper interpretation of his words, as evidenced by the examples that follow:

> « he tries to improve his situation in the eyes of voters » / « He is against plain packs; the only reason: to twist discontented people around his finger; « SARKOZY goes fishing for votes » / « Sarkozy is acting like Sarkozy, he bustles about like Zébulon looking for his lost electorate » / « He'll say or do anything to get the French to vote for him in 2017» / « he'll do anything to rope in votes! »

The same line of interpretation can be found listening to professional commentators, for example the journalists Claire Fournier and Christophe Barbier on ITélé:

> Claire Fournier: There is politics, behind all that, anyway
> Christophe Barbier: for sure, it is gutter electoralism

In all these cases, the mention of Sarkozy's electoralism serves a strategy aiming at rejecting his position on the plain package measure by disqualifying the intentions that motivated him. Similarly, many comments suggest that Nicolas Sarkozy is deliberately serving the interests of the tobacco lobby, which he expects in return will fund his campaign. In so doing, these comments display a circumstantial *ad hominem* rebuttal, that is, they reject a position on the grounds that it is biased by the pursuit of private interests.

Even if the "scholarly" analysis and the analysis evidenced by the comments converge in connecting Nicolas Sarkozy's stance on plain packets with electoral issues, what is characteristic of participants' comments is that this connection is subordinate to a refutative aim. The scholarly analyst, in principle at least, does not take a stand in the debate, and does not side with one point of view rather than another.

Let us examine further the reactions to Nicolas Sarkozy's talk, beyond the interpretation of it in the light of the intentions attributed to him. The comments display two main lines of interpretation: some present Sarkozy's reasoning as an argument of direction, while others present it as an argument by comparison.

How can I access the way commentators interpreted Sarkozy's speech in terms of argument schemes? Let us first examine the meta-argumentative terms they use, and the way they rephrase Sarkozy's line of reasoning. Meta-argumentative terms frequently appear in association with the comparison interpretation, but never with the slippery slope interpretation. It is not really surprising, since the vocabulary of comparison (that is, words such as *compare, liken, like, similar, analogue…*) pertains to people's general linguistic competence, whereas it is not the case for "argument of direction" or "slippery slope argument". So we encounter terms like "*comparer*", "*incomparable*", "*assimiler*", "*faire un parallèle*", which clearly orient toward an interpretation in terms of argument by comparison.

> Comparing a product that kills one consumer out of two (tobacco) to a product that kills only in the case of excessive consumption (wine) or that does not kill at all (cheese)
> Nicolas Sarkozy equates [« assimile »] cigarettes and agricultural products such as French wines
> How can one draw a parallel between cigarettes and products of the 'terroir'?

As far as the interpretation in terms of slippery slope is concerned, whereas the scheme is never designated as such, commentators resort to the vocabulary of causality (*to cause, to affect, lead*

to), and to expressions pointing to a step-by-step, progressive process (*more and more, less and less*).

> **you start with** that and you never know **where they will stop**
> **Tomorrow** he will ban the sale of lighters and matches and **the day after** that ashtrays, and **after comes the weekend,** phew, 2 days out for us
> The packet causes something else to happen and as far as islamists are concerned France eats humble pie **more and more**.

Beyond meta-argumentative designations or indications given by the way the reasoning is rephrased, the way Sarkozy's reasoning is criticized also reveals the way it was interpreted in terms of argument scheme.

Sometimes the criticism is phrased in such a way that it may address both interpretations. Claims like "X has nothing to do with Y", or "I can't see the connection between X and Y" may challenge a similarity as well as a causal relationship between X and Y.

However, criticism is frequently more specific, and points to a specific interpretation in terms of argument scheme; the angle of criticism is then particular to the scheme that is being questioned.

As far as the comparison interpretation is concerned, many comments judge Sarkozy's argument severely on the grounds that "he compares what cannot be compared", for instance:

> Drinking milk or eating cheese is in no way comparable with smoking.

The alleged reasons why the comparison is not acceptable are the following:
- One term of the comparison is French, the other comes from abroad; one is "artisanal", the other is industrial;
- One term of the comparison is clearly health-endangering and potentially lethal, the other is risky only if consumed without moderation;
- One term of the comparison is rooted in a long-lasting tradition, whereas the other is not;
- Such criticisms end in an evaluative distinguo between "noble" products we can be proud of, and trivial, vulgar items, with which the first cannot be compared without committing a crime of lèse-majesté.

A way of denouncing the absence of any central property shared by the terms of the comparison is to claim that they don't belong to any subsuming category, since cigarettes are not "produits du terroir" whereas wine and cheese are:

> Since when did cigarettes become a regional product?

> So, Marlboro, Camel… are the fruit of French regions? N Sarkozy really takes voters for morons!

Such criticisms sometimes give rise to reactions which support the acceptability of the comparison by putting forward common properties between the items compared. Take this pair of messages:

> Message 1: How can he compare tobacco to a Burgundy wine, it cannot be compared, and he wants to be a candidate for the presidential elections, lol!
> Message 2: Both cause cancer, the sale of both is regulated by the state, both are the target of lobbying.

Such a criticism, as well as the reaction to it, confirms that Sarkozy's argument has been interpreted in comparative terms.

Now, as far as the interpretation in terms of argument of direction is concerned, the criticism challenges the mechanism purportedly leading, from the adoption of the measure for cigarettes, to the adoption of the measure for wine and cheese:

> Why should a measure on cigarettes affect the produce of our regions?

When looking deeper into the criticisms, it appears that interpretations in terms of comparison give rise to the most severe assessments of Sarkozy's line of argument:

> So, comparing cabbages with turnips is worth an F.
> What nonsense!… Drinking milk or eating cheese can in no way be compared to smoking

By contrast, when interpreted in terms of slippery slope, Sarkozy's argumentation seems to be considered worth discussion:

> The correlation with plain bottles of wine is interesting because it is logical, alcohol causes serious diseases, tobacco only aggravates them, for sure, there is a certain logic in what Mister Sarkozy said.

> As far as cheese is concerned, I can't really see the dangers attached to its consumption!!! By contrast, for wines and spirits, it would definitely be logical to demand plain labels displaying filthy pictures of a liver suffering from cirrhosis, rosacea and rhinophyma!!!

Interpretations of Nicolas Sarkozy's reasoning as an argument of direction thus indicate that the commentator takes a more charitable stance towards it.

To sum up, the most critical assessments of Sarkozy's speech are those where the displayed interpretation is expressed in terms of comparative argument, whereas when it is understood as an argument of direction commentators take a much more benevolent stance. Consequently, I would have expected that the first line of interpretation (argument from comparison) would be characteristic of commentators opposed to Sarkozy or favorable to the plain packet measure; similarly I would have expected the second line of interpretation to be supported by commentators more sympathetic towards Sarkozy, and radically opposed to the plain packet measure.

And it is the case that sometimes, identifying a line of reasoning as a specific argument scheme forms the preamble to a refutative move. In such cases, the comments that follow an argumentation should not be considered as testifying to the way this argumentation was really understood, but as the interpretation that the commentator chose to display, and this choice may be fully strategic. When interpreted as a comparative argument, Sarkozy's speech is easier to refute; so it may be interesting, for an opponent, to display this interpretation in order to point to its pitfalls and to reject it more easily.

Nevertheless, examining the data further shows that the interpretations that are displayed in the comments posted as reactions to Sarkozy's speech do not always obey this strategic requirement, as shown in the following example, which disconnects a negative opinion on Sarkozy from a rather positive assessment of his line of reasoning:

> Though I can't stand this character, we cannot consider him completely wrong. Alcohol kills about 50 000 people a year in France. So why could not we think that some useless and costly associations could propose plain bottles of alcohol … We live more and more in a world where liberty is in danger.

Here, although the commentator has no liking for Sarkozy, he acknowledges that the chain mechanism he anticipates is plausible, and also shares with Sarkozy the negative assessment of its predictable outcome (endangering liberty).

The reverse is equally possible: a previous positive attitude towards Sarkozy can coexist with a negative assessment of his reasoning:

> I am right-wing but in this case, I can't see the connection between cigarettes and 'terroir'!

The focus on the critical examination of the 'slippery slope' mechanism at the core of Sarkozy's reasoning, regardless of what one thinks of Sarkozy – and even regardless of the conclusion he intends to support – sometimes results in a counterproductive support, through which the commentator acknowledges the rationality of the step-by-step forecast on which the argument of direction relies, but concludes from it to a claim contrary to the one targeted by Sarkozy:

> 'Terroir' or not, on the roads, there is a huge difference between someone who smokes and someone who drinks wine or spirits: the smoker doesn't kill people, while the drunken driver does. So one cannot bore us all year long talking about the dangers, risks and often lethal accidents due to alcohol, while not applying to the bottles that contain it the same packaging sanction as the one applied to cigarette packs – except that on the label of the divine bottle one will see dead or handicapped people, or extracts from convictions.

The commentator acknowledges that the logical application of the rule of justice should lead, along with an *a pari*, and even an *a fortiori* principle, from the plain packet for cigarettes, to the plain bottle of wine. But, whereas the identification of this logical link serves as a reason for Sarkozy not to accept the first measure (plain packaging for cigarettes), for the commentator it serves as a reason, beyond plain packets for cigarettes, to impose plain bottles for wine.

4. CONCLUSION

In conclusion, I would like to recap some of the results I obtained through the analyses I have presented to you, based on Sarkozy's speech on plain packets and on the commentaries that followed.

The interpretative work done by the scholarly analyst, on the one hand, and by the "ordinary" participants, on the other hand, relies on clues that are very similar, and results in diagnoses that may be more or less convergent. The main difference however is that the ordinary participant is, well, a participant: he is engaged in the exchanges, he is sensitive to the issues at stake, to accomplish his own objectives he has to negotiate with his partner in the interaction, who pursues other objectives that may be incompatible with his. And when he shows, through his approval or his criticism, how he interpreted his opponent's argumentation, it may sometimes not be just for the sake of it: since some interpretations in terms of argument scheme result in an increased or decreased vulnerability of the initial argumentation, they have to be understood as strategic moves.

But this is not always the case: as we also observed, many commentators do disconnect their own position on the question at stake from the way they criticize it. They interpret and assess the argument under discussion per se, from a somewhat detached position that is reminiscent of the scholarly analyst's position.

My intention is not to claim that we, as analysts, should quit our jobs since so many people do it, sometimes in a witty way, and for free. It is rather that the cognitive process through which participants in an argumentative discussion interpret their partner's argument, the choice they make of displaying, in their own reaction to it, such or such an interpretation, of expressing approval or disagreement on the basis of the assessment they attached to this interpretation, are very complex, valuable and exciting objects for us, as scholars in argumentation studies.

On the necessity of community argument, along with inherent and emerging obstacles to it

DALE HAMPLE

Department of Communication
University of Maryland
United States of America
dhample@umd.edu

ABSTRACT: The most productive arguing typically involves differences in views, and these are to be experienced in contact with communities other than the arguer's. These communities can be social groups or, metaphorically, discrete sections of long term memory. Evolution has ensured that people are inclined to agree with their own social communities and disparage out-group views. It has also designed human memory to have isolated chunks of information that do not normally touch. These inheritances are inherent obstacles to community argument. Emerging ones come from recent work by social scientists, who are designing persuasion techniques that are intended to short-circuit critical thinking. These research projects include distraction, nudging, narratives, visual messages, and others. The ISSA community should begin work on a pedagogy to address these matters.

KEYWORDS: community argument, critical thinking, evolution, interpersonal argument, memory

1. INTRODUCTION

Although arguing can take place without controversy, its great merits occur when it is used to regulate or explore disagreement. Disagreement is normally initiated by contact with the outside – that is, with something external to one's immediate opinions and memories. So a comfortable sequence of thoughts is suddenly interrupted by an inconvenient recollection, or a familiar set of arguments receives an unexpected objection from a new friend. I use the term "community" to describe the sources of both the alien thoughts and the novel interpersonal objection. Disagreement and controversy are always new in this sense, and come from friction within one's interior or social community. Community argument is at once the comfortable give and take one has with well-intentioned intimates, and perhaps more importantly, a social practice in which outsiders are being invited to join and reinforce one's community. At its best, arguing both declares and implements community.

Humans have evolved to participate in homogenous social communities, and the strictures of cognitive efficiency have also generated evolutionary pressures for us to search only local memory to generate our views and decisions. These barriers against community argument (involving disagreement and controversy) are inherent. They can be interrupted, but only by dramatic interventions such as programmatic education systems.

Other obstacles to community argument are more recent. These are emerging in social science research that is designed to prevent critical thinking about potentially controversial topics. In the last half century researchers have been developing persuasion technologies that intentionally induce people not to think hard about persuasive messages. These technologies include distraction, narrative argument, visual argument, heuristics, nudging, and immersive virtual reality.

The ISSA community is uniquely qualified to invent critical thinking principles that can be applied to all these persuasive technologies, not just to the linear verbal forms that have been our preoccupation. I call on the ISSA community to work on a generalized

argumentation pedagogy that can be simply taught, and that can therefore become a reflexive part of people's self-defense systems against exploitive or otherwise bad arguments. We need to be able to teach people how to push any argument up against a community that might be justifiably discrepant.

In this paper, I will first review the well-understood case for having community arguments. Then I will explore both the inherent and emerging obstacles to it. I will conclude by suggesting how our own community should try to address the problems I describe.

2. THE NECESSITY OF COMMUNITY ARGUMENT

I am using "community" partly as a metaphor here. By this term, I mean to indicate that various people (or thoughts, but we will get to that) live jointly and communicate freely with one another, so that when they exchange reasons they experience a community argument, aimed at community agreement. The fact that all these people are part of the same community is not a small thing, and we will soon see how important it is. In the modern age, literal communities are shared by heterogenous people. These different people have different backgrounds and life histories, and so they often diverge in terms of their beliefs, values, and judgments. When they talk or exchange reasoning with one another, they speak from different stances and reflect different views.

These differences are the source of much of arguing's value. We can review an argument that draws on nothing new. This happens to some of us when we read an article that we wrote 20 years ago. This sort of argument review is no longer inventive and might remind us of something, but it does not really move us to any new conclusions. However when we talk with a person noticeably different from ourselves – a person strange in his value judgments, odd in her life experiences, peculiar in his attitudes, mysterious in her allusions, and surprising in his reasons – that is when we are challenged. We may turn stubbornly away from the challenge, and in that case we will gain little. But alternatively we may engage our neighbor in her suddenly apparent differences, and it is then that we can improve our thinking.

Notice that several things are required for profitable community arguments. First, there must be difference, difference that leads to disagreement in the moment. In addition to this friction, we must also have mutual engagement, variously called clash or responsiveness (Jackson, 2017). And of course, we need to have enough commonality for communication to take place (Brockriede, 1975; Sprain & Black, 2018). These are the conditions that have led to some of the great debates in human history: between democracy and the divine right of kings (Habermas, 1989), between Protestants and Catholics (Edwards, 2004), between subordinate women and dominating men (Beauvoir, 1972), between the sciences and the humanities (Snow, 1963), between private property and public interest (Carson, 1962), and a multitude of other great arguments that have brought each of us to our present place.

We can also understand our own minds as communities. We have chunks of memory segregated from one another to varying degrees. Sometimes we pass easily from one community of knowledge to another, as when we think about automobiles and then about mass transit. Sometimes it is more effortful to move from one to another, as when we think about automobiles and then Roman aqueducts. I will use "community" metaphorically to include this interior passage from one portion of our mind to another because for the purposes of this paper, that interaction is enough like moving from one's own thoughts to a neighbor's that I can make similar points about both processes.

Arguments without controversy have their place and can generate entertainment, self-esteem, or social identity (Cho, Ahmed, Keum, Choi, & Lee, 218; Hample, 2018, ch. 2). But they do not generate intellectual growth or change. Whether we are interested in personal or

social development, community argument is necessary. Divergence and reasoned engagement are essential for the development of new meanings, which is the province of serious argument (Hample, 2009). Thus, I am convinced that community argument is a necessary feature of civilization and personal improvement.

3. INHERENT BARRIERS TO COMMUNITY ARGUMENT

In this morning's time and place, I doubt that there is much controversy about the value of the sort of arguing I have described, and so I will not elaborate on that theme any further. Instead, I want to discuss some of the threats to the possibility of vigorous, divergent, reasoned disagreement. In this section I will examine two inherent problems for community argument, obstacles that human evolution has insisted upon. In the next large section, I will address some recent barriers that also deserve more notice from our community.

3.1 Evolved sociality

Humans evolved as a social species. Both our primate ancestors and early versions of our own species lived in small tribes or family groups. Fagan (2010, p. 6) suggested that a typical Neanderthal never came into contact with more than a few dozen other humans in a lifetime, and that most of the out-group contact was very brief (also see Simpson & Belsky, 2016, p. 94). A person's life was tightly composed in regard to social relations. Every individual depended on others for hunting, for gathering, for exploring, for sheltering, for mating, and so forth. Today we think of our social groups as sources of interpersonal stimulation and emotional pleasure, but in our environment of evolutionary adaptedness (EEA) the kinship group was a decisive determinant of life or death.

 People who lived comfortably in groups were favored evolutionarily. Loners, people who were uncooperative, those who would not do their part – these people either left their tribes or were shunned (Cosmides & Tooby, 1992; Roos, Gelfand, Dau, & Lun, 2015). Alone, one's survival prospects were slim, and life expectancy would be measured in days or weeks. Survival and reproduction required cooperation, conformity, reliability, reciprocity, and trust (Bateson, 1988).

 But this cannot be the whole story. As we contemplate our own lives, we see that argument is all around us. Disagreement, withholding cooperation, not taking the other at his or her word, insisting on a different decision – how could all of these also have developed as psychological adaptations in the face of these critical needs for sociality? Mercier and Sperber (2017) proposed that arguing originated in response to persuasion. The simplest sort of persuasion is a command or request, a more nuanced version includes a reason for the desired action, and a much more sophisticated kind of persuasion provides a *good* reason. Mercier and Sperber said that people developed epistemic vigilance so that they could distinguish these sorts of communicative events from one another, and thus to protect themselves against unreasonable exploitation. As millennia passed, persuaders learned to anticipate critical reactions and thus began to argue better.

 So from an evolutionary point of view, arguing has always lived in the friction between two powerful energies: sociality required cooperation and agreement, and self-defense required reasoning and reserve. The inevitability of difference among humans collided with the need to merge oneself into the tribe. Rejecting the kinship group would be fatal, and inability to defend oneself against self-interested persuaders would be fatal as well. People who could not maneuver between these pressures did not become our ancestors.

Of the two forces, sociality is the one that presents an evolved obstacle to community argument. Spoor and Kelly (2004) said that our early tribal communities were oriented to group affect, and that positive feelings were one of the factors that kept people together. A key sort of affect was cohesiveness, which had three elements: interpersonal attraction, commitment to a task, and a sense of pride in one's group membership. Here again we see the idea of cooperation and the impulse for agreement as a foundation for group life. To disagree, to reject, to doubt, to refuse – these are all contraindicated by cohesion. To bond is to agree, and so agreement is pleasurable.

This sociable wiring continues to affect human life today. A huge quantity of contemporary research in social psychology is collected under the idea of a "need to belong," which has the evolutionary basis just reviewed (Baumeister & Leary, 1995, esp. p. 499). Today, isolation is connected to poor physical and mental health, and people are distressed at the prospect of a social bond breaking (e.g., by divorce or geographical separation). Evolution established the norms and essential behaviors for interpersonal attachment from birth to old age, and so continues to outline the organization of our families and close relationships (Simpson & Belsky, 2016). Our social lives can be partly summarized as continuing patterns of attachment impulses, and these are determined by our trust and respect for others as well as our self-regard. These put us into a place in every relationship. And more importantly, these motivations cause us to seek affiliation and to be disturbed or hurt by a lack of attachment.

Belongingness, a highly desirable form of sociality, reverberates though the human condition, and we can see how it influences arguing. The need to belong can spontaneously transform into a need to step back and pacify because human social systems had clear hierarchies of power and status (Boehm, 1999). When people are faced with danger, professors of argumentation would like to mention that one might try to manage the threat with arguments, but this is a minor suggestion in view of the main impulses evolution has provided: fight/flight or tend-and-befriend (Taylor, 2012). Fighting might be argumentative but might also be physical or otherwise unreasoned. Flight is avoidance, and so rules out any sort of interaction. Tend-and-befriend is the impulse to affiliate immediately and insistently in response to an outside threat. Very generally speaking, evolution has taught men to fight or flee and has taught women to retreat to a condition of social support that throws up a barrier to invaders (Taylor, 2012). Tend-and-befriend is a particular sort of motivated avoidance, in which one retreats from an outside challenge – physical or argumentative – and seeks protection within one's most valuable social group. Tend-and-befriend, flight, and maybe fight have in common that they shun argumentative involvement.

We see all these impulses still strongly at work today. People prefer to interact with people they agree with and therefore people who can be depended upon to agree in return. Normally we seek to bond, not to debate. People are threatened by the prospect of discussing any divisive issue (Simons & Green, 2018). Noelle-Neumann's (1974) "spiral of silence" theory said that the fear of social isolation would make people reluctant to express unpopular opinions. A recent meta-analysis (Matthes, Knoll & von Sikorski, 2018) has shown that the spiral of silence is reliably apparent in human behavior and intentions. The modest overall effect ($r = .10$) was dramatically increased ($r = .34$) when people were confronted with the possibility of expressing a minority opinion about a personally important matter to one's friends or family. The more important the social bond, the more attractive was the silence.

The ideal of community argument, however, objects to silence and requires that people come into serious contact with others who disagree. In terms of the EEA, this might amount to interacting with a member of another tribe. Here again, we see innate pressures not to engage productively. Mackie, Devos, and Smith (2000) explored the connections between group identification and various reactions to the out-group. Respondents were asked to identify themselves as members of the "group" that had particular views – e.g., that drug

offenses should be strongly punished – but received no advocacy from the other side. Just knowing that the other "group" disagreed with them produced significant feelings of anger and contempt toward that group, as well as intentions to confront or attack the other group. These effects were particularly pronounced when respondents felt that their in-group was in a strong position regarding the issue at hand.

Those group affiliations were artificial, of course. Political parties are more natural tribes today. Gervais (2015) exposed Republicans and Democrats to online comments that were manipulated to be civil or uncivil, but all critical, regarding an Obama Administration policy. The Democrats became angrier than the Republicans when exposed to the incivility, and were also more likely to critique the author of the Obama-opposed comment. This is consistent with the idea that the Democrats were emotionally protecting their home group, but the Republicans were not. This has immediate implications for whether any argumentation is likely to be productive. Molina and Jennings (2018) tested the effects of civil and uncivil online remarks on people's willingness to engage in the deliberation. They found that civil comments led to greater mental elaboration of the issues, and then to more willingness to engage.

So this cursory summary of sociality, one element of our evolutionary heritage, shows that we evolved to need social bonds. Our very survival depended on our motivation and ability to maintain membership in close tribal groups. We continue to act that way today. We try to find groups for ourselves, communities of like-minded people with whom we are comfortable in a literally agreeable relationship. We find disagreement threatening. We prefer cooperation to confrontation, and are hurt and disturbed when our groups begin to flounder or dissolve. Nastiness is a natural response to a disagreeable out-group, but only civility invites good arguing. We have evolved to meet contradiction with silence.

Biology is not destiny, and the inevitability of human differences means that there is also a countervailing pressure that favors arguing. But we should recognize that passivity, avoidance, and insincere agreement are evolved adaptations that are in service of our larger social lives. These things can be addressed with large-scale interventions, such as K-12 public education, but superficial complaints about people occupying "echo chambers" are no more than shouting into a hurricane.

3.2 Evolved cognitive modularity

To this point I have been considering "community" in a fairly literal way. I have been thinking about families, neighborhoods, and identity groups, and contemplating the consequences of members of those communities not arguing with one another or their more distant neighbors in a constructive way. But not long ago, reading Cherniak (1986) made me realize that another sort of community, this one more metaphorical, also had important relevance to whether or not we argue well. These "communities" are the little sections of our minds that operate with easy modularity and only effortful cross-module coordination. I am proposing that we think of each module as a community, and that we consider what happens when the communities do not easily speak to one another.

A number of psychological theories deal with the "modularity of mind," a theoretical orientation that began in modern times with Fodor (1983) and has much older roots in faculty psychology. The basic idea is that evolution created specialized information processing abilities so that people could avoid danger, detect cheaters, recognize safe habitats, remember words, form sentences, and so forth. The modules are distinct both biologically and functionally, so that verbal abilities have particular brain locales, as do musical abilities or spatial reasoning. It is easy to see how one module's activity might not coordinate in a community way with that of another module. For instance, if a children's song gave directions

for finding your way home in a forest, people might well be able to sing the song without absorbing anything about navigation in the woods. Kenrick (2012) said that humans and other animals evolved minds in which different functions are separated so that they can operate without interference from other elements of the mind. He offers the example of birds that learn birdsong in starkly different ways than they learn what foods are poison, and that both are quite different from how birds learn and remember the day's location of good food. This is in the service of speed and efficiency, so that conclusions that were urgent in the EEA would appear as quickly and simply as possible.

Here I want to concentrate on a special modularity, the one that Cherniak (1986) discusses at length – the modularity of long term memory (LTM) stores. Humans have two memory sites, short term (STM) and long term memory. Our active thinking goes on in STM. We can bring about half a dozen things into STM at once, and we shake them together, making inferences, noticing consistencies, realizing how one is an exception to another, and so forth. All these things (even the names of percepts) have to be retrieved from LTM. Essentially, our thinking goes on in STM, which is therefore the site for producing, evaluating, and comprehending arguments. LTM, on the other hand, is like a warehouse in which innumerably more than half a dozen things are stored. The items on the shelves of LTM are essentially inert, dissolving slowly unless the forklift comes around periodically to take them into the STM showroom. If all the relevant items are not retrieved from LTM so that some memories have no voice, we have something analogous to a failure of community interaction.

The architectural problem is that the forklift needs to find things efficiently. LTM searches cannot be done randomly because that would be hopelessly inefficient, and our ancestors would all have died thinking about clouds or flowers because the forklift failed to return anything involving predators that live in caves. LTM has to be organized somehow, just as we put particular files in particular folders on our hard drives. Even with today's high computer search speeds, most of us still look for files by going to a particular directory, looking at the list of subfolders, and then looking at the names of the files in the list. Imagine looking at a random list of arbitrarily named files, all of them together in a single jumble. Hard drives, libraries, academic conferences, and our own memories – all of them have labeling, indexing, hierarchy, and networking, and all of this is in the interest of efficient retrieval. Some of your hard drive's subfolders are close together in some superordinate folder, but some of them are in storage sections that are so distant that you have to back up almost to your root directory to navigate from one file to another. Some files – some chunks of memory – are in the same community and some are in remote ones.

The point of organizing, remember, is that we do not have to search the whole warehouse. We find what we need and quit looking. This is part of the reason that Cherniak's (1986) theory is called minimal rationality (for other explicit application of Cherniak's theory to argumentation, see Canary, Brossmann, Brossmann, & Weger, 1995; Weger & Canary, 2010), which is a descendant of Simon's idea of bounded rationality (Crowther-Heyck, 2005). There would be no point in bothering to organize memory if we continued to search once we found what we thought we needed. But neither the memory organization nor the search strategies are guaranteed to be perfect.

Cherniak (1986, p. 50) made this point clearly: "…part of the human condition is in fact to fail to 'make the connections' sometimes in a web of interconnected beliefs, to fall short of a synoptic view of one's belief system." That is, human memory is not one liquid volume or force field in which any perturbation (a perception, someone else's excellent argument) automatically ripples out to every other relevant element. STM and LTM are distinct subsystems. Only material in STM can be "worked on:" material in LTM is dormant. Thus if an arguer suddenly realizes that the other person is right, only material that is already

in STM (or that is suddenly retrieved) will be altered. Strength of association predicts ease and likelihood of the materials being connected to one another, and thus able to inform one another. Cherniak (1986, p. 57) related the example of a man who understands that a match will ignite gasoline but nonetheless uses a match to peer into a gas tank. Cherniak's explanation was that "means of ignition" was in a folder not closely associated to "means of illumination." As time and life experience accumulate, "…the inactivity of the beliefs in long-term memory in itself degrades rationality. It results in the accumulation of unrecognized inconsistencies, valuable inferences not being made, and so on. Only the behavior of the contents of short-term memory can counterbalance the results of the inertness of the beliefs in long-term memory and so contribute to the maintenance of adequate rationality" (Cherniak, 1986, pp. 60-61).

So to state my point: We have evolved a mental organization that serves us efficiently but not with perfect rationality. Whether arguing alone or interpersonally, we may forget to mention some important things, we may not realize that we are saying something that we know to be wrong in another context, and we may, in the moment, not bring to bear enough of our own experience to test another person's views properly. These circumstances are analogous to those we noticed when we realized that we prefer to agree with people who are like us, that we exaggerate the badness of out-group arguments, and that we do not seek out people who can give our tribe's arguments their most demanding tests. These are not thinking flaws that derive from the narcissism of millennials, the superficiality of youth, the profit focus of modern technology corporations, or the closed-mindedness of the other political party. These are inherent remnants of our evolutionary heritage. We can rise above them, but only with very substantial interventions that take seriously *why* we have these apparent flaws in critical thinking.

4. EMERGING BARRIERS TO COMMUNITY ARGUMENT

Here I change my chronological focus from the Pleistocene Era to the present day, and my critical focus from the harsh but unprejudiced workings of evolution to the intentional aim of social scientists, who do not seem to have noticed that their work has ethical implications. I will review research from the last half century, research that has been aimed at the development of persuasion technologies that are intended to eliminate or reduce critical thinking on the part of the persuasion's audience. Having reviewed the importance of community arguing in the first portion of the paper I think I do not need to establish here that anything aimed at corroding critical thought is ethically questionable.

4.1 Distraction

As far as I can tell, this history begins in the 1960s with some early research on distraction. Festinger and Maccoby (1964) provided a persuasive message to two experimental groups. One of these was distracted from the message by a silent movie that was being played. The distracted group was more persuaded. Festinger and Maccoby explained this outcome by suggesting that the distracted group had been unable to counter-argue. They paid just enough attention to the message to have been reached by it, but not enough attention to think about it properly. The connection of this distraction effect to counter-arguing was substantially sharpened about ten years later by Petty, Wells, and Brock (1976). They pointed out that distraction's suppression of counter-arguing should promote more persuasion if the counter-arguing would have been negative, but that the suppression might lessen persuasion if the people would otherwise have had positive thoughts about the message. Their pair of

experiments supported this theory. They concluded that "distraction is most likely to lead to *enhanced* persuasion when a message presents poor arguments (i.e., arguments that are open to refutation and counterargumentation) and to *reduced* persuasion when a message presents very good arguments" (p. 883).

The distraction research has continued under a more contemporary label. Jeong and Hwang (2012) studied "multitasking" of the sort that students do while studying. Their experimental groups experienced one of three conditions: no multitasking, multitasking with a primary focus on the persuasive message, and multitasking with a secondary focus on the message. The written messages were constructed on the Toulmin model so that a reasonably capable person could detect flaws in either the data or warrant of the arguments. The experimenters used a portion of a *Transformers* movie as the "other" task. Results showed that the non-multitasking group showed far more counter-arguing than the distracted conditions (η^2 = .12 or .20, depending on the operationalizations). Students distracted by the movie were less able to defend themselves against the poor arguments in the persuasive message.

While Buller's (1986) meta-analysis of distraction effects revealed a somewhat choppy record of designs and findings regarding counter-arguing, he reported an overall correlation of r = -.17 between distraction and counter-arguing, and a correlation of r = -.50 between counter-arguing and attitude change. The first result bears only on distraction as our first documented impediment to counter-arguing. The second result, however, shows how strongly one can increase adherence if only one can reduce critical thinking.

So half a century of research has found the first persuasive technology I am considering here. That is distraction (or multitasking). It is a systematic way of suppressing counter-arguing, and therefore a way of making weak persuasive messages more effective. I have not discovered any papers on this topic where the authors worried about the ethics of distracting audiences so that they thought less critically.

4.2 Nudges

Distraction obviates critical thinking by the simple expedient of getting people not to pay attention. Let us continue that theme by considering nudging. This idea generated a lot of public discussion with the publication of Thaler and Sunstein (1999), but quite a few of us had made at least a general contact with the basic idea by reading or teaching from Cialdini's (1984) book on persuasion tricks, a book that has now moved through many editions, revised titles, and newer publication dates. Cialdini's tricks involve few arguments, and none at the substantial center of the decision. He showed how people's behaviors could be changed by giving them little favors, getting them to agree to something not as weighty as what is wanted, describing a product as scarce, and so forth.

The basic idea of nudging is that people can be persuaded toward some behavior by means of "choice architecture," which is essentially some design feature that encourages the behavior without attracting thought or using explicit argumentation. A prized example is that organ donation choices became enormously more common in France when citizens' default choice changed from "don't donate" to "donate." The government claimed the "automatic" ground in this decision without needing to make an explicit argument to those being asked to donate their organs. E. Johnson et al. (2012) summarized the nudge idea as having two types of strategy: structuring the choice and/or structuring the options. Structuring the task involves things such as deciding how many alternatives to offer, supplying particular online information aids, or setting defaults. Presenting the options to be chosen among may involve placing them into strategically described groups or making certain attributes foregrounded or backgrounded. Notice that none of this involves arguments for or against any of the decisions.

The persuader merely arranges things in a "suitable" fashion and walks away without needing to say anything that a person might think critically about. *The persuasion works by arrangement, not argument.*

Lest readers be skeptical about my worries that the persuasion research I am summarizing will be implemented by professional persuaders such as political or corporate interests, be informed that the U.S., Australian, and U.K. national governments proudly make official use of nudging for what the administrations feel to be our public interests (BETA, 2019; Grunwald, 2009; Halpern, 2015; Social and Behavioral Sciences Team, 2015). Other national governments sponsoring nudge units include the Netherlands (Stroeker, 2016), Germany, India, Indonesia, Peru, and Singapore. International institutions such as the U.N., the World Bank, and others also nudge. More than a few commentators have noticed the ethical implications of persuading people by arranging rather than arguing (e.g., Campbell, 2017). I personally favor organ donation and this is not the place to undertake a critical study of the various things that governments have nudged us to do. My argument in this paper does not depend on my personal balance of skepticism versus cynicism about world governments, marketers, and high-revenue non-profit organizations. I merely want to point out that since the key element of nudging is arrangement, the persuader is not providing anything that can easily be counter-argued. Critical thinking is suppressed, on purpose.

4.3 Narratives

Stories have points to them – perhaps a moral point, perhaps an insight about human nature, or perhaps a behavioral recommendation. Stories can be told so that they feature explicit arguments favoring their conclusion, but more often they simply perform or display the argument's point (Olmos, 2013; cf. Lake, 1983). When the narrative merely enacts the desired behavior, we can see that this is at least a cousin to nudging, because the point is made by arranging the reader's imagined experience, not by making one's reasoning apparent. To model a behavior is not necessarily to argue for it.

Since no linear arguments may be obvious or even present in a narrative, we should not be surprised that Cin, Zanna, and Fong (2004) indicated that one of the sources of narrative's persuasive effectiveness is that very little counter-arguing takes place. Narratives can be conveyed in novels, short stories, poems, ballads, and simple self-disclosures, but quite a bit of the academic interest in the past few decades has concerned what is called edutainment. Governments or other influence agents influence the plot lines of televised dramas or similar vehicles to display safe sex practices, how to deal with school bullies, what to do when your spouse opposes vaccination for your child, and similar topics. Shen and Han's (2014) meta-analysis showed that edutainment modestly promotes persuasion in health contexts ($r = .12$, $k = 22$, $n = 19,517$).

Slater (1997; Slater & Rounder, 2002; also Moyer-Gusé, 2008) made a fundamental theoretical connection between narrative persuasion and the elaboration likelihood model of persuasion (ELM). Readers will know that the ELM proposes that people are persuaded (or not) by careful scrutiny of a message's arguments when they are engaged by the message's topic, but are influenced (or not) by peripheral elements of the message (e.g., source credibility or attractiveness) when they are less engaged. Slater says that when people become caught up in a story or entranced by a character in it (i.e., they are "transported"), they cease to scrutinize the message – either its narrative development or its point. Thus, good narratives reduce counter-arguing.

The empirical record for this prediction is not clear-cut, but perhaps we should not have expected it to be. The degree to which counter-arguing is suppressed is affected by the narrative's power to transport, as well as by the degree to which people can detect that

someone is trying to persuade them. All of the empirical studies use only a few narratives, and we know this will prevent secure generalizations. And most fundamentally, it will never be clear what the narrative is being compared to because narratives inherently cannot contain precisely the same information as a linear message aimed at the same point.

Let me offer a sample of the empirical research on the relation between narratives and counter-arguing. Niederdeppe, Shapiro, and Porticella (2011) compared three written messages about obesity: a narrative, an evidence-based argument, and a combination of the two. They found that the narrative condition generated fewer counter-arguments than the evidence condition, but only for people who self-identified as liberals. The counter-arguing suppression only appeared for a certain group in that study. It did not appear at all in another investigation. Moyer-Gusé and Nabi (2010) showed videos about unplanned teen pregnancy to teenagers in the U.S. One of the videos had a narrative structure and the other did not. They found that being transported by the narrative actually increased counter-arguing, contrary to predictions. They also found that counter-arguing was strongly predicted by viewers' levels of psychological reactance, implying that narratives might successfully be targeted to people who have little disposition to be reactive. However, we should notice that counter-arguing is only one form of message elaboration. Elaboration can also be supportive of a message's point (Petty, Wells, & Brock, 1976), and we should be just as interested in pro-arguing as counter-arguing. Shen and Seung (2018) discovered that self-reported message elaboration was very strongly predicted by transportation and related measures in their study of four videos dealing with sexual health.

Empirical research does not indicate that edutainment always or strongly suppresses counter-arguing. I suspect that the common conclusion that it does (e.g., Cin, Zanna, & Fong, 2004) may be more influenced by the attractiveness of the original theoretical reasoning than by the empirical record. However, in spite of its unevenness, the research literature does seem to show that a suppression of counter-arguing is expectable in some conditions, which of course may be exploitable by a persuader who can distract, nudge, or target audiences to magnify a narrative effect. The more involving narratives seem to have considerable potential for stimulating some sort of elaborated thinking by the audience. Since narratives only need to perform a point rather than argue for it explicitly, institutional persuaders may not find it hard to control what sorts of thoughts are invited.

In the case of narrative persuasion, we have a long-standing theory of argumentative analysis, Fisher's (1987) suggestion that we focus on both the internal consistency of a story (its coherence) and the veridicality of its reference to the external world (fidelity). I think this pair of considerations has promise for critical analysis of narratives and perhaps other sorts of persuasion that suppress critical thinking. But empirical work to this point indicates that these are not spontaneous critical impulses for persuasion audiences.

4.4 Visual persuasion

Some forms of narrative such as edutainment combine a narrative schema with a visual presentation. For some time, argumentation scholars debated whether one could reasonably categorize a visual production as an argument. Today, I believe the debate is over and the consensus is that photographs, cartoons, films, and other images are (or at least can be) arguments (e.g., Birdsell & Groarke, 1996; Groarke, 1996). The reason for the initial debate was that argumentation theorists remained committed to their own educations, which presupposed that an argument was a linear verbal construction that featured explicit premises and conclusions. The argumentation community was able to work through enthymemes and warrants reasonably well, but got stuck for a while when we were confronted with what appeared to be entire arguments with nary a word. Once we were able to understand how to

find the "point" of a drawing or photo, we got to work and learned to move backwards from the visual claim. Current research takes visual-as-argument for granted, and generally tries to work out how to analyze and critique such arguments (e.g., Dove, 2016; Godden, 2013; Ripley, 2008).

But for my present focus on counter-arguing, I want to revisit why it was originally hard to reconcile visual art to argumentation theory. The basic complaint was that visual material wasn't verbal – that premises were hopelessly camouflaged, that inferences seemed magical, and that conclusions could not be securely tracked back to anything. I want to express this in terms that are fundamental to communication theory, as a contrast between digital and analog information (Watzlawick, Beavin, & Jackson, 1967). Watzlawick and his colleagues insisted on a clear distinction between verbal material, which has digital meaning, and nonverbal behavior, which is analog. In 1967, people commonly knew the difference between a digital computer, which stored precise numbers, and an analog computer, which took a continuous input from one source and passed it on to another. A 1960s era thermostat, for instance, was an analog device that took continuous temperature input by heating or cooling metal strips and passed it on to the furnace in the form of continuous adjustment instructions. Wristwatches and clocks used to be analog in those days, too. Language is digital, and a proof of this is that words are to be found in dictionaries that list precise meanings for each word. Nonverbal behavior is analog, and a proof of this is that nonverbal behaviors do not have dictionaries. (This is why "body language" is a nonsense phrase.) For instance, a smile can have innumerable degrees. At one point it is alert; at the next point it is polite; at a further point it is friendly; and at yet another point it is welcoming. Those "points" cannot be found in a dictionary. They are more like the continuous information displayed on an old wind-up pocket watch than they are like a machine translator moving words from one language to another. Propositional arguments are digital and visual ones are analog.

With this background, consider a political cartoon. At what point does a politician's nose become Jewish, and the cartoon become anti-Semitic? At what point is the politician's waistline exaggerated so that he becomes greedy? At what point does the curve in the politician's hands become dangerous, so that her extended gesture becomes a choking threat rather than an invitation? These are all interpretive problems and they all have the same nature. In every case I am asking that feathery analog information be translated into granite digital meaning. I can see what the cartoon is conveying, in just the same way that I can regard an internet meme as annoyingly cute. But I cannot make a sentence that precisely carries what I feel into what I can say. I can convey my intuition or my feeling (cf. Gilbert, 1997), but that is different from being able to write down a clearly examinable verbal argument.

So if the visual argument is something like a heap of impressions, how does one counter-argue against it? That is the crux of the matter for this paper. Just about any objection that is levied against a visual argument can be answered by replying, "I never said that" or "That's only your take on it." Almost everything is deniable, and we are aware of that whenever we start to resist a poster, or a movie, or some protest graffiti. As I mentioned above, some members of our community are working out how to answer a visual argument, but I suspect that the most typical reactions to a visual argument are either to accept it or to walk away. If I am right about that, the only possible outcomes for a visual persuader are to win or to draw. A visual argument cannot be lost, because engagement often seems pointless. Even if a critic believes that he or she has discovered reasoning in a bit of political artwork, the argument can be disowned and denied. Counter-arguing against such a message is like punching air in a dream. I am doubtful that people will naturally try.

4.5 Some new horizons

We are seeing the rapid development of various communication technologies, and naturally these carry affordances for persuasion. Some of the new research continues to see counter-arguing as persuasion's enemy, and suppression of thinking as a badge of persuasive effectiveness.

Advertisers are beginning to generate computer games for children to play (e.g., Waiguny, Nelson, & Terlutter, 2012), and have already found that the degree of children's involvement in the games is important to whether the advertising works. Immersive virtual reality, using either elaborate equipment or newer smartphones, will surely be attracting more and more research attention in the years to come. Blascovic, Loomis, Beall, Swinth, Hoyt, and Bailenson (2002) have written a thorough theoretical review of how to integrate this technology with social psychology, and have identified "social presence" as a key process. Social presence belongs to the family that includes transportation, identification, and parasocial interaction, all of which are now theorized to have implications for counter-arguing. Research on persuasion in this context has already begun, and has shown effects for the realism of digitized persuasive sources (e.g., Guadagno, Blascovich, Bailenson, & McCall, 2007).

I know of only one study that has connected immersive virtual reality to counter-arguing. Two pairs of messages were prepared, an immersive virtual reality one and an ordinary video version. For both topics, the immersive virtual reality version substantially reduced counterarguing (Ma, 2018). The experiences of computer gaming and immersive virtual reality are theoretically similar to those of movies, televised narratives, and edutainment. Distractions can be programmed into these new digital experiences as well. I expect a synthesis of all this theoretical work as soon as the novelty of the new research topics has receded, and we will begin to see systematic exploration of how to suppress counter-arguing across a broader set of communication experiences.

As new media and technologies appear, we can expect that social scientists will continue the patterns of persuasion research that we have seen. That research prizes effectiveness and respects only the most obvious ethical limits. Suppression of critical thinking is too nuanced a consideration for their research programs.

5. COMMUNITY CONCERNS AND AMBITIONS

I hope that I have made a case for concern about the ethical implications of persuasion research. I have reviewed some of the literature on distraction, nudges, narrative, and visual appeals to show that suppression of counter-arguing is a genuine research objective.

The social scientists interested in persuasion only rarely have intellectual backgrounds and commitments that match our own. They seem not to have been educated to valorize critical thinking, at least as we understand it, and when they do reflect on the ability to argue, they seem not to notice that this affordance has ethical implications for personal and public life. This research will not stop, because suppressing counter-arguing is an undeniable route to increased persuasive effectiveness, profit, and votes. So this is going to fall to us, to our very specific academic community.

I think that we need to develop theories and curricula to teach critical thinking about non-propositional and nonverbal arguments. We have had some modest success in teaching critical thinking (Abrami, et al., 2008), as conceptualized by our own Delphi report on critical thinking (Facione, 1990). Students' improvements were most marked in elementary and middle school, with quite small effects reported for high school and college (Abrami, et al.,

2008, p. 1117; Huber & Kuncel, 2016 gave a more positive report about university education's effects on critical thinking, but they reviewed the ordinary experience of college rather than focused pedagogy). However, as we are well aware, these conceptualizations, interventions, and measurements of critical thinking all presuppose linear verbal arguments.

We must develop theories and then pedagogies for doing at least as well for nonverbal materials as we do for verbal ones. Presently, I think our best start is to be found in our literatures about visual and narrative argument.

Godden (2013) argued that visual arguments can be successfully analyzed by means of the theories we have developed for verbal arguments, and others have pursued that same idea. Ripley (2008), for instance, analyzed a simple advertisement for ceramic tile of the sort one might install in a bathroom, and systematically connected that message to theories from formal logic, informal logic, the Toulmin model, multi-modal argumentation, and pragma-dialectics. Dove (2016) applied various argument schemes and their allied critical questions to a simple graphic illustration of the domino theory used by the U.S. to justify military action in Vietnam. The work to date persuades me that we can analyze visual arguments using verbal tools, but I think whether those theories can give a *satisfactorily complete* analysis of visual arguments remains an open question. For one thing, we will need to be quite clear about when one of these visual events is actually intended to be persuasive, because the world is full of innocent distractions, TV shows, and doodles.

In the realm of narrative persuasion, Fisher's (1987) focus on internal and external consistency seem useful. In fact, these two ideas seem analogous to me to the illative core and dialectical tier that we have met elsewhere (R. Johnson, 2000). It might be possible to apply Fisher's ideas to visual arguments of some sorts, and certainly to edutainment.

At a minimum, we need to learn how to identify those features of an argument that are intended to hide it – that is, to suppress counter-argument or other intellectual engagement. We must be able to point to dangerous elements in an argument ("Notice how the music rises up to distract you during the recitation of the drug's side effects"), and we ought to figure out how to detect the targeting of certain audiences ("Why does this edutainment drama feature attractive vampires?"), as is standard in propaganda analysis (Jowett & O'Donnell, 2015). These are not the sorts of things that we ordinarily think about in terms of argumentation theory. Perhaps we need to be more practical and absorb more social science findings into our work, in order to promote critical thinking in emerging communication experiences.

I believe that we need to develop something akin to the old Institute for Propaganda Analysis program for K-12 education (Sproule, 1997). They came up with a list of about half a dozen fallacies, gave them bright contemporary names, and taught students to recognize them. That approach, of course, now seems to have been unduly restricted to verbal appeals. Our community needs to develop a simple list of basic idea that apply across the board – to verbal arguments, but also to visual ones, musical appeals, stories, virtual reality, digital games, product placements, nudges, distractions, and all the rest. It is, as many of us teach in our classes, a matter of public self-defense.

ABSTRACT: People sometimes infer questions from one or more statements. According to Wiśniewski, such an inference is valid in a formal language if and only if the statements entail that the question has a true direct answer but do not entail any of them. I extend his account to natural-language inferences to open-ended questions that cannot be represented in his formalism. On this extended account, the title of the paper has a valid inference.

KEYWORDS: inferences, open-ended questions, questions, validity, Andrzej Wiśniewski

1. INTRODUCTION

In this paper, I show by examples that people sometimes argue for questions, propose criteria for good inferences to questions, and apply these criteria to my title.

2. EXAMPLES

In April 2003 the following conversation occurred on a phone-in program on a radio station in Hamilton, Canada:

(1) *Bus drivers* (taped 2003 04 09)

Caller (Gina, from Toronto): Hi. I wanted to speak about the SARS.[1]

Host (Roy Green): Yes, go ahead, please.

Gina: OK. On the weekend they had... were looking for court orders for two people who had not obeyed the quarantine. They now have a student who cut short her quarantine after ten days to write an exam. She's now ill, and they have now 25 students and a teacher, I believe. *So*, considering how the government mishandled Walkerton[2] and the East Nile virus[3], where... it's worked out OK with SARS, I realize they're not saying an epidemic, but last week before they really, really knew and the TTC [Toronto Transit Commission–DH] drivers wanted to wear a mask, *where* was their union? They said their hands were tied, that they can't do anything when the

[1] 'SARS' abbreviates 'Sudden Acute Respiratory Syndrome', a new respiratory illness contracted by inhaling droplets in the air from infected people, with a high fatality rate (11.5% in Toronto [Low 2004]). Health care workers treating patients with SARS wore masks to protect themselves from infection.

[2] In May 2000, the water supply of Walkerton, Ontario became contaminated with a highly dangerous strain of E. coli bacteria. At least seven people died from drinking the contaminated water, and about 2,500 became ill.

[3] The caller means the West Nile virus. In 2002, Ontario had more cases of human West Nile virus infection than any other Canadian province, with a dozen deaths potentially attributable to it. Spurred on by potential class action suits alleging that Ontarians were ill-informed about the virus, which is usually transmitted by mosquito bites, the Ontario government announced in March 2003 a six-year, multi-pronged West Nile virus action plan.

Board of Health says this, but *why* do people so blindly believe government officials? (Appendix to Hitchcock 2009, pp. 36-39; corrected transcript)

The tone and content of the caller's remarks indicate that she was engaging in argumentation and producing arguments. The conclusion for which she was arguing has the form of a question, introduced by a. conclusion indicator and interrogative particle, which I italicize. It would be easy to extract her argument, set it out in standard form, and display visually its structure and content, numbering the premises and conclusion.

There may be doubt as to whether the conclusion is really a question. The noun 'question' has three distinct senses: a syntactic sense, a pragmatic sense, and a semantic sense (Groenendijk and Stokhof 1996). In the syntactic sense, a question is a kind of sentence (an "interrogative sentence") distinguished by various devices from other kinds of sentences, such as declarative and imperative sentences. In the pragmatic sense, a question is the illocutionary act typically performed in uttering an interrogative sentence; it is the "interrogative act" of asking for certain information. In the semantic sense, a question is the "thing" that is asked (the "question" in the narrow sense) when someone performs an interrogative act, i.e. the content of this act.

I have argued, most recently in (Hitchcock 2018), that the premises and conclusions of arguments are illocutionary act-types, and that the conclusion of an argument can be an illocutionary act-type of any of the five main kinds recognized by Searle (1976): a representative, a commissive, a directive, an expressive, or a declarative. On this conception, the issue concerning the caller's argument is whether her utterance of an interrogative sentence following a conclusion indicator is an interrogative act. Is she really asking something? Not all utterances of interrogative sentences are interrogative acts that ask a question.[4] In particular, so-called "rhetorical questions" are not interrogative acts and do not ask a question. A rhetorical question is an indirect quasi-assertion whose author illegitimately shifts the burden of proof by implicitly challenging the addressee to give a reason for disagreeing with the expected answer (Kraus 2006; cf. van Eemeren 1987).

The interrogative "why" sentence that concludes the caller's argument is not merely rhetorical. It does not challenge her audience to disagree with an assumed answer. Indeed, it is hard to imagine what that assumed answer might be. Rather, it asks the listeners to explain why people so blindly believe public health authorities, given that public health authorities recently mishandled two public health crises. More particularly, she asks the Toronto bus drivers' union in a public forum to justify its alleged belief in the Toronto Board of Health's statement that bus drivers did not need to wear masks.

This single example is enough to establish that people sometimes argue for questions. Existential generalizations are conclusively established by a single instance. However, there may still be doubt about whether Gina's conclusions are really interrogative acts that request information. To allay lingering doubts of this kind, I did a Google search for more examples of arguments for questions, using as search terms two-word strings consisting of an interrogative particle and a conclusion indicator in either order, such as 'so how' or 'why then'. I list the 16 arguments thus discovered in an appendix, grouped according to the apparent purpose of arguing for the question: to stimulate interest in a forthcoming answer (10 passages), to challenge an addressee or a third party (five passages), and to solicit an answer from an addressee (one passage).

I take these 16 passages, along with the passage just discussed and the title of this paper, to establish that people sometimes argue for questions. Further, if arguing for something is trying to justify it, then people sometimes try to justify questions. And, if there

---

[4] Nor do speakers who ask a question always do so by uttering an interrogative sentence. One can ask a question, for example, by uttering an imperative sentence like 'Tell me how you are feeling'.

are norms for doing so that people can satisfy, then people can justify questions. Let us consider, then what such a justification amounts to.

3. HOW TO JUSTIFY AN INTERROGATIVE ACT: A FORMAL APPROACH

The Polish logician Andrzej Wiśniewski has been developing since the late 1980s what he calls "inferential erotetic logic", a logic of inferences to questions, which he calls "erotetic inferences" (Wiśniewski 1996; 2013). His underlying insight is that interrogative acts do not just occur; they arise. In thought or speech, they arise in two different ways. The first way is from beliefs, or, to put it linguistically, from assertions. The second way is from another interrogative act, perhaps with the help of one or more beliefs or assertions. Except in the example listed last in the appendix, the question-conclusions in our examples arise from statements (occasionally disguised as rhetorical questions). I shall therefore restrict my attention to Wiśniewski's account of the validity of inferences of the first kind, from statements to interrogative acts.

Wiśniewski's account of valid erotetic inference applies to any formal language with a dichotomy between declarative sentences and interrogative sentences (which he calls "erotetic formulas"). In such a language each declarative sentence has a truth-value, once its non-logical symbols are assigned an interpretation. The logic for these sentences can be anything one likes. Each erotetic formula consists of a question mark followed by a sequence of two or more declarative sentences within braces and separated by commas. Consider for example the interrogative sentence in example 9 (*Drunks*):

(9) Scientists say there are four types of drunks – *so which* are you?

The conclusion-question is: "Which [type of drunk–DH] are you?" The quoted title does not identify these types, so let us simply use the symbols 't1' through 't4' to abbreviate the sentences 'you are a type 1 drunk' through 'you are a type 4 drunk'. The natural-language interrogative sentence "Which [type of drunk–DH] are you?" would then be formally represented in a Wiśniewskian formal language by the erotetic formula '?{t1, t2, t3, t4}'. An erotetic formula is thus a list of the direct answers to the question that it expresses. In other words, an interrogative sentence is interpreted as the set of its direct answers.

An "erotetic inference of the first kind" is an inference from a set of declarative sentences to an erotetic formula. What does it mean for such an inference to be valid, i.e. for the erotetic formula to "follow from" the declarative sentences? As an analogy, consider the standard model-theoretic conception of the validity of an inference from a set of declarative sentences to a declarative sentence: Validity of this sort is the absence of a counter-interpretation, i.e. the absence of an interpretation (of the inference's non-logical symbols) on which the premises are true but the conclusion is untrue. Wiśniewski, sensibly enough, does not regard erotetic formulas as having truth-values. Rather, they are sound or unsound, depending on whether they have a true direct answer (on a given interpretation of their non-logical symbols). For an erotetic formula to arise from a set of declarative sentences, the set must entail (i.e. logically imply) that the erotetic formula is sound in this sense. That is, on any interpretation on which the declarative sentences are true, the erotetic formula has a true direct answer. Wiśniewski (2013, p. 51) calls this condition "transmission of truth into soundness"

Transmission of truth into soundness is however not enough to make an inference to an erotetic formula valid. For this condition is met by any inference to an erotetic formula from one of its direct answers. For example, it would be met by an inference to our erotetic

formula '?{t1, t2, t3, t4}' from the sentence 't1', a formal representation of the inference to the question 'Which of the four types of drunk are you?' from the assertion 'you are a type 1 drunk'. But validity of an erotetic inference of the first kind is supposed to capture the informal notion of a question arising from given information. If the given information includes or entails a direct answer to the question, then the question does not arise; it has already been answered. Thus the second condition for validity of an erotetic inference of the first kind is that no direct answer to the erotetic formula is entailed by the premisses, a condition that Wiśniewski (2013, p. 51) calls "informativeness". He uses the term 'evocation' for the relation between premisses and conclusion in an inference that meets the two conditions of transmission of truth into soundness and informativeness. A set of declarative sentences evokes an erotetic formula if and only if the set entails that the erotetic formula has a true direct answer but does not entail any particular direct answer.

The concept of evocation does not require that the premisses that evoke an erotetic formula are actually true. It is a conditional concept: *If* the premisses are true, then the conclusion has at least one true direct answer (but the premisses do not settle which).

Further, evocation is always general. The relationship of entailment is a function of the semantics of the logical symbols of the formal language and of the structure of the declarative sentences in the premisses and conclusion. The entailment of the conclusion's soundness and the non-entailment of any direct answer are thus independent of the meaning and reference of the non-logical symbols of the language. We can illustrate this generality by representing formally the inference in example 9:

(9) Scientists say there are four types of drunks – *so which* are you?

For simplicity, let us abstract from the frame "scientists say" and take the premiss to be: there are four types of drunks. This premiss could be represented in a first-order language with a symbol for exclusive disjunction, as follows:

EITHER type 1(x) OR type 2(x) OR type 3(x) OR type 4(x).[5]

And the conclusion could be represented as follows:

?{type 1(you), type 2(you), type 3(you), type 4(you)}[6]

The inference from premiss to conclusion can be interpreted for any universe of discourse (over which the implicit universal quantifier ranges), any four one-place predicates in that universe, and any individual in that universe. For example, the universe of discourse could be taken to be giraffes, the four types could be taken to be the recently distinguished four species of giraffes (Fennessy et al. 2016), and 'you' could be taken to be another name of a baby giraffe named 'Tajiri' born in April 2017 in the Animal Adventure Park in upstate New York. Then the formal inference would represent the following natural-language inference:

(18)   There are four species of giraffes. *So which* is Tajiri?

The formal representation of examples 9 and 18 shows how Wiśniewski's concept of evocation can be used to evaluate natural-language inferences to interrogative acts. There must be a defensible formalization of the natural-language inference that captures the features

---

[5] An initial variable-binding universal quantifier: 'For every x' is implicit in the use of the letter 'x'.
[6] The formalization takes the liberty of treating the word 'you' in the context as a proper name of whoever is reading the passage.

relevant to its evaluation, and this formal representation must represent the interrogative act as a finite list of declarative sentences (the possible direct answers to the question being asked). The premisses of a natural-language inference to an interrogative act evoke the interrogative act if the premisses of such a defensible formalization of the inference evoke (in Wiśniewski's sense) the formal representation of the interrogative act. Applying this criterion to example 9, we can conclude that the premiss in the headline evokes the interrogative act that follows it.

4. HOW TO JUSTIFY OPEN-ENDED WHY-, HOW- AND WHAT-QUESTIONS

This condition for a valid natural-language inference to an interrogative act is a sufficient condition for its validity but not a necessary one. For many natural-language inferences to interrogative acts intuitively are valid but have no defensible formalization that is valid in Wiśniewski's sense. In particular, using his apparatus to evaluate a natural-language inference to an interrogative act requires that the interrogative act can be understood as a request to select at least one member of a specified set of direct answers. But many natural-language interrogative acts, such as almost all why- and how-interrogative acts, do not meet this requirement; one cannot specify in advance a set of direct answers to such questions.

Of our 17 numbered examples, only six (examples 4, 7, 9, 10, 12, 15) argue for an interrogative act that can be construed as a request to choose from among a finite set of direct answers.[7] The rest argue for what we might call 'open-ended' interrogative acts, i.e. for acts that do not contain or entail, even with the help of their context, a specification of their possible direct answers. Eight of these open-ended interrogative acts are why-questions, three are how-questions, and two are what-questions. Wiśniewski calls them "topically-oriented questions" and describes them as "a hard nut for the analysis of questions, both logical and linguistic" (2013, pp. 10-11).

Although we cannot apply Wiśniewski's formal criteria for evocation to inferences to "open-ended" or "topically-oriented" questions, the informal insights underlying these criteria do seem applicable to them. Despite the absence of a complete finite list of the direct answers to such a question, we can ask whether the premisses in context entail that the interrogative act is sound (i.e. has a true direct answer) and whether they entail a direct answer to it.

Consider first any inference from a set of declarative sentences to a why-question. A why-question is a request for an explanation. Showing that a why-question is sound, in the sense of having a true direct answer, requires establishing the reality of the "thing" for which an explanation is requested. In example 1, for instance, if the union leaders did not in fact believe the Board of Health, but were merely legally obliged forced to accept its assurance, then Gina's question to them ("Why do people so blindly believe government officials?") is not sound. There is no true explanation of the occurrence of something that did not occur.

An additional requirement for a sound why-question appears to be that the "thing" for which an explanation is requested actually can be given one. Arguably, some facts cannot be given an explanation; they are "brute facts, random events, things coming about without rhyme or reason, occurrences happening because of nothing in particular, capricious actions, ultimate truths, so's without why-so's" (Bromberger 1992, p. 167). If there are such "things" for which why-questions make no sense, do the premisses and context of a natural-language inference to a why-question need to entail that this particular why-question does make sense? That is, do they need to show that the "thing" for which an explanation is requested actually has an explanation? Here we can perhaps accept a default position that in general things have explanations, so that a why-question is always apt about any reality, whether this reality is a

---

[7] Example 6 raises two questions, one construable as a request to choose from a finite list of direct answers, the other not so construable.

general phenomenon or a particular event or a particular decision or a person's mental state at a given time or whatever. An argument for a why-question would thus not need to establish that the "thing" for which an explanation is requested has an explanation, although a critic of such an argument could object that the "thing" in question is the sort of thing that lacks an explanation. The burden of proof would rest on the critic to sustain the objection. In solo reasoning, an inference from a set of beliefs to a why-question would be defeasible, subject to a rebutting defeater that makes the question empty.[8]

The second informal criterion for a valid inference from representative illocutionary acts to an interrogative act is that the premises do not entail a particular direct answer to the interrogative act. This requirement applies directly to a natural-language inference to a why-question: if the premises in context include or entail a direct answer to the question-conclusion, there is no point in asking it, i.e. the question does not arise.

Further, a question does not arise if it is common knowledge, independently of the premises, that there is no point in asking the question. One obvious reason for asking a question is that the questioner does not know the correct answer and is asking the addressee to supply it; this may be Gina's reason in example 1 for asking her question. Another reason is to motivate interest in finding out the correct answer, in a case where the questioner knows it but the addressee does not, as in example 2 about smart phones, where the questioner has an answer ready to the question why you cannot put your smart phone down but assumes that the addressee does not. There is a similar structure in the pedagogical use of arguments for questions. The teacher can make learners aware of something that needs explanation, as a basis for requesting the explanation, perhaps inviting the learners to make their own suggestions and test their adequacy. In a test situation, an examiner may pose a question to which both the examiner and the test-taker know the correct answer, but the examiner does not know whether the test-taker knows the correct answer and wants to find out. The common feature of all these situations is that posing a why-question makes sense, whether as a request for information or as a motivator of attention to a subsequent proposed answer or as a pedagogical device or as a testing device. An inference to an interrogative act would make no sense if there was no such reason for posing the question. It is perhaps debatable, however, whether the existence of a reason for posing a question-conclusion is a requirement for the validity of the inference or merely a pragmatic constraint on when it makes sense to draw the inference. Let us include it as a requirement for validity, with the parenthetical acknowledgement that it may be just a pragmatic constraint.

We can summarize the informal requirements for a valid natural-language inference to a why-question as follows:

1. The premises and context entail that the "thing" for which an explanation is requested is a reality.
2. There is no good reason to think that the "thing" for which an explanation is requested lacks an explanation.
3. The premises and context do not entail any particular explanation of the "thing" for which an explanation is requested.
4. The context provides a good reason for posing the why-question, typically lack of knowledge of the correct answer by the questioner or the addressees. (This

---

[8] Bromberger (1992) on the other hand seems to regard the class of unexplainable facts as quite large, so that judging that a why-question is sound requires knowing that the fact for which an explanation is requested actually has one. Further, as he points out, the structure and content of a why-question do not provide a basis for this knowledge. Hence "what we don't know when we don't know why" (the title of his article) is what we must find out to know whether there is anything to know at all (p. 168).

requirement may be a pragmatic constraint on making the inference rather than a requirement for the validity of the inference.)

How-questions request a description of the mechanism by which something occurs.[9] The conditions for a valid inference to a how-question are thus similar to those for a valid inference to a why-question, with the second requirement replaced by the requirement that the "thing" for which a how-explanation is requested is the outcome of, or is constituted by, a process, whose components and sequencing can be described.

Let us consider finally open-ended 'what' questions whose content and context do not entail a specification of the kind of thing that can be a direct answer, such as Wiśniewski's example of a "topically-oriented" what-question: "What do you know about the case?" (Wiśniewski 2013, p. 11).[10] In standard contexts, uttering such a sentence would constitute a request to the addressee to tell the questioner everything that the addressee knows about the referenced case, whose identity would need to be established by the context. How could we apply Wiśniewski's two criteria to such an open-ended what-question? The first criterion is that the premisses entail that the question has a correct answer. In Wiśniewski's example, the soundness of the interrogative act seems to consist solely in there being a single case to which reference is being made. It seems too demanding, however, to require that the set of premisses by itself entails that there is one and only one case. The identity and reality of the case referred to may be obvious from the context. For a natural-language inference to an open-ended what-question, it seems enough to require that the set of premisses and the context of utterance entail the reality and identity of any objects whose reality is presupposed by the interrogative act.

Wiśniewski's second criterion is that the set of premisses does not entail a particular direct answer to the conclusion. We can embrace this criterion directly. However, in addition to embracing directly the criterion of not entailing a direct answer to the question, we should require, as with inferences to open-ended why-questions and how-questions, that the context provides a good reason for posing the open-ended what-question.

We can sum up the conditions for a valid natural-language inference to an open-ended what-question, as follows:

1. The premisses and the context entail the reality and identity of any objects whose reality is presupposed by the interrogative act.
2. The premisses and context do not entail any particular direct answer to the what-question.
3. The context of the inference provides a good reason for posing the what-question, such as the questioner's or addressees' lack of knowledge of the correct answer. (This requirement may be a pragmatic constraint on making the inference rather than a requirement for its validity.)

---

[9] Not all interrogative sentences beginning with 'how' express a how-question. The sentence 'How could you do that?', for example, is typically not a request for a description of the process that made it possible for the addressee to do "that". It is a reproach, calling for a justification or an excuse or an apology.

[10] Neither of the two what-questions in our sample is completely open-ended. The what-question in example 4 (*The benefit of each form of consciousness*) is a request for a list of the benefits of each of three posited types of consciousness, and depends for its soundness on the adaptationist paradigm accepted by its author. Within this paradigm, benefits are, roughly speaking, things that increase the probability of the continued existence of the species that has them. This conception of a benefit provides a rough guide to the invention of hypotheses that can be tested in "just-so" stories. The what-question in example 6 (*Cooking oil*), "what should we be cooking with?", can be elaborated on the basis of the context as the question: What sort of oil should we be cooking with? The possible cooking oils can be completely specified. Thus this particular what-question is amenable to Wiśniewski's formal approach.

It seems possible to extend to other types of open-ended questions the proposed approach to evaluating natural-language inferences to open-ended why-, how- and what-questions.

5. APPLICATION OF THESE CRITERIA

Doubts about the adequacy of the proposed criteria may arise when we apply them to the arguments in our sample for open-ended why-questions and how-questions. Some examples clearly meet them. The title of this essay meets them. So, it seems, do examples 1 (*Bus drivers*), 5 (*How to make choices in life*), 6 (*Cooking oil*), 8 (*Eating vegetables*), 11 (*Roseanne*), and 13 (*The Cranberries*). In these arguments, the premiss or premisses entail (or at least might plausibly be thought to entail) the reality of the phenomenon for which an explanation is requested (justifying questions, belief by the bus drivers' union in the Board of Health's assurance, human beings' freedom to make decisions for which they can be held responsible, some oils being better than others to cook with, some people disliking vegetables, Roseanne's fictional Lanford being based on the real suburb Elgin, other musicians issuing records of the type of music that The Cranberries play). Thus they contribute to satisfaction of the criterion of transmission of truth of the premiss to soundness of the question-conclusion.

Five other arguments in the sample, however, have premisses that seem relevant but make no contribution to satisfaction of the criteria derived from Wiśniewski's formal account[11]–examples 2 (*Smart phones*), 3 (*Eating Tide Pods online*), 12 (*Paul's letter to the Galatians*), 14 (*Bigoted harassment at New Zealand sports events*), and 16 (*The holy coat at Trèves*). Not coincidentally, each of these arguments is an argument for an open-ended why-question. In each case, the sole premiss neither states nor entails the reality of the phenomenon about which the why-question is asked (the Galatians regarding Paul as their enemy, the addictiveness of smart phones, moral panic at teens eating Tide Pods online, harassment at New Zealand sports events, country people coming to see the holy coat at Trèves). Rather, the arguer seems to presuppose knowledge by the addressees of the reality of that phenomenon. Instead of asserting or entailing the reality of the phenomenon for which an explanation is requested, the premiss provides a reason for finding the phenomenon puzzling, and thus in need of an explanation. The Galatians warmly welcomed Paul in the past, so their present coolness needs an explanation. Smart phones make people stupid, antisocial and unhealthy, so people's addiction to them needs explanation. Only 86 teens ate Tide Pods online, so the worldwide moral panic at teens eating Tide Pods online needs explanation. There is no room for bigotry in sport, so the bigoted harassment at New Zealand sports events needs explanation. Nobody shuts the Tower of London to sightseers because of the legends associated with the objects displayed there, so objections to country people coming to see the holy coat at Trèves need explanation. In these five arguments, the premiss seems to have the function of establishing the fourth, possibly pragmatic criterion for a good inference to an open-ended why-question: that there is a reason for posing the question. The premiss establishes that the phenomenon presupposed by asking the why-question is not what one would expect, and is thus in need of explanation. Thus, despite initial appearances, the apparent validity of these five arguments is compatible with the account in the previous section of a valid inference to an open-ended why-question.

---

[11] I owe recognition of this fact to Marcin Selinger, who pointed out in e-mail correspondence that the premiss of example 3 (*Eating Tide Pods online*) was not a presupposition of its question-conclusion.

6. THEORETICAL ISSUES

Three theoretical questions have been raised about this account of arguments for questions:

1. Are the premisses of a valid inference to a question just the presuppositions of that question?
2. Does it make sense to speak about arguing for a question?
3. Does it make sense to speak of justifying a question?

I shall discuss each of these questions in turn.

(1) Are the premisses of a valid inference to a question just the presuppositions of that question? To answer this question, one needs to clarify the concept of a presupposition of a question. Belnap (1969) defines a presupposition of an interrogative sentence as a declarative sentence that is entailed by each of its direct answers.[12] In languages where any declarative sentence entails infinitely many distinct declarative sentences (e.g. those obtained by successively adding one disjunct at a time or by successively conditionalizing with a new antecedent), an interrogative sentence that has one Belnapian presupposition has infinitely many of them. Thus in such languages the premisses of an inference to an interrogative sentence cannot assert all its Belnapian presuppositions. They may however entail all of them. Since the falsehood of any such presupposition entails the falsehood of each direct answer (i.e. the unsoundness of the question), the truth of them all is a necessary condition for the soundness of the question. Hence the premisses of a valid inference to a question (including those supplied by the context) must entail the truth of all its Belanpian presuppositions. But, as pointed out in the previous section, they may include other information, such as a reason for thinking that a why-question needs to be investigated, that its obvious answer is false.

(2) Does it make sense to speak about arguing for a question? Some scholars argue on theoretical grounds that the conclusion of an argument must be of a certain type–a type that does not include questions (whether these are construed as illocutionary acts of asking or as their semantic contents). For example, the pragma-dialectical approach of van Eemeren and Grootendorst (1984; 1992; 2004) construes argumentation as a complex of assertives put forward in an attempt to justify or refute a proposition, in the context of a critical discussion whose function is to resolve an expressed difference of opinion about the proposition. The epistemological approach of Christoph Lumer (1990; 1991) holds that the conclusion of an argument must be a judgment that a definite proposition is true or acceptable, on the ground that an argument is an instrument whose standard function is to produce knowledge in an addressee who knows the premisses but not the conclusion. Such theorists have at least two ways of dealing with apparent arguments to questions like those in examples 1 through 17. One way is to construe them as preliminary to argumentation as they understand it. For example, the pragma-dialectical model of a critical discussion could be expanded to include a stage prior to the confrontation stage at which a question is shown to be sound; the confrontation stage would then consist of an expressed difference of opinion about a proposed direct answer to this question. A second way is to reconstruct them as being really arguments for something else. For example, what looks like an argument for a question could be construed as an argument that the question is worth investigating, since it has a correct answer that is not yet known. In the pragma-dialectical approach, the proposition that a given

---

[12] In the logical theory of questions developed by Kubiński (1980), questions of many forms have a single syntactically constructed presupposition, and the truth of that presupposition entails the soundness of the question. Space limitations prevent discussion of this alternative conception of a question's presupposition. It does not extend to formal representations of the open-ended why-questions and how-questions that occur most often in examples 1 through 17.

question is worth investigating could then function as the locus of initial disagreement. In Lumer's epistemological approach, an apparent argument for a question could be construed as an attempt to produce knowledge in the addressee that the question is worth investigating. Lumer (2014) has already produced a nuanced parallel example of such a reconstruction, in which he uses his epistemological approach to develop criteria for a good argument that an action is prudentially justified. The conclusion of such an argument is not a decision to perform the action, but a judgment that, prudentially speaking, the agent ought to perform the action. Nevertheless, such an argument serves to justify and motivate performance of the action.

(3) Does it make sense to speak of justifying a question? To argue for something is to try to justify it, i.e. to show that it is correct. (To argue against something is to try to refute it, to show that it is incorrect.) Thus, if there are arguments for asking questions, then there are attempts to justify such acts. And, on the approach taken in this essay, such attempts can succeed. Hence, if the approach of this essay is correct, people sometimes justify acts of asking a question. That is, they show that it is correct to ask the question. The reader may doubt that it makes sense to say that asking a question is correct. To allay such doubt, one can point out that correctness here does not mean truth or warranted acceptability or any such truth-like status. It means soundness, the existence of a correct direct answer to the question asked, combined with ignorance of what that answer is. Thus to call asking a question "correct" may involve some stretching of the concept of correctness, but the stretching is to something closely analogous to the correctness of asserting a proposition. If this stretching is accepted, then it does make sense to speak of justifying a question.

7. EVALUATION OF THE TITLE

The interrogative component of my title expresses a genuine question: How does our justification of questions work? It is a how-question, a question about the process by which a question is justified. The word 'so' is genuinely inferential, indicating a basis for posing the question in the statement that precedes it, "We justify questions", whose meaning is that people sometimes try to justify a question. My 17 examples were directed at establishing the truth of this premiss. The question-conclusion is a normative one: a request for criteria for justifying an interrogative act.

Let us then apply to my title the proposed criteria for a valid inference from a set of declarative premisses to a how-question. I repeat each criterion in italics, then apply it:

1. *The premisses or the context entail that the "thing" for which a how-explanation is requested is a reality.* The premiss directly asserts the reality of the thing for which a how-explanation is requested.
2. *The "thing" for which a how-explanation is requested is the outcome of, or is constituted by, a process, whose components and sequencing can be described.* Justifying anything is a process, whose components and sequencing can be described.
3. *The premisses and context do not entail any particular how-explanation of the "thing" for which an explanation is requested.* My premiss, which lacks a context, does not entail any particular explanation of how one can justify a question.
4. *The context of the inference provides a good reason for posing the how-question, such as lack of knowledge of the correct answer on the part of the questioner or of the addressee(s).* I assumed in composing my title that my

prospective audience generally would not have a ready explanation at their disposal of how justification of questions works, given that the most influential contemporary normative theories of argumentation, which construe it as an attempt to justify a claim or a standpoint, do not include questions among the sorts of things that argumentation tries to justify. I hoped that, given the interest of my audience in understanding argumentation, its members would be interested in finding out how a set of declarative sentences can justify a question. In fact, when I composed my title, I did not know the answer myself.

Thus, as far as I can see, my title meets the conditions for a valid inference to a how-question. These conditions are ontic conditions, which may hold even if those invited to draw the inference are unaware of whether the conditions are met. In this case, however, I am confident that my audience realized that these conditions are met. Hence the inference of my title is not only optically valid, but is also epistemically valid for my initial audience.

8. SUMMARY

People sometimes justify questions. They do so by advancing arguments whose conclusion is a question. The inference in such an argument is valid if the context and the premises entail that the question has a correct answer but do not say what that answer is. There must be a point of asking the question, such as ignorance of the author or addressees of the correct answer. This requirement may be a pragmatic constraint rather than a requirement for the validity of the inference. The title of this paper meets these criteria, and thus has a valid inference.

APPENDIX

This appendix quotes and analyses briefly 16 arguments for questions found in the Google search mentioned in the text. As in example 1, I italicize the conclusion indicator and interrogative particle that introduce the conclusion.

In 10 of these arguments, the reason for arguing for a question was to provoke interest in the subsequent revelation of the correct answer.

> (2) *Smart phone* (2018)
> Your smart phone is making you stupid, antisocial and unhealthy. *So why* can't you put it down? (Eric Andrew-Gee, *The Globe & Mail*, 2018 01 06; available at https://www.theglobeandmail.com/technology/your-smartphone-is-making-you-stupid/article37511900/; accessed 2018 01 31)

The argument in this headline is arousing interest in the columnist's explanation of the addictive properties of the smart-phone experience.

> (3) *Eating Tide Pods online* (2018)
> Only 86 teens ate Tide Pods, *so why* did the world erupt in moral panic? (Amelia Tait, *New Statesman America*, 2018 01 30; available at https://www.newstatesman.com/science-tech/internet/2018/01/only-86-teens-ate-tide-pods-so-why-did-world-erupt-moral-panic; accessed 2018 01 31)

The argument in the headline is stimulating interest in the author's explanation of the allegedly disproportionate moral panic at online videos of teenagers swallowing Tide Pods.

(4) *The benefit of each form of consciousness* (posted 2012 09 20)
There are a lot of different definitions of the word "consciousness." There are three that I find useful. One is basic consciousness that all animals probably experience some version of: awakeness, alertness, a coherent sense of one's body state and one's placement in the world. Then there's the additional thing that humans have: social consciousness, the awareness of minds in the world with their own intentionality, from which comes the awareness of our own minds. It's likely that all of the other big, social mammals have their version of this, and maybe birds do too. Finally, there's yet another layer of recursive abstraction: awareness of one's self-awareness (and awareness of that awareness, and so on.) This ability requires a lot of processor power, a large memory, a vocabulary of semantic symbols to efficiently store things in that memory, and so on. I'm pretty sure that humans are the only animals to have this ability, though maybe some of the other apes do too; it's hard to know. *So what* is the benefit of each of these forms of consciousness? (Ethan Hein, self-described "enthusiastic amateur evolutionary biologist", answer posted 2012 09 20 on *Quora*,[13] in response to the question raised in passage (17) below; available at https://www.quora.com/What-value-does-conciousness-add-and-therefore-why-did-it-ever-come-into-existence; accessed 2018 01 31)

The author of this online post is setting the stage for a description of the benefit of each form of consciousness that he distinguishes.

(5) *How to make choices in life* (2009)
We recognize that life is filled with decisions for which we are both free and responsible. Thus, we find ourselves asking, "*How, then*, should we choose?" ("Preface", in Douglas S. Huffman (Ed.), *How then should we choose?: Three views on God's will and decision making* (Grand Rapids, MI: Kregel Publications, 2009), p. 7)

The writer of the preface is motivating the reader to read essays in this collection on how human beings should make choices.

(6) *Cooking oil* (2015)
There's been a lot of controversy lately over whether you should or should not be cooking with olive oil. *So*, *what*'s the story? *What* should we cook with and *why*? (Mark Hyman, "What's the verdict on olive oil: Is it good or bad for you?", *Ecowatch*, 2015 06 02; available at https://www.ecowatch.com/whats-the-verdict-on-olive-oil-is-it-good-or-bad-for-you-1882045884.html; accessed 2018 02 05)

The food columnist is motivating his readers to read on to find out what kind of oil they should cook with and why.

(7) *Cannibalistic tomatoes* (2017)
So Are The Vegetables In "VeggieTales" Cannibals Or What? In episode one of "VeggieTales in the City" the veggies grab some sandwiches, loaded up with delicious

---

[13] *Quora* is a website on which anyone can submit a question, which self-appointed volunteers then answer.

tomato and lettuce. This is problematic because one of the characters is literally a tomato. (Brad Esposito, "So Are The Vegetables In "VeggieTales" Cannibals Or What?", *BuzzFeed News*, 2017 03 09; available at https://www.buzzfeed.com/bradesposito/veggiecannibals?utm_term=.uh9Ma7666#.ibErj8qqq; accessed 2018 02 05)

The online news feed columnist is motivating readers to join him in a light-hearted inquiry into the ethical status of a tomato depicted as eating a tomato and lettuce sandwich.

> (8) *Eating vegetables* (undated)
> Now we have a dilemma. Vegetables are good, and healthy, and important. Everyone's taste preferences are different. Some people may be genetically more likely to dislike vegetables. How do we get the benefits of vegetables if we don't want to eat them? *So*, in this article, we'll explain:
> *Why* some people don't like vegetables.
> *Why* they're not bad or wrong for disliking vegetables.
> *What* to do about this. (James Heathers and Jennifer Nickle, "What to do when you don't like your vegetables", *Precision Nutrition*; available at https://www.precisionnutrition.com/dont-like-vegetables; accessed 2018 02 05)

The authors of this article start out by providing reasons to read what they have to say about some people's dislike of vegetables and what to do about it.

> (9) *Drunks* (2017)
> Scientists say there are four types of drunks – *so which* are you? (title of an article by Jasper Hamill, *Metro*, 23 Nov 2017; available online at http://metro.co.uk/2017/11/23/scientists-say-there-are-four-types-of-drunks-so-which-are-you-7103363/; accessed 2018 02 06)

The title is a hook to entice the potential reader to read the article about types of drunks. It is left to the readers to answer the question for themselves.

> (10) *Singapore residential development company stocks* (2018)
> Singapore property prices expected to rebound 3%-7% *so which* stocks should do well? (title of a column in the Singapore newspaper *The Edge*, Jan. 12, 2018; available at https://www.theedgesingapore.com/property-prices-expected-rebound-3-7-so-which-stocks-should-do-well; accessed 2018 06 05)

The column explains which publicly traded property development companies are likely to do well financially if property prices in Singapore increase as expected. The title entices prospective investors to read what the column has to say about this question.

> (11) *Roseanne* (2018)
> 'Roseanne' show's Lanford is based loosely on Elgin. *So how* do they compare? (title of an article by Mike Danahey in the *Elgin Courier-News*, May 21, 2018, available at http://www.chicagotribune.com/suburbs/elgin-courier-news/news/ct-ecn-elgin-roseanne-st-0520-story.html; accessed 2018 05 21)

The article appeared in the newspaper of a Chicago suburb (Elgin) on which the small town (Lanford) of the (subsequently cancelled) television show 'Roseanne' is based. The title's

question entices the reader to read about how the fictional town is similar to its model and how it is different.

The argument in this paper's title ("We justify questions, so how does that work?") also had the function of stimulating interest in finding out the answer to its question-conclusion; its premiss draws attention to a fact of which its readers may have been dimly aware, as a basis for raising the question of how to explain this fact, an explanation which (I believed) my audience did not yet have.

Not surprisingly, all these arguments whose function is to stimulate interest in their question-conclusion appear at the beginning of the text in which they appear: in the title, in a preface, or in an opening paragraph. They have an introductory function.

The second most common reason in the sample for arguing for a question is to put one or more addressees, or a third party, on the spot–to challenge them to explain or justify their behaviour. This purpose can be detected in example 1 (*Bus drivers*). Gina from Toronto is putting the bus drivers' union on the spot to explain their acceptance of the Board of Health's statement that Toronto bus drivers do not need to wear masks to protect themselves from infection by the SARS virus. It is also the purpose of the following five arguments.

> (12) *Paul to the Galatians* (written in the first century CE)
> .. you received me as a messenger of God, as Christ Jesus. *Where then* is your blessing? For I bear witness to you that if possible you would have gouged out your eyes and given them to me. *So have* I become your enemy by telling you the truth? (Galatians 4:14-16, my translation)[14]

Paul is reproaching the Galatian Christian communities for their failure to give him their blessing as they did on a previous visit; his question whether he has become their enemy by speaking the truth is a provocative suggestion of a possible explanation. This passage was originally written in *koinê* Greek in the first century of the Common Era. It thus shows that arguing for questions is not peculiar to contemporary argumentative discourse in English.

> (13) *The Cranberries* (album released 01 March 1993)
> Everybody else is doing it, *so why* can't we? (title of Irish rock band The Cranberries' debut studio album; available at https://www.allmusic.com/album/everybody-else-is-doing-it-so-why-cant-we-mw0000097782; accessed 2018 06 09)

The Cranberries, a rock band, chose for their debut album what the *Entertainment Weekly* review called a "self-effacing" title calling attention "to the glut of bands currently playing dream pop" (http://ew.com/article/1993/06/04/everybody-else-doing-it-so-why-cant-we/; accessed 2018 06 05). The title thus puts prospective listeners, especially music critics, who might complain about yet another album of this type of music on the spot to justify their complaint.

> (14) *Bigoted harassment at New Zealand sports events* (2018)
> There's no room for bigotry in sport, *so why* is harassment still rife? (headline of an article by Megan Gattey in *Stuff*, 2018 01 31; available at https://www.stuff.co.nz/sport/100901694/theres-no-room-for-bigotry-in-sport-so-why-is-harassment-still-rife; accessed 2018 01 31)

---

[14] ... ὡς ἄγγελον θεο¬ ἐδέξασθέ με, ὡς Χριστὸν Ἰησο¬ν. πο¬ ο⇒ν ὁ μακαρισμὸς ὑμ™ν; μαρτυρ™ γὰρ ὑμ℘ν ὅτι εἰ δυνατὸν τοὺς ὀφθαλμοὺς ὑμ™ν ἐξορύξαντες ἐδωκατέ μοι. ὥστε ἐχθρὸς ὑμ™ν γέγονα ἀληθεύων ὑμ℘ν; (... *hôs angelon theou edexasthe me, hôs Christon Iêsoun. pou oun ho makarismos humón? marturô gar humin hoti ei dunaton tous ophthalmous humón exoruxantes edókate moi. hôste echthros humón gegona alêtheuôn humin?*)

The question in the headline challenges New Zealanders to put an end to the homophobic, racist and sexist harassment that is still prevalent at sports matches in that country. The article describes in detail verbal harassment of spectators at professional sports matches in New Zealand, and explores possible reasons why this harassment is occurring. The argument in the headline thus serves a dual function, of challenging harassers and of enticing the reader to learn about the nature and frequency of the harassment and about proposed explanations of it.

> (15) *The mayor's plans* (2017)
> Mayor John Tory has got plans *so when* is the time for action? Proposals that council has approved but left out of the city budget are a shorthand summary of progress under Mayor Tory, Edward Keenan writes. (headline in *The Star*, 2017 12 19; available at https://www.thestar.com/opinion/star-columnists/2017/12/19/mayor-john-tory-has-got-plans-so-when-is-the-time-for-action.html; accessed 2018 01 31)

The column contrasts Toronto's mayor favourably to his predecessor in having plans for improving the city, but casts doubt on whether he will ever implement them, given his commitment not to raise property taxes. The question raised in the headline puts the mayor on the spot to give a timetable for implementing the approved projects.

> (16) *The holy coat at Trèves* (delivered as an address in 1851)
> Is the Tower of London shut against sightseers, because the coats of mail or pikes there may have half legendary tales connected with them? *Why then* may not the country people come up in joyous companies, singing and piping, to see the Holy Coat at Trèves? (John Henry Cardinal Newman, *Lectures on the present position of Catholics in England addressed to the Brothers of the Oratory in the summer of 1851* (London: Longmans, Green, 1908), pp. 309-310; available at http://www.newmanreader.org/works/england/lecture7.html; accessed 2018 02 04)[15]

Cardinal Newman is using the analogy of visits to the Tower of London to put critics of pilgrimages to the Holy Coat at Trèves on the spot to justify their opposition.
 The third reason in our sample for arguing for a question is to solicit answers to it.

> (17) *The value of consciousness* (posted September 2012)
> What value does conciousness [*sic*] add, and *therefore why* did it ever come into existence? (question on *Quora*; available at https://www.quora.com/What-value-does-conciousness-add-and-therefore-why-did-it-ever-come-into-existence; accessed 2018 01 31)

The poser of the question why consciousness came into existence is looking for someone who will answer the question. Not coincidentally, this passage is the only one in our sample where the premiss is a question rather than a statement. It is what Wiśniewski calls an "erotetic

---

[15] Charles Kingsley, in *"What, then, does Dr. Newman mean?" A reply to a pamphlet lately published by Dr. Newman* (available at http://www.newmanreader.org/works/apologia/kingsley.html; accessed 2018 02 04), calls this discourse a sophism: "In his "Lectures on the present position of Catholics in England, addressed to the brothers of the Oratory," in 1851, he has again used the same line of sophism. Argument I cannot call it, while such a sentence as this is to be found: ... To see, forsooth! To worship, Dr. Newman would have said, had he known (as I take for granted he does not) the facts of that imposture." The sophism charged against Newman is apparently faulty analogy, not the form of using a question as a conclusion.

inference of the second kind", an inference from a question (possibly supplemented by one or more declarative sentences) to a question.

Dialecticality and deep disagreement

SCOTT F. AIKIN

Department of Philosophy
Vanderbilt University
United States of America
scott.f.aikin@vanderbilt.edu

ABSTRACT: In this paper, I will argue for a complex of three theses. First, that the problem of deep disagreement is an instance of the regress problem of justification. Second, that the problem of deep disagreement, as a regress problem, depends on a dialecticality requirement for arguments. Third, that the dialecticality requirement is plausible and defensible.

KEYWORDS: deep disagreement, dialecticality requirement, epistemology, regress problem

1. REGRESSES AND DEEP DISAGREEMENTS

Regress problems are familiar to anyone who's interacted with a small child. The question of '*why?*' can be asked again, and again, and again. This interaction yields series of reasons that not only test our patience, but test our understanding of what is at issue. For regresses to get started, with the '*why?*' questions, four requirements for reasons must be in place. Call this *the recipe for justification regresses:*

> **#1: Iterated Backing Requirement**
>> Only Justified Reasons can Justify
> **#2: Non-Circularity Requirement**
>> Only non-circular justifications can justify
> **#3: The Fact of Cases**
>> There are Justified Commitments
> **#4: Finitism**
>> Justifying reasons are finite

Once nice thing about the recipe, as stated, is that it gives us a handy roadmap for solutions to the regress problem for justification, since it is an *apory set* – a collection of independently plausible, yet inconsistent, propositions, and the solution to the problem (stated in this case as the inconsistency of the set) is to identify which proposition one eliminates or revises to mitigate the tension between the members of the set.[1] So Foundationalists and Externalists modify #1, Coherentists modify #2, Skeptics reject #3, and Epistemic Infinitists reject #4.

Deep disagreements are argumentative circumstances wherein there is insufficient overlap of agreed commitments and epistemic resources to resolve an issue between disputants. So, in normal disagreements, we can appeal to some fact we both believe that bears on the question, or we have some decision procedure to determine the right answer. So we may appeal to a mutually recognized authority or consult a source we both take as reliable. With deep disagreements, however, we do not share enough in common ot provide enough information to cut the argumentative ice. As Robert Fogelin puts it:

---

[1] See Nicolas Rescher 1985, 2006, and 2008 and Aikin and Talisse 2017 for developments of the aporetic method.

> The possibility of arguments, the possibility of a genuine argumentative exchange, depends … on the fact that together *we* accept many things. (1985: 4)

> We get a deep disagreement when the argument is generated by a clash of framework propositions (1985: 5)

The takeaway from Fogelin's invocation of Wittgensteinian hinge propositions is that we have commitments that ground much of our system of belief, but for which we do not have further reasons. As Wittgenstein describes these framework propositions:

> [T]he *questions* that we raise and our *doubts* depend on the fact that some propositions are exempt from doubt, as if it were like hinges on which those turn. (*On Certainty* 341)

The key, though, is that these propositions are not shared by all, and so those for whom some proposition is dubitable seem to be unintelligible to those who cannot doubt them. Because these hinges "form the foundation of all operating with thoughts (with language" (*On Certainty* 401), those who consider doing without them are not, from the perspective of those convinced, making sense at all. And so, given this hypothesis of *hinge commitments*, deep disagreements are instances where arguments are impossible, because these sides cannot see each others' reasons as reasons at all. This is why Fogelin holds, "deep disagreements cannot be resolved through the use of argument, for they undercut the conditions essential to arguing" (1985: 8).[2]

It is not difficult, given this description of deep disagreements, to see how the problem of deep disagreements is an instance of the problem of the regress of justification. Here is how the argument for the view should go:

1. Framework Propositions are (supposed) reason regress-enders only for those who believe them
2. If framework propositions are not believed, then they do not end a reasons regress
3. Deep disagreements are defined by non-shared framework propositions
4. *Therefore:* Deep disagreements have no regress-ending reasons

What's needed, then, is a way to see that what I'd called the *recipe for the justification regress problem* to have a special instance for the problem of deep disagreements.[3] Here's what I see as the *recipe for deep disagreements:*

Backing
> Only reasons acknowledged as good reasons can play proper role of backing

Non-Circularity
> No reason can be in its own backing ancestry

Fact of Cases
> *Normal* arguments: Yes – shared reasons
> *Deep* disagreements: No shared backing reasons

Finitism
> Arguments are finite endeavors

The key is that, given that backing in the case of deep disagreements, is driven by the fact of controversy – if your audience doesn't accept a premise or support relation essential to your argument, that is a problem with your argument. This thought about the deep disagreement instance of the backing requirement must be expanded.

---

[2] For the current representation of what 'hinge epistemology', see Pritchard (2015) and Schönbaumsfeld (2017). Further, see Siegel (forthcoming) for a critique of not only the hinge commitments in question. Additionally, a critique of the notion of 'depth' in deep disagreement, namely that it can be *gradable*, can be found in Duran (2016) and Aikin (forthcoming b).

[3] Elsewhere (Aikin, forthcoming a), I have argued that the problem of deep disagreement is a special instance of the problem of the criterion, which I argue is a regress problem.

The backing requirement, given this description of invoking not only a further supporting reason, but one that is acceptable to an audience, brings the *dialecticality* of the backing element into sharp focus. This should be contrasted with the demand of epistemic backing, which is only that a proposition can justify only if it itself is justified. In the case of dialecticality, not only must the justification be transmitted for a good argument, but that support must be *mutually recognized*. So, the contrast can be captured as follows:

> **Epistemic Backing:**
> P may justify Q only if P is *justified*
>
> **Dialectical Backing:**
> P may serve as a premise supporting Q only if P's acceptability is *shared*

Take 'shared' in these cases to be roughly that the claim's status is recognized as having a positive status, endorsed as at least a *prima facie* reason without a clear defeater, and one that has achieved either explicit or tacit approval in the exchange. This yields the following complex norm for argument:

> **Dialecticality Requirement:**
> An argument is good only if it is *dialectically adequate* to its audience
> An argument is dialectically adequate to its audience only if its illative core (the premises and their support for the conclusion) is *accepted* or *acceptable* to its audience

The core thought behind the dialecticality requirement is the idea that arguments are occasions wherein we are exchanging reasons, our objective is to come to a mutual accord, one reached not only by the best reasons, but on our shared regard for those reasons as best.

The dialecticality requirement is a pretty demanding norm, one that takes on not only a commitment to being an exercise of our shared rationality, but an exercise of our *recognizing* that shared rationality as such. It is an exercise of what Ralph Johnson calls *manifest rationality:*

> What is distinctive of argumentation is that it is an exercise in *manifest rationality*, by which I mean not only that a good argument is itself a rational product […] but that it is part of the nature of the enterprise that *this product appear as rational* as well. (2000: 144)

The point of manifest rationality is that we be committed no not only ways that are *good* for resolving our differences, but to ways that we *actually see as good*. It is ruinous, on analogy, for a just decision to nevertheless *appear unjust* to those affected, or for a fair decision to have the *air of improper partiality*. Arguments, like these other shared social goods and ends, have their purchase only if, in our living up to their norms, not only live up to the norms, but also *appear as doing so, too*.

Manifestness is a norm undergirded by two appealing thoughts. The first is a norm of rational respect, one of recognition. Here is a way to capture it:

Following the Dialecticality Norm … is a norm of *rational respect*.

> With argument, we are trying to engage someone's reason, so that they see the world in a way we can share. Rational resolution requires that the rationality of the reasons be manifest.

Not caring what others, with whom one disputes, sees as decisive reason is a failure to see them as having the moral and cognitive standing of regard. We must live our lives from the inside, and not being moved by this thought when taking up with what others see from their instances of 'inside' is to refuse to appreciate and respect those with whom one disagrees and argues. If one doesn't have that respect, then why *argue* in the first place?

A second reason supporting the manifestness commitment behind the dialecticality requirement is simply that it is good pragmatic policy. Arguments are more effective and durable if we live by the dialecticality norm. Here is how to capture the thought:

> With argument, we are trying to resolve an issue in a way that is quick and durable. Were we not to respect the dialecticality norm, we'd make the argument drag out longer and have more easily rejected resolutions.

The lesson is, if we go for dialectical arguments, our conclusions are more likely to stick.

2. DIALECTICALITY AND ITS DISCONTENTS

So far, what I've done is argue for two theses – that the problem of deep disagreement is a particular form of the problem of the regress of justification, and that instances of the regress-generating backing requirement for arguments in the recipe for the deep disagreement problem is a norm roughly captured by the dialecticality requirement for arguments. The question, then, is whether, if the regress problem can be mitigated by rejecting a proposition in 'the recipe' (and the backing requirement, in particular), then the dialecticality requirement can and should be rejected to solve the problem of deep disagreement. The most prominent critic of the dialecticality requirement for arguments is Richard Feldman. He holds that the consequence of accepting dialecticality is a form of audience-relativism for argument-quality. In particular, f one requires dialecticality, "there is no such thing as the simple quality of an argument" (1994: 172). In support of this thought, Feldman proposes two cases:

> **Case 1: The Blackboard**
> [I]f I walk into a classroom and see an argument written on the blackboard, I can evaluate it without knowing for whom it was intended. I don't ask, 'Are there premises justified for the intended audience?' Instead, I consider the merits of the premises and their connection to the conclusion (Feldman, 1994: 172)

> **Case 2: The Newspaper**
> [Y]ou come across an argument […] in the local newspaper. You know most of the readers of the paper are not justified in accepting some of the premises, although you know that the premises are in fact true [….] You'd be forced to say, using the acceptability theory, that the argument is no good. It seems clear to me, however, that it would be a mistake simply to leave one's evaluation at that. If you know the premises are true and that they support the conclusion, then **there is surely something good about the argument**, even if its intended audience lacks knowledge (1994: 172-3; emphasis added)

The key to a reply to Feldman's cases is that with both, Feldman has inserted *himself* as the target audience for the arguments at issue. I believe this is easy to see when we consider the fact that arguments, as arguments, are both *processes* and *products* – that is, they are both diachronic exchanges between people, and they are structural relations between propositions. And just as we can evaluate the exchanges in terms of the structural relations between propositions, the structural relations can be evaluated in terms of how they are produced in the exchanges. Consider Feldman's Blackboard case. Let Feldman view the argument on the blackboard, from where he sits, as a *false dilemma*. Perhaps between A and B (with B eliminated). He may agree that B should be eliminated, but he holds that C is also a relevant option, but in the argument given, it's neglected. But imagine, further, that the argument as assessed (*A or B, not B; so A*) is itself the product of a longer process, one stage of which has the trilemma, with A, B, and C as options and C eliminated. For the participants in the longer dialogue, the argument that Feldman would see as a false dilemma is not – this is because the *tertium quid* has already been eliminated. Insofar as we think that the dialogical history of an

argument as a product is relevant to its quality, the audience-indexing for the dialecticality requirement must be a component of evaluation.

The relativism Feldman worries about needn't follow. One reason is that Feldman is right that we can still acknowledge, for example in the Newspaper case, that there are elements of arguments that can be successful, independent of audience and their assessment. In the newspaper case, Feldman still holds that "there is something good" about the argument that dialecticality doesn't capture, and this is correct. But the dialecticality requirement is only *one necessary condition among many*, and so cannot capture *all* the norms of argument. So, for example, a valid argument will still have something good about it, regardless of audience capacity to detect it, but for the argument yet to completely perform its function, the audience still must be able to assent to that validity. The same, the reasoning should go, for Feldman's Newspaper case where the argument, were the audience more scientifically literate they would see that it is scientifically well-founded.

The dialecticality requirement, as stated, is only a necessary condition for argumentative success. Being properly hooked up with the argumentative process, that the argument is a relevant contribution to the discussion, and is one that adds to the progress toward resolution or clarification of an issue, is what this requirement identifies. And it, alongside other structural and purely epistemic matters, identifies the aim of argument improving our cognitive position on a matter in question.

3. CONCLUSION

I've argued here for a complex of theses. The primary is that the problem of deep disagreement is an instance of the regress problem of justification, but it is one with a particular version of the backing requirement – what I've called the *dialecticality requirement.* In particular, given the notion of a deep disagreement on offer, the problem is best captured by the thought that arguments about hinge propositions can never be dialectically successful. One way to resolve the theoretical problem of deep disagreements is to reject the dialecticality requirement, but I've argued here that the norm is very appealing on both recognitional and pragmatic grounds. And further, I've argued that the case for rejecting the dialecticality requirement, as we see with Feldman's two cases, is not well-founded.

The lesson, as I take it, is that if we are to have a solution to the problem of deep disagreement, given that it is a dialectical form of the regress problem for justification, it must be (a) consistent with the dialecticality requirement, and (b) be a recognizable solution to the regress problem for justification. Classically, the prospects for a program of reply to the problem have been very dim. Sextus Empiricus's Five Modes is founded on the notion of dialectical regresses, and his solution is skepticism (see PH 1:175). That said, everything about the problem of deep disagreement depends on its description of being a clash between hinge propositions, and perhaps there is reason to be skeptical about the prospects of hinge epistemology.

Analysing moderators' narratives on debates behind Wikipedia articles

MICHAEL J. BAKER & FRANÇOISE DÉTIENNE

Centre National de la Recherche Scientifique, Telecom ParisTech, SES Department
Interdisciplinary Institute on Innovation (CNRS UMR 9217)
France
{michael.baker, francoise.detienne}@telecom-paristech.fr

ABSTRACT: Wikipedia is the most consulted source of information across the globe. We analyse first-person narratives of moderators who were asked to narrate the 'life cycle' of articles on controversial topics (the Turin Shroud, Freud), based on discussions between participant writers. Wikipedia articles are not only the sites of cognitive-textual elaboration and interpersonal attacks, but may also be seen as displaying forms of 'trench warfare' on the terrain of a globally distributed text.

KEYWORDS: online debates, debate moderation, Wikipedia, narrative

1. INTRODUCTION

Wikipedia is the seventh most consulted website and the most consulted source of information across the globe. Following rapidly growing participation (Kittur et al. 2007), recent years have seen the rise of 'editing wars' (repeated text deletions/'reverts'), partly controlled by Bots (robots), followed by their migration to discussion pages 'behind' the articles (Viégas et al. 2004). These are often characterised by personal attacks on the expertise of (anonymous) participants (Détienne, Baker, Fréard, Barcellini, Denis & Quignard, 2016), given the principle of participation open to all.

Whilst the analysis of these argumentative discussions is of import for the quality of Wikipedia articles, it is also of interest to argumentation research, given characteristics such as free global participation, specific online community rules (e.g. requiring neutral viewpoints) and debates extending over years. Argumentation research usually adopts the researcher-third-person perspective to the analysis of written or spoken argumentative discourse. Wikipedia provides an opportunity, no doubt unique, to study debates on a global scale on a large variety of issues, some of which are controversial, given that text pages on the web are accompanied by a "discussion" tab, that contains all discussions between writers of the articles, sometimes extending over years and over hundreds of participants. Here, in order to address such large amounts of data we analyse first-person *narratives* of moderators of debates occurring within discussion traces 'behind' articles (see Baker, Détienne & Barcellini, 2017, for further details), inspired by the work of Bruner (1991) who claimed that narrative and meaning-making are fundamental modes of human knowing. Seasoned "Wikipedians", who spontaneously took on the roles of "moderators" were asked to narrate the 'life cycle' of articles, from the beginning to the present day, focussing on the nature of verbal conflicts and the moderation strategies that they used.

We analyse how the strategy of requiring protagonists to cite specific sources is often not effective, given that disputes then migrate to the validity of the sources to the credentials of their authors and the sincerity of protagonists. A further issue concerns countering the "mass effect" (participants attempting to 'drown' opposed viewpoints with their own) by requiring contradictory views to coexist in the text. Thus, Wikipedia articles on controversial

issues are not only the sites of cognitive-textual elaboration and interpersonal attacks, but may also be seen as forms of 'trench warfare' on the terrain of a globally distributed text.

2. BACKGROUND: RULES GOVERNING WIKIPEDIA ONLINE COMMUNITIES

The processes of construction of articles in Wikipedia are framed by five main "pillars" that are described in the encyclopedia itself[1]. One of them, named "neutrality of points of view (NPOV)", is particularly important for our analysis. The NPOV rule states that:

> articles must be written in a way that does not take sides for certain points of view rather than others. To the contrary, it is a matter of presenting all relevant points of view, whilst attributing them to their authors, but without adopting any of them (…). Neutrality of point of view is not the only foundational principle. Relevance of content is also important. Therefore, neutrality of viewpoint does not mean that one must necessarily present all existing points of view on a subject. Only the relevant ones need to be taken into account, whilst giving them space that is proportional to their importance in studies on the subject.

Nevertheless, the principle of relevance that grounds neutrality of viewpoint may lead to a "*neutrality controversy*"[2], when some Wikipedia participants (e.g. editors) judge that the NPOV is not respected for a particular article. This may lead to debates, conflicts associated with debates, and/or "editing wars" in Wikipedia. Conflicts are initiated and/or waged by participants who express major disagreements on a particular point (e.g. the title of an article, a non-neutral part of the text) in discussion pages associated to articles (Viégas et al. 2004; Suh et al. 2009). They are characterized by cycles of deletions followed by "reverts" of texts ("editing wars"), aggressive comments in discussions page, personal attacks, and inconclusive debates.[3] Attempts to manage such conflicts often involve requiring parties to provide further references (sources) for their claims.

In previous research (Détienne et al., 2016), we analysed such a conflict[4], conjecturing that despite their having often high costs in terms of communication, time and effort, conflict management processes can nevertheless be productive, in terms of the collaborative elaboration of shared community knowledge, and ultimately, the quality of articles. To do so, we developed a qualitative approach based on analysis of the content, form and meaning of discussions, in relation to the texts being collectively edited. This approach was original in the body of research on Wikipedia, which mainly uses automatic techniques for 'mining' and automatically processing logfile data (edits, messages) to derive network structures, or questionnaires and interviews. The analysis of such extended and complex discussions requires careful choice of units and levels of analysis. Our choice was to focus on the analysis of roles emerging from interactions (i.e. interactive roles, as opposed to institutionalised statuses), as an appropriate meso-level unit of analysis. These roles refer to: dialogic roles related to informative, argumentative and regulative contributions), epistemic roles related to the task (problem domain or Wikipedia rules) and interpersonal contents (referring to the group, or specific participants' competences). We showed that online epistemic communities can be communities in the true sense of their involving cooperation, given that interactive

[4] The conflict produced by "the descent of Pluto", around the renaming of the article on the celestial body (significantly here, not the cartoon character) "Pluto". The discussion was made necessary by a decision of an international scientific body that required Pluto to 'descend' from its status of a planet to that of an asteroid (the 'descent' of Pluto).

roles are reciprocal and evolve over sequences of the discussion: when one participant changes role from one sequence to another, other participants 'fill in' for the vacant interactive role. In other terms, participants can cooperate in regulating debates. We see this as an emergent property of the interaction, eschewing considerations of intentionality or causality (i.e. we make no hypotheses as to participants' intentionality with respect to the evolution of the roles that they effectively adopt). Secondly, we showed that online communities, in the specific case of a Wikipedia discussion, do not function purely on a knowledge-level, but also, crucially, on that of the negotiation of images of participants' competences with respect to the knowledge domain. In that sense, such communities can be seen to be "socio-cognitive" communities. It transpires that, despite or because of Wikipedia rules of free participation and the possibility of anonymous participation at a distance, in certain cases participants become concerned by the identity and statuses of participants, in order to evaluate the 'weight' of their arguments (is what someone says based on genuine expertise?).

In building on this previous research we sought an approach to taking into account larger amounts of data (controversies in Wikipedia may span over several years) based on multiple points of view: that of the researcher-analyst and that of key participants in the controversies. This is the approach based on argumentative analysis of narratives, described below.

3. THE NARRATIVE STUDY

We identified and contacted major contributors in the French Wikipedia, asking them to identify controversial articles in which they had played a moderator role. It is important to note that such a "moderator" role is not necessarily institutionalised (i.e. in the form of an "administrator" status): as our analyses mentioned above showed, certain major contributors cooperate in regulating or moderating activity in Wikipedia, apparently motivated by genuine concern for quality 'work' to be achieved. Usually, these persons intervene across several articles. These Wikipedians were interviewed, face-to-face, with the articles and their discussion pages available on the computer. They were asked to produce a "narrative" of the evolution of the articles from their inception to the present day (the interviews took place in September 2012), with very little intervention (other than prompting to continue) from the researcher.

The task instructions read to the Wikipedians by the researcher were as follows:
"Imagine that I am a person who would like to contribute to this Wikipedia article. Could you tell me what I would need to know in order to be able to participate? To do so, you are free to look in the history of the article (edition and talks pages) and to refer to it in your narration. You have as much time as you feel necessary."

In this article, we focus on the analysis of two interviews, with two expert Wikipedians who narrate the evolution of the articles entitled "The Turin Shroud" (*Le Suaire de Turin*, in French) and "Sigmund Freud" with their underlying discussions. In what follows, we summarise the main conflicts that were narrated, together with the strategies that the Wikipedia moderators-narrators used try to manage or neutralise them. It is important to note that our analysis is not that of the debates themselves relating to the articles, but rather of the *narratives* of major contributors to those articles and their associated discussions.

4. FIRST CASE STUDY: THE TURIN SHROUD

The Turin Shroud is, according to the first lines of its attendant Wikipedia article in French (our translation from: https://fr.wikipedia.org/wiki/Suaire_de_Turin), "… a cloth of yellowed linen, 4.42 metres long and 1.13 metres wide, showing the very blurred image-imprint (from the face side and the back) of a man presenting traces corresponding to a crucifixion. The representation figuring certain details of the Crucifixion of Jesus of Nazareth described in the canonical gospels is the object of popular pietism and is considered as an icon by the Catholic Church. Some believers venerate it as a bodily relic, the "Holy Shroud". The shroud is conserved since 1578 in the Guarini Chapel of the Saint John the Baptist Church of Turin."

According to the Wikipedian narrator, the debates behind the article had two main groups of protagonists, whom he termed "the religious people" and "the scientists". The narration of the debate comprised four main phases:

Phase 1: the religious people put forward the plausible argument that the marks on the shroud *could have been* made by the body of a man, based on tests;

Phase 2: the religious people attempted to argue against the validity of carbon 14 dating of the shroud, according to which it was made of cloth produced in the Middle Ages, by claiming that the dating was done on the wrong piece of cloth, since the shroud was repaired in the Middle Ages. The "scientists" replied that they were not allowed to analyse other fragments, thus, in a sense, claiming that the religious people had made an unacceptable dialectical move (1st pragma-dialectical rule "Parties must not prevent each other from advancing standpoints or from casting doubt on standpoints").

Phase 3: this concerned the nature of scientific method, and error margins of carbon 14 dating. Each protagonist cited "scientific sources" in support of their claims and the scientists claimed that error margins of carbon 14 dating could not extend over eight centuries.

Phase 4: this concerned the reliability of sources (see below).

The Wikipedia moderator, according to his own narrative, used four different strategies in order to attempt to manage or neutralise the conflict between the religious people and the scientists.

Firstly, he proposed a compromise solution of the type "most scientists agree that …", but which was naturally immediately rejected.

Secondly, he proposed to go to a vote, a proposal that was also rejected.

Thirdly, he adopted a strategy that is well documented in Wikipedia research, which is to require participants to *cite precise sources* (functioning as arguments). In the case of the Turin Shroud article, this was not effective, however. The narrator stated that sources themselves became objects of debate, in that the scientists disputed the validity of sources proposed by the religious people, claiming that they had been written precisely so that they could support their view, that even some may have been written by "scientists", they were also religious people, and not experts in the relevant domain.

Finally, the verbal conflict was neutralised by the technique of 'splitting', i.e. not attempting a genuine resolution of the conflict (how could it be resolved, in reality?), but by separating out conflicting parties into separate sections of the article, entitled "the scientific view" and "Position of the Catholic Church".

In sum, the debates produced behind the French Wikipedia article entitled "Le Suaire de Turin" was underlain — predictably — in the first instance by a "science versus religion" debate, with the scientists citing carbon 14 dating and the religious people claiming that the wrong piece of cloth could be analysed (yet no other analyses are allowed) and that such dating has error margins. But the most important aspect was that the conflict resolution strategy of requiring participants to cite their sources led to a stalemate. Separating out conflicting parties into separate parts of the text proved the only workable solution.

5. SECOND CASE STUDY: FREUD

The article entitled "Sigmund Freud" in French Wikipedia (https://fr.wikipedia.org/wiki/Sigmund_Freud) is currently (in September 2018: such denominations change over time) marked as an "article of quality". Within Wikipedia community rules, this means that it is well written, complete, argued (well sourced), neutral, and that it conforms to Wikipedia stylistic rules. Furthermore, this means that the previously completely open participation is now partly restricted to contributors who have been active for at least the previous six months, a procedure which prevents 'vandalism' of the article — persons only identified by IP addresses, or else new contributors — in the text itself.

According to our moderator-narrator respondent, the discussion pages incorporated two main verbal conflicts, associated with an "editing war" (text of the opponent is repeatedly deleted then reinstated). The first conflict was stated to be between a "cognitivist hard scientist" and a "Freudian psychoanalyst", as follows:

"… err an editing war between two editors who came from two ideologies that were, I'd say, adversaries … Cerhab, from hard science cognitivism … but that remains to be proven someone who quite simply refused the postulate of the unconscious. And someone who was psychoanalytic, really oriented towards Freud, it was errr Léon66"

In this case, the moderator repeatedly asked the conflicting pair for sources which, after a while, led them to quit the 'terrain' of the Sigmund Freud page. In fact, the conflict between "Cerhab" and "Léon66" then migrated mostly towards their own pages, where they repeatedly insulted each other, and partly to related Wikipedia pages, concerned with more general epistemological issues in psychology.

The second conflict concerned the relative importance of two subtopics on which certain participants had written extensively in specific sections of the Wikipedia article: "Freud and cocaine" and "Freud and antisemitism". Here, the moderator invoked the NPOV (Neutrality of Point of View) rule according to which articles should remain on the main topic and be of appropriate length. Thus, the two sections on these subtopics remained, but were significantly reduced in length.

6. CONCLUDING REMARKS

A great deal is at stake in Wikipedia: it is produced and consulted on a genuinely global scale[5], and controversial articles represent the globally available presentation of real-life controversies. The principle of participation open to all, using generally available technologies, obviously creates an arena for debates that are supposed to be controlled 'rationally' by the Neutrality of Point of View (NPOV) principle, but which is itself a subject of debate … (https://en.wikipedia.org/wiki/Wikipedia:Neutral_point_of_view).

Since many controversies remain unresolved in the world, one should of course not expect them to be in Wikipedia articles. What, therefore, can be done to ensure encyclopædia articles that are acceptable across the whole world, given additionally that articles have no specific 'author' to whom a viewpoint can be ascribed?

In the two cases analysed here ("The Turin Shroud" and "Sigmund Freud") we saw debates between manifestly irreconcilable religious versus scientific viewpoints and an epistemological debate concerning what is to count as scientific. In these cases, the common procedure of requiring argumentative support in the form of citation of "sources" did not

---

[5] Wikipedia statistics (31/05/2018) [https://stats.wikimedia.org/EN/Sitemap.htm]: in English: 4 696 703 views per hour; editors of pages (5+ edits per month): 32 532

provide a means for genuine dialectical resolution of debates (which is most probably not to be expected, although this is part of standard Wikipedia procedure). Instead, *debates were neutralised rather than resolved* by either creating parts of texts in which each point of view could be expressed, requiring changes to the 'terrain' occupied by particular topics, or else by pushing warring parties to take their dispute elsewhere. In these two cases, what we term *occupation of the terrain* constituted by the text was primordial. The mass effect, as seen in the first case, led to a neutralisation of the debate by splitting the 'terrain'. In the second case the conflicting pair, not supported by other (or a mass of) contributors, preferred to leave the terrain of the article to continue their fight at a more interpersonal level.

In our previous research on Wikipedia communities (Détienne et al., 2016) we showed that they involve not only socio-cognitive processes (based on cooperation and social interaction with respect to an epistemic and linguistic task) but also depend on socio-relational self- and other-images of expertise, sometimes leading to personal attacks. In the research presented in this paper, we are lead to extend this vision of Wikipedia debates, in considering them as also involving *power struggles* on the *terrain* of a globally co-created and consultable text.

In conclusion, we propose that combining third-person (researcher) and first-person (participant) perspectives on Wikipedia debates is a promising approach to analysing debates in Wikipedia that involve very large amounts of data, sometimes extending over years. Wikipedia represents a 'gold mine' for the exploration of global controversies.

"Argumentexturing": Reflexions on a theory of learning from argumentation dialogue

MICHAEL J. BAKER & BARUCH B. SCHWARZ

ABSTRACT: Classical Argumentation theories focus on structures and validity, minimising constructive meaning-making. By contrast, the negotiation of meaning and conceptual transformations are what matter most in a theory of Argumentation for Learning. We call this theory "argumentexturing" ("argumentissage", in French) to express the interweaving of arguing, thinking, affect and interpersonal relations interweave in arguing to learn (Schwarz & Baker, 2017). The theory of argumentexturing thus aims to bridge the gap between argumentation and learning theory.

KEYWORDS: argumentation theory, learning theory, knowledge elaboration, pedagogical debates, emotion

1. INTRODUCTION

When learning is evoked in argumentation studies, most commonly argumentation itself is what is referred to ("learning to argue"). Thus, learning to argue involves being able to generate arguments and counter-arguments for given theses, the developing ability to produce sound argumentation, avoiding fallacies, and engaging in reasonable argumentation dialogue, according to the rules. In this paper we consider how the activity of argumentation, practiced in groups, can result in learning with respect to some object beyond argumentation itself ("arguing to learn") — for example, concerning the knowledge domains within which argumentation occurs, or with respect to the ability to engage in argumentation with others whilst effectively regulating interpersonal relations and the emotions involved, in social interaction. In this context, however, there is a gap between argumentation theory and learning theory, neither of which corresponds to the other. This paper aims to work towards bridging that gap, in the form of a theory of "argumentexturing". The term "argumentexturing" is our attempt to translate the French term (that we invented: Schwarz & Baker, 2015) "argumentissage", coined as a combination of "argument-" and "-tissage" ("weaving"), with the term "argumentissage" being alzo redolent of "apprentissage" ("learning"). The aim is to capture in one word/concept the notions of *argumentation*, *learning* and *interweaving* of minds and discourses in argumentative social interaction.

There are a number of reasons that motivate the elaboration of a theory of argumentexturing. On the side of education (see Schwarz & Baker, 2017), with the erosion of authority structures, education systems today recognise that it is important for students to be able to argue and to collaborative effectively (these are so-called "21st Century Skills, according to EU directives), and this would bring school practices closer to professional practices of scientists (Osborne, 2010). As we shall discuss, argumentation can give rise to

many desirable outcomes, such as conceptual change, epistemological development and ability to participate in democratic practices (Schwarz & Baker, 2017). On the side of argumentation theory, the study of argumentation in (computer-supported) collaborative learning situations might enable it to move out of its traditional 'comfort zone', of law, politics and the media, thus extending the field of validity of models.

In the rest of this paper, we firstly discuss argumentation seen from learning theory, then the inverse. We then present two examples of innovating argumentative situations which illustrate the subtle interactive learning processes and outcomes that a theory of *argumentexturing* is designed to account for, most of which are not really accounted for by the dominant theories of learning. The concluding sections summarise the varied and innovating types of learning with which we are concerned, with future research directions.

2. A VIEW FROM LEARNING THEORY

The study of learning from engaging in argumentative interaction ("arguing to learn") originated within collaborative learning research, the aim of which, within the "interactions paradigm" (Dillenbourg, Baker, Blaye & O'Malley, 1996) is to identify the types of interactions produced by students working in small groups that are most conducive to learning. As an extension of the theory of socio-cognitive conflict (Doise, Mugny & Perret-Clermont, 1975), itself being an extension of Piaget's theory of development to the realm of social interaction, a number of researchers (e.g. Mevarech & Light, 1992; Baker, 1999) tried to understand how the cooperative resolution of verbal conflicts, in and by argumentative interactions, could lead to collective knowledge elaboration and individual cognitive progress. However, existing learning theories are arguably not sufficiently adapted to this task.

Let us begin by discussing the 'big' theories of learning, of each of Piaget, Vygotsky and H. Simon. As mentioned above, Piaget's original theory of cognitive development was essentially centred on the individual, with little explicit consideration of the role of social interaction. Although Piaget's last wave of students introduced a 'social' concept of interpersonal conflict between viewpoints, it took more recent developments to argue for the necessity of analysing argumentative interaction. Vygotsky's theory is of course, at first sight, the most directly relevant to learning in social interaction, as more elaborate schemas of reasoning are appropriated by a less competent person from a more competent one, within the former's "zone of proximal development". However, Vygotsky's theory (due to the early demise of the Russian psychologist) remained programmatic: social interaction is evoked, but the processes it involves are not. Finally, H. Simon's theory of human cognition as processing of symbolic information, akin to a computer, is centred on the individual. Attempts to extend this to social interaction fail to take into account the qualitative shift involved, and can be likened to considering dialogue as a juxtaposition of monologues.

There are, however, a number of more recent localised models and theories of interactive learning that are potentially useful in understanding arguing to learn, in addition to the theory of socio-cognitive conflict, mentioned above. They include theories of conceptual change (e.g. Driver, 1989), of social regulation (e.g. Isohätälä, Näykki, Järvelä & Baker, 2018) and post-Bakhtinian visions of dialogue as exploration of a space of alternative discourses/voices (Wegerif, 2007).

Argumentation dialogue, produced in situations where knowledge elaboration is at stake, involves subtle interactive processes whereby shared meanings are redefined and elaborated. Existing theory of argumentation-learning is not equipped to take this into account. Recent research in the Learning Sciences has, however, given rise to several proposals as to more macroscopic 'types' of dialogue that are considered more or less 'good'

from the point of view of learning. For example, Kuhn and colleagues (2011) refer to "dialogic argumentation", Mercer and colleagues (1999) to "exploratory", "cumulative" and "disputational" types of "talk"; Michaels, O'Connor and Resnick (2012) to "accountable talk" and Schwarz and Baker (2017) to "collaborative and deliberative argumentation dialogue". There is clearly a need for introducing conceptual order in such research, notwithstanding the fact that argumentation dialogue in collaborative learning situations is clearly a mixed genre, involving argumentation, knowledge exchange and co-construction, as well as negotiation of meaning.

3. A VIEW FROM ARGUMENTATION THEORY

When learning is referred to in argumentation studies, it most often refers to learning to engage in argumentation itself. And what that means of course depends on the argumentation theory in question (see Van Eemeren, Groodendorst & Snoeck Henkemans, 1996). But in general, we could say that learning to argue involves, for example, avoiding the classical fallacies, being able to produce (counter-)arguments for standpoints, being convincing or persuasive, playing the dialogue game according to the rules, etc. Nevertheless, within argumentation theory itself, it is possible to find aspects that create a link with the *constructive* function of dialogue, with meaning making, that both provide points on which a theory of *argumentexturing* could be anchored, and erode attempts to see human behaviour in argumentation dialogue as involving a clear dialogic logic (Barth & Krabbe, 1982), with attendant proof theory, given that the meanings of propositions evolve in interaction.

Argumentation dialogue can be seen not only as an exchange of argumentative moves designed to win the game, persuade, convince, but also as a process working on the plane of meanings, concepts and their interactive redefinitions. Thus Naess (1966) sees argumentation as a process of *prezisation*, of making statements more precise. Walton (1992) describes how argumentative interactions can lead to the conceptual operation of generalisation of the thesis being debated (e.g. "should obligatory tipping in American restaurants be maintained?" leading to "what should be the role of the state in regulating commercial transactions?"). Sitri (2003) has produced a detailed analysis of how the "object of debate" emerges and how its meaning is co-constructed in dialogue.

This research, perhaps marginal in argumentation studies, nevertheless allows us to come closer to the preoccupations of argumentexturing, in that argumentation dialogue is seen as a process of meaning-making, just as much as an interdiscursive logic. Some such new meanings may correspond to situational norms, and thus be considered as forms of learning.

4. TWO EXAMPLES

We briefly describe two innovating learning situations, as examples of phenomena that *argumentexturing* theory should be able to account for. Unlike most teaching-learning situations, learning outcomes in these cases are not predefined by the teacher — rather, they are defined by the participants and emergent from the interaction — which makes them difficult to evaluate. The first situation involves debates on current social issues (in Israel), the second involves structured debates in group creativity (at the Royal College of Art, London).

4.1 The first case: a course based on hot discussions on controversial issues

A course on news trends in educational research for undergraduate students has been organized by the second author (B. Schwarz) at the Hebrew University of Jerusalem. The aims of the course were twofold. First, to expose students to social controversies whose impact on education in Israel is deep; secondly, to acculturate students to practices of deliberative argumentation on hot issues. The structure of the course was as follows:

(1) Three sessions for learning the rules and stages of critical discussions. We listed criteria for good critical discussions. Students were arranged in 19 groups of 5-6 students. The cultural and ethnic background of the students reflected the multicultural character of the Israeli society.

(2) Nine sessions during which researchers in different domains lectured on a research issue that reflects a societal controversy. Each researcher provided one paper that expands on the research issue.

(3) After each of the sessions, the groups of students discussed (in a synchronous mode) the issue in a technological platform (at home)

The scores of the students were based on the quality of their discussions (hence, based on the compliance of the discussions to the criteria for the goodness of critical discussions at the beginning of the course).

We present here some excerpts of the 8th discussion, in which students were invited to think whether organizing a national program on civic education common to Arabs and Jews is possible and desirable. 5 students participated in the discussion, 3 Jews, and 2 Arabs:

> Roni: Hi, friends, we got an opportunity to change civic education in the country. In my opinion, the main problem is a lack of unity, lack of suitability to the reality, and the distance between the different societies in Israel. So, I think that the best would be to make students from different schools meet each other. We should be clear that the idea of democracy is an ideal, which is a bit utopian. We should stress the complexity and the tension between freedom and equity, between democracy and Jewish state…. […] What do you think?
> Rikiya: In my opinion, it will work in Jewish schools, but on the other hand, it won't work. Civic education in Israel doesn't encourage Arabs to elaborate a common identity for all citizens in the country. In my opinion, civic education should serve the whole population in the country
> Roni: When I wrote about clarifying the complexity and the tension, I intended precisely this issue in order that everybody would experience what it is to be Arab, secular Jew or religious Jew, as something real, and relevant. I would be happy to know what you meant by saying that civic education in Israel doesn't encourage a common identity, and how it would serve the whole country, as a Jewish and democratic state
> Rikiya: I learned in a school in East Jerusalem, and there I didn't learn about civic education in Israel, but in the north of Israel, Arabs learn about it. A Jewish and democratic state. Tell me: why do they learn about a Jewish identity and don't learn about a Palestinian identity?? I want to tell you that education in East Jerusalem is very different from education in Jewish schools or for Arabs in the north. There, they learn about a Palestinian identity and not an Israeli one […]

This excerpt shows uncompromising opinions. Somehow, although this except does not show anything constructive in the group, it exemplifies that the technological platform serves as a public space on which extremely different opinions are posted. This is important in a country in which people live in a conflictual context. But the discussion evolved in a surprising direction:

> Jihad: I learned in East Jerusalem, and I am very knowledgeable about it. There, they don't learn about the common identity Roni mentioned. I agree with Roni that it is important to stress the complexity and the tension that exist in the country, but it is not realistic to do that because, as Roni said, there are very different societies in Israel, and these societies will not reach an agreement with the other. For example, when I entered the university, I heard about global citizenship, and international citizenship for the first

time. And I agree also with Rikiya that in our schools we don't learn about citizenship like in the north, and we even don't learn about the other groups in the country.

Ronel: I agree that civic education should serve the whole population of the country. We live together, so that we should learn about it so that we could learn to live better in a more civilized way. I think that the program should begin from primary schools and kindergartens. And should be a basis fro the future […]

Rikiya: I think that the educational system should include information on all the populations in the society, that each group will learn about its own identity and about the identity of the other, and this will help a lot to solve problems between those groups. And we should organize meetings and acquaintances because it is impossible to a modus vivendi without knowing each other […]

We can see in this excerpt that the participants become more empathic and construct arguments together. Jews and Arabs differentiate between discussing the issue in the East Jerusalem context and in the North of Israel. To summarise, the following was what was learned in the course: (a) Students learned to follow the rules of critical discussions; (b) they gained broader, deeper understanding of contemporary controversial issues; (c) they kept being emotionally engaged, and learned to regulate their emotions.

4.2 The second case: Debate and group creativity training

Our second example of an educational argumentative and interactive situation involved students, working in groups of four participants, at the Royal College of Art (London), in the framework of a Masters course that aims to train creative designers (see Mougenot et al., 2017). Most groups are mixed in terms of background, either coming from arts schools or else from Imperial College (adjacent to RCA) engineering school. Within a research project involving researchers from CNRS (Paris), Tokyo Institute of Technology and RCA, we experimented new formats of workshops for creativity training, based on introducing "tensions" into groups. These included time constraints, interpersonal competition and, our focus here, interpersonal conflict, or debate, concerning the ongoing collaborative projects of groups. For this, we designed a workshop inspired by the "argument clinic" sketch of Monty Python [https://www.youtube.com/watch?v=XNkjDuSVXiE]. For creativity training, disagreement generally has a 'bad press': the general credo is "every idea is a good idea". However, work in the design field has shown that creative performance in teams is not achieved only by agreement but also by cognitive confrontation (Badke-Schaub, Goldschmidt & Meijer, 2010.). In the Argument Clinic workshop, we ascribed pro and contra dialectic roles to pairs of students, then required them, half way through the activity, to exchange roles. This approach has two advantages: (1) it counteracts the confirmation bias whereby students are much more able to generate arguments in favour rather than against their claims, thereby encouraging them to be self-critical and to 'think around' the idea; (2) exchange of roles reinforces the idea that this is a (nevertheless serious) dialogical game, within which criticisms should not be taken too personally, thus attenuating negative emotions and necessity for affective regulation (Baker, Andriessen & Järvelä, 2013) that could interfere with group harmony. After the workshop of one and a half hour duration, participants were shown a video of their group work and asked to identify "key moments". In a subsequent debriefing session, participants stated that they felt they were under positive challenge and very engaged ("*Once we started talking about we were so passionate we ignored everything else but the topic*"). They noticed un-inhibition effect ("*some members became more vocal*", "*free from prejudice*"), the absence of negative interpersonal feelings (e.g. "*I also felt no feeling were hurt*") and personal benefits ("*More critique from peers will help me get better*"). In one group, the ongoing project was defined initially by students as "social touch". On the basis of analysis of (self-identified key moments in their interaction, it was found that: (1) the argumentative interaction enabled elaboration of a more clear definition of "social touch" (it

was not only about touching others, literally, but about sensing the presence of others); (2) as a result, there was increased group mutual understanding and cohesion; (3) the 'eurkea' episode of mutual alignment of representations was associated with the interactive circulation of positive affect (laughter); and (4) once the dialogue 'got off the ground', students left behind, surpassed, the pro/contra framework and engaged in free argumentative discussion, sometimes arguing for or against their project definition, irrespective of assigned dialectical roles. In sum, 'learning', in this case, corresponded to better definition and mutual understanding of project objectives, as well as 'team building'.

5. CONCLUDING DISCUSSION

From the beginning of the 1990s, "argumentation" in education, as a method or tool for learning something outside itself, has become a commonplace idea, at least within "progressive" pedagogies and researchers working on collaborative learning. "Collaborative" argumentation (which does not equate to soft consensus) is beginning to emerge in schools, from challenging tasks, in which the role of the teacher is highly important: this has been shown experimentally to be most favourable to learning (see Schwarz & Baker, 2017, chapter 6, for a synthesis).

However, as we have discussed above, we currently lack the theoretical tools for carrying out a serious research programme on collaborative argumentation-based learning, or *argumentexturing*. Some indications as to the theoretical tools to be partially integrated, depending on the domain of study, have been mentioned. We have provided some indications as to what a theory of argumentexturing is a theory 'of'. It is, in terms of learning theory, a theory of:

1. different timescales: microgenetic (the *hic et nunc* of interaction); ontogenetic (a person's development through periods of life); phylogenetic (of Homo Sapiens);
2. collaboration in argumentation in knowledge elaboration (on shifting conceptual sands);
3. mutual regulation on an interpersonal level, including emotions;
4. the process of becoming of human beings, where their organisations and societies become deliberative.
5. becoming more dialogical, open to the circulation of diversity of discourses;
6. being better able to question, elaborate, render more subtle one's value systems; understanding what one's values are and that others may not share them;
7. functioning with the framework of an interpersonal ethics of debate, becoming a democratic citizen.

In educational contexts, one of the major problems is how to evaluate such subtle learning objectives. In terms of argumentation theory, the aim would be to achieve partial integration, according to the field of study to be modelled, of the following dimensions of argumentation dialogue, in relation to learning processes (Baker, 2015; Schwarz & Baker, 2017):

1. the dialectical (rule-based exchange of argumentative moves);
2. the rhetorical (extended to all changes in participants dialogical attitudes, beliefs, opinions, acceptances, …);
3. the discursive (interdiscursive conceptual elaborations, negotiation of meanings);
4. the ethical dimension (interpersonal ethics of dialogue);
5. the interpersonal (relationships, circulation and regulation of affect).

As we indicated above, such a theory of *argumentexturing* would extend both learning theory, towards more rich and socio-relational-emotional situations, and argumentation

theory, beyond adversarial public debate towards the possibility of taking into account knowledge-rich collective activities.

ABSTRACT: Following World War I, the US government built eight permanent cemeteries in Europe and England to honor the approximately 30,000 Americans who died and whose bodies remained in Europe. These cemeteries and their memorial chapels advanced an argumentative brief advancing public diplomacy. This paper examines how the recently constructed visitors center at Meuse-Argonne American Cemetery, *attenuates* the arguments of that brief, reducing its force, effectiveness, and value to the very audiences it seeks to engage.

KEYWORDS: argument, attenuation, cemeteries, public diplomacy, United States, visitors center

1. INTRODUCTION

Following World War I (WWI), the US government, with its chosen teams of architects, landscape architects, and sculptors, designed and constructed eight permanent cemeteries in northern France, Belgium, and the UK. Administered by the American Battle Monuments Commission (ABMC), these sites honor the more than 30,000 Americans who died and whose families chose that their loved one's remains should be interred abroad. As we maintained in an earlier essay, the US sites composed a finely tuned commemorative rhetoric in the service of public diplomacy, with host-country and other European citizens as its intended primary audience (Balthrop & Blair 2018). The locations, aesthetics, and iconographic programs of the cemeteries advanced what amounts to an argumentative brief that does three things: It announces the arrival—culturally, economically, and militarily—of the once-insular US on the international scene; it declares the US to be a virtuous and powerful actor in that scene; and it culminates in an injunction for recognition, regard, and gratitude for the US among European citizens

Our earlier paper traced out the patterns of the argumentative brief forwarded by all of the cemeteries. Here, we bring forward from that paper three general observations about the public diplomacy brief's character. First, the demand of General John Pershing, the commander of the American Expeditionary Force, was that these sites be the most beautiful and best maintained of any nation's cemeteries along the Western Front. That aesthetic, the lushness of the grass and flowers, the presence and opulence of overtly Christian chapels, and the meticulous maintenance of the sites, would convince Europeans, he believed, not only that the US had come of age culturally, but also that the scrupulousness with which the US honored its dead, not to mention God, would indicate the great virtue of the nation.

Second, much of the iconography and inscribed text in the sites encouraged a view that many host nation citizens already held—however naïvely—that the US soldiers interred in the cemeteries were sacrifices made by the US solely to save the allied European nations.

Third, by suggesting that the primary purpose of the WWI cemeteries was (and is) public diplomacy and that Europeans were the primary audience, we do not mean to imply that honoring the dead and welcoming American visitors were considered unimportant. Quite the contrary. The commemorative rhetoric is not displaced or superseded or overwhelmed by the public diplomatic one; the strong commemorative rhetoric here is articulated in honoring the US dead—a message that is culturally legible to almost anyone. But in this geographic context, that articulate commemorative rhetoric speaks in a second register as well to the primary audience—Europeans—not just about the American dead but also about America. That the intent of those who worked to bring the cemeteries and monuments to fruition was precisely to speak in both registers is clear, based on archival records. That the second register remains legible—and persuasive—to many European visitors is apparent still, based on the thousands of reactions those visitors have expressed in guest registers over the past ninety years.[1]

Beginning in 2007, the ABMC began a gradual program of adding visitor centers (VCs) to its cemeteries and monuments. The Commission began with World War II sites, but in just the past two years has expanded that programming to two of its cemeteries and one of its monuments from WWI. In this paper we take up just one of the sites, the VC at the Meuse-Argonne American Cemetery (MAAC), which we believe suffers from overwhelming rhetorical problems. Along with the other US WWI cemeteries, MAAC has a leading role in forwarding the public diplomacy brief, with its prominent thematic of major sacrifice.

We will argue that this visitor center *attenuates* the arguments of the decades-old public diplomacy brief forwarded by MAAC and the other cemeteries, reducing its force, and potentially subverting its effectiveness for the very audiences it seeks to engage. We begin with a brief discussion of visitor centers. We address what we mean in adopting the metaphor of attenuation from the physical and engineering sciences to describe the effect on the argumentative force of the brief forwarded by the US cemeteries. Following that, we pay a visit to MAAC and its VC to analyze some of the VC's many problems and demonstrate why they are problems for this cemetery and its public diplomatic mission. We return at the end to the notion of the attenuated argument, particularly in relation to what should have been the goal *and* the outcome at MAAC's VC (or any other VC, for that matter)—to *amplify* the mission of the site rather than to attenuate it.

2. US VISITOR CENTERS AND THEIR INTERPRETIVE MISSIONS

There is a long tradition at both US culture and nature sites to provide some at least modest accommodations for visitors—guidebooks, maps, information, restrooms, etc. But the idea of visitor *centers*, as such, emerged in the 1950s with the US National Park Service's (NPS's) Mission 66 project that had two primary purposes: (1) to provide for the needs of and to manage/control a major (and growing) post-war influx of visitors, and (2) to offer a much-improved 'interpretive program' for visitors. As Sarah Allaback suggests: 'The use of the word 'center' indicated the planners (sic) desire to centralize park interpretive and museum displays, new types of interpretive presentations, park administrative offices, restrooms, and various other facilities' (2000, p. 24). Mission 66 would end in 1966 with new visitor centers at more than 100 of the US National Parks (Walser 2017). Most of them are still in existence, and each

---

[1] Most of the cemeteries and a few of the monuments have guest registers reaching back to the 1920s, where thousands of visitors have provided responses to the cemeteries, the World Wars, the US dead, and the US more generally.

serves as the hub of the park it serves—usually the visitor's first stop to orient their visits to the park site. In recent years, the impulse to add VCs to preexisting sites has become a headlong rush in the United States. The impulse to append existing sites has intensified in other parts of the world as well, from Stonehenge in the UK to a former slave market and church complex in Stone Town, Zanzibar.

The ABMC is now among the most active proliferators of VCs. In addition to the three World War I VCs, it sponsors such centers at four World War II sites, with two more in the planning stages. The ABMC's VCs are *centers* in ways strikingly similar to those envisioned and executed by the NPS; they are very frequently the first stop for visitors, even if only to use restroom facilities or to ask a quick question. But they are perhaps more properly thought of as *interpretation* centers, because site interpretation is the primary work that they do—more or less well.

3. AMPLIFYING OR ATTENUATING ARGUMENTS: DIVERGENT POSSIBILITIES OF INTERPRETATION

In various branches of the physical and engineering sciences, especially in applications having to do with light and sound, two concepts are central: *amplification* and *attenuation*. Amplification occurs when a substance or device through which sound or light passes makes a signal stronger. So, amplifiers are devices that 'increase the strength in a signal without distorting it' (Crecraft and Gorham 2003, p. 168). Attenuation is, for physics, the diminution or abatement of sound or light when sound or light waves encounter a device or substance that alters the path or wavelength in some way. For example, light is attenuated by encounters with fog or deep water.[2] The light's intensity is diminished by contact with the light or fog in what scientists refer to as 'incoherent scattering' (Gordon 1959).

We adopt the notion of amplification here as a metaphoric vehicle to describe the amplification of an argument or arguments when a secondary discourse—a commentary like exegesis or interpretation—intervenes to increase the argumentative force of a pre-existing argument. We use the idea of attenuation, by contrast, to describe a secondary discourse as diminishing the force of a pre-existing argument or arguments. Indeed, it is possible to consider a case like that of the VC at MAAC as having as its goal to amplify the force of the cemetery site's role in the argumentative brief, though its messages serve, in the end, to attenuate the intensity of those arguments. Either amplification or attenuation, in other words, may occur purposefully or not. The coherence or strength of an argument may be dissipated in a secondary discourse in any number of ways without refuting it; they simply obscure, weaken, or cast doubt on the argument. Although 'incoherent scattering' is not the only way that an electromagnetic wave might be attenuated, it is a useful extension of our metaphoric use of these terms, in the sense that the coherence or strength of an argument may be dissipated in a secondary discourse in any number of ways without refuting it; they simply obscure, weaken, or cast doubt on the argument.

Notions of amplification and attenuation are useful in thinking about all kinds of secondary discourses or commentaries.[3] These 'secondary' discourses appear as what Foucault

---

[2] For relative clear explanations of amplification and attenuation in the sciences, see: Agarwal and Lang (2005); Ballou (2008); and Kane (2009).

[3] Pezzulo and de Onis (2018) address amplification in scholarship about activism, wherein field-based studies may 'amplify' the work of the activists. Although they turn to Farrell's 1998 exploration of Aritotle's concern with 'magnification' to describe their interest in amplification, their exploration of various cases of such amplification suggest that it is similar to what we have in mind. Similarly, De Cleen's (2015) discussion of Flemish nationalists'

called events of 'reappearance'; an apparently inexhaustible primary text (or object) is taken up to be explained, elaborated, brought up to date, etc. in a secondary text. Commentary, he argued, paradoxically 'gives us the opportunity to say something other than the text itself, but on condition that it is the text itself which is uttered and, in some ways, finalised' (1971, p. 221).

In the case of interpretation, particularly of site interpretation, the primary 'text' isn't really a text but the focal *place*, what many interpretation scholars, consultants, and practitioners refer to as 'the resource.' Their writings and 'best practices' declarations, which we incorporate in the analysis that follows, emphasize consistently the role of interpretation as mediation between the resource and the visitor. Hence, the mission of the *resource* is definitive in planning interpretive talks, materials, or exhibits, but the likely needs, desires, and interests of the visitor are also central in that planning.

4. CONFOUNDING DESIGN AND ARRANGEMENT

MAAC's VC is installed in what was originally the reception area for next-of-kin and others to find out information about where a loved one or friend is buried, ask questions about the nature of US involvement in the First World War, or even just learn that the site they are visiting is a US WWI cemetery. Now, on either side of the old reception area, two galleries compose the primary exhibits of the VC, one representing the military campaign and marked at its entrance in bold signage: Courage. On the other side is the Commemoration Gallery, with another prominent entry marker: Remembering Sacrifice. Visitors may choose to visit either or both, and no order is prescribed. The open choice of which gallery one visits first is not unusual for a VC, and accommodating visitor choice is usually lauded by most interpretation experts. What we did not realize, though, until late in our first visit was that the VC has an orientation video, entitled 'Never to Be Forgotten: Soldiers of the Meuse-Argonne.' Oddly and unfortunately, it is not located in the central entrance area, but instead is uncomfortably inserted into a cramped space inside the Commemoration Gallery.[4] The video itself, while flawed in some ways, covers topics related to both galleries and it contains the lion's share of the general orienting content— most of the important material about the cemetery—available anywhere in the VC. Moreover, the orientation it provides would have been far more coherently located centrally so that a visitor could view it prior to choosing which gallery to enter first, or possibly at all.

Unlike the carefully planned aesthetic and meticulous maintenance of the cemetery, the VC seems anything but that. Each of the galleries is overwhelmed with exhibits, some of which encroach upon one another, and others of which seem simply gratuitous. Encroachment is at its worst in the Campaign Gallery, where three large display cases of WWI-era weapons and field equipment are placed immediately in front of a massive LCD screen that plays a loop of three vignettes of quotations and rather generic, reenacted scenes of a battlefield. The entire production, entitled 'Battlefield Experience: The Meuse-Argonne Offensive,' includes silent transitions among the vignettes which show a bleak battlefield scene with haze or perhaps gas wafting across it; at times a hazy photograph or quotation will emerge from the vapor. The displays and looped vignettes obviously distract from one another, particularly since the lights

---

efforts to 'attentuate' the force of claims by a radical right party in Belgium seems to parallel our understanding of attenuation, although De Cleen does not describe what he means by the term.

[4] The tiny seating area for the video is placed at an awkward 90-degree angle to the screen. If visitors prefer to stand to watch it from a better vantage point, they are almost certain to block the paths of visitors through the gallery.

dim every few minutes for a battle sequence, making it almost impossible to read exhibit labels in the cases.

Each of these design errors detracts from the mission of the VC, and in turn, does nothing to support, much less amplify, the mission of the Cemetery. Many of the design problems betray a confusion about what a VC should be. A VC is not a museum. The differences between them may blur at times, but it seems rather obvious that a VC is not a destination in its own right but an installation that takes as its primary mission interpretation of a site. Since that is the case, it should be designed to the specifications of Gross and Zimmerman's advice to 'stick to components that reflect the overall vision, mission, and themes of the site' (2002, p. 115). Exhibit consultants advise, as Ripp does, that for the visitor to 'gain an overview and to assimilate some important points of content, it is essential to reduce the number of facts to a good representative few. . . . [A] visitor center can claim neither to be comprehensive nor fully representative.' (2018). He also notes somewhat wryly that 'courage is required to leave this gap open.' Perhaps so. But to appreciate this or any other military cemetery, or to understand its arguments, a visitor need not (and certainly cannot in this way) assimilate a well-developed knowledge of even one nation's (relatively short-lived) role in WWI or even the battle that took the lives of most of those interred here.

The VC at MAAC, though, attempts not only those things but more, with displays about life on the front, military support units, then-new technologies of war, and the impacts of the war. And that is just in one of its two galleries. In the Commemoration Gallery, it attempts to cover forerunner practices of US commemoration, changes in those practices in the case of WWI, origins of the ABMC, the WWI US policy on repatriation of the dead, Gold Star mothers' pilgrimages to visit the graves of their loved ones in the interwar period, walls of the missing, commemoration on the US homefront, as well as a few highly selective (and decidedly unrepresentative) stories of those who died, interspersed among wall quotations apparently intended to break up the onslaught of information with something a little more affective in character. It also adds in the midsection of the gallery a digitized registry of all US military personnel buried or named on a wall of the missing in all the US cemeteries abroad, another interruption of the narrative. Such design and conceptualization problems already amount to an incoherent scattering effect. But there are far worse instances of attenuation.

5. DISRESPECT FOR THE PRIMARY AUDIENCE

The VC at MAAC, more egregiously, disrespects its audience, especially the intended primary audience of the cemetery. Here we return to the Campaign Gallery and the video 'Battlefield Experience: The Meuse-Argonne Offensive.' Its occasional vignettes of battle (when the lights go down every few minutes) are unnarrated, and the sounds are almost exclusively weapons fire. According to the director, the production was 'designed without dialogue to make the experience available to all languages while helping visitors feel what it must have been like to be an American' (Throckmorton 2018). But those vignettes as well as the transitional moments between them incorporate quotations from soldiers that emerge and then quickly disappear in the visual panorama. These quotations appear only in English. So, that experience is surely not 'available to all languages.' According to on-site ABMC personnel with whom we spoke last summer, there had been some complaints and pointed observations about the lack of translation, unsurprisingly. The oversight itself, though, is rather surprising, since the quotations are all brief and could easily have appeared in both French and English.

The disrespect of host country nationals reaches even further, however. Displays of weapons and other items of military life in the Campaign Gallery include some materiel that call attention to the fact that much of the armament used by US forces upon the nation's 1917

entry into an already-long war was provided by allies France and the British Empire. And it is worth noting that this display *does* include French translations of the exhibit labels for all of the items displayed, perhaps unfortunately. One of the display cases contains three weapons or weapon components. Among them is a replica of a Chauchat magazine, accompanied by this exhibit label in English and French: 'When the United States entered the war, American soldiers relied heavily on Allied materiel, including the French-produced Chauchat light machine gun. The innovative but poorly designed Chauchat was often unable to fire 240 rounds per minute using 20-round magazines as intended.' The same case includes a replica of a US Army Mark I hand grenade, with this label: 'Introduced in 1917, the MK1 grenade was modeled after standard French fragmentation grenades. However, it proved difficult to use in the field and often failed to explode, so it was replaced by the improved MK2 in mid-1918.'

The exhibit labeling here seemed to have begun with the good idea of demonstrating US and French cooperation, with its language of 'reliance' and 'French-produced.' The second label, similarly suggests that even US-made weapons were 'modeled' after French materiel. But both labels then turn to scorn the host benefactor with declarations that the weapons were 'unable' or 'failed' to function as intended. This display, in principle seems to have had the potential to illustrate the cooperation of the US and its partners in the war, as well as to indicate one specific vector of dependence. But with the labeling about the stated or implied mediocrity of the materiel, the potential identification of American-French amity is attenuated by gratuitous and unwarranted arrogance. If not arrogant, it is at least discourteous that the caption of a period photograph on a wall display unit nearby, depicting wartime damage in Exermont, misspells the name of the village as 'Exerment.' Exermont, an agrarian village with a 2008 population of 34, is a neighbor of MAAC, only about 6 miles (10 km) away.

Of course, it is completely conceivable that, in this exhibit-congested gallery, visitors might not notice the specifics of the exhibit labels or a failed spelling of a local village. But what if they do? French visitors certainly seem to have noticed when translations are missing. That is already a signal that their interests/needs are not being served by some of the exhibits. The haughty exhibit labels defy the attitudes historically held by the planners of the cemeteries and monuments who realized that America's intervention in WWI, and thus that its loss of life, was far less significant than those of other combatant nations. So, while there was a demand that the US memory sites be beautiful and well-manicured and that their chapels and other structures be of extraordinary quality, there was a concerted effort to display *deference* toward allied nations, their losses, and the sites that represented those losses (Balthrop & Blair). The worst possible outcome would have been for the US cemeteries and monuments to be an affront to those who had lost so much more in blood and treasure. The mistakes in this VC gallery do represent affronts, and if they are noticed, they have potential not just to scatter but to dissipate the mission.

6. BURDENING THE RESOURCE WITH POSSIBLE PROVOCATIONS

Attenuation of the resource, in this case MAAC and the public diplomacy brief it articulates, can occur inadvertently by burdening interpretation. Such burdening may occur if interpretation introduces into the attention of visitors exhibits or materials that some might take to be inappropriate to the character of the resource.

One case of such 'burdening' at work in the VC is the inclusion of displays that are unnecessary and that could easily invite charges of inappropriateness or tastelessness when introduced into a cemeterial setting. We have already mentioned the display of weaponry that resides in the Campaign Gallery, This exhibit also harbors the potential for being thought of as wholly inappropriate in context. To say that a display of battle accoutrements at a cemetery is

unnecessary seems to us both accurate and obvious on its face. Potentially worse than unnecessary, though, it also may also seem to some visitors that a display of mechanisms of killing simply does not belong in a cemetery. Of course, weapons are almost always on display at museums related to battles or wars. Even in that kind of venue, exhibition of weapons has been deplored by many as a veneration of technologies of warfare and as a cultural means of idealizing war (Blair, Balthrop, & Michel 2013). But in this space that seeks to honor those killed in war, a weapons display seems at least out of place if not ethically inept.

7. SPURNING THE RESOURCE

Attenuation of the resource, in this case the public diplomacy brief it articulates, can occur inadvertently by snubbing the character or attributes of the resource itself. The most obvious and painful spurning of the resource is that the VC speaks not a word about the chapel that presides visually over the cemetery and that bears so much of the task of conveying the cemetery's diplomatic message. Even with an interpretive board in the VC that focuses on the walls of the missing, which are located in the loggia of the chapel, the text in the interpretive wall unit does not mention their location in the cemetery. As with all of the US cemeteries abroad, MAAC's chapel is among the symbolic signatures that sets the site apart from other nation's military burial grounds—that makes it unmistakably legible as American. More important, the chapels in the US cemeteries are tasked with much of the important iconography that composes the diplomatic brief. The omission of even a mention of the chapel in the VC certainly seems to diminish its importance; its omission can hardly be considered encouragement for visitors to inspect it. Even a brief discussion of the chapel would have offered the opportunity to emphasize the prominence of the architects and sculptors who were involved in its design, reinforcing the 'cultural arrival' theme in the public diplomacy brief.[5]

There are multiple missed opportunities in the VC and ones that would be even simpler to have addressed. One obvious example is related to the Commemoration Gallery's treatment of 'Remembrance at Home.' In the primary text and a captioned period photograph, visitors read about and see the US Tomb of the Unknown Soldier (TOU), which was established in Arlington National Cemetery in 1921. The connections between that important US site and MAAC are significant. When the US decided in 1921 to follow France's and Britain's leads in establishing a national TOU, four unknowns were disinterred, one each from four different US overseas cemeteries, including MAAC. The soldier whose remains were chosen in a special ceremony was transported to the US amidst much tribute on both sides of the Atlantic. What happened to the other three? They were reinterred together at MAAC. Their graves are not specially marked in the Cemetery, in keeping with the *ethos* of honoring all burials equally, but their location is certainly not secret. Offering that information would provide visitors with an overt link to the cemetery outside.

'Spurning,' though, is not just about such absurdly missed opportunities offered by 'the resource.' It can also be about a complete loss of attention to what must be presumed to be the mission of this VC—to be a visitor center *for the Cemetery*. In the space where visitors first enter the VC are framed images of two prominent Americans from WWI. One of them clearly belongs here, a photograph of John J. Pershing, Commander of the American Expeditionary Force. Pershing was also named the first Chairman of the ABMC and was instrumental in the

---

[5] The architectural design of the chapel at MAAC is attributed to the New York firm, York and Sawyer, an important contributor to university campuses and cityscapes in the eastern US and best known for its many banks and hospitals. York and Sawyer's lead architect of the MAAC chapel, Louuis Ayers, designed the giant Department of Commerce building and was instrumental in helping to plan the Federal Triangle complex, both in Washington, DC as well as having other major commissions.

cemetery and monument projects after the war. The other is a photograph of Sergeant Alvin York, one of the most decorated *and* famed US soldiers of WWI. He was in action at the *Battle* of Meuse-Argonne. He also outlived the war. His life and deeds were the subject of a 1941 Hollywood film, *Sergeant York*, with Gary Cooper playing the title role. York was an impressive soldier, but he does not belong in a VC for MAAC. These are worse than poor choices; they undermine the value of those who are honored in *this* cemetery, and they shatter the mission of the VC, to be an interpretive site for *this* cemetery. This VC is not, after all, a museum, and it is not about the *Battle* of Meuse-Argonne but about the cemetery site that shares its name.

A similar problem of reaching beyond MAAC is found in one of a number of brief biographies scattered throughout the VC, often accompanied by photographs of soldiers who lost their lives in WWI and who are buried in MAAC. The most prominent biographies are located in the Commemoration Gallery's four large stand-along biography panels, placed in the walkway of that gallery, with the clear expectation that visitors will walk among them, taking special interest in those that have been singled out in this fashion. Almost, but bizarrely not all, of these people are buried in MAAC. One of the biographies is about Private Henry Johnson, who is buried not in MAAC but at Arlington National Cemetery. He was not even a casualty of the war, but died in 1929. His story, including the fact that he was a Congressional Medal of Honor recipient, is compelling, to be sure. But why he is commemorated here in a VC for MAAC is unexplained and inexplicable. Johnson's biography, like the photograph of York, deflects attention from the Cemetery, thus attenuating characteristics of the argumentative brief, particularly those that call attention to French-American amity.

8. CONCLUSION

Articulated responses that weaken argumentative cases need not always be refutations or counter-arguments, and they need not always be purposeful. Refutations are deliberate objections or negations by an opponent of the *substance* of the proponent's argument. An opponent may also attenuate the *force* of a proponent's argument, whether deliberately or unintentionally, in ways other than direct refutation. Crucially, though, attenuation may occur at the hands even of someone who supports the proponent argument.

That is precisely what has occurred with the VC that now appends MAAC. A seemingly supportive commentary, as one would expect in a VC, here subverts the primary brief of the cemetery with an incoherent presentation of information, risking insult of the primary audience, not attending even to primary features of the cemetery and its brief, and diverting attention to matters far outside the domain of the Cemetery.

ABSTRACT: Medical consultations in chronic care can be described as advice-seeking activity types, in which advice-giving is the main discursive activity that entails an argumentative component. This component appears during deliberative and evaluative sequences. In the first case, participants need to find agreement on a solution to a problem. In the second case, participants need to find agreement on how to assess facts in order to make decisions based on those assessments. We are particularly interested in understanding clinicians' use of argumentation 1. when deciding for a certain treatment; 2. when patients disagree with them. In order to do this, we propose the analysis of a corpus composed of interviews with chronic care doctors, collected in Italy and in the Chinese region of Inner Mongolia.

KEYWORDS: activity type, advice giving, deliberation, institutional preconditions, medical argumentation, pragmatic argumentation, shared decision making, traditional Mongolian medicine

1. INTRODUCTION

In an increasing trend towards contextualization of argumentation studies, specific contexts of interaction are being examined closely to identify the constraints that bear on participants' argumentative choices. The exploration of different contexts of interaction has developed following considerations regarding the influence contextual features might have on the production and interpretation of argumentation: "The need for argumentation, the requirements of argumentation, and the structure of argumentation are all adapted to a context in which doubts, opposition, objections, and counterclaims arise" (van Eemeren, 2011, p. 142). In van Eemeren (2011) the notion itself of *context* is specified as a way of giving the analyst appropriate tools for the analysis of argumentation in context: the first level is the *text* of the discourse; then there is the *context*, which can be described as *micro-context* (the text immediately preceding or following the analysed extract), *meso-context* (the situation in which the discourse occurs) and *macro-context* (the speech event, or communicative activity type (van Eemeren, 2011, p. 144).

In analyzing a piece of argumentative discourse, the analyst can rely on information deducted from the text, from the context, on his own inferences and on *background information*, which includes knowledge of certain general rules and regulations that are instrumental for the

interpretation of argumentation produced in a certain interaction (van Eemeren, 201, pp. 144-145).

The medical context is one of the most recent contexts to be explored from this perspective and a very interesting one. It is perhaps redundant to mention the practical and ethical implications that studies on the communicative component of these encounters can and should have; indeed, these implications have been described in a large corpus of studies that spans by now 40 years (Bigi, 2016). However, the domain of medical argumentation is relatively recent and still developing. The main research questions in this domain are the following: What kind of arguments do participants use in medical encounters?; Is argumentation coherent with a patient-centered approach to care?; What are the functions of argumentation in medical encounters?; Can argumentation patterns be identified in the medical context?[1]

In particular, in the search for argumentation patterns that might help determine the functions of argumentation in medical encounters, in this paper we present a small empirical data collection aimed at understanding if and how clinicians' use of argumentative strategies varies in different cultural contexts. More specifically, our research has focused on a comparison between Western medicine and traditional Mongolian medicine: the former is represented by a sample of Italian clinicians and the latter by a sample of Inner Mongolian clinicians, who practice both traditional Mongolian medicine and Western medicine.

So far, the studies on medical argumentation have been centered on corpora collected in Western countries (mainly Europe and the United States) (Pan et al., 2017). However, it is interesting to broaden the scope of our research to include also areas where other kinds of medicine are practiced, in order to identify similarities and differences in the use of argumentation. Traditional Mongolian medicine is particularly interesting in this respect because it rests on radically different methodologies and epistemological tenets if compared to Western medicine. The main difference between Mongolian medicine and Western medicine is the conception of the human body at the heart of the former. Mongolian medicine rests on the 'Three Roots theory', which conceives of the human body as an organic whole. The structure of the human body is such that all its parts are in contact with each other, and the various functions of the body are coordinated with one another. Also in the event of a disease, the various parts of the body interact with each other. At the same time, Mongolian medical practitioners recognize that there is a close relationship between the human body and the environment, and changes in the environment directly affect the body's health (Gula, 2010).

2. ARGUMENTATION IN THE CHRONIC CARE ENCOUNTER

Our working hypothesis regarding the dialogic nature of medical encounters is that they can be described as instances of an *advice-seeking activity type* (Levinson, 1992, p. 69; Sarangi, 1988, 2000, 2013; Bigi, 2018a): the medical consultation is originated by an individual who seeks the advice of an expert in relation to a specific health problem. In order for this intention to be fulfilled, the core speech activity within the interaction is that of *advice giving*. Within this activity type, 'advice giving' is intended as a *discourse type*, i.e. as a form of talk (other examples are, medical history taking, promotional talk, interrogation, etc.) (Sarangi, 2000). It is the typical and most relevant form of talk within the medical consultation, because it is the one that is indispensable for the realization of the activity type's implicit institutional goal.

As argued elsewhere (Bigi, 2018b), argumentation sequences may appear in advice-giving activities with two main functions: as the pivotal component of pragmatic argumentation

---

[1] A helpful review of the studies on argumentation in the medical context has been presented in Labrie & Schulz (2014).

(i.e., providing reasons for supporting or refusing a certain proposal for action); and as the dialogic tool for the alignment of criteria for the interpretation of facts (symptoms).

Pragmatic argumentation happens when the parties need to agree on the solution to a problem, and discuss the validity of a course of action based primarily on its consequences (Perelman, 1959). In this perspective, arguments may be put forward to support or object a proposed course of action, typically pointing out the positive or negative consequences deriving from one solution or the other. However, when making a shared decision it is also important to agree on the criteria that are used to determine the acceptability of the consequences of the actions taken. Usually, interlocutors do not make these criteria explicit, assuming that they are shared or at least intuitive. It is often the case that precisely the lack of shared criteria causes troubles and misunderstandings, such that a shared decision cannot be made. If the interlocutors realize this and are actually able to turn the presupposed criteria into topics of discussion, argumentation can be a useful instrument to scrutinize such criteria, decide which are really relevant for the decision to make and align them.

On the backdrop of this hypothesis, the research question we have tried to answer is the following: given the functions of argumentation hypothesized within medical encounters understood as instances of advice-seeking activity types, will such functions change if the approach to medicine and the cultural background change?

3. THE STUDY

In order to answer the research question described in the previous section, we decided to collect data in two contexts that would differ culturally and also with respect to the kind of medicine practiced. We chose to compare Western medicine, represented by a sample of Italian chronic care clinicians, and traditional Mongolian medicine, represented by a sample of chronic care clinicians from Inner Mongolia (China) who practice regularly traditional Mongolian medicine, but also know about Western medicine.

We limited our study to the area of chronic care, given the specific clinical aims of this field of medicine, which include patient education, empowerment and self-awareness. These goals presuppose that patients are included in the decision-making processes leading to the definition of therapeutic and behavioral recommendations; this makes argumentative practices particularly relevant for the achievement of such goals.

Given difficulties related to recording medical encounters, we conducted interviews with the clinicians aimed at collecting their perceptions of communication and argumentation within the consultations, and their descriptions of the structure and aims of the encounters.

The specification of our research question was: do traditional Mongolian doctors have a different dialogical and argumentative behavior from their Western counterparts?

3.1 Materials and method

We prepared an interview with questions about the communicative component in chronic care medical encounters. We selected a sample of 12 chronic care doctors in total, according to the following categories:
subgroup 1: 1 male + 1 female; just finished university;
subgroup 2: 1 male + 1 female; 15 years of experience;
subgroup 3: 1 male + 1 female; more than 30 years of experience.

The same sample was selected in the Italian region of Lombardia (6 doctors) and in the Chinese region of Inner Mongolia (6 doctors). Each doctor was interviewed and their answers were transcribed verbatim.

The interview topics were the following: communicative behavior; typical structure of the consultation; use of argumentation (agreement or consensus); management of disagreement; style of advice giving for therapeutic prescription; the role of the clinician in the encounter. The interviews were analyzed using a directed approach to content analysis (Hsieh & Shannon, 2005). As initial coding categories, we identified the following:

1 – uses argument from consequences (Bigi, 2014)
2 – uses examples (Williams & Ogden, 2004; Bigi, 2016)
3 – uses simpler terms (Williams & Ogden, 2004; Bigi, 2016)
4 – argues to find agreement (Asterhan & Schwartz, 2009; Bigi, 2018b)
5 – argues to reach consensus (Asterhan & Schwartz, 2009; Bigi, 2018b)
6 – consults patient when making decisions (Elwyn et al., 2012)
7 – does not consult patient when making decisions

The interviews were coded according to these categories and further analyzed qualitatively to determine any additional variables that could be relevant to answer the research question.

The interviews with Inner Mongolian clinicians were conducted in Chinese by ST and translated into Italian by CP, who is an expert in Chinese language and a native Italian speaker. The interviews with Italian clinicians were conducted in Italian and translated into English by SB. This allowed all the researchers to access the data.

The coding was conducted by SB and then discussed with ST to check for incorrect interpretations or misunderstandings. In this process, the contribution of CP as a linguistic and cultural mediator was crucial as it guaranteed that the content of all the interviews was correctly understood by the other researchers, both in terms of exact wording and cultural implications[2].

3.2 Results

In this section, results for each coding category will be reported, followed by a more general discussion of the results.

Category 1: use of the argument from consequences
Only in 2 cases Italian doctors explicitly declare to mention consequences when arguing in favor of a certain treatment or behavior; in other cases, they say that they give their 'reasons'. We don't know what the word 'reasons' implies, whether the causes or the consequences. The majority of Mongolian doctors declares to use the argument from consequences.

Category 2: use of examples
Mongolian doctors never explicitly mention using examples to rephrase explanations.

Category 3: use of simpler terms
Italian doctors declare to use simpler terms only in 2 cases, whereas Mongolian doctors do so in 4 cases.
Observing categories 2 and 3 together, the younger doctors tend to use examples, while the older doctors tend to use simpler terms.

Category 4: argumentation used to find agreement
Italian and Mongolian doctors score similarly in this category, with about half the sample declaring to seek agreement.

---

[2] Given the very small number of interviews collected, we did not think it would be significant to calculate the usual statistical coefficients for coders' agreement.

Category 5: argumentation used to reach consensus
Italian doctors declare to have this goal in 5 cases, whereas Mongolian doctors only in 2 cases. There are cases in which 4 and 5 appear in the same interview: these are the cases in which doctors make a distinction between life-threatening conditions and less serious ones. In the former cases, they do not try to find agreement but definitely try to convince patients to follow a certain therapeutic suggestion; in the latter, since the condition is not putting at risk the patient's life, there is the possibility to allow patients time to try alternative ways.

Category 6: the doctor consults patients when making decisions
The majority of both Italian and Mongolian doctors declared to consult patients when making decisions.

Category 7: the doctor does not consult patients when making decisions
In all cases except one doctors declare to consult their patients when making decisions. In 5 of the same cases, they also declare they do not consult patients when making decisions. By reading the interviews carefully, it appears that the concept of 'consulting' needs to be better specified.

Both groups of clinicians report a similar structure of the consultation, differing only in the use of diagnostic 'techniques':
- Italian doctors: question-asking, physical examination and diagnostic tests
- Mongolian doctors: 'three diagnosis' (observe, enquire, touch) and diagnostic tests

Patients are reported as not expressing disagreement very often, but when they do the reasons for this are different in the two contexts:
- Italian context: proposals that imply a change for patients, e.g. changing therapies (different pills), switching from one kind of therapy to another (from pills to injections); for a minority: undergoing additional exams, especially if they are invasive or perceived as useless;
- Mongolian context: the taste of the Mongolian medicine proposed; fear of the consequences (pain or bleeding); costs of care; effectiveness of medicines.

3.3 Discussion

Clearly, our study has limitations, the most relevant probably being the size of the sample and the formulation of the interview questions, which could be improved to allow for more nuanced information to be obtained. Therefore, we consider our results relevant only as indicators of phenomena that should be further explored, also by employing different methodologies.

In general, Italian clinicians seem to argue more to reach consensus; Mongolian doctors often say that if patients do not agree with their suggestions, they refer them to other clinicians or suggest different therapies, either from traditional Mongolian medicine, from traditional Chinese medicine or from Western medicine. Therefore, having more alternatives available allows more easily the use of argumentation for finding agreement.

Regarding the puzzling result where doctors seem to be consulting and not consulting patients at the same time, the concept of 'consulting patients' probably needs to be specified. It seems that in most cases, 'consulting the patient' is understood as 'asking questions regarding relevant information for the decision at hand', so doctors are not actually involving patients in the selection of options, but only collecting information that will help them provide more appropriate suggestions.

In other cases, 'consulting the patient' means describing the options and asking the patient which one they prefer. In a few of these cases, however, doctors also acknowledge that

they present the options in such a way that patients are led to choose the one the doctor already thinks is the best. In more than one case, doctors specify that they do not involve patients when selecting the options, but only in the final phase of discussing their operationalization.

Finally, in a couple of these cases, the doctors (one Italian, male, and the other Chinese, female) make an interesting comment: they say that it is part of their professional responsibility to come up with the relevant options, and that it wouldn't be fair nor professional to involve the patients in the phase of selecting appropriate therapeutic suggestions, because they do not have the conceptual tools to interpret them. Although this statement was made only by two individuals, it points to a crucial issue for understanding the role argumentative practices should or might have in medical encounters. This issue can be formulated in the following research questions (not necessarily an exhaustive list), which might inform future research: within interactions occurring in institutional contexts characterized by a significant epistemic asymmetry, how should argumentation be used? To achieve which goals? What are inappropriate (invalid) uses of argumentation in these contexts? Does the epistemic asymmetry impact on the capacity of all the parties to play the role of protagonist and antagonist in the critical discussion?

In general, the analysis offers the picture of highly complex interactions, in which apparently contradictory dialogical activities take place.

The analysis of the interviews allowed us also to make some considerations at a more theoretical level. With regard to the working hypothesis underlying our study, i.e. the description of consultations in chronic care as 'advice'-seeking activity types, it can be retained but with a few specifications regarding in particular the activity of advice giving, which is the pivotal activity in the whole interaction.

Advice giving has been described as a sequential speech activity, and a combination of assessing, judging and directing, which regards a future action assumed to be positive for the advisee (Locher, 2006). It also has a weaker force than a request or a command, as the advice seeker is free to follow or not (Locher, 2006; Searle, 1969). The results from our interviews, confirm that it also implies a weaker normative obligation to provide supporting arguments, even if providing them is coherent with a patient-centered approach to care and seems to favor patient engagement. Indeed, from clinicians' answers it seemed that they would more frequently offer a preferential option to follow and then open the discussion about ways to implement it, rather than about reasons for accepting or refusing it.

Moreover, we can further develop the characterization of advice giving by adding that it involves (possibly shared) decision-making, which involves pragmatic argumentation. This implies that the model of the deliberation dialogue (Walton, Toniolo & Norman, 2014) can be retained but with a few adaptations to the context, namely: the context predefines the topics about which patients can put forward proposals (the majority of clinicians declared that they expect patients to participate in the discussion about how to put suggestions into practice, rather than about what to do); the felicity conditions for the act of 'proposal' (Walton, 2007) have to be redefined by considering also patients' possible contributions.

4. CONCLUSION

In conclusion, we think there are two main indications that can be drawn from our study and that may be developed in further analyses.

The first is that the model of shared decision making, at least for chronic care, probably needs to be reconsidered and redefined based on the information that can be collected from the field. An ideal model of deliberation, like for example the one described in Walton, Toniolo &

Norman (2014), can be used as a tool for the identification of certain problems in real-life deliberations (as has been done e.g. in Lamiani et al., 2017). However, it is contextual constraints deriving from social roles, professional commitments, deontic positions and the issue itself (e.g., the type of disease) that define the margins and modalities for the use of argumentation for deliberation; these need to be accounted for in a model that seeks to explain what happens in reality and possibly predict positive and negative effects. In a different perspective, ideal models could be used to advocate for a change of the institutional context within which deliberations take place.

The second conclusion we think can be drawn from our study is that it is the goals of interactions that define their structure and social/dialogical roles. Different cultural backgrounds, instead, impact on the way argumentation is understood as a tool to accomplish the general goal. So, further research should examine the phases of consultations in which argumentation is used; the argument schemes employed; and the argumentative behavior of all the participants (strategic maneuvering) in order to understand if and how the cultural variables are impacting on the realization of argumentation in practice.

ABSTRACT: This study, in collaboration with the *ADR Instituut* in Amsterdam, is guided by the following question: *How do different questions help (re)establish material and procedural starting points in mediation sessions?* Questions with different *local functions* may have the *general effect* of (re)establishing common starting points. This notion is discussed by means of examples from a corpus of mediation simulations and a metacorpus as the result of a focus group with professional mediators.

KEYWORDS: common ground, dispute mediation, opening stage, questions starting points

1. INTRODUCTION

Alternative Dispute Resolution (ADR) style dispute mediation is used to resolve various types of disputes, from environmental to business disputes. ADR mediation is attractive because it is cost saving, confidential, and has relationship restorative effects (see e.g. Burrell and Vogl, 1990). In ADR dispute mediation, an external third party procedurally guides two (or more) parties who are in a highly escalated conflict to a sustainable win-win resolution. Because the solution should be mutually beneficial, this neutral procedural guide does not have the authority to determine the outcome.

In order to come to mutually beneficial and sustainable solutions, parties must engage in reasonable argumentative discussions on possible solutions. For reasonable argumentative discussions to take place, a certain amount of common ground is needed (van Eemeren 1993 et al., p. 172). However, in the initial situation the conflict is at deadlock, meaning that besides their inability to resolve the conflict without the procedural guidance of an external third party, the conflict parties are unable to recognize and/or acknowledge their common ground. In dispute mediation, it is therefore important for the mediator to make common ground more explicit. By making it explicit, the mediator can design a context in which a reasonable discussion can take place (e.g. van Bijnen forthcoming).

Questions, which are some of the mediator's main tools, are important to study if we are to understand how mediators, as designers of the mediation (see e.g. Aakhus, 2007; Greco, 2018; Vasilyeva, 2015) construct different interventions to (re)establish common ground in mediation. Although questions have been discussed in studies on argumentation in mediation before (see e.g. van Eemeren et al., 1993), to the best of our knowledge, questions have not

previously been put at the center of a study and analyzed for their ability to (re)establish common ground.

2. THEORETICAL FRAMEWORK

In the normative model of the *critical discussion* for the resolution of disagreements in a reasonable manner in the pragma-dialectic approach to argumentation, different stages are distinguished (e.g. van Eemeren et al., 1993; van Eemeren, 2015). Here, we focus on the *opening stage*. In this stage, the common starting points as "points of departure" are determined (van Eemeren & Grootendorst 1992, p. 12). These common starting points are divided into two groups; *material starting points* and *procedural starting points*. The *material* starting points concern the beliefs, facts, truths, values, and so on, shared by the parties. The *procedural starting points* concern the shared *norms of conduct*, including rules regarding turn taking, formality of the communication, scheduling, and so on. When a starting point is established it is added to the common ground.

As stated in the introduction to this paper, parties need to be able to recognize and acknowledge their common ground; to this end, it is important for mediators to make *material starting points* explicit, so parties know they share enough beliefs, and so on, for a resolution. Additionally, because of the formalized procedural nature of ADR dispute mediation, many mediation specific *procedural starting points* are addressed explicitly during the sessions. The importance of (re)establishing both types of starting points is related to the idea that it is "only through explicit agreement that the discussants can be a hundred percent certain about what may be regarded as belonging to the common starting points" (van Eemeren & Grootendorst 1992, p. 150). The parties' knowledge that they share common ground not only creates a strong point of departure for argumentation but also a willingness to commit to mediation (van Bijnen forthcoming).

Prior research on argumentation in dispute mediation already revealed that the intervention strategy of *questioning* may serve several functions, such as to "raise issues and open up possible standpoints" (van Eemeren et al., 1993), whilst maintaining mediators' neutrality (van Eemeren et al., 1993; Jacobs, 2002), which is an essential characteristic of dispute mediation. Additionally, Aakhus (2003) has shown that mediators may use questions to help disputants overcome an impasse. Most importantly, questions may help with "raising and shaping the materials for premises" (van Eemeren et al., 1993, P. 136). This study aims to fill a gap by showing how dispute mediators, as designers of argumentation and the mediation context (see e.g. Aakhus, 2007), ask questions concerning the material and procedural starting points with the effect of designing a context with enough common ground for an argumentative discussion on mutually beneficial solutions. For this reason, this preliminary study aims to answer the following research question: *How do different questions help (re)establish material and procedural starting points in mediation sessions?*

3. METHODOLOGY

For this study, the Institute of Argumentation, Linguistics and Semiotics (IALS) at Università della Svizzera italiana collaborated with the ADR Instituut[1] for data collection, which has resulted in a corpus of mediation simulations to be used for discourse and argumentation analyses, and a focus group that provides insight into the questions asked to (re)establish common starting points. Thus, this study has a two-step research design; the corpus of natural data is analyzed, after which the second corpus is used to get a better understanding of questions for common starting point (re)establishment. Whilst the first step helps us understand *what* mediators may design in terms of questions that may create more common ground, and *how* they may do so, whereby it is in line with previous studies on argumentation in mediation (see e.g. van Eemeren et al., 1993; Greco Morasso, 2011); the second step helps us understand *why* and *when* mediators may or may not use certain questions that may create more common ground, whereby more depth is given to the findings in step 1. The results of both steps are presented simultaneously by means of examples of a specific local function with the general effect of (re)establishing either a material or procedural starting point.

3.1 Data step 1: mediation simulations

The emphasis on confidentiality, as a key aspect in mediation (see e.g. Burr, 2002; Deason, 2001) poses a serious problem for the collection of fresh mediation data. To circumvent this issue, the corpus of examples used consists of role-play sessions as performed by professional certified ADR mediators. This method has previously been acknowledged as a good alternative to real mediation sessions for the analysis of discourse and argumentation in dispute mediation (see e.g. Putnam and Holmer 1992, p. 136; Susskind, 2010; Janier & Reed, 2017). Table 1 provides some general information for corpus 1.

General corpus information (corpus #1)	
Type of data:	Oral (mediation simulations)
Date:	21/3/2016, 22/3/2016, 4/4/2016, 5/4/2016
Location:	Amsterdam (NL)
Duration:	4 days (approximately 29'000 words)
Participant total:	8
Mediation specialization:	Labor dispute mediation
Language:	Dutch
Organized by:	ADR Instituut
	Table 1: *General corpus information (corpus #1)*

The simulations take place during ADR Instituut courses on labor dispute mediation. In the simulations, at least one of the certified mediators mediates between parties in conflict (played by other participant mediators). The mediators have different levels of experience. The cases

---

[1] The ADR Instituut in Amsterdam, the Netherlands, is a vocational education institute that specializes in the training of certified and prospective ADR mediators (for more information visit https://adrinstituut.nl/. Last visited on June 6th, 2018).

are presented to them by the mediator instructor, or introduced by the other mediators, and are based on cases they have encountered in their professional life. The turns in the excerpts are numbered and relative to the mediation session. All names of participants, towns, companies/organizations, and so on, are pseudonymized for the sake of anonymity. In case of co-mediation[2], mediators are assigned a random letter of the alphabet to distinguish them. The data was recorded in Dutch and has been translated into English.

3.1.1 Data step 1: case contexts

Tables 2 and 3 provide the basic case contexts of the included extracts.
The first case concerns a *church board versus sexton* conflict, recorded in March 2016:

Participants:	A. New head of a church board of directors (Mr. C) B. Sexton of the church community (Ms. B)
Conflict:	The sexton (Ms. B) receives a meager salary. To complement her income she organizes events at the community center. Mr. C is the new chair of the church board tasked with countering the growing financial problems of the church. He wants to provide Ms. B with a fixed salary only and invest all the proceeds from event organization in the church. Mr. C has requested the receipts and notes on her earnings and spending from the last couple of years. Ms. B is enraged by the suggestion of receiving a fixed salary and access to her books. She claims that there is a lack of trust from the new 'big city' church board and that she cannot live from her meager salary alone.
Case extracts:	1 (section 4.1) and 3 (section 4.2)
	Table 2: *Church board versus sexton context*

The second case concerns a *school collective versus rector* conflict, recorded in April 2016:

Participants:	A. School board representative (Ms. A) B. New school rector (Ms. B)
Conflict:	The new rector was hired a few months prior to the mediation session. The school board wants to terminate the rector's contract because they think she is not functioning well and feel like they were promised something that the rector has not fulfilled. The rector says termination is unthinkable and claims she has not yet been given the chance to prove herself.
Further notes:	This session was co-mediated.
Case extract:	2 (section 4.1)

Table 3: *School collective versus rector context*

---

[2] We refer to *co-mediation* in sessions in which more than one mediator is present as a procedural guide.

3.2 Data step 2: mediation focus group

The second corpus is the result of a focus group organized by van Bijnen and Bakker. Table 4 provides the general information of the corpus:

General corpus information (corpus #2)	
Type of data:	Oral (focus group)
Date:	23/5/2018
Location:	Amsterdam (NL)
Duration/length:	1:56:42
Participant total:	5
Mediation specialization:	3 labor dispute mediation / 2 business mediation
Language:	Dutch
Organized by:	van Bijnen and Bakker

Table 4: *General corpus information (corpus #2)*

During the focus groups, the participants were presented with questions on paper. In case of confusion or ambiguity, they could ask the researcher for clarification. The questions posed in the focus group were based on initial findings of the preliminary analysis of the questions that (re)establish a common starting point in the analysis of the corpus of mediation simulations. Therefore, the questions posed in the focus group are not naïve. The answers given by the mediators are not supposed to confirm or disconfirm the findings of the analyses of the questions found in corpus 1; instead, they provide us with extra insight into the questions that may be asked by mediators, and the reasoning behind the design of common starting point related interventions, and their functions.

3.3 Method for analysis

All excerpts in which questions are presented by the mediator that may establish or reestablish procedural or material starting point are tagged. Although all these interventions may help design common ground (*general effect*) we expect the questions to have a specific *local function.* Locally, the strategic function of the question in a specific moment in the mediation session can be expected to be different from 'reestablishing' or 'establishing' common starting points. Therefore, to understand when, how, and why mediators design questions that establish or re-establish material or procedural starting points, the local function of the question should be identified. To this end, the focus group helps elucidate the function and explicate the use of different questions that have common ground (re)establishing effects.

4. DATA PRESENTATION AND DATA ANALYSIS

Mediators, consciously or not, design common starting point (re)establishing interventions. As discussed in (3.3), we differentiate between the interventions' *general effect*, which is common ground design, and the *local function*, of which the functions can be different for each

	GENERAL EFFECT		
	General effect of (re)establishing procedural starting points		*General effect of (re)establishing material starting points*	
	Local functions of procedural starting point (re)establishing questions:	*Description of local functions of procedural starting point (re)establishing questions:*	*Local functions of material starting point (re)establishing questions:*	*Description of local functions of material starting point (re)establishing questions:*
LOCAL FUNCTIONS	Mediation code of conduct	Get agreement on the norms of conduct for the mediation session	Facts & case context	1) Get all the necessary case information 2) Get to the underlying interests and feelings 3) Create common ground
	External context → mediation context	1) Enable parties to have an informed discussion 2) Involve all (direct and indirect) advisors	Understanding	Get understanding of one party for the other party
	Mediation essence	1) Emphasize the idea of finding mutually beneficial solutions together 2) Emphasize dialogue guidance 3) Emphasize that it is the parties' conflict	Topics for discussion	Establish the important topics for the reasonable argumentative discussion that may result in mutually beneficial solutions
	Mediation commitment	Test and confirm the commitment of the parties	Intentions	Make the parties aware of the fact that there may be good intentions on both sides
			Mediation progression	Getting the conversation back towards something parties build together

Table 5: *The local functions of the two general effects*

intervention and specific to the context in which the intervention is used. Table 5 provides the different local functions and local function descriptions for each of the two general effects.

For this preliminary study, two local functions are selected for a closer look; one with the possible general effect of (re)establishing a *procedural starting point*, namely *mediation essence*; and one with the possible general effect of (re)establishing a *material starting point*, namely *facts and case contexts*.

4.1 Mediation essence (procedural starting points)

In *essence*, mediation is highly procedural. Therefore, most, if not all, questions related to the essence of mediation can be expected to have the general effect of (re)establishing *procedural starting points*, when the preferred response to such a question is provided by both parties. The procedural questions are related to the *norms of conduct*, or in other words, the way in which mediation is carried out to help procedurally guide the parties to and through a reasonable argumentative discussion on win-win solutions.

Questions concerning mediation essence may, at least, have the following different functions: (1) to emphasize the idea of finding mutually beneficial solutions together, (2) to emphasize dialogue guidance, and (3) to emphasize that it is the parties' conflict[3]. All three functions of mediation essence questions that were identified by the focus group are related to a key element of the mediation procedure and the procedural norms. Let us now take a look at excerpt 1. The extract is from the beginning of the first mediation session in a conflict between an employer (Mr. C), who is the new head of the church community's board of directors and employee (Ms. B), the sexton of the church who takes care of the church properties (italics added for emphasis):

48	Mediator	And the intention should e:h be that you are both also willing (.) to <u>re</u>solve it to<u>gether</u>. (4.0) *So yes the <u>question</u> is e:h (.) <u>if you indeed want to <u>revert</u> to that↑</u> because basically therefore therefore we have come together* (1.5) and then I would like to sign a me<u>dia</u>tion agreement (.) that I have send heh↑ so (.) I'm just assuming that you have re<u>ceived</u> it °heh°↑. (3.0) <u>Yes</u> I <u>now</u> see you nodding so that already looks somewhat more <u>pos</u>itive (hhh) (1.0) <u>yes</u>=
49	Ms. B	=Yes
50	Mediator	*°Yes° shall we give it a <u>go</u>↑*

Excerpt 1

Excerpt 1 shows two interventions (turns 48 and 50, italics added for emphasis) that should be taken together. The mediator designed the first part of the question (turn 48) with function (1) – emphasizing the idea of finding mutually beneficial solutions together – in mind. The fact that this is essential in mediation is emphasized by the intervention "basically therefore *we* have come together" (turn 48). However, by stating "therefore have *we* come together" (turn 48), the mediator goes against another important function identified by the focus group: (3) – to emphasize that it is the parties' conflict' – which is related to one of mediation's most important elements: *neutrality* (van Bijnen & Greco, forthcoming). By stating "we" instead of 'you', the mediator includes himself in the conflict instead of distancing himself from the disagreement. This action has the potential of causing a serious mediator *neutrality* issue if parties start

---

[3] These functions were derived both from the analyses of the corpus of mediation dialogues and the focus group answers to the question: "when would you ask (similar or different) questions related to the essence of mediation?", which accompanied the presentation of excerpt 1 during the focus group.

expecting the mediator to be an active participant in the parties' argumentative discussion[4]. Essential to mediation are the notions that (1) parties need to find solutions *together* in order for the solutions to be durable and mutually beneficial, and (2) that the mediator is a *neutral and external third party*, who is neither protagonist nor antagonist in the argumentative discussions. In excerpt 1 (turn 48) the mediator designs the intervention with function (1) in mind, whilst undermining function (3) of the local functions of *mediation essence* with the general effect of (re)establishing *procedural starting points*.

The *general effect* of this question may be that it explicitly (re)establishes a *procedural starting point* and that both parties hear that the other party is willing to commit to mediation and conduct him- or herself in a manner that could lead to a reasonable resolution in the end. However, this is only possible if both parties agree to proceed together.[5]

The local function *mediation essence* is closely related to *mediation progression*, with 'getting the conversation back towards something parties build together' as its function. Yet, although they are related as local functions, as excerpt 2 will show, mediation *essence* and mediation *progression* may have different general effects. As a highly formalized procedural activity, a favorable *progression* of the mediation session is at the *essence* of mediation. Excerpt 2 includes a question concerning the progression of the mediation, and is taken from the case between the board of a school collective (Ms. A) and a recently hired rector of one of the schools (Ms. B). The conflict is at a point of impasse when the mediator decides to intervene (italics added for emphasis):

89 Mediator X	I hear very apo<u>dictic</u> positions right↑ th- this is how it is how I see it ehm and at the same time it is it is the idea of mediation of course to look for for a so<u>lut</u>ion that f- that is <u>fitting</u> for both, ac<u>cept</u>able for both. *Do you have the feeling that we (.) have worked towards something already↑*
	Excerpt 2

Interestingly, excerpt 2 shows a question that is clearly related to the *procedure*, namely the *progression* of the process. However, the *general effect* of this question is not the (re)establishment of *procedural* starting points, but the (re)establishment of a *material* starting point. In this case, the context is of interest; it is an intervention used by the mediator to change the direction of the mediation interaction because the current manner of conduct is not constructive. However, a possible agreement on a presumption, or a shared supposition may be the result, which means the establishment of a *material starting point* (see e.g. van Eemeren et al. 2014, p. 268), instead of a shared norm of conduct. The focus group explains that mediators may use such interventions as a possible strategy: because it "brings it back to the need to work towards something together", which is at the core, or *essence,* of mediation (function 1).

---

[4] Additionally, the focus group emphasized that it is important for mediators to ask questions related to the *essence* of mediation when they notice that the parties assume that the mediator will resolve the conflict for them.

[5] It could be said that this is not really a question to which the mediator expects 'no' as a response, especially because the mediation is in principle *voluntary* (e.g. Hedeen, 2005), and ADR mediation generally includes an intake in which the procedure and goal of mediation were explained. It seems to be a specific question that, unlike rhetorical questions, requires an answer. Yet, a specific answer is expected and preferred. If the answer by either party is 'no', this concrete speech event of the genre of *communicative activity type* (see e.g. van Eemeren, 2010) is terminated as a whole.

4.2 Facts and case contexts (material starting points)

It makes sense that mediators, as outsiders to the conflict but procedural guides of the resolution process, need to have all the necessary information concerning the case, disagreement, and case context. For this reason, mediators may ask questions about the *facts and the context* of the case, especially in the first two phases of the mediation procedure: (1) the *intake* phase, when the procedure and the participants introduce themselves; and (2) the *exploration* phase, when the main issues of the disagreement are made explicit (see figure 1).
Figure 1. *Adapted mediation circle from ADR Instituut (van Bijnen, forthcoming)*

Trying to retrieve information can be risky, because parties may disagree on facts as well. Yet, questions about facts, or parties' 'truths', may be useful for, at least, three reasons: (1) to get all the necessary case information, in order to effectively guide the resolution process; (2) to get to the underlying interests and feelings; and (3) to create common ground.

Mediators may introduce the quest for information with questions such as 'who wants to start [narrating the conflict facts]?', and may ask the parties questions such as: 'when did the two of you meet?' or 'how long have you been working together?' to get the facts. This may have the *general effect* of (re)establishing material starting points. Additionally, asking questions to retrieve the facts may help parties implicitly collaborate when they 'go looking for the facts together'. When parties construct the narrative of their history together, they connect with each other (again) in a constructive manner.

Parties tell their *truths* in a way that is 'colored' or framed in a way that flatters them. However, even when asking a question leads to an inaccurate representation of the conflict, there is still another reason for asking questions related to the facts and context of the case. Namely, that doing so creates a gateway for mediators to access the interests and feelings hidden beneath the 'superficial' facts and truths. More specifically, questions on the *facts* of the case could lead to questions and elucidations of the case *context*, which opens the door to the *feelings* that need to be addressed and the *interests* that need to incorporated in the mutually beneficial resolution.

In short, although eliciting facts will most likely reveal facts that are strategically framed by the parties; although there is a chance that the interventions result in a disagreement on the facts itself, asking for case information may serve specific and valuable functions in mediation: mediators may use these questions to help reveal *interests* and *feelings* that are relevant for the solutions.

Since the focus of this paper is on questions that may (re)establish common starting points, we should also focus on function (3) of *facts and contexts*. In some cases the mediators in the focus group identified the reason for designing such interventions as *'creating common ground'*, which means that the (re)establishment of common starting points is not only the *general effect* of these specific questions, but the *local function* as well. However, although the second and third functions are mentioned separately, the functions can be seen as interrelated. The questions concerning a *fact* or *truth* can lead to answers connected to interests or feelings, and in some cases, they could have the *general effect* of (re)establishing *consensus* on truths and facts, whereby a new *material* starting point is added to the common ground. Excerpt (3) is taken from the same case as excerpt 1: the *church board versus sexton* case. In this example, the mediator asks a *truth* related question (italics added for emphasis):

62 Ms. B	=I have never had to save the receipts. Every month I do groceries at Aldi and I buy Snickers then and and and bottles Cola and and and the coffee [and never]
63 Mr. C	[That is very good.]
64 Ms. B	has anyone gotten it into their heads to to to to doubt my honesty or my
65 Mr. C	No
66 Ms. B	I have never had to SAVE these receipts so WHY all of a [sudden]
67 Mediator	*[You thi]nk [that that there ( )] honesty. Is it true↑ Do people doubt that↑*

Excerpt 3

The mediator refers to the new church board as "people" (turn 67), and asks a question (turn 67) that elicits a truth related to the experiences of people who are not participants in the mediation session. Thus, the question is related to the larger case *context*. The question is also directly related to the interest of Ms. B to be perceived as *truthful*: "has gotten it into their heads to doubt my honesty" (turn 64). If the question posed in turn 67 is answered with 'no', the answer has the *general effect* of creating a new *material* starting point. Whilst Ms. B's interest is (implicitly) at the center of this question on honesty, and thus arguably related to the function of 'getting to the underlying interests and feelings', the question seems to be an explicit elicitation of an agreement, and, thus, the *local function* and the *general effect* of the question are both to establish a *material* starting point.

5. CONCLUSION AND FINAL REMARKS

In this preliminary study, the questions that may help broaden the explicit common ground between parties in dispute mediation are presented by means of examples, in order to answer the research question: *How do different questions help (re-)establish material and procedural starting points in mediation sessions?*.[6]

This study shows that although a question may have a *general effect* of establishing or reestablishing a common starting point, the *local functions* of questions may differ. In this paper, a first exploration is presented of three different functions of questions with the general effect of (re)establishing either a procedural or a material starting point: *mediation essence, facts and context, mediation development.*

Questions with the *general effect* of (re)establishing a *procedural* starting point may be expected in every mediation session due to mediation's highly formalized procedural nature, and the necessity of having commitment from both parties to abide by the same (mediation specific) code of conduct. During the preliminary analyses, the questions related to *mediation essence* showed three different *local functions*: (1) to emphasize the idea of finding mutually beneficial solutions together, (2) to emphasize dialogue guidance, and (3) to emphasize that it is the parties' conflict. *Mediation essence* presented a link with another function: *mediation progression*, because a favorable progression of the mediation is at the essence of dispute mediation. However, in the case of *mediation progression* questions, it was revealed that even though the *local function* of a question may relate to the *procedure* of the mediation session, the *general effect* may be the (re)establishment of a *material* starting point.

For the questions with the general effect of (re)establishing *material* starting points, the questions related to *facts and case context*, revealed that they are mainly used as a tool to get to the underlying feelings and interests of the parties. The main *local function* of asking questions related to the *facts and truths* is that it may help the parties open up about the *contexts* of the conflict, which in turn opens the gate for mediators to further help parties reveal the conflict relevant *feelings* that need to be addressed and the *interest*s that need to be included in the win-win resolution, in order for the solutions to be sustainable. In some cases, a question may be *intended to explicitly elicit agreement* on a truth or a fact, in which case both the *general effect* and *local function* is *material* starting point establishment.

Using arguments to advocate and to inquire

J. ANTHONY BLAIR

Department of Philosophy
University of Windsor
Windsor, ON
Canada   N9B 3P4
tblair@uwindsor.ca

ABSTRACT: In earlier and also more recent work (Blair 2004, 2007, 2016), I had contended that the use of arguments in investigations or inquiries is worthy of attention. I had further claimed that the use of arguments to inquire is distinct from their use to advocate, and that approaches to argumentation that assume advocacy as the only use of arguments fail to account for this distinction. In this paper I consider four arguments against my thesis, which, I think, call for some revision in my position, though not for its abandonment. I suggest that my error was due to my adopting a widely shared false assumption about the concept of argument.

KEYWORDS: advocacy, advocate, argument argumentation, inquire, inquiry, investigate, uses of argument

1. INTRODUCTION

In some earlier papers (Blair 2004, 2007, 2016) I explored the idea that there is a difference between using arguments to *advocate* and using them to *inquire*. Advocacy seems to require commitment to a position on an issue—whether the commitment is heartfelt, or just conventionally assigned (as in legal representation). Advocacy seems typically to occur in adversarial contexts, where there are winners and losers: one party retains its initial commitment, the other gives up its initial commitment. Rhetorical maneuvering, designed to influence the outcome, is to be expected. Inquiry of the kind I have had in mind, on the other hand, is aimed at discovering what position on an issue is worthy of commitment, so to commit to a position before starting is at odds with the purpose of inquiry. Using arguments to inquire begins with hypotheses to be examined, not with a position to be defended. The context of inquiry is cooperative, not competitive. The parties involved, if there are more than one, are not adversaries, but collaborators. There is no role for rhetorical maneuvering in order to win victory for one's position, for the whole point of an inquiry is to discover what position deserves to be defended. And, putting several good minds to work in a collective inquiry would be likely to produce better results than would come from one person acting alone.

I first encountered the idea of using arguments to inquire in Jack Meiland's little book called *College Thinking*, which is full of good advice to undergraduates about how to get the best out of college (Meiland 1981). Among many other things, Meiland advised students assigned to write an "argumentative paper" not to follow the common suggestion that they choose a position on a controversial issue and argue for it, for unless one has already thought about it, how can one know what positions to argue for? Instead, he proposed that they select what seems like a plausible position on the issue and find and assess the best arguments both for and against it. On that basis, students could discover which side seems best supported. See also (Bailin and Battersby 2016) for an excellent contemporary pedagogical application of Meiland's idea.

It might appear that this use of arguments has already been fully discussed by Walton and Krabbe in *Commitment in Dialogue* (1995) where they also use the label "inquiry" to name

a dialogue type. What they have in mind, however, is a dialogue that seeks proof (Walton and Krabbe 1995, p. 75), whereas the kind of inquiry I am discussing in this paper seeks epistemic entitlement to advocate. Walton devotes an entire chapter of *The New Dialectic* (1978, pp. 69ff.) to "the inquiry", and there a further difference emerges. Walton writes, "The most important defining characteristic of the inquiry as a type of dialogue is the property of cumulativeness" (*ibid.*, p. 70). He goes on to add: "Cumulativeness in an inquiry means that the participants can't change their minds" (*ibid.*); and while the fact that "cumulativeness is a property of the goal of the inquiry as an ideal model of argumentation ... does not mean that retraction of commitments never happens in argumentation in an inquiry," nevertheless, "the goal of the inquiry as a type of dialogue is to minimize or, if possible, eliminate retractions" (*ibid.*). In the kind of inquiry I have in mind, in contrast, retractions based on the discovery of previously unnoticed sound objections and counter-arguments are to be encouraged and such grounds for retraction are to be sought. I am not here arguing that Walton, or Walton and Krabbe, are mistaken; my point is that we are using the same label for two different uses of arguments.

One significant implication of the use of arguments to inquire in the ways I propose is that the use of arguments to try to resolve a difference of opinion on the merits is not their only use. Furthermore, if argumentation includes communications involving the deployment of arguments to inquire into what position on a controversial issue deserves one's support, then 'argumentation' should be defined broadly enough to include this purpose, and not be restricted to the use of arguments to resolve differences of opinion.

2. OBJECTIONS

Before proceeding with the project in more detail, however, I am obliged to respond to some objections against claims I made in those papers. Here are four.

2.1 The model of inquiry is unrealistically idealistic.

The kind of argument-using inquiry involving more than one person that I had envisaged flies in the face of the psychology and the sociology of actual inquiries. Even a sympathetic characterization of such inquiries finds the harmonious co-operation that I had imagined taking place to be unrealistic. Michael Gilbert puts it this way:

> When involved in an inquiry the [dialogue] partners are completely unattached to the outcome, desiring only to reveal the truth, or, at worst, the best possible answer to a question or best solution to a problem. When you and a dispute partner commence such an inquiry, neither of you has a preconceived result to which you are committed, no ego investment in the result, no advantage to be gained by one answer being deemed correct. Even when you enter the inquiry with an idea as to the proper conclusion, you have no compunction in giving it up when it has been demonstrated to be incorrect, insufficient, inadequate. Inquiries like this involve careful listening, turn taking, avoidance of strong emotion, and ... willingness to help your partner to make a strong case. When it happens in this manner, I will call it "pure inquiry."
> *The difficulty is, pure inquiry almost never happens.* (My emphasis; Gilbert 2014, pp. 36-37.)

In other words, it is naïve to suppose possible a total absence of prior commitment and of adversarial relations: that contradicts human experience. People enter into inquiries with hunches, with fixed theoretical assumptions, with strong attachments to favoured hypotheses and often with deep hostility to alternatives.

2.2 The alternative—competitive advocacy—works for science.

Scientific advance thrives on competition. As Nicholas Rescher writes at the conclusion of his study of dialectics, it is ...

> ... a mark not of malignancy but of health that competing schools of thought should endeavor to argue for conflicting theories by the most powerful supportive reasonings they can marshal. Rivalry, competition and conflict must ... be seen not as unhappy aberrations, as deviant and regrettable manifestations of a human perversity that impede the smooth progress of science; rather they [are] ... a natural and requisite component of the ongoing process of scientific advance. (Rescher 1967, 123-124.)

Not only do scientists, the archetypical inquirers, tend not to inquire co-operatively and collaboratively, Rescher thinks it's a good thing that they don't.

2.3 Special pleading is unavoidable.

It follows from the first two criticisms that in advocating their favored views inquirers will be inclined to deploy as many persuasive devices as needed in order to give those views a positive spin and a sympathetic hearing, and to throw the difficulties facing their opponents' views into stark relief. Strategic maneuvering is to be expected.

These three objections strike me as eminently reasonable, so they call for a change in my thesis. I have to abandon any realistic hope that what Gilbert calls a "pure inquiry" is routinely attainable, and indeed to stop regarding it as essential. I have as well to distinguish the sort of rivalry and competition between advocates of differing scientific approaches and theories that Rescher commends from the differing hunches of investigators who are on the same team, working within a shared framework. And if inquiry is to be practicable, its execution has to be prepared to handle the perhaps unconscious rhetorical maneuverings of its practitioners. While these objections force me to reconceive how inquiries can function, what they do not do is force me to give up the distinction between using arguments to advocate and using them to inquire. That is the burden of a fourth objection.

2.4 The inquiry vs. advocacy distinction is a distinction without a difference.

This fourth objection is one I raised myself (Blair 2016). Even in using arguments to inquire, agents must play the role of advocates for and against the various hypotheses that are mooted as resolutions of the problem the inquiry is out to solve. I had granted this fact, but denied that it's an objection, on the ground that the kind of commitment required in inquiries is hypothetical, whereas in advocacy it is not, so the contrast remains.

However, my dismissal of this objection now strikes me as premature. For if the use of arguments to inquire or investigate entails even hypothetical advocacy, that seems to be because *any* use of arguments in itself entails advocacy. To argue for or against a position just is to advocate its acceptance or its rejection, whether in order to try to persuade someone who disagrees to accept or reject the position, or in order to test whether or not it deserves to be accepted. In trying to contrast using arguments to inquire with using arguments to advocate, I was making a category mistake. It was like trying to contrast using a gun for target practice with using a gun to fire a projectile. Target practice with a gun *just is* using a gun to fire a projectile, not something different. Similarly, the activity of arguing, of formulating and expressing arguments, whether to test an hypothesis or to justify a contention, simply *is* using arguments—reason-claim complexes—to advocate for or against.

3. MY MISTAKE

What led me to my mistake? I think I can explain it in the following way. We standardly distinguish between an argument *tout court* and an argument *event*. An argument *tout court* is a set of related reasons thought to support a clam. An argument event is an occasion on which arguments *tout court* are used. When someone reasons to herself that she had better wear her raincoat because rain is forecast, an argument event is occurring. When a friend gives her companion reasons why she should be allowed to pick up the dinner tab, and he replies with reasons why on the contrary it is his turn to pay for dinner, an argument event is occurring. *An argument* is a consideration or a set of considerations taken as support for something—the truth or falsehood, or the acceptability or unacceptability of a proposition; the advisability or inadvisability of an action or policy; the positive or negative evaluation of something; and so on. Argument *events* are occasions on which arguments are used. The property of containing the expression of considerations pro or con something is an essential property, a necessary condition, of an argument event.[1]

Arguments for or against are deployed in argument events, or arguings, of various kinds that can be distinguished by their purposes. One purpose of arguing is to persuade people to accept claims. To that end, you might offer me arguments for the denial of *p* in order to try to persuade me of *not-p*; or you might set before me arguments for *p* in order to try to persuade me of *p*. Another purpose of arguing is to try to get someone to keep an open mind about whether some claim *p* is true, and so you might offer arguments both for *p* and for *not-p* that you think are equally compelling. Yet another purpose of arguing is to recommend performing, or refraining from performing, some action. And still another purpose of arguing is to test the plausibility of a claim. In order to decide whether to endorse *p*, you might consider the ground-level arguments for *p* as well as those for *not-p*, and test their merits by reviewing meta-arguments for and against those ground-level arguments (see Finoocchiaro 2013 for the "ground-level" vs. "meta" argument distinction).

Thus, in one sense of 'advocacy', any argument advocates its conclusion. That is different from advocating a position as its champion—from using only arguments that support it, either directly, or indirectly by refuting or deflecting objections and other criticisms. My mistake lay in taking the purpose of persuading someone to adopt a point of view as constituting all there is to advocacy, and thus in thinking that using arguments for the different purpose of inquiring into whether a point of view merits consideration or support could not involve a kind of advocacy too. I overlooked the ambiguity of 'advocacy' in this context. In one sense, to assert an argument advocating a thesis is to be its champion and to urge its acceptance; in another sense, to assert an argument advocating a thesis is to report a pro-thesis consideration, without taking a final stand on the thesis.

Christian Kock points out, in a body of work collected in a recent book (Kock 2017), that it is possible to endorse arguments in favour of an action or a policy without thereby advocating the performance of that action or the adoption of that policy. This is because it is equally possible at the same time to endorse arguments against that selfsame action or policy. That is, there can be good reasons for *doing* something and also good reasons for *not doing* it. I think that there can also be situations in which there can be good reasons for and also against *accepting a proposition*, such as that the accused is guilty of the crime or that a particular explanation of an event is satisfactory. Thus presenting arguments *that support* a position is not equivalent to trying to persuade someone to accept that position.

---

[1] The "argument/event" distinction is of course D. O'Keefe's old "argument₁/argument₂" distinction (O'Keefe 1982). I think it is useful to keep in mind that an argument₂ is an event.

I think it follows from these considerations that the pertinent contrast is not between using arguments to advocate and using them to inquire; it is, instead, between using arguments to try to persuade and using them to inquire.

4. INQUIRIES AND THE ROLES OF ARGUMENTS IN THEM

Is there nothing special or distinctive about using arguments to inquire? I think there are clear differences between inquiries as kinds of events and other kinds of events in which people use arguments, and also differences among kinds of inquiries; but I don't think there is any difference in the nature of the arguments so used.

Consider, for instance, the difference between a criminal investigation and a criminal prosecution. Such an *investigation* is aimed at *discovering whether* a crime has been committed, and if so, by whom; a *prosecution*, on the other hand, is aimed at *convincing* a judge or jury *that* a crime has been committed and that the accused is the perpetrator. Or consider the difference between what is involved in the investigation into the cause or causes of an accident, on the one hand, and the accident report in which the inquiry's findings are presented and backed up, on the other. The aim of the investigation is *to discover* the causal factors; the aim of the report is to present the findings and the evidence that *supports* them. The aim of one kind of activity is to discover what position merits acceptance, whereas the aim of the other kind of activity is to have an asserted position accepted by some audience. Whatever hunches police investigators might have, whatever hypotheses are strongly suggested by the initial evidence, a thorough inquiry must review and assess all the relevant evidence. The prosecutor, in contrast, has the task of framing a story in which the best explanation of the evidence unearthed by the investigation is the guilt of the accused (see Woods 2007). The prosecutor begins with the assertion of guilt and tries to show that the truth of that assertion is born out by the evidence. However, the arguments used by the prosecutor to convince the judge or jury of the accused's guilt can be, and maybe usually are, the very same arguments that led the criminal investigator to conclude that a crime was committed and that a particular person is the one who committed it.

5. HOW ARGUMENTS ARE USED TO INQUIRE

We inquire into different kinds of things. We might want to know the cause of a particular event, or a type of occurrence (investigative inquiries). We might want to decide what action it seems best to take in a particular situation or type or situation (decision-making inquiries). We might want to decide what attitude to take towards something. We might want to discover the best means to a particular objective (problem-solving inquiries). In general, we might want to decide what position to take on some matter about which there are as yet no opinions, or whether to agree or disagree with some opinion that has been asserted. In short, there is a question that we want to answer.

In order to conduct an argumentative inquiry, there must be candidate answers to the question. Working alone, or together with others in a group, the best place to start would seem to be the answers that first occur as plausible, since the inquirer(s) would want to investigate them at some point.

Each candidate is treated as an hypothesis and arguments for and against it are sought and formulated. These arguments are then tested by raising challenges to their premises and, assuming the premises are accepted, challenges to the adequacy of the support they offer to the

hypothesis or to its denial. Those challenges may be rebutted, or granted in whole or in part. If granted, they require rejecting the hypothesis, or else modifying it. If objections to the argument are rebutted (i.e., successfully defeated) the argument stands. An argument pro or con that stands after such critical examination may be decisive, at one extreme; merely suggestive, at the other; or have some intermediate weight. When all the arguments for and against an hypothesis that can be unearthed have thus been considered and the strength of their support for their conclusions assessed, the case for the hypothesis and the case against it can then be summed up and compared to each other, and so an all-things-considered judgment made as to the merit of the hypothesis.

The same review is carried out for all the competing hypotheses. In some cases, a positive or negative verdict might be indicated early on, and there is then no point to continuing to investigate them. Once the case for each live hypothesis has been made, the respective cases are compared to each other, and some way of ranking them (such as pairwise comparisons) carried out. When two or more incompatible hypotheses are judged equally maximally meritorious, or the differences are too close to call, then, ideally, belief or action should be suspended until some way of deciding between or among them has been contrived and a final judgment can be made.

The objective of such inquiries is to end up with judgments that are as close to being true or correct as it is practical to achieve. Obviously, limitations of information and ingenuity will result in judgments that fall short of that standard, and where these limitations aren't recognized by the inquirers, they can have too much confidence in their judgments. In any case, the judgments of such inquiries are always in principle contestable.

6. TO CONCLUDE—FURTHER QUESTIONS

A great many issues remain to be dealt with to complete this sketch of using arguments to inquire, and many more again need resolution to provide a complete account of using arguments for inquiry purposes. Here are just five.

(1) What are the conditions for the possibility of a group's fruitfully using arguments to inquire? Ideally, the participant(s) should be genuinely open-minded about what the findings will be. They should be prepared to abandon initial hypotheses that are not confirmed by the evidence. At the same time they should be disinclined to abandon plausible hypotheses until the evidence forces them to. The group psychology of an inquiring team should permit or encourage co-operation and discourage destructive competition. The question is how to deal with realities that fall well short of these ideals.

(2) Are there protocols that, if adopted, tend to foster success in "real-world" argument-using inquiries? Rules: prohibitions, obligations? What makes for successful inquiries is an empirical question.

(3) How are "on balance, all-things-considered" conclusions best reached? Christian Kock has argued (Kock 2017) that arguments about what to do have an inescapable subjective property, given that they rely on values, and how to determine which values apply in a given case and how to weigh and rank conflicting values are not things that can be decided apart from individual preferences. Is there room for argument about which values should apply in various decision-making situations?

(4) More generally are there significant differences between types of inquiry. I earlier distinguished between Walton's and my sense of 'inquiry', and also among problem-solving inquiries (seeking the best means to a given end), decision-making inquiries (seeking the best option when faced with choices), and investigative inquiries (seeking causal explanations of

given events or types of event). There are others, such as meaning-seeking inquiries (seeking to understand the nature and significance of actions, events, or choices). Has an inventory been made of inquiry types? (Would seeking such an inventory constitute yet another type— "discovery" inquiries?) Are there significant differences among them?

(5) What is the relationship between inquiry and persuasion? Are these points at opposite ends of a spectrum, as Scott Jacobs proposed during the discussion of this paper at the 2018 ISSA conference? Do scientists shift back and forth between inquiry and persuasion as their investigations proceed and they communicate with their respective communities, as Isabela Fairclough suggested during the same discussion? These are questions to which the literature may well hold the answers, if a proper investigation of it were to be carried out.

I would like to conclude by thanking Professors Jacobs and Fairclough, and also Professor Krabbe, for their comments during the discussion of the paper at the ISSA conference. I am also grateful for comments by Dr. Michael Baumtrog and by members of the Centre for Research in Reasoning, Argumentation and Rhetoric at the University of Windsor on earlier versions of the paper.

Does cognitive research affect critical thinking understanding?

ANGELINA BOBROVA

Philosophy Department
Russian State University for the Humanities
Russia
angelina.bobrova@gmail.com

ABSTRACT: The paper contributes to the debates on critical thinking and cognitive theories correlation. I argue that original critical thinking understanding can fruitfully work within cognitive approach *(framework)*. Critical thinking is treated as a normative ideal that is aimed at "careful thinking directed to a goal". This conception incorporates logical and philosophical ideas (Kant's intuitions about critical method). Critical thinking concept is scrutinized within Sperber and Mercier's argumentative theory of reasoning.

KEYWORDS: argumentative theory of reasoning, cognitive science, critical thinking, Enlightenment project, Kant, Sperber and Mercier

1. INTRODUCTION

Today critical thinking (CT) is a highly attractive but highly vague concept. There are many variations of how it could be defined. Its understanding "differs with respect to the scope of such thinking, the type of goal, the criteria and norms for thinking carefully, and the thinking components on which they focus" (Hitchcock, 2018). But generally critical thinking is understood as "careful thinking directed to a goal" (Hitchcock, 2018). It serves as a normative ideal (Maynes, 2017, p. 114) of how a good or well-grounded argument can be reached and stays in the same line with creative thinking, decision making, *etc*. Some scholars distinguish these types of reasoning whereas some of them insist on their identification. Anyway, all these uncertainties cause a problem that is accentuated by fast cognitive science development.

Cognitive science is an influential field of knowledge, and as a result its achievements have an impact on many related studies. CT is one of those. Cognitive researches deal with reasoning as well as CT does, and it seems that they modify CT perception. Do these modifications significantly affect the essence of CT? Can CT sustain itself in the face of cognitive investigations? What kind of CT and cognitive science collaboration would be the most productive? These questions have to be considered if we want to have an up-to-date version of CT conception. In my paper I will present how original understanding of CT or correlate with cognitive theories.

Taking into account the plurality of cognitive conceptions, I will focus on the argumentative theory of reasoning (ATR) being the most developed cognitive elaboration about reasoning at the moment (Sperber & Mercier, 2011, 2017). As for the CT conception, I will go back to the Enlightenment philosophy. Although the term 'critical thinking' is often associated with the name of the American philosopher John Dewey who used it to describe an educational goal, the utmost attention should be paid to the Enlightenment practical philosophy. I share Battersby's position that the Enlightenment tradition should be seen as a predecessor of the CT project:

> Enlightenment philosophers virtually changed the course of history by advocating for scientific reasoning and rationality to replace the old deference to church and king. What is sometimes known derisively as the *Enlightenment Project*, for all its over reach, had a

momentous and largely beneficial effect on the thinking and politics of western civilization. The critical thinking movement is the inheritor of this project and I suggest that we now think of the critical thinking movement as the *Critical Thinking Project* [Battersby, 2016, p. 100].

Contemporary diversity of CT definitions makes them more difficult to discuss in the context of cognitive field. We need to identify general characteristics or, as Johnson and Hamby (2015) would say, a meta-level peculiarities of this thinking. The Enlightenment tradition serves as a good foundation in that regard. It defines CT as a normative conception, which normativity is based on logic but not reduced to it. Logic grants a necessarily but not a sufficient condition for good reasoning construction and evaluation. It cannot offer a method enabling us to perfect our performance of various mental operations. It does not clarify the differences (if there are any) between, for instance, critical and creative thinking or critical and skeptical, or critical and polemic styles of reasoning. So, other than logical skeleton, CT needs a philosophical foundation (ethical, epistemological, *etc*.) that meets the above mentioned requirements.

These philosophical ideas are highly important if we want to compare critical and cognitive traditions. Roughly speaking, CT is differentiated from cognitive studies because of its normative basis. If CT project turns around the question "What should we do to be a good (critical) reasoner?", cognitive science addresses another problem, *i.e.* "What does a good reasoner do?" CT may pay attention to experimentally collected materials (this is an interest of cognitive approaches), but first of all, it is about rules. It is not dependent on concrete person's capacities.

My contribution consists of three sections. The first and the second sections briefly introduce logical and philosophical aspects of CT respectively while the third one clarifies how these features work within ATR.

2. LOGIC AS A FOUNDATION OF CRITICAL THINKING

It seems obvious that "being rational" means "being logical". If CT is treated as rational thinking, it has to be tied to logic (it does not matter whether we speak of symbolic or informal approaches). Nevertheless, logical postulates were revised several times during the 20th century. First of all, mathematical means separated logic from the reality; then Frege-Kuhn's paradigm limited its field to justifications (logic does not study discoveries); finally, psychologists came to the conclusion that human reasoning does not follow strict logical rules. Context and content peculiarities, intuitive backgrounds, and cognitive biases could turn even invalid reasoning into something rather sound. This attitude was illustrated by many experiments, for instance, Wason's[1] (1968) selection task or Byrne's[2] (1989) contextual modus ponens investigations.

The situation could not but alter a general vision of CT. The weight of traditional logical rationality within this concept started decreasing, and in the end of the 20th century, there was even an attempt to substitute it with neo-economical rational choice theory. The

---

[1] The task concerns deductive reasoning that can be presented as follows: there are four cards placed on a table, each of which has a number on one side and a letter on the other side. The visible faces of the cards show 4, 7, E and K. Which cards must be turned over in order to test the truth of the proposition "if a card shows an even number on one face, then its opposite face is a vowel"? The correct answer is to turn over E and 7.

[2] "In certain contexts subjects reject instances of the valid modus ponens and modus tollens inference form in conditional arguments. For example, when a conditional premise, such as: If she meets her friend then she will go to a play, is accompanied by a conditional containing an additional requirement: If she has enough money then she will go to a play, subjects reject the inference from the categorical premise: She meets her friend, to the conclusion: She will go to a play. Other contexts suppress the conditional fallacies" (Byrne, 1989, p. 61).

core of the theory constituted the idea of *homo economicus* who behaved logically from economic point of view. *Homo economicus* was seen as a mathematical idealization of a person who maximized her utilities and minimized the costs. Although the theory was clear and convenient, it failed. People are rational or, at least, reasonable, but economic rationality is principally weak. As Battersby repeats after Kahneman and Tversky "Regret, frustration, and self-satisfaction can also" (Battersby, 2016, p. 111) affect reasoning.

Moreover, if we speak of CT, we expect that this conception will govern us through the pitfalls of natural reasoning. It means that neither intuitive backgrounds nor cognitive biases are able to provide a structure of CT as they are too subjective and vague. The core should be made up of logic because "being rational" means "being logical". This sort of vision can be observed if we go back to the applied logic of the 18th century (Darjes, 1742; Wolff, 1754). Couple centuries ago, logic was tightly inscribed into philosophy; it was aimed at building a skeleton (a propaedeutic function) that could be fulfilled with ethical and metaphysical representations. In spite of a modest technical means, logic studied real reasoning and was concerned with both justification and discovery problems. It could be concluded that the disturbances of the 20th century have played a doubtful role regarding CT acknowledgment.

It is interesting to observe that contemporary informal logic (the formal approach is intentionally left aside), which can be seen as a continuation of the applied logic tradition, is adopting a similar position now. This approach focuses on real arguments analysis (Blair & Johnson 2000; Blair 2011), and it has proposed original criteria for reasoning evaluation. Let me bring ARG conditions, i.e. premises acceptability, relevance of premises and good grounds for the conclusion (Govier, 2010, p. 87), as an example. Until recently, informal logic was saying almost nothing about context dependencies and reasoning construction, but the situation is changing. At the moment, there are papers, in which the problem of reasoning construction as well as the question of context and structure correlations are analyzed from a different angle (Macagno & Walton, 2016, 2018; Godden & Zenker, 2015). I think that such investigations will be multiplied since the philosophy of logic revises the basic logical concepts, namely formal language (Dutilh Novaes, 2011), logical form (MacFarlane, 2000), *etc*.

3. KANT'S APPROACH AND CRITICAL THINKING

To be honest, the Enlightenment Project did not deal with CT directly. But it developed its basis that could be posed as a combination of logical and philosophical (ethical and metaphysical) ideas. This combination is worth being discussed in the light of cognitive revolution.

Leaving debates on (traditional) logical theories aside, let me turn to the philosophical vision on what 'critical' means. It leads us to Kant whose interpretation of this term has been considered the foremost authority on the matter till now. The philosopher offered the critical method. More accurately, he was searching for a method that could normatively define capacities of human reason and his deliberations resulted in four styles of thinking (dogmatic, polemic, skeptical and critical). Before the critical method presentation, I will introduce the remaining three styles. It will be done on the base of N. Hinske's (2010) position but within the framework of argumentation theory.

The first, dogmatic, method is applied in cases of mathematical foundations. It rests upon a monolog. The second, polemic, method is comprised of a dialog. It limits itself to real arguments observation, weighting or evaluation. The third, skeptical, method overcomes these limitations. It also evaluates arguments but these arguments can be either observed or

experimentally attained. The term 'experimentally' signifies that arguments or counterarguments may be artificially constructed. Such construction allows taking reasoning to extremes, which is, admittedly, quite desirable as it is the way of how necessary additional information is obtained. The last, critical, method makes another step forward. It looks as a combination of the dogmatic and skeptical approaches: "Now comes the critical method, *i.e.*, I investigate the sources of the dogmatic and the skeptical methods..." (Kant, 1992, p. 332).

What is special about the critical method? Accepting natural restrictions of our reason, it is intended to extent the limits of our cognition. There is no unique mechanism for doing it. Arguing, we may search for the right position, but this strategy can be failure. Mostly debates contain mistakes or wrong beliefs; they are based on dubious presumptions. In such cases, the search for the right position may be substituted with a search for a vague presumption identification as it may help "eliminate" the subject of the debates. Anyway, the method appeals to objectivity. It considers the variety of opinions and admits persons' inner independence. It expects a person to abstract from her estimations or preferences and accept all relevant positions as equally valuable. This is the best way of sound information generation.

In other words, the method emphasizes that interlocutor's values are able to be estimated only if a person sets his or her intellectual snobbery aside. How can it be done? Some directions are clarified with Kant's maxims of human understanding (the term is treated as understanding in general) usage. If you want to expand the limits of your cognition (Krouglov, 2014), you should:

1) employ your own understanding;

2) place yourself in your opponent's position;

3) think consistently, compare your opponent's position with yours, and enrich your knowledge.

At the first step, an agent technically appraises a given argumentation, *i.g.* ARG conditions, argumentative profiles method or argumentation schemes conceptions are applied. At the next stage, she puts herself in her opponent's position, which means that an agent rejects all her own ideas, presumes her opponent's representations, knowledge or beliefs and re-builds the same argumentation from that point of view. Original argumentation and its reconstruction can vary because of different agents' presumptions and believes. At the final step, these differences have to be reconciled, for which the reconstruction has to be consistently incorporated into the first version of argumentation. If such incorporation flows without contradictions, the original position is enriched or corrected. Otherwise, argumentation is criticized or even abandoned.

As we see, Kant's treatment of 'critical' confirms that CT is about both belief formation and belief maintaining. It avoids the ambiguity regarding the conception. CT is targeted at better understanding of our own position rather than at arguments criticizing. It functions as a normative solution that governs each person through the difficulties (CT skill can be developed by individuals). Kant's treatment of 'critical' confirms several peculiarities of the meta-level approach to the problem of defining CT that has been recently developed by Johnson and Hambly (2015). But more importantly, it specifies the philosophical foundation that facilitates critical and cognitive approaches comparison.

4. CRITICAL THINKING AND THE ARGUMENTATIVE THEORY OF REASONING

Why is CT conception compatible with contemporary cognitive studies, namely ART? Let us look at ART first and then compare it with our approach to CT. ART has been analyzed within argumentation theory many times (Mercier 2012; Sterrett 2012; Santibáñez), but it is

not the purpose of the current paper. All I want is to demonstrate that our CT comprehension is consistent with Sperber and Mercier's approach, even though the result at first glance may look different.

The fundamental principles of ATR can be briefly presented within four steps. First, reasoning doesn't help us get better beliefs and make better decisions. Its main function is to help us convince other people and to evaluate their arguments. Reasoning is aimed at finding and evaluating reasons in dialog contexts. A speaker gives reasons to accept a given conclusion. A listener evaluates then these reasons to decide whether she should assume them or not. If reasoning does this job properly, communication is improved. Second, there is a gap between argument constructing and argument evaluation. Usually people are better at finding premises that provide reasons to admit a conclusion than at critical evaluation of current arguments (reasoning). Third, reasoning is a part of communication, which means that instead of being a purely individual activity, it has a social foundation. Reasoning yields better results in groups than alone. Fourth, there is a distinction between inferences and reasoning that can be introduces as follows:

> Inference (as the term is most commonly understood in psychology) is the production of new mental representations on the basis of previously held representations. <…> It is at work not only in conceptual thinking but also in perception and in motor control (Kersten et al. 2004; Wolpert & Kawato 1998). It is a basic ingredient of any cognitive system. Reasoning, as commonly understood, refers to a very special form of inference at the conceptual level, where not only is a new mental representation (or conclusion) consciously produced, but the previously held representations (or premises) that warrant it are also consciously entertained (Sperber & Mercier, 2011, p. 57).

Any reasoning is a form of inference but not *vice versa* as inferences are understood wider than reasoning (Sperber & Mercier, 2017, p. 15).

It seems that ATR ruins CT functioning. Indeed, ATR emphasizes another aim of argumentation and shifts its focus from arguments construction to arguments evaluation. Moreover, it stresses the social core of argumentation as well as argues for the necessity of inference and reasoning distinction. However, the situation can be scrutinized somewhat differently. ATR refers to real reasoning flow while CT does not. It regulates the process from the normative point of view. This feature changes everything. Taking the normative foundation of CT into account, it must be admitted that it is not about real arguments, but it is about their improvement. In this case, CT starts being totally consistent with ATR. Let me demonstrate it on the basis of ATR characteristics. I'd prefer to scrutinize them backwards: (1) the difference between inference and reasoning, (2) the social basis of reasoning, (3) an asymmetry between argument constructing and argument evaluation, (4) the goal of argumentation.

First, cognitive science would define CT as energy-consuming. Once we think critically, we have to scrutinize the problem in details. It is clear that CT presumably deals with difficult problems. In Sperber and Mercier's terminology, it is limited to the level of reasoning (intuitive inferences are left aside). Indeed, the premises or reasons are identified, and the level of conclusions support is measured only if the question is complicated. Thus, the difference between inference and reasoning does not conflict with CT but, on the contrary, it specifies its place in communication.

Second, even if we admit the presumption that humans reason better in groups than alone, which is quite reasonable, we cannot ignore the fact that a general level of argumentation is defined with group members capacities. A social basis of argumentation does not cancel the fact that the more each person knows, the more argumentative variations are produced by the whole group. The more group members are educated, the better they

listen to counterarguments. As CT does not study real reasoning but regulates the mode of how these abilities of individuals could be improved, it easily falls within the scope of ATR.

Third, people are better at finding premises than in their critical evaluation. At the same time, Sperber and Mercier claim that this situation can be overcome as "individuals may develop some limited ability to distance themselves from their own opinion, to consider alternatives and thereby become more objective" (Sperber & Merscier, 2011, p. 72). How can it be done? The question leads us back to the accustomed CT understanding that, as it has been wildly discussed in the previous section, is aimed at the development of regulations existed on the subject.

CT is nicely correlated with ART regarding the last, fourth, characteristic. ART states that people are keen at argument evaluation rather than argument building. CT, in its turn, deals with good arguments criteria. In means that CT is equally interested in both arguments construction and evaluation. Does the aim of CT look old-fashioned? In the light of our approach it is not at all. If somebody wants to be a better arguer, she has to improve her argumentation skills. But she needs regulations for that, and CT conception specifies the way of how it could be done. Thus, if somebody wants to be a better arguer, she has to pay attention not only to arguments evaluation but also to arguments construction.

5. CONCLUSION

Both CT and cognitive conceptions operate with reasoning but they do not do it in the same mode. If cognitive theories study reasoning flow, CT regulates this process. This peculiarity forms the basic point of CT that can be even seen within German Enlightenment tradition. This tradition covers main aspects of our CT project, *viz*. it is understood as a rational ideal that regulates the borders of our cognition and specifies the way of sound reasoning construction ("being critical" is not equal to "being criticizing"). It appears to be a regulation that can be taken by individuals in case they want to improve their argumentative capacities. Such CT conception is nicely incorporated into cognitive theories (ART, in my case). So, cognitive researches do not ruin the core of CT that has been formed at the beginning of Modern period.

Of course, I do not want to say that CT conception cannot be enriched with the result of cognitive investigations. On the contrary, cognitive achievements influence is significant. But it is the beginning of another story.

What determines the strength of practical and cognitive presumptions?

PETAR BODLOVIĆ

Department of Theoretical Philosophy
University of Groningen
The Netherlands
p.bodlovic@rug.nl

ABSTRACT: This paper investigates the relationship between practical and cognitive presumptions. It argues that two types of presumptions come with different conceptions of strength. While the strength of a practical presumption is supposed to be correlated with the weight of rebuttal, the strength of a cognitive presumption is correlated with the degree of a proposition's plausibility. However, the degree of plausibility is not necessarily correlated with the weight of the burden of rebuttal.

KEYWORDS: burden of proof, cognitive presumption, instrumental rationality, John Pollock, Nicholas Rescher, plausibility, presumption, strength, undercutting defeater

1. INTRODUCTION

This paper investigates the relationship between practical and cognitive presumptions. According to Ullmann-Margalit (1983) and Godden (2017), practical presumptions are best understood as non-epistemic means, claims that are *taken to be true* for non-epistemic ends (such as precaution or social safety) in the context of evidential uncertainty and deliberation pressure. By contrast, Rescher (2006) defines cognitive presumptions as epistemic means, plausible claims that are taken to be true in order to achieve epistemic ends (such as the acquisition of information or knowledge). In the context of dialogue, both types of presumption reverse the burden of proof: a particular presumption stands until or unless the opponent provides a sufficient reason against it.

I argue that the two types of presumption serve not only different contextual goals but also have different conditions of strength. While the strength of a practical presumption is supposed to be correlated with the weight of rebuttal, the strength of a cognitive presumption is correlated with the degree of plausibility. However, the degree of plausibility (e.g. the strength of evidential support for *p*) is not always correlated with the weight of rebuttal (i.e. how difficult it is to prove ~*p*). Leaning on Pollock's concept of an undercutting defeater I seek to show that cognitive presumption *p* may become weaker (less plausible) even though ~*p* has not become easier to prove.

In Sect. 2, I present some distinctive features of presumption. In Sect. 3, I focus on Rescher's account, and the difference between practical and cognitive presumptions. In Sect. 4., I explain the concept of an undercutting defeater and discuss the conditions that determine the strength of practical presumptions. Finally, I show that practical and cognitive presumptions have different conceptions of strength, and must be evaluated by means of different criteria.

2. THE GENERAL FEATURES OF PRESUMPTIONS

Originally, "presumption" is a legal notion, and presumptions have been controversial ever since their introduction in Roman law. Legal, as well as philosophical scholarship, offer many incompatible accounts of the nature, function, justification and the overall importance of presumptions.[1] However, the literature still recognizes a number of common, distinctive features of presumptions.

Let us begin with some paradigmatic legal examples. Probably the most famous, but also the most controversial legal presumption is the *presumption of innocence*. It is based on the rule of criminal law requiring that the accused should be treated as innocent until or unless his/her guiltiness is proved. Another example is the *presumption of death*. Here, the rule states that the person who has been absent (without any explanation) for more than seven years should be presumed dead until or unless there are good reasons to think differently. These presumptions are different in many respects, but they also have some general features in common.

I will present four general features of presumptions. First, a presumption is a modal status of a proposition that indicates the reverse burden of proof. Second, the purpose of a presumption is to enable dialogical progress or/and to prevent an infinite dialogical regress. Third, logically, presumptions are conclusions of presumptive reasoning. Finally, the justification of presumptions is ultimately instrumental (pragmatic) rather than theoretical.

2.1 Presumption as a modal status

In the standard view, presumptions are defined as claims that are appropriately qualified. In other words, proposition *p* counts as a presumption if and only if *p* is, either explicitly or implicitly, introduced with the modal qualifier/status "presumably" (see Ullmann-Margalit, 1983; Hansen, 2003; Rescher, 2006; Godden & Walton, 2007; Walton, 2014; Godden, 2017). But what does "presumably" mean?

First, the qualifier "presumably" modifies the speaker's commitment. It indicates that the speaker is only tentatively committed to *p*. For example, the parties in the legal dialogue are committed to "Presumably, John is innocent" but their commitment is only provisional—it is conditional upon the absence of sufficient reasons to think differently. Once sufficient reasons against the presumption are provided, the parties are obliged to retract their commitment.

Second, a modal qualifier modifies not only the speaker's commitment but also the status of a statement (Godden, 2017, p. 488). Presumptions are, thereby, statements with special deontic modality—"presumably" indicates a special distribution of probative obligations. In the standard view, "Presumably, *p*" indicates that, at the particular point in the dialogue, the proponent can use *p* in arguing *without providing* sufficient reasons for it. At the same time, "Presumably, *p*" allocates the burden of proof to the opponent—if the opponent disagrees with the acceptance of *p*, s/he *is* obliged to provide sufficient reasons against it. Accordingly, in a legal dialogue, the party who claims "Presumably, John is innocent" is not obliged to prove his/her case, while the disagreeing party is obliged to provide sufficient reasons for "John is guilty." Hence, the most fundamental feature of presumption is deontic in nature—"presumably" indicates that the qualified statement entails the reversed burden of proof (see, e.g., Pinto, 2001; Freeman, 2005; Rescher, 2006; Walton, 2014; Godden, 2017).

---

[1] For the presentation of various approaches to the presumption in law see Gama (2017). For the similar presentation within the scope of argumentation theory see Godden & Walton (2007).

2.2 The dialogical functions of presumptions

But what is the typical dialogical function of presumption? In Bodlović's (2017, p. 518) words, the presumption reverses the burden of proof *in* the dialogue, but what does the presumption do *for* the dialogue? The answers to this question typically fall into two broad categories.

First, the function of presumptions is to enable dialogical progress.[2] Suppose that the argumentative dialogue seeks to resolve an urgent issue before a particular deadline.[3] Suppose that the deadline is approaching, that there is a pressure to resolve the issue "here and now," and that the resolution depends on whether p is the case. Suppose, however, that p is uncertain, i.e. that, in the present circumstances, there is no sufficient (or even any) reason to believe p. In these circumstances, the obligation to provide sufficient reason for p will get the dialogue stuck. But we obviously cannot afford this (since the issue is urgent) and we need an effective means to "unlock" the dialogue. The presumptive status of p is just that—it shifts the burden of proof to the opponent and allows us to proceed tentatively as if p is the case. The presumption enables the dialogue to make a desirable progress, to continue on a provisional basis toward the resolution of an urgent issue.

Second, presumptions have the function of preventing an undesirable dialogical regress.[4] Suppose that the dialectical rule concerning the burden of proof is universal, namely that every proposition introduced in the dialogue can be challenged and, if challenged, needs to be supported by the proponent. So, as soon as the proponent introduces p, the opponent is allowed to request the proof of p, and as soon as the proponent offers q to support p, the opponent is allowed to request the proof of q. This allows the opponent to sabotage the dialogue by challenging the proponent's claims *ad infinitum*. The problem that follows is quite famous—the proponent will be obliged to justify his statements *ad infinitum*, and s/he will never be able to prove his original thesis. In principle, this situation can happen although both parties are "playing by the rules."

The solution is to change the rules. As Rescher observes, the burden of proof rule should *not* be universal. It should have exceptions and, in fact, the very exceptions make the rule applicable. The chain of (providing) reasons must end somewhere (see Rescher, 1977, p. 33; 2006, p. 30). This leads us to the second function of presumptions—in dialogue, they make tentative starting points. By reversing the burden of proof, they prevent the dialogue to fall in the infinite regress and enable the proponent to defend his/her statement. Presumptions provide a solution to a dialogical variation of the famous skeptical problem of infinite regress.

2.3 Presumption and presumptive reasoning

Dialogically, presumptions perhaps form one class of basic premises but, logically, they are also conclusions of presumptive (defeasible) reasoning.

In the standard view, every presumption is drawn from some basic, presumption-raising fact, in accordance with a presumptive rule (see Ullmann-Margalit, 1983; Hansen, 2003; Rescher, 2006; Godden & Walton, 2007; Walton, 2014; Godden, 2017). For example, the legal *presumption of death* "Presumably, Steve is dead" is drawn from the basic fact

---

[2] The main advocates of this purpose of (practical) presumptions are Ullmann-Margalit (1983), Godden (2017) and, occasionally, Walton (2008).

[3] Legal dialogues are good examples. After all, they cannot last forever—at some point, when all the available evidence is taken into account, the decision needs to be made. And sometimes it needs to be made even when the evidence is far from conclusive.

[4] The main advocates of this approach are Freeman (2005), Rescher (2006) and, occasionally, Walton (2008, 2014). Van Laar & Krabbe (2013, p. 210) also interpret presumptions as "non-fixed initial concessions." For the difference between presumptions that enable progress and prevent regress see Bodlović (2017, pp. 521-524)

"Steve has been absent (without any explanation) for more than seven years," in accordance with the presumptive rule "If the person has been absent (without any explanation) for more than seven years, then the person is presumed dead (until or unless there are good reasons to think differently)." The basic fact can be either an elementary or a complex statement. The presumptive rule is a conditional statement that is typically defeasible.[5]

2.4 Instrumental justification of presumptions

Apart from their conditional form and defeasibility, the crucial feature of presumptive rules is the instrumental (or pragmatic) justification. In the standard view, presumptive rules do not represent material or empirical generalizations (Ullmann-Margalit, 1983; Rescher, 2006; Godden, 2017) and this is clearly illustrated by the *presumption of innocence*. That is, the basic fact "John is accused" indicates John's guiltiness rather than John's innocence,[6] but the legal parties are still obliged to presume John's innocence. This clearly reveals that the presumptive rule "If X is accused, then, presumably, X is innocent (until or unless…)" cannot be epistemically or theoretically justified. Instead, it is instrumentally justified. The presumption of innocence is based on a procedural rule that serves to reduce a risk in deliberation (the risk of punishing innocent persons) and, more generally, to protect social (or moral) values (Ullmann-Margalit, 1983).

Importantly, even when a particular presumptive rule is consistent with the corresponding empirical generalization, its justification is still instrumental rather than theoretical. In the *presumption of death*, it is true that people who have disappeared for seven years without explanation are probably dead, but the presumptive rule primarily helps to proceed with practical matters—it enables deliberation progress in the circumstances of an evidential impasse or epistemic uncertainty. Typically, the presumption of death serves to enable the distribution of the missing person's estate when there is no conclusive evidence indicating either the person's life or death (Ullmann-Margalit, 1983, p. 146; Rescher, 2006, p. 27). So, the presumptive rule is empirically adequate, but its justification is not theoretical—it is the existence of instrumental reasons that "transforms" the empirically adequate conditional into a presumptive rule.

This ends my presentation of the general features or the standard characterization of presumption. In the next section, I will focus on Nicholas Rescher's theory. I will use Rescher's work to present different kinds of presumptions that may be subsumed under the standard view. More pointedly, I will explain the distinction between practical and cognitive presumptions.

3. RESCHER'S CHARACTERIZATION OF PRESUMPTION

Ever since his influential *Dialectic* (1977), the nature and role of presumptions have been common subjects in Rescher's theorizing. However, he recently developed a comprehensive theory of presumption in *Presumption and the practices of tentative cognition* (2006). I will mostly base the presentation and analysis of Rescher's theory on this recent work.

---

[5] Although the legal literature recognizes the so-called irrebuttable, deductive or conclusive presumptions (see, e.g., Macagno, 2010; Macagno & Walton, 2012; Gama, 2017), paradigmatic legal presumptions are, as we have seen, defeasible.

[6] Without some evidence that he might be guilty, John wouldn't be accused in the first place.

Rescher's general characterization of presumptions is rather standard,[7] but his approach is especially interesting due to a specific domain of their application and analysis. Namely, together with Freeman (2005), Rescher is a rare example of a scholar who *primarily* studies presumptions in the epistemic context.

3.1 Practical and cognitive presumptions

In the standard view, all presumptions are instrumental and their legitimacy lies in their efficacy—good presumptions are effective means to achieve desired ends. However, presumptions can be applied in different contexts that include different kinds of ends. Two different kinds of ends are usually distinguished in the literature on presumptions: non-epistemic (non-alethic), and epistemic (alethic). Following Rescher's (2006, p. 27) terminology, a presumption that is a means to achieve a non-epistemic end (such as safety) I call *practical presumption*. By contrast, a presumption that is a means to achieve an epistemic end (such as the acquisition of information and knowledge) I call *cognitive presumption.*

Some scholars doubt that the concept of cognitive presumption has genuine theoretical importance. In an epistemic reading, they typically remark, "presumption" does not denote any novel or original phenomenon. That is, cognitive presumptions can probably be reduced to defeasible or *prima facie* claims and, in this case, they deprive the concept of presumption of its distinctive theoretical potential. According to Ullmann-Margalit and Godden,[8] presumptions become the matter of a genuine theoretical interest only if interpreted as a characteristic means to achieve practical ends in the context of epistemic uncertainty and deliberative pressure. We don't presume *p* for the epistemic purpose, due to the evidential support—we presume *p* for the practical purpose (e.g. safety) precisely when *p* is lacking sufficient evidential support, and there is a pressure to act "here and now" (see Ullmann-Margalit, 1983, p. 152; Godden, 2017, pp. 503-506). Along these lines, within the standard approach, presumptions are usually characterized as both instrumental *and* practical.

The legal presumptions of *innocence* and *death* serve to achieve non-alethic ends but practical presumptions do not belong only to the context of legal deliberation. In everyday contexts, we also often take propositions as true with various non-epistemic goals in mind. This is nicely illustrated by Bermejo-Luque. In her theory, presumptions are defined as "reasonable assumptions" (2016, p. 16), and

> assuming something may be adequate as a means … to *promote certain attitudes in others* (as when we presume the honesty of our kids or students—even against evidence!), or as a means to *increase efficiency* (as when we presume that everyone has read the document under discussion); or a *matter of politeness* (as when we presume that the person we invited to our home is trying to be kind to us); or even a *principled matter* (as when we presume the value of human life). (Bermejo-Luque, 2016, p. 12, emphasis added)

By contrast, cognitive presumptions amount to "policies, deemed effective in gaining knowledge" (Rescher, 2006, p. xii). Their justification is instrumental, but the ultimate goal is epistemic and their effectiveness is typically linked to evidence or the reliability of the corresponding epistemic source. In our terminology, they are instrumental but *not* practical.

---

[7] Rescher claims that presumption is the status of a proposition (2006, p. 22). Also, he claims that the presumptive status indicates a provisional commitment (pp. 29-30) and reverses the burden of proof (p. 15). Furthermore, the presumption is linked to presumptive reasoning (p. 8) that includes a defeasible presumptive rule and a basic fact (p. 33). Finally, although their efficacy may depend on very different contextual goals, presumptions are always justified instrumentally (p. 53). When it comes to a dialogical purpose, Rescher emphasizes the role of presumptions in preventing an infinite regress (pp. 23-26).

[8] At times, also Walton (see 2008, 2014).

3.2 The concept of cognitive presumption

Cognitive presumptions have all the general features described in Sect. 2. However, unlike practical presumptions, they are tailored to acquire information. Let us briefly present two paradigmatic examples (Rescher, 2006, p. 31).

First, to be effective in gaining knowledge we should trust our senses and memory. Let us call this *the standard sources presumption*—if our standard cognitive sources (e.g., perception and memory) indicate *p* [basic fact], then we should take *p* as true [presumption] unless there are sufficient reasons to think that, in this particular case, standard sources may be wrong [defeater clause]. Second, in a long run, our prospects of acquiring information are better if we take as true the declarations of other people. Trusting people is much better default policy for acquiring information than doubting them. Let us call this *the testimony presumption*[9]—if some person asserts *p* [basic fact], then we should take *p* as true [presumption] unless there is a sufficient reason to think that, in this particular case, the person could be wrong [defeater clause]. So, when we seek to acquire information, "betting on" our senses, memory, and declarations of other people are, in a long run, cost-effective cognitive policies (2006, pp. 48-52).

Rescher defines the concept of cognitive presumption in terms of plausibility. Cognitive presumptions represent "truth-candidates, data that are no more certified *truths* than candidate-presidents are certified presidents" (2006, p. 37). But truth-candidacy is not enough—in order to gain presumptive status, a proposition needs to be *the most plausible* truth-candidate.

> Presumption favors the most *plausible* of rival alternatives–when indeed there is one. This alternative will always stand until set aside (by the entry of another, yet more plausible, presumption). (Rescher, 2006, p. 39)

The notion of plausibility plays, then, a crucial role in defining the cognitive presumption. For our present purposes, two things need to be mentioned.

First, in Freeman's (2005, p. 26) words, Rescher's concept of presumption is *singular*. There may be more presumptive rules operating simultaneously and there may be more incompatible truth-candidates but, at a particular point, only the most plausible truth-candidate may be presumed. Second, there are different sources of plausibility. Roughly, we may distinguish between evidential and non-evidential sources.[10] Evidential sources render the proposition plausible on the basis of evidential support or standard sources (perception, memory, testimony, etc.). Here, the proposition becomes a presumption if it is supported by stronger evidence or a more reliable source than any rival truth-candidate. By contrast, non-evidential sources render propositions plausible on the basis of principles such as simplicity, uniformity, normality, etc. (Rescher, 2006, p. 40). These principles become especially important when the evidence does not discriminate between the rival truth-candidates. For instance, if two rival truth-candidates are equally supported by evidence, one may presume the candidate that is closer to the "usual course of things" (normality) and coheres better with other cognitive commitments (2006, p. 41).

---

[9] Closely related to this presumption is the *presumption of trust*—we shall presume that people are honest, i.e. that they mean what they say (Rescher, 2006, p. 89). But presuming the person's honesty is clearly different from presuming the truth of the person's testimony. For example, the opponent may have a sufficient reason to defeat the truth of a particular testimony without having any doubts concerning the testifier's honesty.

[10] Or, in Rescher's (2006, p. 40) terms, we may distinguish plausibility of the thesis warranted by evidentiation and plausibility of the thesis warranted by principles.

This ends my short presentation of practical and cognitive presumptions. In the final section, I will argue that practical and cognitive presumptions may be more different than the previous characterization reveals.

4. THE STRENGTH OF PRESUMPTION AND THE WEIGHT OF REBUTTAL

Practical and cognitive presumptions are similar in all the general respects, but there are clear material differences. First, practical presumption, unlike cognitive presumption, is not an *epistemic* status of a proposition. Second, practical presumption, unlike cognitive one, will serve to enable *deliberative*, rather than cognitive progress. Consequently, unlike cognitive presumption, a practical presumption will be justified if it is effective in accomplishing a *non-alethic* end. However, there is also a structural difference concerning the conditions of weakening.

In this section, I will argue that cognitive presumptions can be weakened by an undercutting defeater, while practical presumptions cannot. But before the argument is presented, the standard characterization of presumption's strength, as well as the notion of an undercutting defeater, must be explained.

4.1 What constitutes the strength of a practical presumption?

The strength of (practical) presumption is defined in terms of how much evidence is needed to overturn it (Godden & Walton, 2007, pp. 337-338) or, more precisely, how difficult it is for the opponent to rebut it. Technically, to *rebut* a proposition means to defeat a proposition by proving the negation (see Pollock, 1987, p. 485). So, when Ullmann-Margalit (1983, p. 152) claims that "an index of the strength of the presumption" is correlated with "the weight of the reasons ... required for the rebuttal," she claims that the strength of the presumption p is measured by how much evidence is required to prove $\sim p$. In his chapter on legal presumptions, Rescher offers the same characterization.

> [P]resumptions will differ in strength according to just how much it takes to defeat them–that is, on just how great a burden of proof is being carried by anyone seeking to defeat them. Presumptions are *strong* or *weak* as their associated burden is *heavy* or *light*. (Rescher, 2006, p. 18)

This characterization, for instance, renders the *presumption of innocence* stronger than the legal *presumption of sanity*[11] because the former can be rebutted only by conclusive evidence, while the latter can be rebutted also by the preponderance of evidence (2006, p. 18). However, the weight of the burden of rebuttal depends on the importance of a particular practical goal. So, the practical presumption that is related to a more serious issue and serves to achieve more important non-alethic end will be more difficult to rebut and, thereby, stronger (Rescher, 2006, p. 18; Godden, 2017, p. 508). For instance, the presumption that serves to protect human life will not be as easily rebutted as the one promoting politeness.

In summary, the importance of a non-alethic goal determines the weight of rebuttal, and the weight of rebuttal determines the strength of a practical presumption.

---

[11] According to this legal presumption, we shall presume that the accused was sane (in a right state of mind) when the crime in question was committed.

4.2 What is an undercutting defeater?

Let us now turn our attention to the notion of an undercutting defeater. This notion, crucial for our purposes, is quite famous in a contemporary epistemology. It played a major role in John Pollock's theory of defeasible reasoning. Put simply, an undercutting defeater r is a piece of evidence that attacks the reliability of the connection between the premise q and a conclusion p. In Pollock's words,

> [Undercutting defeaters] attack the connection between the reason and the conclusion rather than attacking the conclusion itself. For instance, "X looks red to me" is a prima facie reason for me to believe that X is red. Suppose I discover that X is illuminated by red lights and illumination by red lights often makes things look red when they are not. This is a defeater, but it is not a reason for denying that X is red (red things look red in red light too). Instead, this is a reason for denying that X wouldn't look red to me unless it were red. (Pollock, 1987, p. 485)

The undercutting defeater r is consistent both with the reason q and the conclusion p—it attacks neither q nor p, but the connection between q and p. In Pollock's classical example, "X is illuminated by red lights" is consistent both with the premise "X looks red to me" and the conclusion "X is red." However, "X is illuminated by red lights" is also consistent with the conclusion, for instance, "X is white." This renders conclusion evidentially uncertain and, from a purely epistemic perspective, we should suspend judgment as long as the undercutting defeater remains undefeated.

4.3 The strength of cognitive presumption and the weight of rebuttal

Departing from the previous characterizations, I will now argue that the strength of a typical cognitive presumption is not necessarily correlated with the weight of rebuttal. The cognitive presumption may be weakened even though the burden of rebuttal does *not* become any lighter, i.e. although it remains equally difficult to prove the contrary.[12] This is clearly incompatible with the standard (practical) definition of strength discussed above.

Once we accept Rescher's definition of cognitive presumption, a condition that determines its strength appears to be quite straightforward. Since the cognitive presumption is *the most plausible* truth candidate, we can expect that plausibility is a matter of degree and that the strength of presumption will be correlated with the degree of plausibility. Supposing that this is correct, and that p is a cognitive presumption, the following statement must be true:

> If p becomes less plausible, then (the cognitive presumption) p becomes weaker.

Furthermore, let us suppose that p is the most typical, evidential type of cognitive presumption, and that p loses plausibility by losing some evidential support. Therefore, we substitute "p becomes less plausible" with "p loses some evidential support."

> If p loses some evidential support, then (the evidential cognitive presumption) p becomes weaker.

This statement is also true. However, once we interpret a consequent "p becomes weaker" in accordance with the standard (practical) definition of strength, we get the following statement:

---

[12] I assume that the weight of rebuttal is *not* determined *only* by the contextually appropriate standard of (dis)proof. In everyday contexts, we can expect that "proving the contrary" may become more or less difficult for the opponent even if the standard of (dis)proof remains fixed.

<center>If *p* loses some evidential support, it becomes easier to prove ~*p*.</center>

This statement is false. By means of applying the notion of an undercutting defeater, it is not difficult to think of an example that satisfies the antecedent but not the consequent. Suppose that *q* is one *among many* evidential reasons for presumption *p* and that an undercutting defeater *r* defeats the reliability of a connection between *q* and *p*. In this case, *p* loses some evidential support (and the cognitive presumption *p* becomes weaker) but *r* does not make it any easier to prove ~*p*. (By definition, undercutting defeaters are *not* reasons to the contrary.) So, as long as the opponent's obligation to prove ~*p* is concerned, *r* is either irrelevant (at best) or equally destructive (at worst). Let us illustrate this by an example.[13]

1. Suppose you are sitting in the coffee bar and at the time t_1 you see a man walking a dog. Despite the distance, you can clearly see that the person must be either Smith or his *twin brother* Jones, your long lost high-school friends. So, by the supposition, there are only two truth candidates ("The person walking a dog is Smith" and "The person walking a dog is Jones"), and none of them is more plausible. Your visual impression (in conjunction with the information that brothers are twins) renders both truth-candidates equally uncertain and, consequently, no truth-candidate has the status of a cognitive presumption at t_1.

2. However, at time t_2, you hear a bartender saying "Look at that dog lover Smith over there!" Given the presumptive rule that you should "accept at face value the declarations of other people" (Rescher, 2006, p. 31), you start thinking that Smith is the person you are looking at. The testimony makes "The person walking the dog is Smith" the most plausible truth candidate, i.e. a cognitive presumption. It is important to notice that the basic fact, "The bartender asserts: 'Look at that dog lover Smith over there!'" is a complex statement. The bartender asserts two relevant claims: "The person walking a dog is Smith" and "Smith is a dog lover." To my mind, these claims provide independent (convergent) support for the cognitive presumption that the person in question is Smith.[14]

3. But just a few seconds afterward, at time t_3, you hear another person saying "Yeah, his brother Jones is a dog lover, too." From this moment, "Smith is a dog lover" cannot provide evidential support for "Presumably, the person walking a dog is Smith." Given that the person walking a dog is either Smith or Jones, and that both Smith and Jones love dogs, "Smith is a dog lover" is not a reliable indicator that it is Smith (and not Jones!) you are looking at. The presumption is, therefore, weakened. The evidence that used to provide some (albeit weak) support to "Presumably, the person walking a dog is Smith," does not provide this support anymore.

---

[13] The example is formulated in a monological fashion and in terms of evidence, but it can be easily reformulated in dialogical terms where the allocation of the burden of proof will be more explicit.

[14] Let us start with the bartender's claim that "The person walking a dog is Smith." Since you have completely lost a contact with both Smith and Jones during the past, say, twenty years, it is reasonable to expect that they may not be living in the same neighborhood, not even in the same city. In these circumstances, the fact that the local bartender recognized Smith and not Jones must count as evidence that the person in question is, in fact, Smith. Also, in the circumstances where you don't know anything about Smith's or Jones' dog preferences, the bartender's claim "Smith is a dog lover," must count as evidence that the person walking a dog is Smith. As long as you don't know anything about Jones' dog preferences, the bartender's claim must make some evidential difference.

However, while "Jones is a dog lover" weakens the presumption, it does not make the contrary ("The person walking a dog is Jones") any easier to prove. To see this, let us approach the situation from the perspective of an imagined opponent. At time t_1, the opponent's "perceptual reason" supporting "The person walking a dog is Jones" is defeated by the existence of a twin brother and, by the time t_3, the evidential position of this statement does not become any better. At t_3, the imagined opponent possesses two pieces of evidence and they are both annulled by undercutting defeaters. The connection "The person walking a dog *looks like* Jones, therefore the person walking a dog *is* Jones" is undercut from the start by the existence of a twin brother Smith, and the connection "Jones loves dogs, therefore the person walking a dog is Jones" is undercut by the information that his twin brother Smith loves dogs, too. So, nothing that happened between t_1 and t_3 made the opponent's obligation to prove the contrary any less demanding. By contrast, the cognitive presumption that arose at t_2 surely became weaker at t_3.

In conclusion, the role of an undercutting defeater indicates that the strength of cognitive presumption cannot be properly expressed by the weight of rebuttal. It is correlated with the degree of plausibility, and the degree of plausibility is not necessarily correlated with the weight of rebuttal. This indicates a structural difference between practical and cognitive presumptions because when it comes to determining their strengths different mechanisms seem to be in play.

5. CONCLUSION

In this paper, I sought to show that the standard definition of the strength of presumption, associated with the so-called practical presumptions, cannot be applied to cognitive presumptions.

First, I explained the most general features of presumptions, widely discussed in the literature. In a standard view, all presumptions pertain to special deontic statuses. They are typically used to enable dialogical progress or to prevent dialogical regress by reversing the burden of proof. They are not stipulations but consequences of reasoning, and their ultimate justification is instrumental rather than theoretical.

After providing a general framework, I focused on the theory of Nicholas Rescher. I explained Rescher's notion of cognitive presumption and claimed that cognitive and practical presumptions (as understood by Ullmann-Margalit and Godden) entail different conceptions of strength. While the strength of practical presumption is supposed to be correlated with the weight of rebuttal, the strength of a cognitive presumption is correlated with plausibility. Due to the possibility of undercutting defeaters, the degree of plausibility does not need to correspond to the weight of rebuttal. This means that two types of presumptions are not weakened by the same set of conditions. Besides material differences, there is also a structural one.

The importance of this difference is primarily theoretical. Although the distinction between practical and cognitive presumptions is well-known, it still lacks detailed analysis. The purpose of this paper is to stress the importance of the issue, raise some relevant questions and, perhaps, provide some guidance for further investigations.

Toulmin's warrant-establishing arguments

DAVID BOTTING

Independent Researcher
davidbotting33@yahoo.co.uk

ABSTRACT: In the two places where Toulmin describes warrant-establishing arguments, the descriptions appear to be in conflict. I will argue for a combination of these descriptions, but it will be shown that, on this interpretation, warrant-establishing arguments are a wider class than Toulmin takes them to be and have a different structure from warrant-using arguments—while warrant-using arguments fit the Toulmin model, warrant-establishing arguments do not. I reject the anti-logic moral drawn by Toulmin.

KEYWORDS: S.E. Toulmin, warrant-establishing arguments, warrant-using arguments, Toulmin model

1. INTRODUCTION

At (Toulmin 1958, pp. 137-38) Toulmin sets out five distinctions:

i)   Necessary and probable arguments.

ii)   Formally valid arguments and those that cannot hope to be formally valid.

iii)   Arguments whose warrant has already been established and those used to establish a warrant. These are called respectively *warrant-using* and *warrant-establishing* arguments.

iv)   Arguments expressed in 'logical' words and those not so expressed.

v)   Analytic and substantial arguments.

The focus of this paper is on (iii). Toulmin accuses formal logicians of conflating this distinction with the deductive/inductive distinction, mistakenly taking deductive arguments as co-extensive with warrant-using arguments and inductive arguments as co-extensive with warrant-establishing arguments (and to make similarly mistaken conflations with regard to the other distinctions).

It is not entirely clear why Toulmin thinks this: possibly, Toulmin is thinking of a structural distinction between deductive and inductive arguments, deductive arguments being those that reason from the general to the particular and inductive arguments being those that reason from the particular to the general. Warrants being general statements of some kind, the arguments that establish them (from singular statements) would be taken as "inductive" on this criterion. However, making the distinction between deductive and inductive arguments in this structural way is quite different from making it in the way where deductive arguments are necessary and inductive arguments are probable [as in (i)], since although it is true that an argument whose conclusion is a general statement and all of whose premises are singular statements will not be formally valid and hence not necessary in that sense (and so it is not wrong to claim that inductive arguments are non-necessary, i.e., probable), it is not true that deductive arguments are always those reason from the general to the particular, since we may also reason deductively from the general to the general and from the particular to the particular or, for that matter, we may reason inductively in these ways as well so that their conclusions are only probable. There are two different distinctions that logicians might make with the words "deductive" and "inductive", then, and if my hypothesis is correct, Toulmin conflates them. No logician describes the arguments he calls necessary "deductive" in the same sense of "deductive" that he calls arguments that reason from the general "deductive." If this is Toulmin's motivation, then it is Toulmin, and not the logicians, who mistakenly conflates the

necessary/probable distinction of (i) with the warrant-using/warrant-establishing distinction of (iii).[1] The deductive/inductive distinction that (i), (ii), (iv) and (v) are held to map onto is modal while for (iii) it is structural.

The warrant-using/warrant-establishing distinction, then, is not simply one of passing interest to the taxonomist of arguments: Toulmin aims at drawing far-reaching morals from the distinction. In particular, he wants to show that there can be warrant-establishing arguments that are not inductive but deductive (or to be more precise, analytic), for this would be a counter-example to the logician's position, or so he thinks. Since they are both "deductive", Toulmin wants to argue for instance that necessary arguments and warrant-using arguments would be claimed by logicians to be co-extensive, but this simply overlooks the fact that necessary arguments are not deductive in the same sense of "deductive" as warrant-using arguments.

Enough about the distinction and how it relates to the deductive/inductive distinction and the necessary/probable distinction. What about warrant-establishing arguments themselves? What are they and what do they look like?

Surprisingly, there are only two places where Toulmin describes warrant-establishing arguments, and on the face of it these two descriptions conflict and lead to two different accounts. I will show that one of these accounts runs into serious theoretical difficulties such that we cannot charitably adopt it. The second account is tenable and probably what Toulmin intends, but it does not conform to the Toulmin model of argument. In the conclusion I will back-track somewhat: both accounts are necessary, and I will give an account that combines them, but this gives a much wider class of warrant-establishing arguments than I think Toulmin intends.

The first place Toulmin describes warrant-establishing arguments says:

> Suppose we contrast what may be called 'warrant-using' arguments with 'warrant-establishing' ones. The first class will include, among others, all those in which a single datum is relied on to establish a conclusion by appeal to some warrant whose acceptability is being taken for granted—examples are 'Harry was born in Bermuda, so presumably (people born in the colonies being entitled to British citizenship) Harry is a British citizen', 'Jack told a lie, so presumably (lying being generally reprehensible) Jack behaved in a reprehensible way', and 'Petersen is a Swede, so presumably (scarcely any Swedes being Roman Catholics) Petersen is not a Roman Catholic.' Warrant-establishing arguments will be, by contrast, such arguments as one might find in a scientific paper, in which the acceptability of a novel warrant is made clear by applying it successively in a number of cases in which both 'data' and 'conclusion' have been independently verified. In this type of argument the warrant, not the conclusion, is novel, and so on trial.
> . . .
> The point of idiom to be noticed here is this: that the distinction we have marked by the unwieldy terms 'warrant-using' and 'warrant-establishing' is commonly indicated in practice by the word 'deductive', its affiliates and their opposites. (Toulmin 1958, pp. 111-12)

From this, it seems that what Toulmin has in mind is something like the deductive-nomological model and hypothetico-deductivism. For example:

All gases expand when heated under constant pressure
This sample of gas has been heated under constant pressure
Therefore, this sample of gas has expanded

is a deductive-nomological explanation of why this sample of gas has expanded. An explanation of this type is a sound deductive argument (with some additional features). On the other hand, we could have put "All gases expand when heated under constant pressure" forward as a hypothesis, heated the sample of gas as an experiment, and then taken the expansion of the gas

---

[1] This should be qualified by saying that Toulmin's necessary/probable distinction is actually quite different from the logicians' necessary/probable distinction (referred to here) and is not modal at all. Unless indicated otherwise, assume that "necessary" means that the conclusion must be true when the premises are true.

as confirmation of our hypothesis. This, roughly, is hypothetico-deductivism. Now, we are not really inferring here from the conclusion to the hypothesis, because we do not start from "This sample of gas has expanded" and derive the hypothesis logically; rather, we start from a position where we have already invented a hypothesis and are testing it.

If this is Toulmin's idea, then the important thing to note is that there is no change in the ordering of the propositions, that is to say, the warrant to be established figures as the warrant in the warrant-establishing argument just the same as it does in the warrant-using argument.

The second place Toulmin describes warrant-establishing arguments is at (1958, p. 126). This is, in fact, the only example Toulmin gives of a warrant-establishing argument:
Jack has three sisters
The first has red hair
The second has red hair
The third has red hair
So, all Jack's sisters have red hair
It seems from this that what Toulmin has in mind is an argument where the warrant ("all Jack's sisters have red hair") appears as the conclusion or (using Toulmin's terminology) the claim. (Note also that this argument is not inductive in the structural sense because it includes the "Jack has three sisters" as a premise and this is arguably a general claim, unless we count it as a singular claim about a finite set of things, viz., Jack's sisters; if the premises were the individual instances alone, then it would be inductive. If we allow that arguments can be deductive in the structural sense even when its conclusions are not particular but general, then this argument is deductive; otherwise, it is neither inductive nor deductive, being reasoning from the general to the general. This is one reason why the structural deductive/inductive distinction is rarely used: it is not exhaustive).

This example is meant to be a counter-example: couching his discussion in terms of analyticity, Toulmin advances this as a warrant-establishing argument that is "analytic" [as in (v)] and formally valid, but, "analytic" being a technical term in Toulmin, much the same points can be made more intelligibly by re-describing what he is doing as showing that the argument is deductive. Additionally (although Toulmin does not mention it) the argument is necessary in Toulmin's sense that it establishes conclusively the warrant in question. Generally, in cases where the induction is a complete enumeration and the fact that it is a complete enumeration is explicitly stated, the warrant-establishing argument is deductive and necessary.[2] Toulmin's argument is then a counter-example to the thesis that being warrant-using is co-extensive with being deductive and being warrant-establishing is co-extensive with being inductive, because it is both deductive and warrant-establishing.[3]

---

[2] The conclusion might be argued to be established conclusively and so "necessary" in Toulmin's sense even without having "Jack has three sisters" as a premise. Without this premise the argument is not formally valid, although arguably it is semantically valid in that if the premises are true the conclusion must likewise be true; I believe that something like the latter is what Toulmin means by "analytic", and if so, his argument that this is an analytic warrant-establishing argument works just as well (or badly) without this premise. Note, also, that without the premise the argument would still count as inductive according to the structural deductive/inductive distinction. The counter-example would then be of an argument that is inductive yet analytic and necessary (in Toulmin's sense), but not formally valid.

[3] Likewise, there are arguments that are probable in the logicians' sense that their conclusions do not follow necessarily from their premises and for that reason called "inductive" in the modal sense may quite well be "deductive" in the structural sense, and these will be inductive, warrant-using arguments. Neither deductive warrant-establishing arguments nor inductive warrant-using arguments are genuine counter-examples: it is only by confusing these two senses of the deductive/inductive distinction that there might be felt to be any contradiction. Once these two senses are separated there is no reason to suppose that in the modal sense [which is the sense in use in (i), (ii), (iv) and (v)] warrant-using arguments should be deductive and warrant-establishing arguments should be inductive in the first place.

The point that concerns us is not the success or lack thereof of Toulmin's counter-example, but that the big difference between the two passages is that in the first the warrant seems to occur in the warrant-establishing argument *as* a warrant, while in the second it seems to occur in the warrant-establishing argument *as* a claim. For want of a better terminology, I will call these respectively the W-interpretation and the C-interpretation.

Both interpretations have their followers, though few acknowledge the difference. The C-interpretation seems be followed by Castañeda when he says (1960, p. 284): "Toulmin can be taken to mean that B appears in a new argument whose conclusion is W, which must have a warrant W2 linking B and W". It also seems to be implied when Klumpp (2006, p. 109) refers to warrant-establishing arguments as "the generation of chained arguments in which the arguer makes claims about the relationships of data and claim." More tentatively, such chaining seems to be in Hitchcock's mind also when he refers at (2006, p. 215) to "reasoning to a conclusion that will later serve as a warrant for further reasoning".[4] This kind of chaining seems to be in Toulmin's mind when he says:

> But the backing of the warrants we invoke need not be made explicit—at any rate to begin with: the warrants may be conceded without challenge, and their backing left understood. Indeed, if we demanded the credentials of all warrants at sight and never let one pass unchallenged, argument could scarcely begin. Jones puts forward an argument invoking warrant W1, and Smith challenges that warrant; Jones is obliged, as a lemma, to produce another argument in the hope of establishing the acceptability of the first warrant, but in the course of this lemma employs a second warrant W2; Smith challenges the credentials of this second warrant in turn; and so the game goes on. Some warrants must be accepted provisionally without further challenge, if argument is to open to us in the field in question: we should not even know what sort of data were of the slightest relevance to a conclusion, if we had not at least a provisional idea of the warrants acceptable in the situation confronting us. The existence of considerations such as would establish the acceptability of the most reliable warrants is something we are entitled to take for granted. (Toulmin 1958, pp. 98-99)

The argument produced "in the hope of establishing the acceptability of the first warrant" is a warrant-establishing argument, which Toulmin says will have its own warrant. This could go on for ever in an infinite regress; it is only because we take some warrants for granted and do not make their backing explicit that Toulmin says we can argue at all.

None of these writers seem to consider any alternative interpretation. One who does acknowledge the difference and consider both alternatives is Sweeney (1980). The C-interpretation seems to be meant by Sweeney when he suggests (1980, p. 117) as the first approach: "*The claim will represent the yet-to-be-established warrant*, data will include the records of various successive trials, and the warrant will assert the suitability of empirical testing to the establishment of general principles within the particular field" [my italics]. It is worth noting that Toulmin does not mention the warrant of the warrant-establishing argument at all in the places where he discusses warrant-establishing arguments explicitly, but that he does mention them in the excerpt from pp.98-99 given above. Sweeney has reconstructed the argument to give this second warrant on Toulmin's behalf.

The important thing for the time being is that the warrant occurs as the claim, differing in this way from the W-interpretation. We see this when Sweeney describes the W-interpretation as a second approach:

> [T]he tentative warrant may be stated as a warrant while the data include the controlled variables and the claim predicts a result. Then, every time the argument is found to successfully predict the results of an experimental trial, the backing for the tentative warrant becomes stronger and the warrant becomes

---

[4] It is also how Kienpointner distinguishes warrant-using from warrant-establishing arguments (Komlósi 2007, 8; Katzav & Reed 2004, 252). Being unsure how closely Kienpointner intends his distinction to match Toulmin's, I would not like to attribute to him any particular interpretation of Toulmin's distinction.

This seems to endorse the W-interpretation.[5]

Although he thinks that it is the W-interpretation that Toulmin intends, Sweeney does not, in the end, think that it matters much: "It may be that either interpretation is adequate . . . . This objection to the Toulmin model is, however, judged relatively inconsequential in that it appears that arguments may be analysed with the Toulmin model regardless of any determination of whether they are warrant-using or warrant-establishing" (Sweeney 1980, p. 293). This, however, I deny. In fact, it is the W-interpretation that poses
a problem for the applicability of the Toulmin model. But first let us look at the problems with the C-interpretation.

2. THE PROBLEM WITH THE C-INTERPRETATION

Let us consider two arguments: one in which a warrant is established and another in which it is used:

WARRANT-ESTABLISHING (W_E)	WARRANT-USING (W_U)
$Data_1$	$Data_2$
$Warrant_1$	$Warrant_2$ (= $Claim_1$)
So, $Claim_1$ (= $Warrant_2$)	$Claim_2$

We see, then, that the warrant-establishing argument W_E is chained to the warrant-using argument W_U — the warrant (i.e., $Claim_1$/$Warrant_2$) is established as a claim in W_E and then used as a warrant in W_U.

    There are two major problems with this.

    Firstly, assuming that any warrant-establishing argument requires a different warrant as its warrant from the one it is intended to establish, $Warrant_1 \neq Warrant_2$; and if we wanted to establish *that* warrant in a warrant-establishing argument, then that argument will require a different warrant, and so on to a familiar-looking infinite regress of warrants. Perhaps this regress might terminate with a warrant-establishing argument whose own warrant can simply be taken for granted without any kind of backing at all.

    The rejoinder may be made here that this is precisely what Toulmin discusses at pp.98-99. Note, however, that Toulmin does *not* say that the regress actually stops at a warrant that is taken for granted; this is wise, because to stop the regress we need a warrant that has no backing, and to say that the warrant is taken for granted and the backing need not be made explicit is not to say that there is no backing. Toulmin's point then seems to be deflationary: we need not worry because in practice we do not always ask for the backing of a warrant, so the mere

---

[5] Likewise, earlier Sweeney says:

> For a warrant . . . must at some point become "established." This means that each warrant goes through a period in which it is only tentatively applied, in much the same way as an experimental hypothesis is entertained until and unless it becomes untenable. . . . . While such warrants are becoming established, the arguments in which they are used are classified as "warrant-establishing arguments." (Sweeney 1980, pp. 43-44)

Another who seems to follow the W-interpretation is Cooley (1960, p. 314), who regards it, however, as a naïve view of scientific procedure.

possibility in principle of an infinite regress is not a bar on argumentation. Although I agree that we can argue with warrants that have simply been conceded without giving their backing, the fact that they still have a backing, and that in principle this backing *could* be made explicit, is still a problem. An infinite regress seems to show that it is a conceptual impossibility for something to be a warrant as Toulmin conceives them, because if there is one warrant, then there is an infinite number of them, and there cannot be an infinite number of warrants; therefore, there cannot be even one warrant. We need to stop the regress somehow, and far from suggesting that it can be stopped, Toulmin seems to accept that it cannot. His "Don't worry" response only works up to a point.

Secondly, it turns out that the field in which an argument is used is, by definition, different from the field in which it is established, yet surely we would want to say that they belong to the same field.

Let me explain this. Fields are individuated from each other in the following way (Toulmin 1958, p. 14): "Two arguments will be said to belong to the same field when the data and conclusions of each of the two arguments are, respectively, of the same logical type". In other words, the data of the first argument must be of the same logical type as the data of the second argument, and the claim of the first argument must be of the same logical type as the claim of the second argument. Is that the case with W_E and W_U? We might assume that their data is of the same logical type — there is no reason to think otherwise. But is $Claim_1$ – in other words, $Warrant_2$, which is what we are currently trying to establish – of the same logical type as $Claim_2$?

Here we have an immediate problem, because it is not at all obvious that a warrant itself *has* a logical type as such. If we take it as an inference-license then it involves two logical types, that of the data and that of the conclusion. If we take it as a general statement about a finite set of objects, then *the members of this set* are of the same logical type as the claim, *but the statement itself is not* of this logical type, since Toulmin (1958, p. 215) considers general statements to be of a different logical type to the singulars of which they are the generalizations (which is the same as saying that it is different to the logical type of the Data in both W_E and W_U, these types being the same when the arguments belong to the same field).

We seem to have three options: we either give it some kind of hybrid logical type, or we take it as some kind of generalized 'supertype' of the claim, or we adopt the convention that it has the same logical type as the claim. If we take either of the first two options, then $Claim_1$ and $Claim_2$ will not have the same logical type and must, *ipso facto*, belong to different fields; the logical type of $Claim_2$ is not of the same logical type as a hybrid type or generalized supertype. You cannot, then, chain arguments in the way that the W-interpretation supposes and as Toulmin himself seems to imply; at least, not while staying in the same field. In fact, if we have an infinite number of warrants then we also have an infinite number of fields.

If we take the third option, then $Claim_1$ and $Claim_2$ *will* have the same logical type and consequently W_E and W_U belong to the same field. But this is too permissive. Suppose we have a $Warrant_3$ whose embedded claim is of the right logical type but whose embedded data is not. Such a warrant will be of the right logical type to occur as a claim in the field, but it clearly could not be used in or belong to that field because of the type-mismatch between its own embedded data and the field's.

3. THE PROBLEM WITH THE W-INTERPRETATION

On the W-interpretation the warrant is put forward tentatively, its acceptability not being taken for granted as in warrant-using arguments. This being the case, it should be modally qualified as something other than certain. Similarly, because in this case the claim is known, it should *not* be modally qualified. In other words, while the warrant-using argument has the form
Data; Warrant; So, (Qualifier) Claim
a warrant-establishing argument has the form
Data; (Qualifier) Warrant; So, Claim
This is so even if the claim does not follow with certainty from the data and warrant, since Toulmin insists that once we know that something is true, it is inappropriate to describe it as probable; also, since Toulmin considers any argument whose claim is put forward unequivocally as necessary, it also follows on the W-interpretation that all warrant-establishing arguments are necessary! Consequent to this is another difference, which we can see more clearly when we expand the warrant: while
Data; (if Data then (Qualifier) Claim); So, (Qualifier) Claim
is formally valid (as Toulmin says that arguments should be when the warrant is made explicit),
Data; (Qualifier) (if Data then (Qualifier) Claim); So, Claim
is *not* formally valid (and still would not be if we put "So, (Qualifier) Claim"). In short, adding a qualifier to the warrant itself breaks the formal validity of the argument.

Toulmin (and Sweeney) is wrong, then, in supposing that all arguments can be put into the form of "Data; Warrant; So, (Qualifier) Claim" or analysed in the same way; the Toulmin model is not as ubiquitous as has been supposed. The modifications needed to be made to Toulmin's account in the W-interpretation are minor compared to the C-interpretation, however; we simply have to have slightly different models for warrant-using arguments and warrant-establishing arguments.

The problem now is: why should this be confined to warrant-establishing arguments? After all, in warrant-using arguments too the claim could serve to back the warrant. Perhaps Toulmin would say that it is only a warrant-using argument while the claim is something unknown, or perhaps, known only inferentially as opposed to independently.[6] When we come to know those truths directly, or perhaps by being inferred through a different warrant, the argument – if put forward now – is a warrant-establishing argument. These are two different acts of arguing and reasoning, however. Using a warrant-using argument does not, then, make the warrant any more reliable than it already was. It is only by how the qualifiers are arranged that warrant-establishing and warrant-using arguments are really distinguished.

4. CONCLUSION

Two distinct conceptions of warrant-establishing arguments can be derived from Toulmin's rather terse comments and both run into difficulties. We have a choice between an interpretation that runs into serious theoretical difficulties – namely, the regress objection and the field objection – and may even be theoretically inadequate and an interpretation that seems theoretically adequate but is inconsistent with the Toulmin model. I have concluded that the latter interpretation is the easier to accommodate. With this accommodation, Toulmin does succeed in defining a coherent distinction. But does it accommodate Toulmin's example?

Remember that Toulmin raised this distinction in the first place in order to argue that logicians would wrongly rule out the possibility of deductive warrant-establishing arguments.

---

[6] It would be a kind of boot-strapping if truths known inferentially were then taken to support the warrant through which they were inferred.

His counter-example was:
Jack has three sisters
The first has red hair
The second has red hair
The third has red hair
So, all Jack's sisters have red hair
But this lent itself to the C-interpretation, which has been rejected. However, we cannot reject this example, because then there would be no reason for Toulmin to make this distinction in the first place. Can we find a way for the W-interpretation to make sense of this argument?

Now perhaps the idea is that we can put forward "All Jack's sisters have red hair" as a warrant and treat "The first has red hair" as a confirmation, and so on until we have "The first has red hair; the second has red hair; the third has red hair" as the backing of our warrant. Then, taking "Jack has three sisters" as the data we can *deductively* conclude the warrant. Perhaps the point is that, having put forward the warrant at first tentatively on the basis of inductive support we can, with the addition of the datum that Jack has three sisters (thereby indicating that the inductive support in the backing amounts to complete enumeration), infer it as a certainty. Then the point would be that certain backings can be such that, when combined with the right data, the warrant they back can now be put forward with certainty, i.e., an argument of the form "Data; Backing; so, Claim" where the tentative warrant has been left implicit, like

Jack has three sisters	Data
The first has red hair	
The second has red hair	Backing
The third has red hair	
(All Jack's sisters have red hair)	Warrant to be established (implicit)
So, all Jack's sisters have red hair	Warrant established (conclusively)

Note that this reconstruction differs from that of Sweeney's, who would treat "The first has red hair" as a datum while I treat it as part of the backing. Note that there is no regress problem here because the warrant to be established functions as the warrant in the argument as well; our assumption that what was used as the warrant in the warrant-establishing argument must be different from the warrant being established (which seems to be the upshot of Toulmin's comments at pp.98-99 and is assumed explicitly by Castañeda) actually turns out to be false, if this suggestion holds water. And perhaps we can solve the field problem by adding to the identity condition on fields that arguments that have the same thing as both warrant and claim belong to the same field as the warrant itself does, where that depends on the logical types of the data and claim involved in it. Perhaps the C-interpretation is not as hopeless as we thought, although it does still imply that we cannot chain arguments.

But how does this argument differ from an ordinary warrant-using argument?

Warrant-establishing arguments are not now distinct from warrant-using arguments but just a subtype of them that happen to have the same thing in the claim as in the warrant. Our renewed C-interpretation changes the nature of the distinction altogether into something that cannot serve Toulmin's purposes for it. Nor can we bail out into the W-interpretation and say that it is warrant-establishing because the arguments by which we got the backing in the first place were warrant-establishing, because Toulmin (1958, p. 126) says that "Jack has three sisters; the first has red hair; the second has red hair; the third has red hair; so, all Jack's sisters have red hair" *itself* is a warrant-establishing argument that has been put into a form that is formally valid. Perhaps we can say that it is not warrant-using simply because of the tentative way the warrant has been put forward, despite the fact that it is clearly being used to infer the claim. But now we are back at the W-interpretation again.

To get a class of warrant-establishing arguments that will do anything like what Toulmin wants them to do I think we have to depart even further from Toulmin than we have done

already and understand them to be a much wider class than Toulmin supposes. We cannot drop the C-interpretation, because then Toulmin's example is simply a mistake and the distinction will not do what he wants, and we cannot drop the W-interpretation, because then the distinction between warrant-using and warrant-establishing arguments does not divide arguments into two mutually exclusive classes. The main thing that makes an argument warrant-establishing is not the fact that the warrant occurs as the claim but that the warrant is put forward tentatively and as a warrant, and we must suppose that Toulmin simply failed to notice that this meant that it should be possible to modally qualify the warrant. The claim *may* also be the warrant itself, but it can be warrant-establishing even without this, i.e., if it is merely a confirmation. When the claim is the warrant, we have a curious situation where an argument in the "Data; Backing; So, Claim" form is deductively valid, but, due to the warrant being qualified, "Data; Warrant; So, Claim" is not. If it is merely a confirmation, though, it is inappropriate to modally qualify the claim, for this is something that we must know.

Still, one wonders what there is here to trouble the logician. There are deductive warrant-establishing arguments, principally when an enumeration becomes completed. Fine. Why should a logician want to deny this? Only if he confuses the modal deductive/inductive distinction with the structural distinction. Thus, I deny the moral that Toulmin wants to draw. I could say the same (for varying reasons) of the other four distinctions as well, but those must be subjects for other papers.

Argumentation and knowledge dissemination in the Greenpeace detox campaign

EMANUELE BRAMBILLA

Department of Humanities
IULM University, Milan
Italy
emanuele.brambilla@iulm.it

ABSTRACT: At the dawn of the Anthropocene, environmental NGOs are striving to popularise scientific evidence regarding the human impact on the planet. The paper, therefore, turns to Pragma-dialectics to analyse the knowledge-dissemination strategies whereby scientific topics are recontextualised at the popular level in activism discourse. The study focuses on the Greenpeace Detox campaign, highlighting that argumentation against fashion-driven pollution hinges on the discursive construction of a metaphorical catwalk through the interplay of verbal and visual arguments.

KEYWORDS: Detox, Greenpeace, knowledge dissemination, popularisation, visual arguments.

Whenever a Coketowner felt he was ill-used – that is to say, whenever he was not left entirely alone, and it was proposed to hold him accountable for the consequences of any of his acts – he was sure to come out with the awful menace, that he would 'sooner pitch his property into the Atlantic'.
(Charles Dickens, *Hard Times*)

1. INTRODUCTION

In Charles Dickens's *Hard Times*, Coketowners are the rich and powerful businessmen of Coketown, the fictional industrial town of red brick covered with smoke and ashes that has become the symbol of pollution and oppression in the collective imagination. The period in which the novel is set marked the actual beginning of the Anthropocene, the era in which humans "have become a geological force capable of affecting all life on this planet" (Braidotti, 2013, p. 66). Since then, innumerable industrialists have refused to come to terms with the fact that their corporate actions have consequences on the planet and its inhabitants. By describing and telling the story of Mr Bounderby, the prototypical businessman, Dickens further suggests that convincing Coketowners to revise their choices or change their behaviour is a daunting argumentative task. Yet, it is what environmental NGOs have been striving to do over the last few decades.

The countless and ambitious activist endeavours that have marked the passage from the 20th to the 21st century raise a question in discourse analytical settings: how can Coketowners be convinced? What is sure is that, despite their menaces, "they never had pitched their property into the Atlantic yet, but on the contrary, had been kind enough to take mighty good care of it" (Dickens, 2003, p. 112). In simpler terms, captains of industry cannot generally be convinced on moral grounds but only if their profits are somehow jeopardised.

In the light of the centuries-old and apparently endless argumentative struggle between Coketowners ad activists, the present paper turns to Pragma-dialectics to analyse the

knowledge dissemination strategies (Garzone, 2006; Bondi, Cacchiani & Mazzi, 2015) whereby NGOs strive to lead industrial companies to reconsider their polluting corporate habits and embrace green and responsible business. The study focuses on the *Detox Campaign*, whereby Greenpeace has been exposing the risk of the release of toxic substances into the environment. The letter *x* in the *Detox* logo is replaced by the Chinese pictogram for "water", making clear that the NGO is primarily campaigning against water pollution caused by industrial production. The campaign is divided into two main branches: *Detox my Fashion*, exposing the links between the textile industry and water pollution, and *Toxic Tech*, focusing on pollution in the electronics sector. The campaign is closely related to Corporate Social Responsibility (Catenaccio, 2012) and raises substantially complex scientific questions, as notions pertaining to toxicology and chemistry are addressed. The present paper focuses on the first branch of the campaign, *Detox my Fashion*, a world-famous argumentative mission that has already attracted scholarly attention owing to its significant recourse to images as forms of argumentation (Brunner & DeLuca, 2017).

Since its launch in 2011, *Detox my Fashion* has aimed at identifying the toxic chemicals commonly used in the production of high-street fashion with a view to their elimination. In 2012, the initial investigation was expanded to include twenty global fashion brands and identify more toxic chemicals. More than a hundred items of clothing were purchased in twenty-nine different countries and analysed, unveiling the significant presence of toxic substances, especially nonylphenol ethoxylates, phthalates and azo dyes that can release cancer causing amines. The chemicals detected are used in cleaning and dyeing processes, as plasticisers in the plastisol prints of T-shirts and sweaters, or to fireproof or waterproof textiles (Greenpeace, 2012; 2015). The absence of a legislative ban on toxic chemicals in the textile and fashion industries results in wastewater discharges containing substances that enter public waterways (Greenpeace 2012) and pollute rivers, lakes and oceans. Consumers have become the "unwitting accomplices in the cycle of toxic water pollution" (Greenpeace, 2012, p. 11), as they release chemical residues into their domestic wastewater as they wash their new and faddy garments. Notably, some of these substances have been demonstrated to be bioaccumulative, reprotoxic and/or hormone-disrupting (Greenpeace 2012; 2015), with adverse effects on the environment and human health (Greenpeace, 2012, p. 5).

Despite the significant findings gathered by 2012, the campaign has not stopped yet, and further investigations are continuously commissioned to uncover the environmental risks posed by *fast fashion*, i.e. today's mainstream industry based on the environmentally detrimental "make-buy-use-dispose" model. With the aim of breaking this vicious cycle, Greenpeace has been challenging "top brands to make amends by working with their suppliers to eliminate all hazardous chemicals across their entire supply chain, and the entire life-cycle of their products" (Greenpeace, 2015); at the same time, it has tried to make the unwitting accomplices in the toxic water cycle a little less unwitting. In a nutshell, Greenpeace has ventured into an ambitious knowledge-dissemination mission by producing a series of documents to inform the public about the connections between fashion and water pollution; these documents have provided the foundation for the present study.

2. CORPUS AND METHODOLOGY

Since activist campaigns "find in the Web their privileged site of discourse" (Degano, 2017, p. 292), the reference corpus is composed of texts drawn from the official website of Greenpeace International (www.greenpeace.org). Particularly, three texts have been extracted and collected in the corpus: *Toxic Threads: The Big Fashion Stich-Up* (2012), *Eleven*

hazardous chemicals which should be eliminated (2015) and *The Detox Catwalk 2016* (2016). These three texts, which will henceforth occasionally be referred to as text 1, text 2 and text 3, reflect Greenpeace's knowledge-dissemination effort: broadly speaking, while texts 1 and 2 present themselves as scientific reports and aim at disseminating knowledge at the intra- and interspecialistic levels (Garzone, 2006, p. 11), text 3 appears as their simplified version, disseminating findings at the popular level (Garzone, 2006, p. 11).

The present paper focuses precisely on this third text, adopting a mixed-method approach to investigate the role of argumentation in the reformulation, simplification, dissemination and popularisation (Garzone, 2006) of scientific knowledge regarding fashion-driven water pollution. The analytical tools offered by Pragma-dialectics have been supplemented with those of multimodal discourse analysis (O'Halloran, 2004; Kress & van Leeuwen, 2006), as Greenpeace resorts to both verbal and visual arguments to convey meaning and enhance the acceptability of its standpoints before an unfathomable judge, i.e. the vast and heterogeneous 21st-century internet audience. Before describing text 3 and presenting the analytical findings, however, a few remarks regarding the other two texts are necessary to frame the topic and put the analysis on *The Detox Catwalk* in perspective.

3. SCIENTIFICITY AND NON-SCIENTIFICITY IN GREENPEACE REPORTS

Text 1 and text 2 share a series of features with scientific discourse, including the presence of acronyms that "are totally opaque, and thus impenetrable for anyone who is not already familiar with their meanings" (Garzone, 2006, p. 33).

(1) *NPEs* were found in a total of 89 articles (63% of all items tested). The levels ranged from just above 1 *ppm* up to 45,000 *ppm*.

Example (1) shows that, among others, *NPEs* (nonylphenol ethoxylates) and *ppm* (parts per million) "contribute to meeting the requirements of economy of expression that is typical of specialized communication" (Garzone, 2006, p. 33). Besides acronyms, specialised lexicon is found in these two texts, particularly the scientific names of the eleven chemicals identified as the most hazardous (e.g. *organotin compounds*, *chlorobenzenes*, *short-chain chlorinated paraffins*). Yet, not only the denominations of toxic chemicals but also scientific terms and concepts such as *hormone disruptor*, *feminisation*, *reprotoxic* and *bioaccumulative* are regularly used and discussed, challenging the preparation of the audience. Moreover, the recourse to schematisation procedures (Garzone, 2006, p. 68), e.g. tables, charts and lists, contributes to bestowing a scientific and technical flavour on these reports.

Despite disseminating scientific data for the benefit of an audience capable of understanding chemistry and toxicology concepts, however, texts 1 and 2 cannot be said to be scientific texts. Certain features of non-scientific discourse also stand out, especially the absence of the *IMRAD pattern*, the structure of scientific and academic texts requiring a strict sequence of specific sections, i.e. Introduction, Methodology, Results and Discussion (Garzone, 2006, p. 41). The reports in question are, instead, freely organised, with the latter being a multimodal text harnessing the persuasive potential of photographs and pictures.

An indicator of the simplification of scientific discourse enacted in the two texts at issue is provided by the presence of excerpts in which certain scientific terms and/or acronyms are explained. In text 2, for instance, the concept of *biomagnification*, probably obscure to most non-experts, is elucidated through the parenthetical phrase "increase in concentration through the food chain" (Greenpeace, 2015). Text 1 even contains a section entitled "Terminology used in this report" (Greenpeace, 2012, p. 2) that serves as a glossary

for those readers who do not feel too sure about the meaning of scientific terms such as *persistence* and *surfactants*. Furthermore, the occasional presence of non-technical terms such as *greenwashers*, *laggards*, *villains* and the recourse to creative language (Jones, 2016) to coin the expressions *the toxic trail of clothes* and *the big fashion stitch-up* further point to the actual pseudo-scientificity of the "scientific" reports published within activist contexts. Put differently, the *content* of these reports can be considered scientific but not their *form*. Yet, despite sharing a non-negligible number of features with non-scientific discourse, texts 1 and 2 remain fundamentally referential and denotative texts, whose audience is required to have at least a certain familiarity with the chemical and toxicological issues addressed. Text 3 is, on the contrary, substantially different.

4. THE DETOX CATWALK

The Detox Catwalk 2016 is the discursive means whereby the scientific data reported in texts 1 and 2 are recontextualised, rephrased and simplified to disseminate knowledge at the popular level, to keep a wider public of non-experts informed.

As stated at the beginning of the text, "the Detox Catwalk […] assesses the steps taken by fashion brands to fulfil their commitments" (Greenpeace, 2016). The NGO, thus, immediately presents itself as an expert subject, a scientific authority in charge of monitoring corporate commitments to take responsibility for toxic pollution. The following pages will demonstrate that the choice of the noun *steps* is non-casual, as are other presentational devices. After a brief introduction to the problem of fashion-driven water pollution, a question introduces the text; written in capital letters, it clarifies that the investigation aims at verifying *"Who is walking the toxic free talk?"*. Together with the title, the choice of the idiomatic expression *walk the talk* provides linguistic evidence of the non-scientific nature of *The Detox Catwalk*.

The numerous occurrences of the adjective *hazardous*, the noun *elimination* and the verb *to eliminate* signal the non-casual recourse to the *topos of threat* (Wodak, 2009, p. 44) and the argumentative pattern problem-solution (Bortoluzzi, 2010, p. 167). These strategies are functional to pursuing two objectives; first, conveying the idea that "if specific dangers or threats are identified, one should do something about them" (Wodak, 2009, p. 44) and, second, further simplifying argumentation by discursively turning a multifaceted crisis into an unambiguous problem requiring one unambiguous solution, i.e. the elimination of toxic chemicals. Examples (2) and (3) highlight the lexical items whereby Greenpeace generally defends its main standpoint, i.e. "the hazardous chemicals commonly used in the fashion industry should be eliminated":

(2) Detox 2020 plan - a system for *eliminating hazardous* chemicals that is proactive and precautionary.

(3) C&A needs to [...] keep pushing for improvements on the *elimination* of *hazardous* chemicals in its supply chain.

Further examples could have been provided, as the adjective *hazardous*, the inflected forms of the verb *to eliminate* and the noun *elimination* proliferate in the text. These lexical items are, actually, also widely employed in the "scientific" reports described in section 3. The argumentative strategies they convey, therefore, appear to be a pillar of Greenpeace discourse irrespective of the relevant audience; yet, from a linguistic and discursive point of view, *The Detox Catwalk* is different from texts 1 and 2, as it ventures into a systematic

deconstruction of the complexity inherent in those pseudo-scientific, albeit "exclusive", reports.

Topical simplification and de-scientification are primarily achieved through a "compression" of the propositional content; *The Detox Catwalk* presents itself as a list, as the companies assessed are ranked according to three criteria: *Detox 2020 plan*, *PFC elimination* and *transparency*. The first refers to the companies' deadline to eliminate toxic chemicals from their entire supply chains; the second promotes the replacement of perfluorinated chemicals with safer alternatives, as they persist in the environment, bioaccumulate, biomagnify and act as hormone-disruptors (Greenpeace, 2015); the third encourages companies to "disclose information on suppliers and the hazardous chemicals they discharge".

The companies are divided into three categories: *avant-garde*, *evolution mode* and *faux pas*. The *avant-garde* category includes "committed companies […] leading the industry towards a toxic-free future with credible timelines, concrete actions and on-the-ground implementation". The *evolution mode* group gathers those companies that "are committed to Detox and have made progress implementing their plans, but their actions need to evolve faster to achieve the 2020 Detox goal". The "companies which originally made a Detox commitment but are […] failing to take individual responsibility for their supply chain's hazardous chemical pollution" are, instead, included in the *faux pas* category. Actually, a fourth category is also mentioned, that of *toxic addicts*, assembling "uncommitted" companies "that have failed to take responsibility for their toxic trail and have yet to make a credible, individual Detox commitment".

The names of these categories are non-casual, as they shed light on the *steps* taken by fashion brands to fulfil their commitments and, notably, they pertain to the semantic field of movement. Actually, the term *avant-grade* cannot be said to pertain to this semantic field, but the presence of the French preposition *avant* (forward), coupled with the meaning of the French-borrowed adjective, contributes to conveying the ideas of progress and progression; the pre-modifier *evolution* in the noun phrase *evolution mode* denotes the advances made by committed, albeit imperfect, companies; and, however *faux* (wrong), the *pas* is also a *step* indicating that brands in the third category are showing dedication to the Detox cause, despite all their flaws. Incidentally, the presence of terms borrowed from French also appears to be non-casual and functional to evoking a "fashionable" atmosphere while arguing about fashion. The semantic field of fashion is, indeed, also exploited by Greenpeace to argue against the industry. Together with the title of the text analysed, the continuous references to *steps* and progression indicate that argumentation in favour of detoxification builds on the discursive construction of a catwalk, in which fashion brands ideally participate and compete to be "the best models" in the Detox challenge. Scientific discourse is, thus, transferred into a "trendy" and more easily accessible context; the subtitle of the report, *Who's on the path to toxic-free fashion?*, clarifies that the catwalk referred to metaphorically evokes a linear trajectory and stands for the path towards detoxification that all brands should follow.

The companies are grouped, listed and ranked according to their attempts at satisfying the three Detox criteria. The name of each brand is accompanied by a short stretch of text in which other presentational devices further contribute to shedding light on the position of companies along the Detox catwalk, especially verbs indicating linear movement:

(4) A few companies *are ahead of the curve* and *on track* to meet their commitments.

(5) Benetton *takes a step forward* […] for its performance on eliminating PFCs.

(6) Fast retailing is *one step away from* "Avant-garde".

(7) G-Star *is making steady progress* […] *goes further*.

(8) Burberry is in EVOLUTION MODE, unable to *move beyond* this category.

(9) M&S *is firmly stuck* in EVOLUTION MODE […] Li-Ning is *stuck* in the FAUX PAS category.

(10) Companies which […] *are* currently *heading in the wrong direction*.

(11) Esprit finds itself in the FAUX PAS category, mainly because it has *backtracked* on its commitment.

The performances of *avant-garde* companies are described by verb forms denoting rapidity, superiority and leadership (*are ahead of the curve*) or steady progress and respect for the commitments undertaken (*are on track*, *takes a step forward*). Companies in *evolution mode* are also said to *make progress* and *go further* (7), but their unsatisfactory status is signalled by highlighting their immobilism (*is firmly stuck*) or their inability to *move beyond* their position (8). Brands that take a *faux pas* are not only said to be *stuck* (9) in their category but also to *backtrack* (11) or even *head in the wrong direction* (10). All these non-casual verb forms are functional to depicting fashion brands as models; their duty should be treading the catwalk rapidly and responsibly, without stopping or stumbling, in order to be considered impeccable top models in the Detox fashion show.

Notably, examples from (4) to (11) incidentally show that fashion brands are addressed in the third person and are, therefore, not the intended addressees of the text. A couple of occurrences of the first-person pronoun *we* and the possessive adjective *our* help identify the audience:

(12) While *we* still need to work on Detoxing the textile industry - *our* addiction to fast fashion and the increasing rate that clothes are made, bought, used and thrown away is amplifying the environmental and human impacts of fashion.

(13) For decades, industrial companies have chosen to use the environment and in particular *our* waterways as a dumping ground for hazardous chemicals, unhindered by ineffective government regulations.

Excerpts (12) and (13) suggest that the few occurrences of the inclusive *we* and *our* indicate Greenpeace and "someone else"; in (12), *we* and *our* seem to refer to "*the people* as a whole" (Fairclough, 1989, p. 187), invited to work harder and acknowledge their *addiction to fast fashion*. This inclusive use of *we*, thus, appears to serve the purpose of leading the readership to realise they are "the unwitting accomplices in the toxic water cycle" but also a prospective part of the solution to this environmental predicament. The solution is implicitly suggested in (13), where the inclusive use of *our* to qualify intoxicated public waterways is functional to establishing commonality with the audience and inciting them against the culprits of pollution, i.e. negligent fashion brands and feeble governments. There are no occurrences of the pronoun *you*, but imperatives crop up and challenge the readership, such as in (14):

(14) *Take* a closer look and *challenge* the brands.

The sentence displayed in (14) is followed in the text by a series of links, whereby internet users can *tweet to* each specific company if they do not approve of their performances. If this is the openly expressed way to *challenge* polluting brands, another, unexpressed suggestion can inferentially be gleaned throughout the report: *if you do not approve company x, boycott its clothes*. This possible solution to fashion-driven pollution is, therefore, not stated overtly but can be inferred from the criticism levelled against uncommitted companies and, especially, from the excerpt show in (12), where "*our* addiction to fast fashion" is explicitly said to be the additional problem underlying the environmental crisis.

In the light of the analysis of personal pronouns and possessive adjectives shown in excerpts (12), (13) and (14), it becomes manifest that the intended audience, never mentioned directly, is composed of an indistinct group of consumers and internet users, spurred to take the side of Greenpeace and join the environmental activist culture (Horton, 2004). In particular, they are encouraged to take a closer look at what fashion brands are doing to the environment. Metaphorically speaking, if companies walk the catwalk, readers/consumers are invited to attend the fashion show in the quality of spectators, entrusted by newly-acquired knowledge with the task of watching and judging. The audience is led to acknowledge not only what companies have done but also what they *need to* do. Take example (15):

(15) Nike […] still *does not commit* to eliminate all PFCs in all the products it makes. […] Nike *does not ensure* its suppliers to report their hazardous chemical discharge data and *has not made* a commitment to do so. Nike *needs to* transform its attitude to its Detox programme and take individual responsibility.

In (15), Greenpeace argues that Nike has fallen short of its commitment to eliminate PFCs, monitor its suppliers and Detox the production of its clothes. After the negative sentences describing Nike's lack of dedication (*does not commit*, *does not ensure*, *has not made*), a normative sentence containing the deontic verb *need to* follows, in which Greenpeace warns Nike to revise its behaviour, commit to Detox and act responsibly. The negative sentences and the deontic sentence (Mattessich, 1978, p. 135) are simply separated by a full stop but actually linked by a relation of causal dependence; since Nike's shortcomings have determined the need to change, the negative sentences and the deontic sentence can be said to be tied by an implicit argumentative indicator (van Eemeren, Houtlosser & Snoeck Henkemans, 2007), such as *therefore* or *consequently*.

In *The Detox Catwalk* there are different simple formulations of the type of (15), containing instances of causal argumentation (Garssen, 2001, p. 92); just as (15), they regularly take the form of "*Company x* + verb in the negative form + implicit argumentative indicator (*therefore, consequently*) + *Company x needs to* + verb". Particularly, the proliferation of the deontic verb *need to* in the text is functional to establishing a relation of causality between the constellation of propositions advanced to justify Greenpeace's standpoint (i.e. "hazardous chemicals should/need to be eliminated"); notably, the deontic verb also plays an instrumental role in implicitly re-presenting Greenpeace as a scientific and (also) moral authority, in charge of assessing companies and instructing them on what they are required to do.

Broadly, examples from (2) to (15) suggest that Greenpeace's standpoint is verbalised and reiterated through the recourse to different presentational devices, including "threatening" adjectives, verbs and expressions indicating linear movement, causal arguments put forward with the aid of simple constructions and implicit argumentative indicators, and a sporadic and non-casual use of personal pronouns to seek the attention of world consumers. In spite of the heterogeneity and rhetorical effectiveness of this "arsenal", however, argumentation in *The*

Detox Catwalk builds on additional discursive resources. In particular, another standpoint seems to be advanced; verbalised by means of the phrase "closing and slowing the loop", it is actually nothing but a reformulation of Greenpeace's standpoint through a different expression. In the arguer's opinion, "closing and slowing the loop" is what companies need to do to successfully walk the catwalk, and this standpoint is verbalised in the first introductory lines anticipating the ranking. The *loop* referred to stands for the detrimental *cycle* of *fast* fashion that needs to be *slowed* and *closed*; this standpoint is considered so important that it is supported by a visual argument (Degano, 2017), a circle showing the loop and the extent to which the single companies are committing to closing and slowing it. The reader is guided to the comprehension of the visual argument right at the outset of the text, where a key is displayed; this key is also shown in figure 1.

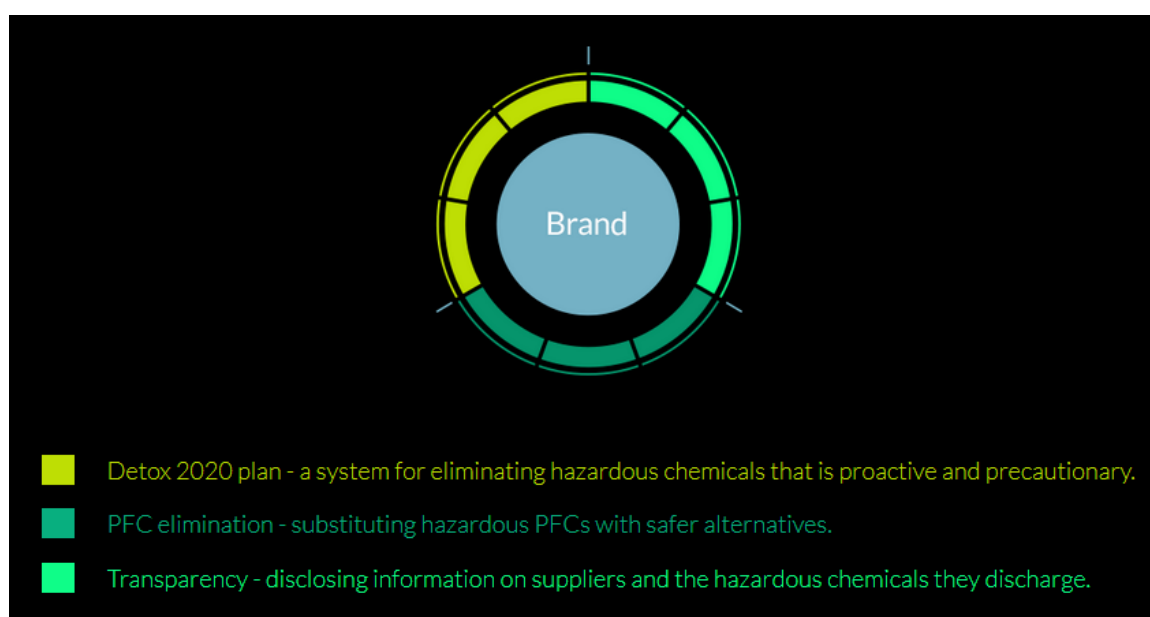

Figure 1. Key to the comprehension of visual arguments in *The Detox Catwalk*

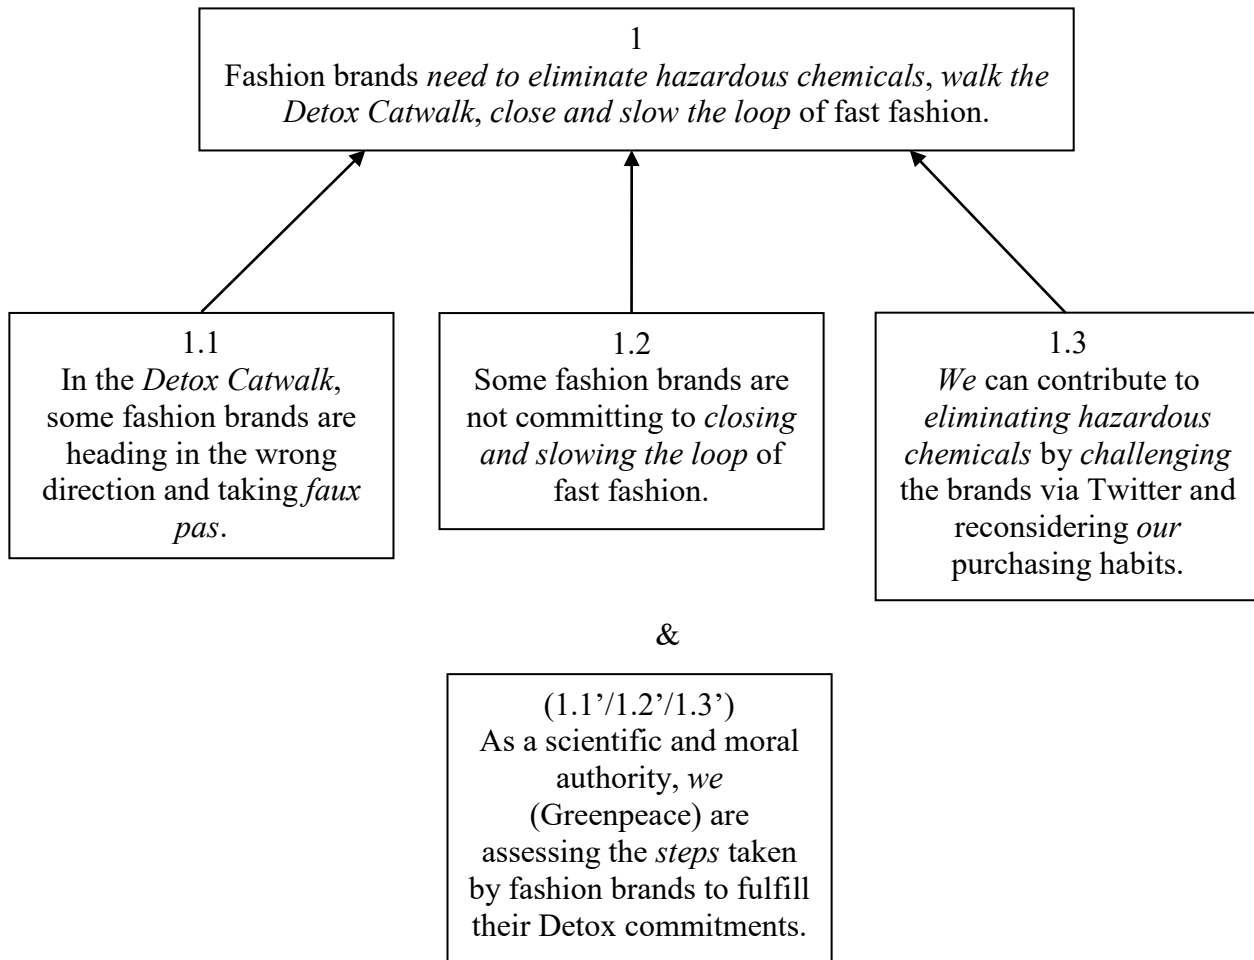
The key shown in figure 1 is displayed before the list of companies to enable the reader to appreciate not only the verbal arguments advanced in this section but also a visual representation of the performances of the single companies. Each stretch of text shedding light on what company *x* has done and still needs to do is flanked by a loop (such as that in figure 1) showing the extent to which the company at issue is sticking to its commitment to Detox, eliminating PFCs and disclosing information on suppliers and the chemicals discharged. These items of information are conveyed by making recourse to three bright colours (yellow, green and aquamarine) that compose the loop and refer to the three criteria whereby companies are assessed and consequently ranked, as explained in the key. Each of the three sections of the loop is divided into three sub-sections, coloured if the company is performing well or left blank if it needs to improve. Figure 2 displays two examples, the loops accompanying the descriptions of the performances of *H&M* and *Nike*.

Figure 2. Visual arguments regarding the performances of *H&M* and *Nike*

Together with *Inditex* and *Benetton*, *H&M* leads the Detox Catwalk by showing off excellence in two of the three fields under analysis; the company still needs to improve its commitment to transparency, but two of the three sub-sections of the aquamarine "transparency" section are filled with colour, indicating that *H&M* does not perform that poorly in this field either. On the contrary, *Nike* sees its loop completely blank, as a proof of its apparently irreparable *faux pas* status. Notably, figures 1 and 2 also show that *The Detox Catwalk* is characterised by the presence of a black background that, standing in opposition with the three bright colours of the company loops, seems to increase the acceptability of Greenpeace's argument: certain companies such as *H&M* shine bright and are, therefore, slowing and closing the loop; others like *Nike* are stuck in a polluted darkness, and still need to strive to slow and close the loop.

5. RECONSTRUCTION OF ARGUMENTATION IN THE DETOX CATWALK

The analysis of the verbal and visual arguments set forth in *The Detox Catwalk* enables the reconstruction of argumentation in favour of total detoxification in the fashion industry. The elimination of all the hazardous chemicals used is the only standpoint defended by Greenpeace, but this standpoint is actually verbalised by resorting to different presentational devices; in addition to advocating the *elimination* of *hazardous chemicals*, the standpoint is also expressed in terms of *walking the Detox Catwalk* and *closing and slowing the loop*. As a consequence, multiple arguments (van Eemeren, Grootendorst & Snoeck Henkemans, 2002, p. 75) are recurrently put forward, even though their difference often lies in their form rather than in the actual message they promote.


1
Fashion brands *need to eliminate hazardous chemicals*, *walk the Detox Catwalk, close and slow the loop* of fast fashion.

1.1
In the *Detox Catwalk*, some fashion brands are heading in the wrong direction and taking *faux pas*.

1.2
Some fashion brands are not committing to *closing and slowing the loop* of fast fashion.

1.3
We can contribute to *eliminating hazardous chemicals* by *challenging* the brands via Twitter and reconsidering *our* purchasing habits.

&

(1.1'/1.2'/1.3')
As a scientific and moral authority, *we* (Greenpeace) are assessing the *steps* taken by fashion brands to fulfill their Detox commitments.

Figure 3. Multiple argumentation in *The Detox Catwalk*

As figure 3 shows, three arguments (1.1, 1.2, 1.3) are used to defend standpoint 1, verbalised in different manners to reiterate that fashion brands need to reconsider their toxic way of doing business. Each argument in figure 3 rests on a partially implicit premise, i.e. "As a scientific and moral authority, we (Greenpeace) are assessing the steps taken by fashion brands to fulfill their Detox commitments" (1.1'/1.2'/1.3'). Arguments 1.1 and 1.2 are, respectively, the key verbal and visual arguments advanced in *The Detox Catwalk*, whereby Greenpeace addresses fashion brands in the third person. Characterised by different presentational devices, the arguments nevertheless foster the same idea, namely the fact that some companies are persevering in their toxic behaviour while others are striving for environmental preservation.

Rather than focusing on fashion brands, argument 1.3 addresses an inscrutable group of activists and internet users. Based on the need to acknowledge that they are a part of the problem, this argument turns to readers/consumers invoking them to become a part of the solution; they can contribute to detoxing the fashion industry either by directly *tweeting* the brands or by reconsidering their purchasing habits. While the first suggestion is reiterated in the text through second-person imperatives, the second can be gleaned from the ranking of companies and inferred from the reference to *our*, i.e. global and generalised, addiction to fast fashion.

Notably, figure 3 highlights, in italics, some of the most frequently used presentational devices in *The Detox Catwalk*. Arguments 1.1, 1.2 and 1.3 reflect the two problems underlying the environmental crisis at issue; while 1.1 and 1.2 point to the direct

responsibility of fashion brands, 1.3 highlights the indirect but equally significant responsibility of consumers. The solution to the crisis is proposed in this argument and condensed in the pronoun *we*, whereby readers/consumers are invited to join the Greenpeace cause to challenge fashion brands and bring about change in the fashion industry.

6. CONCLUSION

Besides exemplifying meaningful strategies of popularisation and dissemination of scientific knowledge, the elements of argumentation in *The Detox Catwalk* blaze the trail towards a definition of the prototypical arguments (van Eemeren, 2017) used in activism discourse, as argumentation in activist contexts appears to hinge on a few fundamental tenets. First of all, multimodality is selected as a presentational device to favour topical de-scientification and the deconstruction of the inherent complexity of scientific matters. Secondly, instances of causal argumentation contribute to presenting the arguer as a scientific and moral authority, with implicit argumentative indicators and deontic verbs rendering causal argumentation more effective and enhancing the acceptability of the standpoint. Finally, the intended audience does not include Coketowners. Though characterised by the perlocutionary intention to lead industrialists to revise their practices and make more ethical and environmentally safe choices, *The Detox Catwalk* does not directly address them, but rather aims at "recruiting" a wider, indistinct audience of world consumers; considering "the uniformly profit-driven logic of corporations" (Boggs, 2012, p. 191), some members of this other group are more likely to be convinced on ethical grounds and might more easily be induced to revise their purchasing choices, thereby threatening the profit of Coketowners and determining their conversion to environmentalism.

Compliments in the light of the theory of argumentation: Reasons in compliments

LILIT G. BRUTIAN

Department of Russian Philology
Yerevan State University
Yerevan 0025, Armenia
lilit.brutian@gmail.com

ABSTRACT: The aim of the paper is to analyse the reasons why compliments are being/not being made, are being/not being accepted. Among the reasons for making compliments are: the wish to lay the foundation for the continuation of communication, express politeness, hear a compliment in response, etc. Among the reasons why compliments are not being paid are gender and status differences, etc. Among the reasons why compliments are being rejected are: the modesty of the addressee, the insincerity of the speaker, etc.

KEYWORDS: argumentation, compliment, explicit, implicit, intercultural, mentality, reason, speech act, universal

1. INTRODUCTION

Nowadays, as a result of intensification of contacts of various kinds the study of both interpersonal and intercultural communication which aims at minimization of communication failures and the achievement of effective and harmonious communication has been in the focus of keen interest of linguists, philosophers, psychologists, specialists in communication and argumentation, as well as in related disciplines, because of its *importance* and *urgency.* In the framework of modern anthropocentric scientific paradigm the theory of speech acts as an integral part of the theory of communication, which is based on the ideas of Grice, Searle, Austin and others, occupies its own, very important niche. *The object* of our investigation is one of the types of speech acts, the speech act of a compliment which has been analysed little so far. As A.P. Sadokhin correctly mentions, "it has been ascertained that the character, form and the style of communication depend to a great extent on the first minutes, sometimes – seconds of communication. There exist a lot of very simple devices that allow practically in every situation to make the initial stage of communication easier, which determines the entire further course of this process. Among such devices is a compliment" (Sadokhin, 2010, p. 139). *The aim* of the paper is to reveal, analyse and classify one of the elements of the given speech act, that is the reasons why compliments are being/ not being made and are being/not being accepted.

2. THE REASONS FOR COMPLIMENT MAKING

Let us consider first the *reasons for making compliments.* Among the various reasons for compliment making is a) the wish of the speaker "to achieve the affection of the addressee and to establish the foundations of long-lasting and effective communication" (ibid). Compliments are paid also b) because of courtesy, to express politeness and to receive polite treatment, as well as c) to raise the estimation of the addressee. On the other hand, often compliments are made d) to receive a compliment in return: "*You scratch my back and I'll*

scratch yours", " Courtesy on one side only lasts not long", "He may freely receive courtesies, that knows how to requite them". In connection with the two-way character of a compliment F. Laroshfuko said: "As a rule, we praise other people just to hear words of praise addressed to ourselves" (Laroshfuko, 1990, p. 52). There are also other reasons: e)"We sometimes extol the valour of one person to humiliate another person" (Laroshfuko, 1990, p. 60). Finally, among the intentions of compliment making f) flattery and personal advantage can be singled out.

As can be easily seen, all the singled out reasons for compliment making can refer to as *universal* ones. From the point of view of *structure*, all these reasons are complex consisting of explicit (words of praise, compliment) and implicit, hidden intentions. Among these reasons we can single out combination of positive intentions, reasons (cases a, b, c), as well as combination of positive and negative ones (cases d, e, f).

3. THE REASONS FOR NOT MAKING COMPLIMENTS

Let us consider now the reasons why compliments are not being paid. Among them are a) norms of culture and intercultural differences, b) gender, c) status and d) age differences. What concerns case c, often subordinates avoid making a compliment to their chiefs, not to be interpreted as flattery. In patriarchal societies it is not typical for younger people to make a compliment to older ones (case d).

3.1 Compliments and gender

Of interest is also the study of compliments in the aspect of gender differences. It is believed that compliments must be addressed only to women, that by means of two or three trivial compliments their vanity can be flattered, that men do not like compliments. In fact, it is fallacy. In reality, as observations, as well as various investigations of researchers in the field of psychology of communication show, both women and men like to hear compliments. And the false opinion that men do not like compliments can be explained, first, by the fact that they, being more reserved, hide their reaction (in fact, positive, if it is not flattery), whereas women, being more emotional than men, do not hide their emotions, their satisfaction and joy when getting compliments and are always open to them: it is known that women love by hearing, they strongly need 'verbal strokes' (N. Formanovskaya's term). It should be added that the difference in the attitude to a compliment on the part of the two sexes is in that women are never tired of compliments, they want to always hear them to keep up their self-esteem and self-confidence. On the other hand, in many cultures it is typical for men to make compliments to women and not vice versa: males, being 'strong sex', allow themselves to "favour women with attention" and say pleasant words determined by their higher status. There is one more factor: compliments concerning appearance are addressed mainly to women but not men, and there are many things to praise (the new dress, the hair-do and so on and so forth). Finally, in spite of gender discrimination the woman has always been an object of worship, admiration, reverence and the muse for men. In V. G. Gak's words, "it is common knowledge that the best words in the world have been addressed to the women or said about women …" (Gak, 2003, p. 598). All the above said speaks to the inequality of distribution of compliments among men and women: women receive them more often though men like to get as much.

3.2 Compliments in the light of intercultural differences

Let us now consider the speech act of a compliment in the light of intercultural differences, in particular, the reasons for not making compliments determined by the mentality of the bearers of this or that culture, by the difference in the norms of expressing emotions, namely, the feeling of liking. Thus, for example, in English-speaking cultures "they encourage to praise people to raise them in their own eyes. On the contrary, in the Japanese culture they do not encourage to praise in somebody's face, but they approve to speak 'badly' about themselves" (Wierzbicka, 1997, pp. 397-398). The Japanese who are restrained in praise and compliments (and who, at the same time have a special form of gratitude in reply to the words of praise) interpret the direct compliments made by Americans as flattery but not expression of sincere praise. It is known that in the USA to make a compliment to a woman during work hours (to praise her appearance, her clothes, etc.) can be interpreted as sexual harassment which can lead to imprisonment and heavy fines (by the way, many American feminists have used this opportunity). In the USA complimenting a woman can, indeed, be sometimes very dangerous, whereas in Italy where there is a general cult of beauty, "it is common to admire a woman and to express this admiration. A feature that characterizes Italian men positively is that they admire and, most importantly, demonstrate their admiration to each woman, with no exception: ugly, old, young, silly, beautiful. … Even if it is a game, it is a game that is pleasant deep in their heart to the most awful feminists" (Pavlovskaya, 2006, pp. 234-235). In the muslim countries, on the contrary, it is forbidden to make compliments on the appearance of the addressee's wife, even though in the countries of Arab world it is a common thing to shower praises on each other.

4. THE REASONS FOR REJECTING COMPLIMENTS

On the whole, compliments are received with pleasure, as each person is delighted by the fact that the speaker wishes to say something nice to him. Yet, there are cases when compliments are being rejected. Let us now proceed to the analysis of the *reasons why compliments are being rejected.*

a) Sometimes compliments are not being accepted by the addressee who has the intention to hear it again. This tactics of compliment rejecting can be considered as an indirect fishing for a compliment. In F. Laroshfuko's words, "Evading praise is a request to repeat it" (Laroshfuko, 1990, p. 52).

b) Among the reasons of compliment rejecting is the modesty of the addressee, which is, in Adair's words, "an active means with the help of which a worthy person reacts to words of praise. ...Yet, to reject the words of praise completely is not modest, in its turn. If it is, to be exact, false modesty. It questions the truth of speaker's words, as if blaming him in falsity and lie" (Adair, 2006, pp. 244-245).

c) Among the reasons are the insincerity of the speaker, the lack of confidence in him. The replies, such as "It is only a compliment", "You are flattering me" and the like come to prove that the words of a compliment do not reflect the reality and are just flattering. As an English proverb says, "Complimenting is lying".

d) Another case when the compliment is not being accepted, can be perceived wrongly and interpreted as flattery is the case when the addressee and the addresser are in relations of 'chief and subordinate'.

e) The doubtful and ambiguous character of the compliment is also one of the reasons why it can be rejected. Thus, for example, quite an opposite meaning can attach to the words of a compliment a specific smile accompanying these words, which transforms them to

mockery. Or, the words of praise having multi-interpretation cannot be accepted as 'pure', genuine compliment.

f) One of the reasons of different reactions to compliments, even opposite reactions, is the factor of intercultural differences: the perception and the interpretation of a compliment often differ to a great extent in different cultures, sometimes even in close ones. That is the reason why one and the same expression used as praise, admiration, approval in one society can be perceived in another one as flattery and even as insult. Thus, for example, in many lingvo-cultures comparisons with animals are used as compliments, and often what is used as a compliment in one culture can not be accepted as such and even be perceived as insult. In I. Gorelov and K. Sedov's words, "very curious impression on bearers of other cultures can leave some compliments to women. In India people can flatter a woman comparing her with a cow and the way of her walking with that of elephant's. A good compliment to a Japanese woman is the comparison with a snake, to a Tatar and Bashkir woman with a leech which is an embodiment of the perfection of forms and movement. Addressing a woman by means of the word 'Goose' is insulting in the Russian culture. In Egypt it is a gentle compliment" (Gorelov æ Sedov, 2005, p. 132]. Here is an example of how the women of Scandinavia, which is considered to be "the bulwark of victorious feminism", react to compliments: "The 8th of March, as usual, was marked by the battle for women's rights. Many Scandinavian women reject on the 'Women's Day' flowers, *compliments,* small presents and other manifestations of gallantry typical for other countries, as they see in them a hidden attempt to return to the patriarchal structure of a society where 'the weak sex' is subordinate to males" ("The New Times", 2010, p. 8).

Frank Miller, Professor of Columbia University in New York, who teaches there Russian and who has a rich experience of communicating with the Russian people, describes in one of his interviews the difference in reactions to compliments determined by different cultural traditions: "The Americans will gladly accept a compliment with words of gratitude, while the Russians will by no means reject it, saying: 'Not a bit of it!' ('Oh, come!') or 'Knock a wood'" ("The Russian Language Abroad", 2011, p. 51).

The observations show that the Armenians, especially the Armenian women are in the habit of rejecting compliments with words: "No, it is not so", "Just the opposite", etc. Such reactions reflect our mentality: the lack of confidence in the speaker, the orientation towards seeing some trick or flattery, some implicit, hidden meaning, as well as our certain restrictions, the lack of experience in getting compliments. It should be stressed that this concerns to a great extent middle-aged and senior women. Today's young Armenian women and girls accept compliments with great dignity and words of gratitude under the influence of globalization and widely spread Americanization.

Thus, as the analysis has shown, among the reasons of rejecting compliments there are a) culturally determined (case f) and b) universal ones of pragmatic character: (cases a, b, c, d, e). From the viewpoint of implicitness and explicitness, we can differentiate between hidden intentions (case a) and explicit reasons (cases b, c, d, e, f).

5. CONCLUSION

To sum up the above-made analysis, we can come to the following conclusions. Among the reasons for making compliments are: the wish to a) lay the foundation for the continuation of communication, establish good relationship with the addressee, win his favour, b) express politeness and receive polite treatment from the addressee, c) raise the estimation of the latter, d) hear a compliment in response, e) humiliate the third party, f) flatter and get personal advantage. Among the reasons why compliments are not being paid

are norms of culture, gender, status and age differences. The reasons why compliments are being rejected are: a) evading them as an indirect request to repeat them, b) modesty of the addressee, c) the insincerity of the speaker, the lack of confidence in him, d) the hierarchical relationship between the communicators, the higher status of the addressee, e) the doubtful and ambiguous character of the compliment, f) intercultural differences.

All these reasons are differentiated into *universal* and *culturally determined*. From the point of view of expression *explicit* and *implicit reasons* can be differentiated.

Finally, it should be mentioned that the detailed analysis of reasons and intentions in complimenting leading to the adequate interpretation of the whole speech act can help better understand each other in the process of communication and make the quality of our communication, hence, lives, better.

American town halls: Public sphere to public screen

ABSTRACT: The raucous turn in American town hall meetings has captivated the public and startled politicians. Politicians have increasingly turned to digital modes of engagement and more intimate, controlled physical venues. Constituents view this techno-spacial shift as a form of withdrawal from public accountability. We explore the intersection of public argument, public space, technological influence, and democratic accountability by examining town halls as exemplars of a shift from a traditional public sphere to a 'public screen.'

KEYWORDS: civic discourse, decorum, new media, political argument, public screen, public sphere, town hall meetings

1. INTRODUCTION

American Town hall events draw their inspiration from the idyllic collective memory of pre-colonial New England town meetings. Their contemporary form has shifted from direct democratic decision-making to constituent-representative information sessions – and sometimes, to shouting and spectacle. Politicians have increasingly turned to digital modes of engagement such as Facebook and Twitter, as well as more interpersonal modes of engagement, such as coffees, conference calls, and office hours. Constituents who value face-to-face dialectic have viewed this techno-spacial shift as a form of withdrawal from public accountability. This paper explores the intersecting lenses of public argument, public space, communication modality, and democratic accountability by examining town hall meeting controversies as exemplars of a shift from a traditional 'public sphere' to what DeLuca and Peeples (2002) call a 'public screen'.

In this paper, we expand on DeLuca and Peeples' definition of public screen as a technologically mediated mode. Understanding that their intent is to utilize the image of a computer or cell-phone screen, we employ a secondary understanding of 'screen' – as a barrier or filter that limits entrance into a space – to highlight the more limiting technological and face-to-face modalities that Members are also increasingly adopting.

2. CIVIC DISCOURSE AND AMERICAN TOWN HALLS

Contemporary American town hall meetings are steeped in the ancient Greek humanistic tradition of rhetoric, a civic art devoted to the ethical use of symbols in order to address public issues. They celebrate the notion of civic engagement in the public arena – participation in

organizations, institutions, and societies with the goal of contributing to the public good. In their articulation of the public screen, Deluca and Peeples (2002) review the key features and implicit limitations of the contemporary Habermasian notion of a public sphere built on the classical rhetorical model of civic engagement.

Even today, the notion of public sphere "denotes a public space wherein private citizens gather as a public body with the rights of assembly, association, and expression in order to form public opinion" (Deluca & Peeples, 2002, p. 128). More than just an information gathering session, the public sphere utilizes open access to a forum, to each other, and to a discursive process that goes beyond *articulating* public opinion; through its sometimes messy dialectic, it *creates* public opinion.

The public sphere also serves an important democratic check, as it "mediates between civil society and the state, with the expression of public opinion working to both legitimate and check the power of the state" (Deluca & Peeples, 2002, p. 128). The underlying assumptions that support this vision of the public sphere include "open access, … rational discussion, focus on common issues, face-to-face conversation as the privileged medium, and the ability to achieve consensus" (p. 128).

The geographical makeup and composition of "citizens" has changed profoundly from ancient Athens to contemporary America. Contemporary town halls draw their inspirations from the idyllic practice of colonial town hall meetings, with a few notable changes. First, whereas colonial town meetings drew together citizens of small towns and communities, contemporary public events cover sprawling cities and regions. Participants in these settings are less likely to know each other. Second, participants aren't direct decision-makers. They are constituents of an elected representative who has voluntarily advertised a public meeting. In congressional town halls, no direct voting occurs. In its best form, the contemporary congressional town hall is an opportunity for some citizens to express their opinions to the representative. Nevertheless, a public need not have a direct vote in order to have influence, provided there's an open forum and discursive engagement. Representational democracy is not fatal to public sphere.
Increasingly important in the contemporary context, members of Congress have discretion over whether to hold public meetings and over the shape and content of those meetings.

3. MEMBER-CONSTITUENT COMMUNICATION

The scholarship on the U.S Congress suggests that several factors influence a representative's decision to hold public meetings. Members believe that constituents expect them to be accessible. They believe that constituents want to be able to see the representative and to engage him in two-way conversation – conversation that involves speaking and listening (Fenno, 1978, p. 131). Members use diverse methods for providing this accessibility, but all methods are for the purpose of building constituent trust, which in turn builds and maintains electoral support. The three rhetorical tools Members utilize in public appearances to cultivate trust are qualification, identification, and empathy.

> To a large degree these three impressions are conveyed by the very fact of regular personal contact. That is, "I prove to you that I am qualified," or "I prove to you that I am one of you," or "I prove to you that I understand you," by coming around frequently to let you see me, to see you and to meet with you. If, on the other hand, I failed to come home to see and be seen, to talk and be talked to, then you would have some reason to worry about trusting me. (Fenno, 1978, p. 60).

Members make deliberate choices about how to present themselves to their constituents in order to build trust and gain electoral support. The style a Member adopts is

related to context, personal preference, and strategy. If they perceive that holding these meetings will do more electoral harm than good, then we should expect them to avoid this public exposure. New technologies allow Members connectivity without the uncertainty and hassle of face-to-face meetings. However, "some scholars have demonstrated that political leaders rarely use the most interactive platforms for fear of losing control of the content they produce and the messages they craft" (Howard, Savage, Saviaga, Toxtli, & Monroy-Hernández, 2016, p. 59). Members are also driven by a decades-long national trend toward centralized party-scripted messaging that discourages a focus on local issues that have historically driven town hall discourse.

4. CENTRALIZED POLITICAL MESSAGING, COORDINATED TACTICS OF DISRUPTION

Popular perception is that the 21st Century Tea Party movement crystallized the nationalization of coordinated town hall events by elected officials and political protests by citizens. However, several national partisan rhetorical campaigns predate this period, taking advantage of the accessibility and trust-building functions of the local town hall meeting to disseminate a centralized political platform.

For instance, the Republican "Contract with America" in the mid-1990s organized congressional races across the country around a platform of carefully crafted rhetorical messages. The centralized messaging from the House Republican Conference in the early 2000s concerning accountability in education, social security privatization, and the marriage tax and estate tax represented a shift to consistent messaging and external communication by congressional leadership.

When President Bush and Congressional Republicans pursued Medicare reform and a prescription drug benefit in 2003, House Democrats began to orchestrate a national public relations campaign to frame the Republican agenda as an attempt to privatize Medicare, and town hall events were part of this campaign. They challenged the rank-and-file members to "take this debate directly to our seniors" through "the give-and-take of town hall meetings that individually generate favorable media coverage in your District and collectively generate a pro-active, positive message about House Democrats in the national media" (Billings, 2003 as cited in Malecha & Reagan, 2012, p. 92). In tracing the development of sophisticated public relations tactics used by congressional leadership to influence public opinion, Malecha and Reagan point to these events as evidence of a newly centralized messaging approach to representational politics.

Republicans responded in kind, organizing 150 of their own town hall forums to clarify Medicare reform using presentations, talking points, and scripts for consistent and intense messaging in anticipation of the open enrollment deadline (Goldstein, 2004; Fagan, 2006; summarized in Malecha & Reagan, 2012, p. 100).

Highly coordinated town hall meetings – a.k.a. public relations events – that members frequently hold signify some of the threats that current congressional communication practices pose for deliberative politics. Members assemble citizens, and deliver a scripted message hoping for support and additional media coverage for their party's positions. While this may present the façade of allowing the public's voice to be heard, it leaves the public's opinion unexplored and unchallenged. In response to these sterilized messages, constituents have turned to strategies of confrontation and disruption. As Deem argues, violating the expected decorum of a venue has the capacity to disrupt majoritarian discourse by "making it stutter" (1995, p. 226).

The Case of Health Care Reform and the Affordable Care Act, 2009-2010, exemplified this trend. Following Obama's presidential campaign, House Democrats prioritized health care reform through passage of the Affordable Care Act. President Obama called for Members to use the August recess in 2009 to hold town hall meetings and listen to public opinion. In doing so, he invoked the traditional notion of town hall events, connoting deliberative, reasoned, and civil discourse. The response to these events was far from what national Democratic politicians intended. Through strategic use of incivility, organized protesters focused on disrupting the flow of Member remarks through early and persistent questioning, attracting media attention through verbal assault, and challenging the competence and sincerity of the representative in front of fellow audience members (Herbst, 2010). Central to this effort was Bob MacGuffie, manager of the website Right Principles. In a memo on practical instructions for influencing local town halls, entitled "Rocking the Town Halls: Best Practices," he suggested:

> You need to rock-the-boat early in the Representative's presentation. . . . Don't carry on and make a scene – just short intermittent shout outs. The purpose is to make him uneasy early on and set the tone for the hall as clearly informal and freewheeling. It will also embolden others who agree with us to call out and challenge with tough questions. The goal is to rattle him, get him off his prepared script and agenda (MacGuffie, 2009, p. 87).

Scholarship on decorum as a construct in public discourse helps unpack the power dynamics at work in the name of civility. Hariman (1992) defines decorum as "(a) the rules of conduct guiding … behavior and place; (b) embodied in practices of communication and display according to a symbolic system; and (c) providing social cohesion and distributing power" (p. 156). The expectation of decorum, central to our classical understanding of a vibrant public sphere, embeds problematic power dynamics of who gets to define decorum, and undermines the value of openness if decorum is a prerequisite to access, argue Deluca and Peeples (2002).

In a mass mediated society, freedom of speech entails the ability to violate the norms of decorum and "… thus embrace…enemies in an ugly scene, hoping that the unpopularity of the radicals will rub off on those embraced" (Novak, 1968 as cited in Scott & Smith, 1969, p. 5). As Tea Party protestors exemplified, such a strategy disrupts the power dynamic. A *New York Times* report on town halls in 2013 opined that "many who attend the meetings now seem intent on replicating clashes like the one in Pennsylvania in 2009, when Senator Arlen Specter, a Republican turned Democrat, was shouted down by an angry constituent, a scene captured on camera and played on an endless loop on cable news" (Peters, 2013, para. 9).

Scott and Smith (1969) note, however, that political officials are almost always the winners of this power struggle, citing Novak's point that, "in a society with respect for its political institutions, officials have only to act with decorum and energy in order to benefit by such respect and to have their views established as true until proven false" (p. 5). And, when the elected officials are holding a public forum voluntarily, the power to demand civility or else withdraw from the public engagements is virtually absolute.

5. PUBLIC RESPONSES TO SHUTTERED TOWN HALL MEETINGS

Calls for civility at the town hall meetings, and announcements that some members planned to stop holding them, began to rise even before left leaning meeting-goers employed similar tactics as anti-Obamacare constituents had years before. Jennifer Stefano, the Pennsylvania chapter director of a Tea Party group, explained that "the reason 2009 was so successful for

the grass roots was because the politicians never saw it coming…Now they know. And they [Republicans] are terrified.'" (as cited in Peters, 2013, para. 10).

Members of both parties reported a noticeable decline in meetings and an increased secrecy about the time and locations of the meetings that Members were holding (Peters, 2013). Avoidance tactics include releasing meeting announcements at the last minute, scheduling small rooms and inconvenient times, prohibiting signs bigger than a sheet of notebook paper, and holding Facebook and tele-town halls screened by operators, all of which limit video-recorded spectacle (Peters, 2013; Bauer, 2017; Phillips, 2017).

Matt Kibbe, president of a 2009 Tea Party group who had previously coordinated town hall demonstrators, expressed dismay over the withdrawal. "'The whole thing is very anti-democratic, and it's classic behavior of entrenched insiders," said Kibbe, adding, "We've lost that Rockwell image of citizen participation in democracy" (Peters, 2013, para. 6*)*.

A Washington Post article from 2017 traced the newer, strict rules regarding entrance to town halls, and the cancellation of others altogether, noting that the trend "seem to be a direct response to the intense activism springing up across the nation right now, driven mostly — but not completely — by the left of the political spectrum. It's creating some tense moments for Republicans who decide to hold town halls and no-win situations for Republicans who don't" (Phillips, 2017, para. 3).

Indeed, Scott and Smith's caution about the power dynamic at play in the decorum fight is supported by numerical data, which reveal trends in Members withdrawing from town hall engagements in favor of more tightly controlled venues as their favored policies come under attack.

6. MEMBER TRENDS IN PUBLIC MEETINGS WITH CONSTITUENTS, BY THE NUMBERS

Legistorm is a legislative information database firm. Among other services, it tracks advertisements of upcoming public events announced by Member offices. According to the codebook on the data provided by Legistorm, the organization loosely defines public events as 'town halls'. It states, "We define a town hall as any event in which a member of Congress makes him- or herself available to a relatively broad swatch of the public where constituents have an opportunity to engage in a back-and-forth dialogue with the member" ("Data Documentation for University of West Florida," 2018).

The complete dataset includes 11,869 advertised events by Members of Congress from 2014 to 2017. We exclude delegates and independents, only focusing on representatives and senators from states and affiliated with one of the two major political parties. Frequency statistics suggest that the percentage of Members of Congress advertising public events during this timeframe ranged from 66.7% (356) to 87.3% (466) of the total population under analysis.

Members of Congress advertise many types of public events. Most of them are face-to-face in the congressional district, but some of them are at a distance and facilitated through technology. In the data from Legistorm, we discovered the following major types of events (see Table 1).

Table 1: Major Types of Advertised Public Events Held by Members of Congress, 2014-2017	
Type of Event	Description
Face-to-Face	
Town Hall	Event in the district in which public expects to hear from Member on DC activities and convey through Q&A constituent feedback on policy to influence Member's position.
Public Address	Event in the district in which public expects to hear from Member on DC activities with no expectation for Q&A.
Policy Hearing	Event in the district in which Member invites expert testimony on policy issue. Public invited to attend.
Stakeholder Discussion	Event in the district in which Member invites stakeholders to have a discussion on policy issue.
Community Coffee	Event in the district in which Member invites members of the community to visit over coffee without necessarily setting the public expectation for group discussion.
Office Hours	Event in the district in which Member invites constituents to individually bring issues to the attention of the Member and office staff. Often focused on case work for target populations such as veterans.
Public Appearance	Event in the district at which Member makes an appearance. No expectation for public interaction on policy.
Technologically-Mediated	
Tele- Town Hall	Event facilitated by conference call technology at which public expects to hear from Member on DC activities and convey through screened Q&A interaction constituent feedback on policy to influence Member's position.
Radio	Event facilitated by radio technology during which public expects to hear from Member on DC activities but no clear expectation for Q&A.
Social Media	Event facilitated by the Facebook Live platform (or others) during which public views presentation by Member and has opportunity to leave comments on the webpage. No expectation for reply.

Overall, Members increased their advertised technologically-mediated events by approximately 37% (see Table 2). In 2014, Members of Congress hosted 590 technologically-mediated events, and by 2017 hosted 809 of these types of events. However, they also increased their face-to-face events over the same time period (by 25%). It is worth noting that 2016 marked a decline in events, and this is most likely cyclical and related to the 2016 Elections. Notably, the overall number of events held by Members grew from 2741 to 3487 (27%). Though the percentage of technologically-mediated events relative to face-to-face events stayed rather constant from 2014 to 2017, Members advertised significantly more events across the time period. This observation runs counter to the prevalent media narrative that Members are avoiding public meetings with constituents.

Table 2 also breaks down face-to-face events by major type, revealing patterns in Member behavior across the timespan under analysis. On the whole, Members dramatically decreased the number of coffees they hosted and public addresses they made, but they actually increased the number of town halls they held (by 40%). Again this observation runs counter to our expectations. What explains this unusual finding?

Table 2: Frequency Statistics for Member Advertised Public Events Held by Members of Congress, 2014-2017					
Type of Event	2014	2015	2016	2017	% Change Over Time
	% of Total Event Count (N)	% of Total Event Count (N)	% of Total Event Count (N)	% of Total Event Count (N)	as % of Total % raw N
Technologically Mediated	21.5% (590)	22.0% (669)	19.0% (493)	23.2% (809)	+1.7% +37%
Face-to-Face	78.5% (2151)	78% (2375)	81% (2104)	76.8% (2678)	-1.7% +25%
Coffee	21.5% (590)	13.2% (402)	16.1% (419)	7.1% (248)	-14.4% -58%
Office Hours	6.8% (187)	6.0% (182)	4.6% (120)	5.7% (200)	-1.1% +7%
Policy Hearing	0.2% (6)	0.1% (3)	0.2% (6)	0.0% (0)	0.2% -100%
Public Address	1.8% (49)	0.2% (5)	0.7% (18)	0.5% (17)	1.3% -65%
Stakeholder Meeting	1.0% (28)	0.6% (19)	2.0% (52)	1.1% (40)	+0.1% +42.9%
Town Hall	56.8% (1557)	58% (1764)	57.3% (1489)	62.3% (2173)	+5.5% +40%
Total Event Count	100% (2741)	100% (3044)	100% (2597)	100% (3487)	----- +27%

Table 3 presents the same data, but it separates Members by partisan affiliation. From 2014 to 2017, Republicans increased their use of technologically-mediated events both expressed as a percent increase in raw numbers and as a percent of the total event count. At the same time, they decreased certain modes of face-to-face public engagement. In particular, Republicans had fewer coffees and hosted fewer town halls. Once again, this trend is evident when expressed as a percent decrease in raw numbers and as a percent decrease in the total event count.

By contrast, Democrats decreased their use of technologically-mediated events expressed in both terms. While in 2014, technologically-mediate events constituted nearly 24% of all Democratic public events, they constituted only 10% by 2017. The most striking change is in the number of town hall events advertised by Democrats in 2014 (527 or 53.2% of all events) and in 2017 (1224 or 74.4% of all events). Table 3 clearly illustrates a partisan pattern over time.

Table 3: Frequency Statistics for Member Advertised Public Events Held by Members of Congress by Party, 2014-2017					
Type of Event	2014	2015	2016	2017	% Change Over Time
	% of Total Event Count (N)	% of Total Event Count (N)	% of Total Event Count (N)	% of Total Event Count (N)	as % of Total Event Count as % Raw N
Republicans					
Technologically Mediated	20.3% (355)	23.1% (522)	19.7% (370)	31.9% (588)	+11.6% +65.5%
Face-to-Face	79.7% (1396)	76.9% (1739)	80.3% (1505)	68.1% (1253)	-11.6% -10.2%
Coffee	12.7% (223)	13.0% (295)	17.1% (321)	7.5% (138)	-5.2% -38.2%
Office Hours	5.5% (96)	5.0% (113)	4.0% (75)	7.5% (138)	+2.0% 31%
Policy Hearing	0.1% (2)	0.1% (2)	0.3% (5)	0.0% (0)	-0.1% -100%
Public Address	1.8% (32)	0.1% (3)	0.6% (12)	0.8% (14)	-1.0% -57%
Stakeholder Meeting	0.7% (32)	0.8% (17)	1.8% (34)	0.8% (14)	+0.1% -57%
Town Hall	58.8% (1030)	57.9% (1309)	56.4% (1058)	51.5% (949)	-7.3% -8.0%
Total Event Count	100% (1751)	100% (2261)	100% (1875)	100% (1841)	--- +5.0%
Democrats					
Technologically Mediated	23.7% (235)	18.8% (147)	17.0% (123)	13.4% (221)	-10.3% -6%
Face-to-Face	76.3% (755)	81.2% (636)	83% (599)	86.6% (1425)	+10.3% +89%
Coffee	10.2% (101)	13.7% (107)	13.6% (98)	6.7% (110)	-3.5% +8.9%
Office Hours	9.2% (91)	8.8% (69)	6.2% (45)	3.8% (62)	5.4% -32%

Public Address	1.7% (17)	0.3% (2)	0.8% (6)	0.2% (3)	-1.5% -82%
Stakeholder Meeting	0.3% (3)	0.3% (2)	2.5% (18)	1.6% (26)	+1.3% +867%
Town Hall	53.2% (527)	58.1% (455)	59.7% (431)	74.4% (1224)	+21.2% +232%
Total Event Count	100% (990)	100% (783)	100% (722)	100% (1646)	--- +66%

Figure 1 presents a theoretical framework for conceptually differentiating face-to-face public events held by Members of Congress based on the degree to which the public could expect to interact with the Member of Congress and participate in a dialectic speech event. This framework organizes the types of events Members hold as presented in Table 1 in a way that is theoretically meaningful and helps us to unpack the significance of short-term cyclical and partisan patterns as well as long-term drifts in aggregate congressional behavior.

Figure 1: Differentiating Face-to-Face Public Events Held by Members of Congress by Expectation for Dialectical Discourse and Interactivity

Higher Expectation for Interaction

One-on-One / Informal

    Coffee with the Congressman
    Constituent Meeting
    Outdoor Office Hours
    Neighborhood Office Hours
    Meet and Greet
    Constituent Day

Group / Informal

    Town Hall
    Listening Session
    Question & Answer Session
    Neighborhood Conversation
    Community Discussion
    Congress in Your Community

Not Dialectically Focused   **Dialectically Focused**

Appearance / Informal

    County Fair
    Farmers Market
    Appreciation Event
    Open House

Invited Group / Formal

    Legislative Update
    Congressional Briefing
    Public Hearing
    Field Hearing
    Roundtable
    Summit

Lower Expectation for Interaction

A subtle but telling shift in the collective data is the general move toward more informal, less public, less interactive, and non-dialectical modes of face-to-face engagement. Legistorm data reveals Members increasing public events in categories other than the traditional town hall format at a time when they explicitly say they fear confrontation from coordinated groups of protesters. These events include forums such as office hours, coffees, and attendance at fairs – events where public opinion is likely not to be created, challenged, or engaged in any form other than interpersonally. Members can perform the act of accessibility while screening the numbers and types of constituents who can engage them in meaningful dialogue.

At this point, we have traced the origins of town hall meetings in American political history, the motivations for members of Congress to hold or not hold public meetings, the roles of decorum and disruption in public space, and broad trends of public meetings over the past four years. The question remains: what, if any, impact on civic discourse exists when members hold fewer town halls and more alternative events?

7. NEW MEDIA, OLD COFFEE, AND POLITICAL ENGAGEMENT

The evidence on effects of virtual and digital technology on political communication is mixed. New media offers unprecedented interactivity and could enhance democratic dialogue. The digital era and the decorum-busting image event provide fitting and powerful responses

for average citizens to engage and have their voices heard. According to Deluca and Peeples (2002), the face-to-face conception of the traditional public sphere, imagined "as a place of embodied voices, of people talking to each other," limits our understanding about what constitutes political activity and citizenship (p. 129). A technologically advanced 21st century need not privilege bodily presence as a litmus test for engagement.

Rather, write Deluca and Peeples, the speed of communication obliterates "space as a barrier", lessens the need for physical gatherings and expands the public sphere's goal of open access to the 'public screen' (p. 131). Technologies "physically shrink the world while simultaneously mentally expanding it, producing a vast expansion of geographical consciousness…segregated space is breached, flattening multiple forms of hierarchy," they argue (pp. 131-32). Howard (2006) summarizes other scholarship that supports this view: "virtual communities can only add to the public sphere, especially when they . . . [facilitate] exchanging ideas, mobilizing the public, and building social capital and empathy among the participants" (p. 63). They can recruit new people to political conversation. They can cross geographic boundaries, permitting "users to create new social contexts for themselves based outside neighborhood, family, or friendship ties" (Howard, 2006, p. 63).

On the other hand, social networking aggregates like-minded individuals into echo chambers, at times obscures authorship, encourages and circulates extreme and inaccurate rhetoric, and at best only provides 'pseudo-communities' – forums for political communication that offer controlled interactions and experiences (Howard, 2006, p. 64). Political elites benefit from technological tools that are designed to control, rather than expand, audience participation. Larry Purpuro at the Republican National Committee (RNC) commented in 2000, "Anybody involved in a campaign, regardless of their ideology is always concerned about control. Chat is difficult to control" (Howard, 2006, p. 35).

Legistorm data supports taking seriously the controlling function of technologically mediated public engagements, contra to Deluca and Peeples' assertion about the emancipatory, inclusive functions of the public screen. As Republicans have withdrawn from town halls amid complaints about incivility, they have simultaneously increased their technological presence. If the power is truly with the people to engage in productive digital disruption as Deluca and Peeples assert, then it would likely *not* be the venue of choice for Members who are seeking to avoid such spectacle. Conversely, Democrats have increased their face-to-face town hall meetings at the expense of technologically mediated modes, at a time when they seek to amplify their message and are less afraid of raucous spectacle.

Paradoxically, we face a new paradigm in which new technology affords the possibility for immense audience participation, interactivity between the representative and the represented heretofore unfathomable. Yet citizens feel more excluded from the political process and less influential over their elected Members of Congress than ever (Gurevitch, Coleman, & Blumler, 2009, p. 176). Digital venues and intimate meetings provide more control over the public sphere. Both of them limit a true dialectical interaction because there is no requirement or expectation that Members will actually engage in or respond to the questions asked. In a system where Members choose whether or not to hold town halls, what would be the motivation to reverse course on that power?

Public dialectic is more than just 'hearing from constituents' – it about attempting to persuade your interlocutors, and allowing the possibility of them persuading you. Interpersonal meetings and invited tele-town halls can be persuasive, but they are not public sphere. Without open access, they work against the public accountability function of the public sphere that make town hall-style venues a hallmark of American political discourse, as imperfect as they are. Virtual communities can be authentic public spaces of discourse. But there is no expectation of a Member dialectic in a digital town hall. Constituents can post their comments, but they cannot know if Members read them. The same is true for a coffee meet-

and-greet. Constituents can talk to Members, but there is no public pressure to respond thoughtfully, nor public accountability for the answer.

Some value of the traditional town hall comes from the *appearance* of access – that is, attempts to restrict access must be done materially, physically, in plain view. Online, however, we have the right to post – but not the expectation to be read. This is presuming we have access to the digital/analog forum where the conversation is occurring. The attributes of political community that provide access, build trust, generate social capital, promote engagement, and facilitate accountability must be not only possible but purposefully nurtured in these spaces.

8. CONCLUSION

The perception that Members are not holding town hall meetings is disconcerting because it runs counter to our vision of strong democracy. People "should be able to participate in a process of debate and deliberation, open to all on a free and equal basis, about matters of pressing public concern" (Held, 1996, p. 302). Avoidance of physical confrontation and use of mediated information technology systems frustrates constituent participation in debate and deliberation. Member perception that town hall participants are organized protesters, or not their constituents, suggests that public meetings are *not* open to all on a free and equal basis. Finally, the perceived connection between national debate over controversial policy issues such as health care reform and Member avoidance of public meetings during this volatile time suggests that people have no voice on issues that matter. "Caught up in the middle are Americans who feel left out of having their say in this remarkable moment in U.S. politics — but can't," argues Phillips (2017), a reporter covering the disappearing town halls (para. 4).

Not only are members of the public displaced, the body politic is diffused. We are witnessing the fragmentation of information production, dissemination, and circulation as well as the potential displacement from physical corporal meetings and its replacement by social networks, handshake events, and virtual political communication. This has implications for citizen participation in the public sphere. As a physical space for democratic discourse and a stage for political protest, the public sphere is potentially abandoned. As a place of confronting difference of opinion, of perspective, of values, of personal background, and of demographic and socioeconomic status, the public sphere is vacated. The bonding and trust created through these cross-cutting encounters with members of a shared physical political community is unrealized. This potentially undercuts active citizenship and local investment in public affairs.

Revisiting the adversary paradigm

JOHN PATRICK CASEY

ABSTRACT: Some argue that adversariality is extraneous to the core concept of argument. I argue that if we take argument to be about beliefs, rather than commitments, then two considerations show that adversariality is an essential part of it. First, beliefs are not under our direct voluntary control. Second, beliefs are costly both for the psychological states they provoke and for the fact that they are causally related to our actions.

KEYWORDS: adversariality, argumentation, doxastic voluntarism

1. INTRODUCTION

In a common metaphor, argument is an agonistic contest between adversaries (Lakoff and Johnson 1980; Moulton 1983; Ayim 1988; Cohen 1995; Rooney 2010; Aikin 2011; Hundleby 2013). People often describe arguers as *warriors* who are called upon to *defend positions* and *answer attacks* in the hopes of *winning points* or *defeating adversaries*. Critics often *take aim, blast, slam, eviscerate, demolish, silence, or slaughter* those they criticize, who, in their turn, may *not take it lying down*, or *surrender*, or *parry*. The combative language of argument corresponds to a common stereotype where argument is an aggressive act and a generally unpleasant affair (Gilbert 1997).

There are two main objections to adversarial conceptions of argument. The first is a practical objection: whatever argument might ultimately be, adversariality tends to produce bad results (such as the silencing of less aggressive arguers). The second objection holds that, whatever their practical advantages or disadvantages, adversarial notions are fundamentally extraneous to the core concept of argument. This paper challenges the second objection. I begin by considering and rejecting the view that this is merely a definitional controversy, whereby we can "define in" or "define out" notions of adversariality among different definitions of argument. I then distinguish notions of adversariality from notions of aggressiveness and offer a rough definition of adversariality, which is a structured activity where one participant attempts to impose a result on the other (e.g., chess). Whether this conception of adversariality applies to argument rests on whether we regard argument to be about acceptances (commitments) or beliefs. I will argue that argument is essentially adversarial when it is understood to concern beliefs (rather than acceptances). I offer two arguments for this thesis. The first is an argument from doxastic involuntarism. Acceptances are voluntary acts rather than psychological states. As such, they are easy to acquire and to give up. Beliefs, in contrast, are psychological states which are to some extent involuntary. This means we do not directly control their creation and destruction. Others can, however, attempt to directly control specific beliefs of ours through argument. The second argument focuses on the costs of believing. Arguments can be costly because they involve time and effort. Beliefs are also costly both for the psychological states they provoke and for the fact that they are causally related to our actions.

2. ARGUMENT AND ADVERSARIALITY

One initial challenge in discussing whether argument is essentially adversarial is that many definitions of argument include a concept of adversariality, opposition, or disagreement (Jacobs & Jackson, 1980; Willard, 1989; Gilbert, 1996; van Eemeren & Grootendoorst, 2004). For these views, the adversarial posture, based in incompatible standpoints or beliefs, is a precondition of there being an argument at all. Two people have opposed standpoints and the argument they engage is the means of resolving or managing the disagreement. This approach will not help us here, as we are interested in whether adversariality is a requirement in the first place. Besides, as we shall see below, a difference of standpoint is not necessarily sufficient for adversariality. Our interest in this paper is the source of adversariality of argument. For this reason, it is important that look at adversariality in isolation from argument. Unfortunately, it is also difficult to find a clear or non-circular definition of adversariality. Govier's discussion of adversariality in *The Philosophy of Argument* (1999) is a telling case in point. She writes:

> It means that in this practice people occupy roles that set them against one another, as adversaries or opponents. Law, in Western societies is adversarial in the sense that the prosecution and the defense play distinct and opposed roles. Politics is adversarial: it is the role of the governing party to govern and the opposition to criticize the government. Debates are also organized adversarially: one side proposing a claim, the other side opposing it. In these institutions, roles have been organized in a bipolar fashion and the people occupying them are, for institutional reasons, set against each other (p. 242).

Law, politics, and debate are examples of argumentative disciplines, so they aren't helpful in telling us anything about the inherent adversariality of argument. Our question is what it is about argument that makes it adversarial. For this reason, we'll have to start with a definition of adversariality that does not include argument. By the same token, we need to start with definition of argument that does not include adversariality.

As we consider adversariality, it is tempting to consider examples. A more fruitful approach, I think, is to try to come up with a definition of adversariality itself. Let's first consider adversariality in an abstract, structural sense. The most basic kind of adversarial structure is "X versus Y." Reflecting on this basic structure, we can isolate three basic characteristics. First, there are two different participants, X and Y. A game of hockey requires two teams. The teams occupying the different sides are adversaries. To play chess, you need two players, though nowadays one of those players can be artificial (perhaps in some distant future the same will be true of hockey).

To say, however, that an adversarial situation requires two participants is not to say very much. We need to know something about how the participants interact. This is the second feature of adversarialism. If X and Y are adversaries, then the interaction of X and Y will have a peculiar character, namely: X will try to impose a result on Y; Y will try to impose a result on X. This characteristic follows from the opposition of X and Y. To put this another way, the disposition of X bears upon the disposition of Y; a change in X's disposition imposes a change on Y. We can call this, for lack of a better term, "imposing." Naturally, what counts as imposing will vary according to context. In chess, imposing is achieved by movement of pieces; in hockey, imposing is achieved sometimes by moving the puck, sometimes by actual physical contact, such as checking. The critical point is that imposing is not necessarily *touching* and so it is not necessarily physically violent or aggressive.

Our picture of adversarialism is not complete. There has to be some purpose for X and Y's impositional interaction. X tries to impose a result on Y for some objective or according to some kind of structured set of rules. Consider games, for example. In some circumstances, the objective might be a maximum number of points, in others, it might be the possession of a region of the board or some other similar designation. Games, however, are just one example

of an adversarial situation. Business is adversarial, in that competitors try to capture a market from each other. Now we can return to Govier's examples. Law is adversarial because parties seek to impose a legal result on each other; politics is adversarial because parties try to impose a political result on each other; debate is adversarial because, on one model, the participants try to undermine each other's standpoints.

If an adversarial encounter has all three of these requirements, it is essentially adversarial. But, not all types of adversarial practice are like these. A second kind of adversarial structure is what we might call "inessential." The practice is adversarial, but it is only so by designation. This is what makes running, cycling, or other kinds of individual sports adversarial. The same analysis would apply to essay-writing contests, music competitions, competitive chicken breeding, and other similar activities. There's nothing about running that entails an adversary. An event of running becomes adversarial the moment one runner says, "race you to the post!" A critical difference between essential and inessential adversarial contests is the concept of imposing. The inessential adversarial contest, such as a running race or chili cook-off, does not *necessarily* include imposing. While the contestants in a running race vie against each other directly, they don't necessarily need to do so. They can run the race individually (at different times or places) and have their times or distances measured. Nothing about the behavior of the one, imposes anything on the other necessarily. It's up to the rules of the match to make this so. We might also say it's up to the intentions of the participants as to whether imposing takes place. This is another consequence of the inessentiality of the adversarialism. No amount of wishing it away, however, will make the hockey contest not adversarial.

A critical question regards the relationship of aggression to adversariality. This, too, is complicated, because conceptions of aggressiveness vary. For our purposes, let's identify two basic options: an internal approach, where aggression is a part, a somewhat extreme part, of adversariality, and an external one, where aggression is distinct from adversariality. A common version of the internal approach can be found in Infante (1987):

> An interpersonal behavior may be considered aggressive if it applies force physically or symbolically in order, minimally, to dominate and perhaps damage or, maximally, to defeat and perhaps destroy the locus of attack. The locus of attack in interpersonal communication can be a person's body, material possessions, self-concept, position on topics of communication, or behavior (p.158).

Infante includes the desire to diminish another's chances in the ambit of aggression. Moving a chess piece in a chess game, therefore, is aggressive. It is important to note that argument, on this definition, is a form of aggressive communication. A more restricted sense of aggressiveness consists in the intention to do someone harm, where harm extends to the person beyond the person's role in a contest (Bäck, 2004, p.221). This means aggression is something distinct from what we've called "imposing." Imposing is a structural part of the game. While imposing aims to lessen the chances of one's opponent at winning, it's not aimed at harming them.

3. MINIMAL ESSENTIAL ADVERSARIALITY

Armed with our discussion of adversariality, let's now turn to the question as to whether argumentation is essentially adversarial. I maintain that to call a practice *essentially* adversarial will be to claim that it (1) requires at least two participants; (2) includes a concept of imposing; (3) for some purpose. In what follows, I will apply this notion of essential adversariality to Govier's concept of essential adversariality.

Govier's notion of minimal adversariality rests on a distinction between what I have called structural adversariality and aggression, or behavioral adversariality (or what Govier

calls "ancillary adversariality"). This last she defines as the "lack of respect, rudeness, lack of empathy, name-calling, animosity, hostility, failure to listen and attend carefully, misinterpretation, inefficiency, dogmatism, intolerance, irritability, quarrelsomeness, and so forth" (p. 245). To say that argument is *essentially* adversarial is clearly to distinguish it from practices which are inessentially adversarial (such as the running race discussed above). This distinction accords with Govier's argument for minimal adversariality, which she puts schematically as follows:

1. I hold X.
2. I think that X is correct. (Follows from (1)).
3. I think that not-X is not correct. (Follows from (2)).
4. I think that those who hold not-X are wrong, or are making a mistake. (Follows from (3)).
5. Should I need to argue for X, I will thereby be arguing against not-X. (?)
6. Those who hold not-X are, with regard to the correctness of X and my argument for X, my opponents (?) (p. 244).

For Govier, the adversariality of argument is reducible to the elements of argumentation (beliefs, opinions, or standpoints), rather than argumentation itself. This means that believing is inherently adversarial. If A and B believe differently, then A and B are *already* opposed, because they hold different beliefs, *before* or *without* even arguing with each other. She writes, "in holding a belief, one thinks it true and is thereby committed to thinking that those who disagree with it hold a false belief and are in this sense wrong. One necessarily differs from such people" (p. 244).

Phyllis Rooney (2010) raises two objections to Govier's claim: (1) Govier misdescribes the epistemic situation; (2) the distinction between minimal and ancillary adversariality does not hold. The first objection is a general claim about the purpose of argument. From an epistemic point of view, arguments are about truth. The adversarial conception of argument is foreign to this. Besides, logic and epistemology have a much richer vocabulary to describe epistemic situations than just "opponent" or "adversary"(p. 222). To put the matter somewhat differently: the holding of different views doesn't mean the holders of those views are opposed. For Rooney, then, you cannot derive the opposition from the difference in belief. And, importantly, you cannot derive it from the nature of the argumentation, whose epistemic purpose is entirely contrary to competitive opposition.

The second objection rejects the inference from being wrong with respect to p to being opposed, from a person's belief or claim to the person themselves (p. 221). This might seem puzzling because saying that a person has a belief which is false seems to be just another way of saying that a person is wrong, with respect to that belief (which the person has). What is at issue in an argument is the truth or falsity of claims or commitments. If I argue that p and someone else argues that q, we're not opposed with regard to the truth of p, which is, as Rooney argues, the very point of argumentation. To expand the point somewhat, our arguments are ways we propose arriving at the truth, a goal both arguers, by definition, share. So, since the point of arguing is truth, arguers are not opponents, but partners. A similar analysis could be made of the language of "winner" and "loser." To describe the person with a correct view as the "winner," is to describe something as a contest which is not a contest. Terms such as "winner" and "loser" are a sign of an epistemic confusion about the nature of arguments. Arguments have epistemic purposes and are defined in relation to them.

This brings us to a crucial ambiguity in this discussion of adversariality: namely, what are arguments about? Are they about *commitments* (or acceptances) or are they about *beliefs*. The difference is foundational. Beliefs are psychological states of believers; acceptances are commitments that belong to an abstract commitment set. This is a crucial, but oft-overlooked difference in argumentation studies (Paglieri, 2006; Godden 2010, 2012b). Moreover, this

distinction is central, I think, to Govier's case for the minimal essential adversariality of argument. This point comes clear, I think, in considering another objection to Govier's view, that of Catherine Hundleby (2013).

Recall that, for Govier:

1. I hold X.
2. I *think* that X is correct. (Follows from (1)) (1999, p.244).

Hundleby argues that there is no obvious inference from (1) to (2), because "we *believe* all sorts of things at any given time without *consciously recognizing* them as beliefs, never mind *evaluating* them" (emphasis mine, 253). This assessment seems obviously true and it makes a clarifying point about the basic point at issue here. As a psychological observation of actual believers, it doesn't make sense to attribute beliefs to them that they do not have or may not have (or at least do not necessarily have), even if those beliefs are *logically related*.

Hundleby makes a similar case with regard to the next steps of Govier's argument for minimal adversariality. Recall, again, that Govier argues:

2. I think that X is correct. (Follows from (1)).
3. I *think* that not-X is not correct. (Follows from (2)) (1999, p.244).

Again, it seems clearly true that all sorts of things are "not-X" and one is certainly not liable for thinking of all of them. It's not possible to claim that in thinking X you are also thinking of all of the instances of not-X. Imagine a typical introduction to logic scenario, where students work with obversion, and fail to recognize the logical identity.

This objection highlights a crucial confusion on Govier's part. Her talk about beliefs is better understood as talk about commitments. For, after all, commitments *do* have the logical properties in question. To be committed, for example, to the proposition that the earth is round is to be committed to the proposition that the earth has a circumference. It doesn't mean, however, that thinking of the roundness of the earth entails thinking about the circumference, or pi, or any of the other commitments one assumes along with the commitment that the earth is round.

Now the question is whether Govier's conception of minimal adversariality follows from the claim that arguments are about commitments, which do have the logical properties and entailments she suggests they have. This brings us back to Rooney's claim that minimal adversariality is an epistemic misdescription. Arguments will concern the assertion of relations between commitments, and, as Rooney notes, we've already got a vocabulary for those relations; "contradictory" or "inconsistent" express the difference in commitments far more accurately than "opposed" or "enemy" commitment.

For these reasons, Govier's derivation of minimal adversariality from the notion of commitment fails. I should of course stress that Govier doesn't use the word commitment, or acceptance, or even suggest that this distinction concerns her in the least, it just makes the most sense of her argument. For this reason, I'd like to offer a somewhat modified version of minimal adversariality that addresses this issue.

4. DOXASTIC INVOLUNTARISM AND MINIMAL ADVERSARIALITY

In this section I will defend Govier's minimal adversarialism by interpreting the minimal adversariality of argument to arise from beliefs, rather than commitments. This defense depends on two critical features of belief-focused argument. The first is that beliefs are involuntary. The

second is the beliefs are expensive to form, maintain, and change. This means arguments, even those among people who agree, involve one arguer imposing costs on another.

The concept of commitment, as it is understood in argumentation studies nowadays, has its origin in Hamblin-style formal dialogues (Hamblin1970). The concept was refined by Douglas Walton and Erik Krabbe (1995). Hamblin introduced the idea "of a dialectical system—a rule-governed structure of organized conversation" (Walton and Krabbe, 1995, p. 5). The idea is that these rule governed systems could be used to model various kinds of dialogical interaction. Such models could then perhaps be formalized, used to explain fallacies, and so forth. Critically, according to Hamblin, a commitment is not necessarily a belief and the purpose of postulating a commitment store is not psychological" (p.6). The very notion of commitment involves *action*, as in *committed to a course of action* (p.14). But it also involves the concept of *obligation,* as in "obligation to pursue a course of action." According to Walton and Krabbe, *propositional commitment* is a special case of action commitment. *Propositional commitment* is "(1) a kind of action commitment whose (2) partial strategies assign dialogical actions that (3) center on one proposition (or a formulation thereof)" (p. 23). So, a propositional commitment works something like *making* a promise (so, e.g., if X asserts that p, then X must defend p, repeat p, etc.). So, in essence, commitments are public-doings which are subject to rules, and, most significantly, laws of logic. Most importantly, for our purposes, the commitment-oriented language of argument-evaluation is decidedly not psychological.

In contrast, beliefs are psychological states or dispositions (Cohen, 1992). They differ from commitments in several key ways. First, they are private. I can have beliefs which I do not share, or beliefs I lie about. This is not true of commitments. Second, they are not necessarily subject to logical laws in their formation, maintenance, and extinction. To believe, in other words, that the Evening Star is Hesperus does not necessarily entail that one believes the Evening Star is Venus. Those are distinct psychological states. By contrast, my being committed to thinking the Morning Star is Venus means I'm committed to the view that the Evening Star is Venus, since they're the same (despite my not believing it). A final critical difference between belief and commitment, as we've mentioned, is voluntariness. As actions, commitments are voluntarily adopted and abandoned. Beliefs, in contrast, are not. By way of illustration, try to believe that 5 + 4 = 11. Now imagine I'll offer you a reward, an ice cream cone, if you can. Or, consider an inducement more relevant to the current topic: I'll refrain from hitting you if you believe that 5 + 4 = 11. You probably can't do it (although I'm going to guess that you will tell me that you don't believe it). We can run the same experiment with different kinds of beliefs. Try to believe you're not reading the words that I have written here, or that you're not where you are, or that you are made of glass. You can't.

I should caution that the literature on doxastic voluntarism is quite vast, and, though the consensus view is that beliefs are involuntary with regard to *direct* formation, there are indirect things we can do to bring about beliefs. We can for instance, (1) alter our environment to bring about beliefs—i.e. investigate, change things, to make something happen, or (2) engage in a process of examining evidence. Naturally, we cannot control the *specific* belief we have (which would tend to produce the opposite result). We can only control what kind of evidence we have.

Our lack of direct control over our own beliefs has an important consequence for argumentation: others have more influence over our beliefs than we do. For many, this is one of the main virtues of this sense of argument: to submit yourself to the influence of others. While we cannot, according to the basic thesis of indirect doxastic voluntarism, direct ourselves to a specific belief, others, so it would seem, are in a position to do so. This kind of directing is what arguments are all about, even at the most rational level. I expose you to evidence that gives you *no voluntary option* but to change your mind. Naturally, you have to grant me access to your belief system, but this is part of what is involved in agreeing to argue, or agreeing to hear evidence. This fits in neatly with our picture of essentially adversarial practices in all three

key ways, but particularly with regard to the element of imposing. My sharing reasons with you is the way imposing is practiced in arguments. While this is certainly true of arguments involving explicit disagreements, it's just as true of arguments is the broadest sense possible, including those that do not involve any disagreement at all. The key feature of voluntariness, as I am discussing it here, is that others, even those with whom I agree, can alter my beliefs in a direct way by exposing me to argumentative evidence.

Unsurprisingly, the idea that argument involves involuntary imposition is not a particularly new one. Several authors, Gearhart (1979), Nozick (1983), Foss & Griffin (1995), and Fulkerson (1996) have advanced versions of the view. We might call this view "argument pacifism," where persuasion by argument is inherently something forceful, much along the lines of sports or war, and hence to be avoided. To be clear, their point is *not* that it is *aggressively* forceful—that arguers sometimes *push too hard* or *are too rough*, *disrespectful* or any of the other things that fall into *ancillary adversariality*, but rather that persuasion works in ideal circumstances against the will of the person being persuaded. Persuasion, in this sense, violates equity; you're not treating the other arguer fairly (Fulkerson, 1995). Sally Gearhart (1979) maintains that the problem lies in the *desire* to change someone else, which, for her, issues from a patriarchal desire to dominate:

> Our rational discourse, presumably such an improvement over war and barbarism, turns out to be in itself a subtle form of Might Makes Right. Speech and rhetoric teachers have been training a competent breed of weapons specialists who are skilled in emotional manoeuvers, expert in intellectual logistics and, *in their attack upon attitude and belief systems*, blissfully ignorant of their violation of nature or her processes (p. 197).

Although Gearhart does not note the crucial role the involuntarism of believing play in this, Nozick comes much closer:

> Why are philosophers intent on forcing others to believe things? Is that a nice way to behave toward someone? I think we cannot improve people that way—the means frustrate the end. Just as dependence is not eliminated by treating a person dependently, and someone cannot be forced to be free, a person is not improved by being forced to believe something against his will, whether he wants to or not. The valuable person cannot be fashioned by committing philosophy upon him (p. 5).

The indirect voluntarism of beliefs is a two-way street. While it may be that a thoroughly persuasive argument leaves us in stunned silence or with no other option, as Nozick suggests (p.6), we have little direct control over our belief system anyway. Argument, rational argument at least, may be the *least* invasive way to manage our belief system. Noting that persuasion is forceful, in other words, does not entail that non-forceful options even exist, or, if they do exist, that they're any better.

A central feature of any essentially adversarial practice is what I've called imposing. This bears on argument through the involuntarism of belief. Argument, so far as it is belief-focused, is essentially adversarial because to interact with someone's beliefs is to impose on them, or rather, to *try* to impose a certain belief on them. As Nozick and Gearhart note, such imposing should not be confused with hyper-aggressiveness, or with what Govier calls ancillary adversariality. It is a structural feature of the exchange we call argument. It's worth repeating that imposing isn't just a feature of persuasive argument involving disagreement. Rather, it's a feature of argument broadly understood—including that which aims to strengthen the beliefs someone already has (Perelman and Olbrechts-Tyteca, 49). To return to Govier's argument for minimal adversariality, I should stress that while Govier based the adversariality of belief in the *difference* of belief, in disagreement as it were, this version of her view, discovers adversariality in the basic fact of manipulation of beliefs in argument. It is not because I have a different belief

from you that we are adversaries, it is because of the lack of direct control I have over my own beliefs.

Someone might object at this point that this is a misuse of the term, "adversarial." The fact that *all* arguments involve "imposing" beliefs on others, including willing participants, clearly shows that argument is *not* adversarial in the negative sense often intended by critics of adversariality (Rooney, 2010; Hundleby, 2013). This is correct, if adversariality in this sense is understood not to be distinct from aggressiveness. For something to be adversarial, as I've argued above, is a structural matter. Aggressiveness, by contrast, may or may not apply to an adversarial encounter. I've argued that the involuntariness of believing is the reason that arguments have an adversarial structure. This means, minimally, that directed change of someone's beliefs has to happen against their will. This is not the same as saying that it happens without their consent. By way of analogy, if I play a game of chess, I may lose some of my pieces against my will, but I will have given my consent to play the game in the first place. I may—in fact, I often do—enter an adversarial situation in order to have such involuntary encounters. In the case of believing, and so arguing, I need these in order to change, and hopefully to improve, the epistemic character of my beliefs.

I would like to close this paper by noting some other important consequences of the indirect voluntarism of believing that bear on the adversarial picture of argument. In the first place, what believing we can actually manage, under the best of circumstances, we do so with some effort and with uncertain results (Ahlstrom-Vij, 2013). Belief revision is very difficult and we are often unsuccessful (McFarland, Cheama & Buehler, 2007; Godden, 2012a). Second, engaging in argument can be a risky, and potentially costly, activity. Among the evident risks are the exposure of weaknesses in one's position, the exacerbation of disagreement, and emotional damage to participants (Paglieri & Castelfranchi, 2010, p.74; see also Paglieri, 2009; Hample, Paglieri & Na, 2012).

The costs of argument, however, do not end at the conclusion of the transaction. The desired results of arguing—altered beliefs—come with significant and unavoidable costs of their own. This is because beliefs are psychological states that are causally related to behavior. Consider the myriad costs that might accompany changing a view on, for example, some policy issue. These might include (1) a change your attitude towards those who continue to hold that belief; (2) alteration of your social relations with those who hold those beliefs; (3) revision other of your beliefs which would no longer be consistent; (4) embarrassment of having been wrong and having been corrected; (5) other social costs incurred by the change; (6). Financial costs associated with the changes in belief; and (7) time and energy dedicated to new pursuits. Ideally, all arguments are good ones, with conclusions that are true and well-supported. But even these, perhaps especially these, will require costs such as these just described. These costs are not a side-effect or an irrelevant consideration, but rather the point of the whole enterprise. A conception of the adversarial features of argumentation as I've outlined here foregrounds the real costs of argument for potentially vulnerable human agents. Rather than promoting an aggressive approach to argumentation, this view outlines reasons for us to proceed with caution.

Persistent disagreement and argumentation: A normative outline

DIEGO CASTRO AMENÁBAR

Faculty of Philosophy
University of Groningen

The Netherlands
d.r.castro.amenabar@rug.nl

ABSTRACT: The purpose of this paper is to explore different dialogical approaches to the problem of persistent disagreements which are disagreements that can't be resolved by persuasive argumentation. Taking Walton and Krabbe's (1995) dialogue type theory as a background, the paper distinguishes different kinds of disagreements and types of dialogues, aiming to understand which ones should be considered reasonable and preferable. Finally, an approximation to the notion of argumentation that complements the pragma-dialectical concept will be presented.

KEYWORDS: dialogue types, disagreement, deep disagreement, negotiation, reasonableness, resolution, settlement

1. INTRODUCTION

Disagreement pushes us to argue. When people argue they give their best reasons to back their standpoints. And if they act rationally, then the strength of the reasons should be enough to persuade one of the parties to modify their standpoint. The problem is that argumentation hardly ends in persuasion. Consider the following example:

> *Immigration:*
> *In a forum, two politicians argue about the convenience of deporting illegal immigrants. Senator Smith argues that every illegal immigrant should be deported, while Senator Jones argues that they should regularize the situation of illegal immigrants, allowing them to stay.*

In the example, there are two standpoints that are being defended by the parties. However, it is not very probable that one of the parties succeed in persuading the other. Following Elgin (2010), we may call these kinds of disagreements *persistent.* Persistent disagreements are very common in political, moral, economic or philosophical domains, where arguers do exchange arguments, yet without expecting to really persuade each other, or expecting it in a naïve way.

This raises the following question: if argumentation is not really going to resolve persistent disagreements *how can we reasonably overcome them?* This question calls for two different approaches: a descriptive and a normative one.

A descriptive approach implies asking: what dialogical strategies are *effective* for overcoming persistent disagreements? It implies, then, answering the "how" part of the original question. Resolving that kind of question would imply an empirical task that will not be addressed here.

A normative question would focus in the following: what dialogical strategies are *reasonable* for overcoming persistent disagreements? It implies answering the "reasonably"

part of the original question. This paper will try to advance in such direction. I will defend that there are many dialogical strategies more relevant than critical discussion in order to overcome persistent disagreement and that they should be considered reasonable if they revolve around the act of giving reasons.

To do that I will begin by presenting some basic definitions, focusing especially on the concept of persistent disagreement. Then I will introduce the triple distinction of disagreements about facts, value and policy. Later, I will consider different dialogue types that are related with disagreements, including two dialogue types not contemplated by Walton and Krabbe. Afterwards, I will show a general outline or taxonomy of solutions to different kinds of disagreements, stating which of them should be given priority. Finally, I will make some closing remarks revolving around a new conception of argumentation and reasonability related, more than to the act of persuading, to the act of giving reasons.

2. BASIC CONCEPTS

To clearly understand the scope of this paper, it is necessary to define some concepts.

The first concept that needs to be clarified is *disagreement*. A "disagreement" will be understood as *a difference of opinion, consisting of an interpersonal clash of commitments, between two or more parties in a dialogical context*. This definition owes the concept of commitment to Walton & Krabbe (1995).

A disagreement might be *resolved*, *settled*, *overcome or set aside.* In this paper, these terms should be understood as follows:

Resolving a disagreement is taken in the same sense as van Eemeren *et al.* take it (2014, p. 258). Therefore, it implies that the parties agree on the acceptability of a standpoint, thanks to the fact that one of them has persuaded the other with reasonable arguments.

Settling a disagreement implies ending it using any peaceful method, other than resolution, in which the parties give reasons. For instance: negotiation, casting a vote or calling a third party should be considered kinds of settlement, while beating the opponent shouldn't be settlement because the parties don't provide reasons nor use peaceful means.

Overcoming a disagreement is to be understood as a generic term that considers both *resolution* and *settlement*. Overcoming, then, is as a reasonable mean of finding a solution for the problem posed by the disagreement, in which the parties give reasons.

Setting aside a disagreement implies that the parties decide not to pursue in trying to overcome it. Therefore, it is not a method for overcoming disagreements.

It is also necessary to understand the difference between *persistent* and *not persistent* disagreement, and the difference between persistent and *deep disagreement*.

Persistent disagreement should not be confused with *deep disagreement*, which is a well-known concept in the argumentation theory literature but shouldn't be confused with persistent disagreement. Fogelin (1985) defines deep disagreements as a "clash in underlying principles" (1985, p. 8) which implies that "the parties may be unbiased, free of prejudice, consistent, coherent, precise and rigorous, yet still disagree". The problem with this type of disagreement is that, if Fogelin is right, there is not a rational way around them.

Deep disagreements are always persistent, but many persistent disagreements are not deep. Fogelin himself recognizes this when he says "a disagreement can also be unresolvable without being deep" (1985, p. 8). Deep disagreements, then, are type of persistent disagreements. Therefore, there could be many persistent but not deep disagreements, for instance: disagreements about matters with complicated or partially unknown data, disagreements about taste, disagreements where one of the parties is affected by cognitive bias, etc.

Finally a definition of persistent disagreement would be the following: A disagreement is persistent for A and B, either individually or collectively, if they do not have the means to rationally resolve it by presenting reasonable and cogent arguments.

As we can see, the definition is very general. Therefore, it might be the case that the disagreement is just too deep or difficult to present convincing arguments, that the parties are unable to produce or acknowledge reasonable arguments, or that the circumstances surrounding the disagreement impede them from producing or accepting such arguments. Either case, resolution is not likely to work out, so after attempting —or not— to persuade, the parties might look for other settlement methods.

3. DISAGREEMENTS ABOUT FACTS, VALUE AND POLICY

I propose that different types of disagreements call for different kinds of solutions. And among the different categories of disagreements that might be found, one seems to be relevant at this point: the distinction between disagreements about fact, value, and policy.

3.1 Disagreement about facts

When parties disagree about a fact, they hold clashing commitments regarding a state of affairs. In other words, they disagree about a descriptive proposition (Freeley & Steinberg, 2014) In most cases, these cases of disagreements shouldn't be persistent, since an argument containing a reliable piece of information could enable the parties to resolve it. However, disagreement about facts may still be persistent, for example:

1. *Barbara and Elizabeth disagree the existence of life on other planets.*
2. *Jack and Jill disagree about the causes of the economic crisis.*
3. *Thomas and Michael disagree about whether vaccines cause autism.*

The first case amounts to a lack of information on the subject. Therefore, the parties just make a guess based mostly in other beliefs that they have. In the second case there might be lots of information on the subject, however, it is quite hard to process it and, therefore, the parties might disagree in a persistent way. In the third case we might have the problem of cognitive bias or misinformation (that one of the parties refuses to accept). That is, some people are just stubborn, even when wrong and confronted with the correct evidence. In conclusion, factual disagreements can be persistent.

3.2 Disagreements about value

These kinds of disagreement relate to an interpersonal clash of commitments about the evaluation of a state of affairs, rule or principle. The evaluation is usually a moral one, but it can also be esthetical or political.

Now, what are the roots of a value disagreement? Based on Wedgewood (2010) we could recognize two different sources: (1) disagreement about the underlying facts and (2) purely moral disagreement. An example of each kind will clarify this:

The first case occurs when an original factual disagreement is inherited at the value level. For instance:

Fighting child.

Mary and Leonard are parents of Thomas, a seven year old kid. After Thomas fights with his sister Angela, the following dialogue between the parents ensues:
(1) Mary: Thomas′s attitude is unacceptable; did you see him yelling at his sister?
(2) Leonard: He's just a kid, there's nothing to worry about.
(3) M: But he was fighting for no reason at all! That's not normal!
(4) L: Angela stole his toys, he did have a reason.
(5) M: But Angela denies it, I believe her.
(6) L: I don't, so Thomas attitude was justified.

In this case there is a disagreement about a value proposition: (1) and (2). However, the disagreement is inherited from a fact proposition: (4) and (5). That is, since Leonard and Mary disagree on the fact that Angela stole Thomas's toys, they disagree on the evaluation of Thomas's actions.

Another possibility is that the parties disagree purely at the value level. For example:

Abortion

Joseph and Jane disagree about the morality of abortion. While Joseph considers it's not acceptable, Jane thinks it is a woman's right. When asked by Joseph why she thinks so, Jane replies:
"It is a woman's right to do as she pleases with her own body, as long as she doesn't commit any harm to a third party, therefore, she has a right to perform an abortion".
Joseph answers: "I disagree, the fetus is not an extension of the woman's body, so she is committing harm to a third party."

In this case, the parties haven't made any logical mistakes, and they agree about the pre-moral facts (for instance, the definition of "abortion") however, they disagree at the value level. A purely moral disagreement will be, usually also a deep disagreement because it relates to the framework propositions that the parties hold, as Fogelin shows. That is why, purely value disagreements are usually persistent and unable to be resolved.

3.3 Disagreements about policy

In a disagreement about policy, the core of the disagreement is a practical problem: some decision needs to be made in a given situation, and the parties disagree about the best way to act. For example, parents disagree about whether giving or not contraception pills to their daughter, a group of friends disagree about the best destination for their next vacations or lawmakers disagree about the convenience of a tax reform.

In a way, these types of disagreements are prone to be persistent but, in another way, there are more tools available to overcome them.

The reason why propositions about policy are prone to disagreement is that, in many cases, in order to agree on a policy, the parties need also to agree on facts and value propositions. Therefore, the policy disagreement might be inherited from the fact or the value disagreement.

A case of inheritance from the factual level would be the following:

Global Warming

Adam and Brian are discussing what needs to be done regarding global warming:

(1) *Adam: "Every country in the world should immediately start reducing their carbon emissions."*
(2) *Brian: "Why?"*
(3) *A: "Because global warming is being caused by carbon emissions, and global warming would be a very dangerous threat to life on earth. Therefore, every country should reduce their carbon emissions".*
(4) *B: "I disagree with the fact that carbon emissions are causing global warming, so I don't think that every country should start cutting their carbon emissions"*

In this case, Adam justifies his policy proposition in turn (1) on a fact and value proposition in turn (3). Since Brian would have no difficulty in accepting the standpoint given that the factual proposition is true, we can say that persistence is inherited from the factual level.

In other cases, the policy disagreement is inherited form a disagreement at the value level. For instance:

Party

Peter and Laura disagree about allowing their daughter, Maria, to go to a party:
(1) *Laura: Maria asked me to go to a party tomorrow, should we let her go?*
(2) *Peter: "No, we shouldn't"*
(3) *Laura: "Why?"*
(4) *P: "It is not right to go to parties at her age"*
(5) *L: "I disagree, it's not necessarily wrong to go to parties".*

In this case, the policy disagreement —expressed in turns (1) and (2) — is based upon a value disagreement — turns (4) and (5) — while there is agreement at the factual level.
 Finally, even if the parties agree at the fact and value level, they could still disagree at the policy level. For instance:

Drugs policy

Karen and Janet disagree about policies regarding hard drugs:
(1) *Karen: there has been an increase in the consumption of hard drugs lately.*
(2) *Janet: Yes, I know! And is very bad for our youth!*
(3) *K: I agree, that's why we should be investing more in the persecution of dealers.*
(4) *J: I disagree! Criminal prosecution is not the answer. We should invest in public health instead.*

In this example, even agreeing at the factual level and value, as shown in turns (1) and (2), they disagree at the policy level.

Conversely, sometimes the parties do not agree on the first two levels, but they don't inherit the disagreement to the third level. For example, in the "party" example, even when they disagree at the value level, the parents could arrive at an agreement at the policy level if, for instance, they negotiate.

In conclusion, since (in many cases) an agreement on three different levels needs to be made to reach agreement in a policy proposition, there's more chance of persistence. However, policy disagreements have tools that other kinds of disagreement don't have so, as we will see, there are more chances to overcome them.

4. TYPE OF DISAGREEMENTS AND TYPE OF DIALOGUES

4.1 Types of dialogues

Walton & Krabbe (1995, p. 66) describe several types of dialogue. Three of the dialogue types are related to disagreements and could serve as tools for overcoming them:

In a *Persuasion dialogue*, for instance, one of the parties tries to persuade the other by verbal means. Consequently, it is eminently a dialogue type were the parties disagree. Then, if one of the parties succeed in persuading the other, we could arrive at resolution. The initial situation, then, is disagreement, the main goal y resolution, and the participant's aim is to persuade each other.

Negotiation is a dialogue type were the parties begin with a conflict of interest and a need for cooperation. The conflict of interest can also be presented as a disagreement. Then, if the parties reach a deal, we might say that they have settled the disagreement. Therefore, in a negotiation the initial situation is a conflict of interest, the main goal is to make a deal, and the parties aim at getting the best for themselves.

However, negotiation can only be related to policy disagreements, and never to fact or value disagreements, since the idea of the parties negotiating about facts is just ridiculous ("if you accept to believe P, I will accept to believe Q") as it is the idea of people negotiating values[1].

An *eristic dialogue* is a type of dialogue that serves as a substitute for fighting. In an eristic dialogue the initial situation is a conflict (and, hence, also a disagreement), but the main goal is to reach an accommodation, and the participant's aim is to win the dialogue. However, it is doubtful that eristic dialogues are reasonable, so its use should only be considered in a limited way for overcoming a disagreement.

Besides the types of dialogues explored by Walton and Krabbe, there are two more I would like to introduce: rhetoric dialogue and settlement dialogue.

A *rhetorical dialogue* is a dialogue which looks like a persuasion dialogue but allows the use of some *fallacies* (or *pseudo-fallacies* once they are allowed). A rhetorical dialogue, then, has the same initial position, goals and aims than a persuasion dialogue, but in a persuasion dialogue the use of fallacies is forbidden, since, even if the parties arrive at an agreement, such an agreement would not derive *from the merits* of the arguments given. However, when the parties are faced with a persistent disagreement, and other circumstances

---

[1] Which is exactly what makes Groucho Marx's joke funny: "Those are my principles, and if you don't like them, well… I have others".

are met, the use of *pseudo-fallacies* should be allowed. In that case the dialogue would be a rhetorical one (more on this on the following subsection).

It could be doubted if, under Walton and Krabbe's theory, this kind of dialogue is a novelty or just a mixed dialogue type (for instance, a *debate* which is a mix between persuasion and eristic dialogues). I'm leaving that question open for now, because I don't think it matters so much for the sake of this paper.

A settlement dialogue, finally, is a type of dialogue were the parties discuss and/or execute a settlement method for the disagreement at stake. There could be many settlement methods, for instance: casting a vote, calling a third party or flipping a coin. Just as negotiation, settlement methods can only be used for policy disagreements.

Considering the above, the initial situation of this dialogue is a disagreement over a course of action, the main goal is to agree on a course of action, and the parties aim at making the course of action go in their way. As in the case presented before, settlement methods can also be considered a mixed dialogue between a deliberation and a persuasion dialogue, a definition that will not be taken here.

4.2 Strategies for persistent disagreement about facts and value

There is a sharp difference between factual or value propositions and policy propositions, which lies in the resources that the parties have at hand to overcome them. In policy propositions, the parties have the option to shift from a persuasion to a negotiation or settlement dialogue, which is not an option for fact and value disagreements. Then, for facts and value disagreements, there are only two options: persuasion and rhetoric dialogue.

When disagreement triggers a persuasion dialogue, the parties aim to advocate their standpoint while making their opponent retract theirs. Following Van Eemeren and Grootendorst, (2004), I believe that the Rules for Critical Discussion (RCD) should be observed in this case to avoid fallacies. However, as said before, the mere characterization of persistence tells us that critical discussion is probably not a useful way to overcome persistent disagreements.

A *rhetorical dialogue* understands that the use of *pseudo-fallacies* is necessary and acceptable under some circumstances. Provisionally, I see two different set of cases were *pseudo-fallacies* should be deemed reasonable to overcome persistent disagreements (but it might be many others). I will only, very briefly, refer to them.

The first case is the use of meta-dialogical counter-fallacies. A counter fallacy is a fallacy used to counter another fallacy. And its use should be allowed but only as a sort of meta-dialogue, that is, to attack the use of the fallacy by the counterpart.

This approach stands between Jacobs's (2000) and Krabbe's (2002) positions on how to respond to fallacies. For Krabbe, parties should engage in an explicit meta-dialogue, where the fact that a fallacy has been committed is pointed out. Jacobs, on the other hand considers the use of counter-fallacies reasonable to *balance* the dialogue. A meta-dialogical counter-fallacy, then, is a *pseudo-fallacy* used as an implicit meta-dialogical move.

The second case of an accepted I'm thinking of is the use of *pseudo-fallacies* in the context of degraded dialogues, or dialogues that do not meet higher order conditions.

Van Eemeren and Grootendorst (2004, p. 189) defend that, in order to have a critical discussion, some *higher order conditions* (HOC) must be present. Some examples of these conditions are the following: "The participants must accept that their points of view can prove to be wrong", there must be an "Absence of authority relations among the discussants", or there must be "Equal time-constraints for all participants" (Zenker, 2007).

Following the definition of persistence given before, it is perfectly possible that the reason why the disagreement is persistent is because some HOC are not met. Now, in that

case the question is: should we still follow the RCD or we can ignore some of them? I think that is perfectly reasonable suspend some RCD, in an attempt to overcome the disagreement. For instance, if one of the parties is not willing to listen to the arguments of the other, it should be deemed reasonable not to present the conflicting standpoint even when required.

4.3 Strategies for persistent disagreement about policy

To overcome a persistent disagreement about policy the parties can naturally use the tools available for disagreements about fact and value, but they also have other resources at hand. If the parties are not able to persuade each other, they might want to switch the type of dialogue to a negotiation or settlement dialogue.

Negotiation of a disagreement occurs when the parties offer each other concessions to look for a mutual understanding. For instance:

> *Car seller*
>
> *Richard is trying to sell his car to Luke. He offers his car for 5.000 Euros. Luke refuses and says he is only willing to pay 4.000. Considering that he will not be able to persuade him, Richard tries a negotiation dialogue:*
> *Richard: Let's do something, why don't you get the car for 4.700?*
> *Luke: 4.500 and we have a deal.*
> *Richard: What about 4.600?*
> *Luke: Ok, deal!*

In this case, the parties mutually agree on shifting the dialogue type from persuasion to negotiation. Thanks to that, they can split the difference and arrive at an agreement.

However, sometimes it's not possible to negotiate, since some positions are just not negotiable, for instance:

> *Emergency Room*
>
> *Philip and Rose are doctors who are performing a very complicated surgery when the patient starts having complications. Then the following dialogue ensues:*
> *P: we are losing him! We should give him 100 millimeters of drug x.*
> *R: I disagree! Drug Y would work better.*

In the example, a negotiation dialogue (for instance: "we could give him 50% of each drug) would look as something odd. A better option would be trying to persuade each other. But if persuasion doesn't work, then the more rational thing to do would be to look for a settlement method.

Settlement methods, then, are a sound way to overcome disagreements about policy, when negotiation is not possible or plausible (or even being possible, if the parties prefer it). Since the parties disagree about what to *do*, it is possible to settle on a course of action, even though one of the parties dislikes the result, provided the fact that for both parties prefer agreement to continuing the dispute. For instance, imagine the following continuation to the dialogue presented before:

Emergency Room 2

P: Since we disagree, we should call Doctor Jones, as he has more experience with this kind of complications.
R: Ok then, let's call him. Whatever he says, I'm ok with it.
P: Me too.

In this case, it doesn't matter if Paul was persuaded or not by Doctor Jones's decision because, if he wasn't, he still understands that giving the patient the drug Y is better than no drug at all.

Settlement methods, then, may consist in different strategies to settle things. In the example, they decided to call a third party, but there are other options like casting a vote, flipping a coin or any other method decided by the parties. Sometimes these mechanisms for resolving the disagreement have been pre-established by the parties or the context of the dialogue while in other cases they explicitly accept them on the way. In any case, it is important than, along the way, the parties give *reasons*.

However, to agree on using a settlement method implies that the parties are willing to take the chance to be on the losing side. In other words, they consider that some decision has to be taken and that even losing the discussion is better than no decision at all. However, sometimes that is not the case, because they think that the losing side is even worse than keeping the disagreement alive. Consider the following example:

Hiking expedition

Jane and Patricia are on a hiking expedition. When they are returning they arrive at a crossroad. Jane argues that they should go right. Patricia argues that they should go left. After the persuasion dialogue, Jane says:
Jane: "Since we do not agree on which path to follow, I suggest that we flip a coin."
Patricia: "No way! I told you before! I've walked this path countless times, I'm completely sure that the left path is the right one! Do whatever you want but I'm going left."

In this case, Patricia is not willing to use the settlement method proposed by Jane, so the parties run out of options to overcome the disagreement.

4.4 Dialogue types for persistent disagreement, diagram.

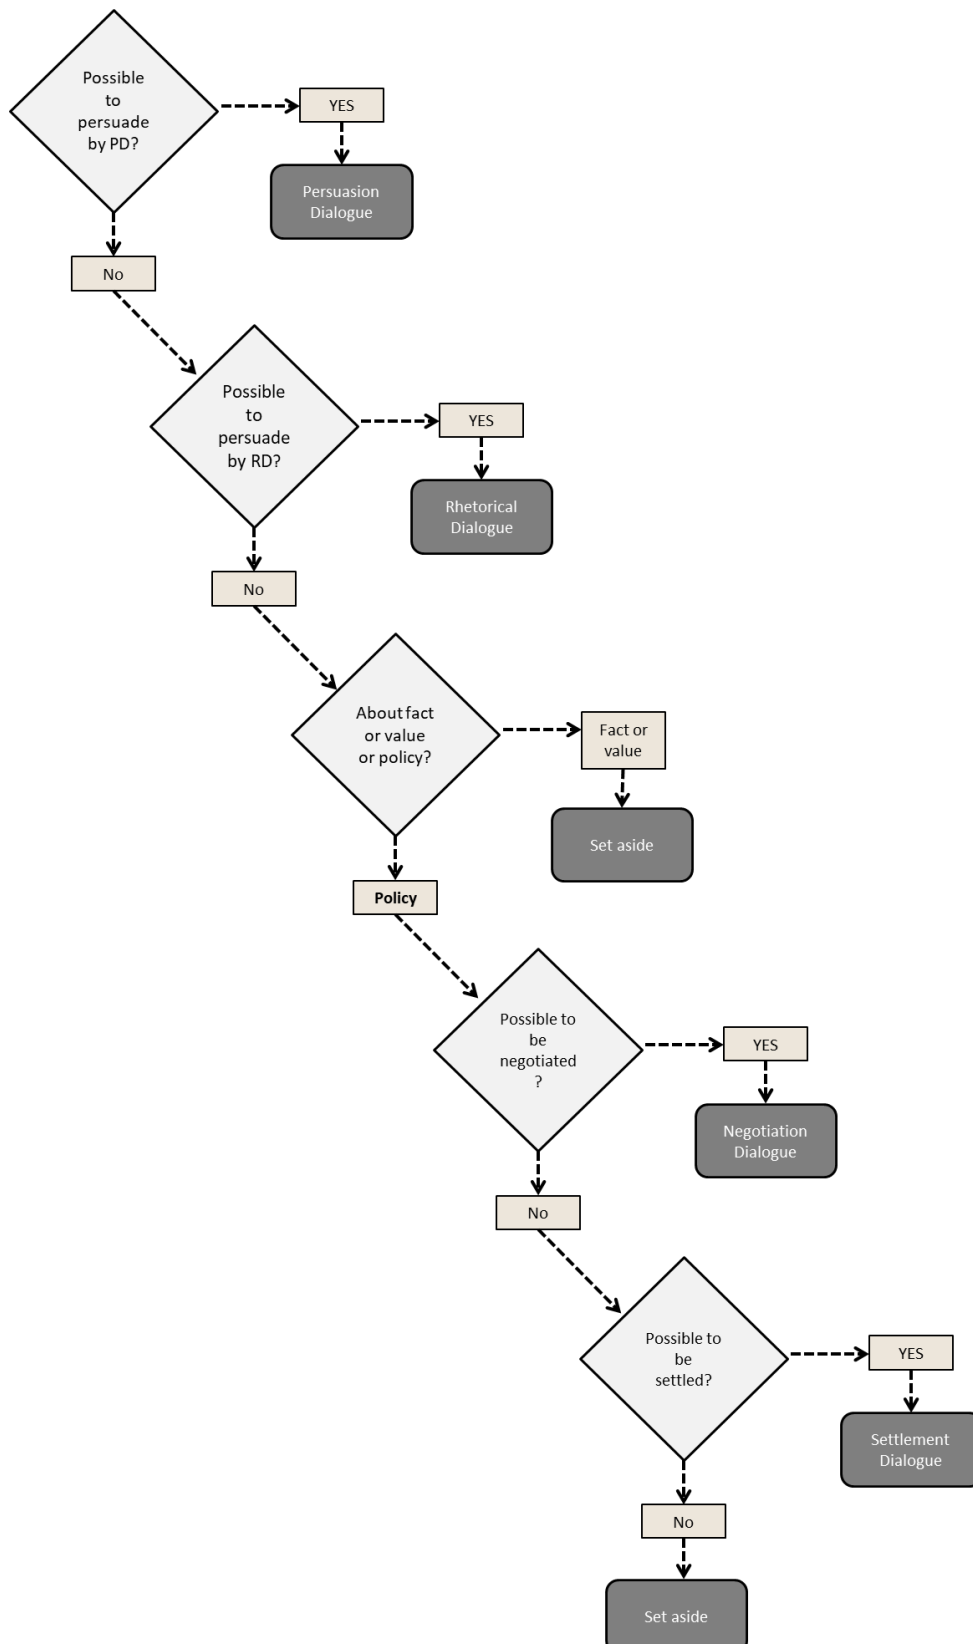
The above said can be summarized in the following diagram:


Fig 1.

     This diagram shouldn't be considered as a decision-making flowchart. The parties don't go stage by stage to see what dialogue type is better for them. Sometimes the parties try to overcome the disagreement straight ahead by a negotiation or settlement, while in other occasions, the parties will try several dialogue types, maybe in a different order than the one

presented. Also, the question "Is it possible to…?" Is something that the parties may know beforehand or discover during the dialogue.

What figure 1 does show, is what method should be considered preferable for the parties to resolve the disagreement. To persuade or be persuaded, then, will be always the better solution because, even if a party happen to be on the side that retracted a commitment, we will then be convinced that the decision adopted was the right one. And a persuasion dialogue is a position a little better than a rhetorical one, because the rhetoric dialogue might have an eristic component. Negotiation is worst than rhetorical dialogue, since the parties need to give away something. However, a negotiated solution is better than a settlement, since in a settlement the parties are risking to lose it all. Finally, setting aside is a last resort, since the disagreement will not be overcome.

5. FINAL REMARKS

Reserving the term "argumentation" only for critical discussion seems to me a mistake. To argue is, ultimately, to *give reasons*, but the outcome of a reason giving process can be persuasion, negotiation, settlement or any other. Conversely, the goals a party have when arguing can also be more than just persuasion. Then, if the desired goal is to overcome disagreements, it shouldn't matter so by which means we do it, as long as we act reasonably.

But what is to act reasonably? It is nothing more than to act according to the reasons given. Then, it is perfectly rational to overcome a disagreement by casting a vote, but it is not if the parties give reasons in favor of option "A" and then vote for option "B".

In conclusion, it appears to me that argumentative resolution has been given way more importance than it deserves. I do not deny that to persuasion dialogue is a sort of dialogical ideal but, focusing too much on it, could be ultimately frustrating. The biggest danger of this *faith in resolution* is that the stalemates at which people will necessarily arrive, when dealing with persistent disagreements, could make them think that the counterpart is not only wrong but vicious, stupid and dishonest.

Then, overcoming those stalemates by any reasonable means is not only rational but also beneficial for society, since the public standard of reasonableness and respect for the other can be maintained. And in times of social media, eco-chambers, post-truth and fake news, take the side of rationality is more necessary than ever.

Building communities: Participatory art and guerrilla advertising

ANNALISA CATTANI

Department of Communication
University of Ferrara
Italy
annalisacattani7@gmail.com

ABSTRACT: 'In recent years, many artists have been appropriating the roles of social workers or urban planners, in order to question and critique the dominant culture by channeling the voices of the ones who are underrepresented, repressed or left out from political processes.'[1] They create 'Participatory Art', an Art form that involves and engages their audience. Advertising followed this trend with its 'Guerrilla Campaigns'. It creates unique and provoking happenings that turns viral provoking a memorable brand experience and in terms of social advertising, memorable ethic experience. They seem both following Zygmunt Bauman's thesis that it is always easier to focus on micro-ethics, rather than confront the macro-ethics of the society in which we are implicated. We are going to analyse the differences between participatory art works and advertisements using topoi, pragmatic functions and argumentative roles.

KEYWORDS: argumentative roles, common places, ethos, guerrilla advertising, logos, participatory art, pathos, pragmatic function, specific places, happening, monument, flash mob

1. INTRODUCTION

Art is no more asked to be contemplated, or just one object to reflect upon, but one action within society becoming an instrument for a Socratic dialogue, which uses structure and infrastructures to re-invent them.

'A recurrent set of theoretical reference points governs the current literature on participatory and collaborative art: Walter Benjamin, Michel de Certeau, the Situationist International, Paulo Freire, Deleuze and Guattari, and Hakim Bey, to name just a few. Among these, the most frequently cited is the French film-maker and writer Guy Debord, for his indictment of the alienating and divisive effects of capitalism in The Society of the Spectacle (1967), and for his theorisation of collectively produced 'situations'. For many artists and curators Debord's critique strikes to the heart of why participation is important as a project: it rehumanises a society rendered numb and fragmented by the repressive instrumentality of capitalist production.'[2] Artistic practice can no longer revolve around the construction of objects to be consumed by a passive bystander. In this framework, the artist becomes a non-specialised labourer who can creatively adapt to multiple situations, in connection to a community, offering a counter model of social unity, often regardless of its actual politics.

But this attitude towards participation is really something new in Art?

At present we have surely become almost completely alienated from art. We live in a society where art is primarily a commodity, something people buy instead of make. Consequently, very few people are actively involved in making art. Because of this general lack of participation, many find it difficult to believe that societies have existed in which literally everybody sang, danced and made their own crafts, all on a daily basis. Active participation in art has been characteristic of human culture for most of its history, and this alienation from art is a relatively recent phenomenon. In primitive cultures singing was virtually interchangeable with speech and done on almost every occasion: social, ritual, work and recreational. Not to be able to sing or dance was considered such a severe social handicap. The making of art was a central part of

people's lives for most of human history, until the relatively recent advent of a capitalist, commodity-based culture in the sixteenth and seventeenth centuries. In that moment the emphasis in art shifted from participants, who could satisfy their own artistic needs, to specialists, who demanded a paying, non-participating audience to buy their products'.

It is one of contemporary art main goal to try to reawaken people from this fetishism transforming art practices into a path against everyday anesthesia. The making of art is an essential part of our being and of our need to express our feelings and thoughts, joys and sorrows.

What about advertising?

Not very long time ago advertisements were clearly delineated, different and separate from art. They were easily recognizable as advertisements and no one expected them to be anything else. Today, the urban environment includes not only separate instances of art and advertisements, but advertisements that look suspiciously like art. For example what's the difference between *participatory art* and *guerrilla advertising*?

You might think that the distinction between the two would be obvious. After all, the goal of advertising is to sell you something, while the goal of art is, quoting Umberto Eco, to create an open work. Public Art Fight Specific, Audience specific or Social turn states a political message, subverts a common belief, exists simply for the pleasure of the beholder, or any number of other reasons. So telling the difference between art and advertisement should be easy. But what about advertisements where we don't understand what's being promoted or campaigns where what's promoted suddenly changes amplifying or subverting the original message?

Let's now see some example analysing them with some rhetorical and argumentative tools in order to find a way to make a difference.

2. FROM THE MONUMENTO TO MEMENTO

As an artist I was asked to create an art work in connection with a small community from Pianoro, Bologna, who goes and uses a new social centre on a daily basis. To start the mediation with the inhabitants I decided to apply *topoi*,[3] according to Perelman schemata. In Perleman and Olbrecht-Tyteca's theory, loci are seen as general strategies or rather catalogues of the habits of mind endemic to a given culture. Topics provide a roadmap, or starting point, for the discussion of problems and the resolution of difficulties. They are both a method of problem recognition and a means of problem solution. 'Invention uses topics to identify and analyse difficulties placed before an actor. Hence invention and topical reasoning are essentially pragmatic in nature for they are directed to the solving of problems about what to do.'[4]

Perleman and Olbrecht-Tyteca framework offers a simplified scheme of the classical topoi as they call topoi only the general premises which make possible to ground values and hierarchies, i.e. the ones that Aristotle studies among the loci of the accident: quality,quantity, existence, essence, order and person. Using these categories I tried to involve people from Pianoro not in my personal initiative, but rather in a Socratic dialogue trying to understand what was important to them, what they wanted to emphasize, in order to grasp their essence within an art work which was supposed to remain inside the social centre. It emerged that their personal stories were the things, that more than any other activity, or material object they wanted in their 'free time surrounding'. As a result they collected their favourite photos and

(ex.1)

we printed them on the curtain of the centre, (ex.1) melting together their private narratives, creating an embodied and empathic public sphere. The quantity, represented by the big amount of pictures collected, helped to build the essence of a community resulting from a melting pot made of old, young, Italian and foreign people, which is part of Pianoro identity today.

This project created a good balance among ethos, logos and pathos. In terms of pathos it promoted compassion in its etymological value, meaning 'feeling together, sharing emotion'. According to ethos it put on the same level the credibility of the artist and that of the spectator or in this case the future users of the art work, letting them plan and create together. For what concerns logos, the semiotic path of the work created a 'warrant', a 'general rule' in Toulmin's terms, which could be expressed as it follows: 'Art works should represent the community in a more direct way, because everyone deserves to be taken as a unique and as a special person, made of memories and desires'

Martha Nussbaum underlines that if there is a project to be put at the centre for the future is to invest in culture and mediation. The crisis in which we find ourselves is rooted in the short-term destructive cuts to education and culture. Efficiency, effectiveness and innovation are directly connected to culture and creativity. We are losing the ability to think critically, together with the ability to represent the other and the complexity of the world. But most of all we are losing compassion and empathy'[5]

According to Martha Nussbaum everyone, in order to be called 'citizen' has to know how to think critically. In connection with an art work contributing critically to the work means becoming aware of a process, as well as of the development of the performance. This awareness approach, however is still quite unusual, most of all towards pre-existing cultural identities that surround us in our urban reality. Above all the monuments, which have almost completely lost their reference and their illocutory force. This is a sort of irony of fate if we take back the etymology of the word monument, obtained from the condensation of the Latin words *monere*, which could be interpreted as 'to warn' and *manere* which means 'to remain'. Therefore it shouldn't simply denote a cultural object, but a cultural dialectical process which should create a critical permanent effect, producing continuing reflection on a given person or event. Unfortunately it is very easy to see how this goal is not achieved, by interviewing any passer by and asking him\her about this or that historical figure, to see how unknown they have become to the average citizen. This reflection inspired me to a project in Bolzano, where I decided to use a monument as a site for a new argumentation.

The artist doesn't create from nothing, he\she transforms dialectically the space adding new indicators, that, taking back again Sorin's Static definitions transform sometimes both pragmatic function and argumentative role or simply the argumentative role. The pragmatic function is a *conditio sine qua non* of the sentence, that in order to communicate must be recognized as a particular kind of proposition, but its propositional function sometimes is very different from its argumentative power and intention.

It was previously underlined the fact that the monuments were originally meant as a sort of personification of a thesis, which should provoke reflection in the mind of the viewer, like for example the thesis embodied by any monument dedicated to the victims of the war, which could be verbalized this way: 'It is a duty to celebrate those who died for the country'. Anyway this argumentative effect has little by little gone lost, leaving marble ghosts watching us from above, without knowing why. In order to re-establish the original identity, but most of all the symbolical universal cultural value of a statue in Bolzano I developed the project 'Riprendiamoci l'Amore' (Let's take back our Love). (ex.2)

(ex.2)

The main square in Bolzano is dominated by the figure of Walther von der Vogelweide a fascinating marble presence, who is apparently in a familiar way simply called Walther. This simplification, anyway, took away the real identity of this famous minstrel, letting people forget that he was one of the most important *Minnesaenger* of the German Literature, and a universal poet of courtly love. But this was not the only degeneration of the statue, it often became the 'stone of discord' in the German-Italian cultural debate. In a bi-lingual city, where the weight of each linguistic and cultural symbol has a capital importance, the fact that the most important square is dedicated to a German speaking Literate is sometimes seen as a form of prevarication. Asking people and most of all teen agers in the neighbourhood who he was, many of them didn't know, even if I was well aware that the presence of Walther had caused many public discussions.

As a first attempt to regain the ethos of 'Walther von der Vogelweide' I used a very popular pretext: superstition, which under an argumentative perspective could be seen as the extreme use of the expressive emotional function. I diffused the information among a group of teen-agers, absolutely not interested, at first, in the figure of Walther, that taking a picture or simply dedicating him a thought or a message would bring good luck. Suddenly the pedestal of the statue was overcrowded with people taking pictures and 'selfies' with the poet. Later I proposed

to the city administration to develop a project on Valentine's day, in order to create a moment of shared culture dedicated to the universal value of love. A sound installation gave German and Italian voice to the statue and some panels, which covered the pedestal, invited anyone to leave a love message on the plinth with a post it. Seven hundred love messages were collected within eight hours. (ex.3)

(ex.3)

As a consequence Walther regained name and surname stopping being 'the German intruder', and starting being the voice of a performative and patemic loving community.

3. MARIANNE HEIER 'A DROP IN THE OCEAN'

The Norwegian artist Marianne Heier was invited by investors to make a project to 'activate' Bjørvika, an area in Oslo which was being transformed from an industrial harbour into Oslo's maybe most ambitious residential area. From being associated with hard work, and also prostitution, this area was supposed to become an area filled with cultural activities, clubs, and the best contemporary Norwegian architecture. This sort of invitation does present some problems that are really impossible to ignore. According to the artist the critical potential of any project in this situation is necessarily at least partly compromised. However critical you intend to be, you still end up confirming the structure you meant to criticize, because the project is proposed within a framework defined and paid for by them. In rhetorical terms the ethos of the artist tends to converge on the ethos of the art initiative's promoter. Anyway even if artists are somehow within the frame of the investors they can use this attention and redirect focus to other problems or parts of the city, and through this create topics for new discussions. 'The challenging nature of the situation triggered me.

After considering the various aspects of the situation as carefully as I could, I decided to accept the invitation' says the artist. She decided, in fact, to create a challenging project connected with the possible loss of the town's historical swimming pools, architectural and social heritage at the same time, as they represent the Norwegian engagement in training children since a very young age. Swimming instruction has had high priority in Norwegian schools during the last half of the twentieth century. It can almost be seen as a part of the social democratic project. As a 'fiord country', drowning accidents have traditionally been common here. Therefore, there was a very specific reason for investing in children's swimming abilities. This actually worked, it lead to a large reduction in the frequency of drowning accidents in Norway. Heier chose to adopt a sort of 'Robin Hood-strategy' recalling the specific place[6] of stealing from the rich, the investors in this case, and giving to the poor, the increasingly impoverished municipality of Oslo'. The initial idea was to encourage Bjørvika Utvikling AS to reopen Sagene Public Baths, but the budget couldn't cover it. So she decided to go for a compromise and to open Sagene Bath to the audience just for one day, in order to focus the

attention on the place and on the service that people were losing and she gave to this action the allusive title 'A drop in the ocean'. (ex.4)

(ex.4)

It was possible to visit the room which contained a sound recording made in another swimming pool in Oslo which is still in use, so the physical emptiness and dryness of the space was contrasted and highlighted by a very realistic sound of water splashes, children playing and jumping. Once again an apparent *assertion* is transformed into the argumentative role of *critique* and *recall,* making the audience well aware of what they were missing.

Claire Bishops underlines that most of the time participatory projects in the social field seem to operate with a twofold gesture of opposition and amelioration. They work against dominant market imperatives by diffusing single authorship into collaborative activities. Instead of supplying the market with commodities, participatory art is perceived to channel art's symbolic capital towards constructive social change. But this has led to a situation in which socially collaborative practices are all perceived to be equally important artistic gestures of resistance. It seems that there can be no failed, unsuccessful, unresolved, or boring works of participatory art, because all are repairing the social bond. 'While sympathetic to the latter ambition, I would argue that it is also crucial to discuss, analyse and compare this work critically as art, since this is the institutional field in which it is endorsed and disseminated.' [7]

4. DANTE BEHIND THE FALLING WALL

Lara Favaretto's research is balanced between the topics of failure and aspiration. The memorial form is pointedly evoked in a series that the artist calls 'Momentary Monuments', which adopt but also subvert the vernacular of public sculpture. Beginning with a swamp that she created at the back of the Giardini in Venice to commemorate twenty historical figures, who have disappeared, and continuing with her sandbagging of a 1896 statue of Dante Alighieri in a civic square in Trento.[8] Even if the idea behind this work could be interesting, there was an evident lack in participation and mediation.

Favaretto created a wall of sacks that, as a trench, blocked the view of the monument to Dante. (ex. 5)

(ex.5)

Dante represents the specific place of high culture which is covered in order to be rediscovered and to make people aware of the loss of cultural identity and of the lack of investments dedicated to education and research. This big visual speech act in undeniably engaging, it also reminds of other walls, letting us infere another important thesis which the artist herself expresses as follows: 'You should not build walls. They are violent and prevent the eyes to look beyond them, they force us to an obliged and unavoidable comparison with our nose. '

However, something unexpected happens, the wall collapses, and the work escapes the will of the artist, but she greets happily the wall's fall. Opening up a new combination of assumptions the work multiplies its relation to reality. The citizens however don't agree with this enthusiastic flexibility and they see a lack of engagement and at the same time a waste of money on a 'non-working' site specific installation. What went wrong? Under an artistic point of view nothing as this work was even mentioned on a prominent international art magazines: 'Artforum' as one of the most interesting art works of 2009. But still in Trento public sphere there is an open wound, there is an evident lack of negotiation. We can only doubtfully imagine possible alternatives like for example involving the local community asking them to contribute to build the wall becoming part of the visual metaphor, they might have felt part of a shared criticism, instead of being just viewers. Each sack could have represented one citizen, instead of being installed by specialized workers. On the other hand if we stop looking for consent and just look for feedback we can say that the speech act was simply 'unlucky', but it reached its perlocutory effect even if it prevailed the argumentative role of objection and criticism against the high costs of an ephemeral construction which was perceived as an unexpected and unprepared vision.

4. MONUMENTS AS TESTIMONIALS

Monuments have recently become the site for social and commercial promotion too. In June 2013, Barcelona's city council shocked residents by renting out the iconic Columbus Monument to two multinational companies to use as a billboard. They put an enormous Football Club Barcelona team jersey on the sculpture and began selling athletic shoes and low-cost trips to tourist destinations in front of the monument.

The advertisement quickly caught the attention of the major TV networks and the most popular magazines. Enmedio, a radical design collective, noticed that this new spotlight was worthy of

some subversive further argumentative articulation. The first thing they did was call a press conference at the base of the Columbus Monument and when many journalists showed up a gigantic yellow balloon suddenly appeared with the words 'Spain: Champions of Unemployment' written across it in Spanish and English. (ex.6)

(ex.6)

The original commercial message which simply promoted some goods in the name of the Spanish sporting victories, was transformed into a very dialectical social critical hyperboles. Nevertheless this was not the result of a shared mediation with the public. The official ad campaign created widespread media attention, which the Enmedio stunt was then able to hijack. In order to do so, Enmedio had to do two things well: it had to create a simple image that could be reproduced easily, and it had to execute the action quickly, before the police arrived. Both of these objectives were met, and the event was a success. It is questionable if the effect is going to be long lasting creating self-consciousness in the city or just a witty moment in which the monument becomes a V.I.P. testimonial.

5. FLASHMOBS VS PARADES

You're walking down the street enjoying some fresh air when all of a sudden a man breaks out singing and dancing. No, it's not a crazy surprise of your friends, you've just been flash mobbed. Flash mob marketing is popular because it's a live act and generates a crowd. Unlike traditional marketing methods such as billboards and print ads, flash mobs have a tendency to go viral if done right. One of the most effective flash mob was that dedicated to passengers landing at London's Heathrow airport. They were welcomed by an all-singing, all-dancing flash mob. The unforgettable welcome at Terminal 5 was laid on by T. Mobile who were filming for the ad. Thousands of passengers were serenaded with a series of songs dedicated to the specific place of travel and they were all captured on a series of secret cameras. T-Mobile's Spencer McHugh said: 'We wanted to create and capture a moment that is so unique and upbeat that people just want to share it.' The communicative and commercial feedback expected the video to be watched by nearly 10 million people across the UK and reach more than 2 million households, letting us imagine the economic advantage of the entire operation. (ex.7)

On the 27th of October 2010, a 300 strong choir and vocal orchestra sang appropriate songs, completely acapella, to unsuspecting passengers as they returned home.

(ex.7)

Analysing the event as a complex speech act we can recognise the performative pragmatic function, through which the locutor performs instead of saying something and in this case, thanks to the presence of many singers at the same time, we can speak of a performance that becomes a big happening involving the audience with a strong expressive emotional function, totally grounded on pathos. The passenger is not invited to be persuaded, but simply to become the protagonist of a dedication to humanity, he\she becomes per absurd more a personification of 'every man', instead of being a specific person, celebrated and greeted by perfect strangers. The flash mob celebrates the need of a warmer communication even in an anonymous place like an airport can be, showing that the telephone company is able to 'do' miracles in connecting not only people who know each other, but also strangers who become the source of passionate feeling. Could we speak of 'participation' when our soul is moved and touched by compassion? And moreover, isn't it dangerous to let the audience reach such an emotional depth, to disguised it in the end as a fictional sort of 'candid camera' which promotes a commercial company? Let's take in contrast Marinella Senatore 'Building communities' practices.

6. MARINELLA SENATORE BUILDING COMMUNITIES

Building Communities is the first museum exhibition of an important selection of projects that Marinella Senatore has created since 2006. Senatore has been focusing on research about the involvement of the audience as a key protagonist of her work. The artist describes her role as that of an 'activator'. 'I feel that I am part of those processes that see the artist as a director who has a score through which people negotiate, or contest, their participation,' Senatore says. 'I seek to put into action an affective exchange that moves from story to story. The tale itself becomes and exchanges an open laboratory situation, where those who are working learn something, which they take away with them, along with the memory of having been on the set.' Creating new possibilities for the involvement of the public, the artist has recently created a

series of projects, in Italy and abroad, which are structured as cinematic productions, workshops, parades and photo shootings, the subject of which includes the creative and collective process itself. (ex.8)

(ex.8)

'Involving in an active dialogue a wide number of people, groups and associations large or small, often outside the art system,' Marcella Beccaria writes, 'Marinella Senatore's projects always construct new and innovative communities, aggregating multiple and heterogeneous energies. Her process rethinks the possibilities of art as a potent agent of exchange and cultural growth.'[9] Senatore organized a public parade, which build a new community around Castello di Rivoli, from Val Susa to Turin. Apparently the effect could be compared to the previously analysed T. Mobile flash Mob, in which people were welcomed with singing and dancing, but whereas in the guerrilla advertising event the spectator remains a spectator, in Marinella Senatore he\she becomes a protagonist and also one of the authors, becoming part of a narrative which modifies values, desires, sense of belonging.

7. CONCLUSION

We agree with Claire Bishop that this new proximity between spectacle and participation underlines the necessity of sustaining a tension between artistic and social critiques and the need to keep alive the constitutively reflections on quality that characterise the humanities. In the field of participatory art, quality is often a contested word: rejected by many politicised artists and curators as serving the interests of the market and powerful elites, but value judgements are necessary, not as a means to reinforce elite culture and police the boundaries of art and non- art, but as a way to understand and clarify our shared values at a given historical moment. Some projects are indisputably more rich, dense and inexhaustible than others, due to the artist's talent for conceiving a complex work and its location within a specific time, place and situation. The central point is to find ways of accounting for participatory art that focus on the meaning of what it produces, rather than concentrating only on the process and one possible way in this sense is starting the analysis with ethos, logos and pathos, which represent the credibility (ethos) the conceptual articulation (logos), and the motion of the feelings (pathos). They might appear obvious elements of a formula, but in reality they are not so obvious. Ethos

in particular is highly confused with a false morality, or with a brand image based on the power of money. To understand the magnitude of this deterioration it is perhaps the case to define two different perspectives under which Cicero and Aristotle defined Ethos. The first argued that credibility was to be understood as the image that you were able to provide for yourself, together with the authenticity of your personal behaviour. Aristotle, on the other hand, argued that Ethos was the credibility that you could communicate with your oratorial skills, giving a sort of 'brand identity', not necessary coherent with your private life. Which of these two definitions prevail today is quite obvious, however it is not obvious which of the two attitudes artists want to embrace, most of all if they are involved in the so called public art 'social turn'. Under the point of view of the logos, then, I recognize a deep need to create platforms that serve as conceptual devices to foment dialectical forms of activism and change. But what makes the two previous points so effective is the pathetic attitude, which becomes the detonator of stories and wonder.

The psychologist Ugo Morelli underlines that the main problem we have today is the access to knowledge and opportunities. We miss the codes to enter, and this becomes consequently lack of power of imagination. Alasdair Macintyre points out that modern reason is no longer able to move to action, because it is a faculty of an isolated individual who does not recognize his dependence on a cultural dimension of community in which he\she is placed. Scitovsky distinguishes between 'new' and 'comfort': what leads to increases in happiness is the experience of novelty, but it turns into comfort that soon leads to boredom. According to this theory, happiness is linked to creativity, which often allows you to make the experience of novelty and opposes comfort. But what are the ways of creativity? Taking up again Martha Nussbaum: first of all we need critical thinking: the ability to argue respectfully with others, to examine the tradition and prejudice with Socratic spirit. Secondly, we need the history of knowledge. Finally we need the ability to put ourselves in the shoes of people different from us, class, race and religion.

From this point of view, Participatory Art has carried out these practices as a free form of expression, creating dialectic engaging art devices. Art does not become simply a subject of debate, but a real learning medium that offers innovative tools in dealing with issues related to communal living.

Nicolas Bourriaud argues repeatedly that art is a state of encounter. Pierpaolo Donati stresses that every relationship is a reality that is immaterial that stands between the acting subjects, and directs the reciprocal act and consists of subjective and objective elements which define the distance. Under this perspective the use of pragmatic functions and argumentative role was very useful to grasp the illocutory force of participatory art and advertising' multimodal processes. The artists and all those who act in this context must first hearkens and then begin a mediation in order to reduce this distance without eliminating it. Donati goes further and speaks of relational goods defined as emergent effects of the action, not the effect of the choices of the actor, or the environment, but the product or effect of concrete relations, assets that can change the very will of the actors, promoting action and knowledge through the desire of the novelty, what Aristotle stressed: 'a reason that desires and a desire that reasons'.

The defence of science in the public sphere

LEAH CECCARELLI

Department of Communication
University of Washington
Seattle, WA 98195-3740
United States of America
cecc@uw.edu

ABSTRACT: This paper examines the argumentative strategies of scientist citizens who embrace their civic responsibility to respond to the post-truth, anti-science politics of the Trump administration. The nascent appeals of a newly awakened expert public combine standard social movement genres and argumentative forms with assumptions and values drawn as much from the technical sphere as the public sphere. The result is something both familiar and entirely new.

KEYWORDS: opinion editorials, posters, protest rhetoric, public letters, rhetoric of science

1. INTRODUCTION

When Donald Trump won the United States presidential election of 2016, scientists were alarmed. Before running for office, Trump had dismissed the scientific consensus on two key issues when he called global warming a Chinese "hoax" (Trump, 2012; Trump, 2013) and when he linked vaccines to autism (Trump, 2014). During the campaign, he selected a running mate who disagreed with the scientific consensus on evolution (Montanari, 2016). As he transitioned into office, he selected a budget director who asked "do we really need government-funded research at all?" (Kasprak, 2016). Nonscientists whose only qualifications were ideological opposition to the very missions of the organizations they were appointed to run were picked to lead key agencies, and rules were put into place that restricted academic scientists from joining advisory boards and that diminished the role of scientific evidence in decision-making by those agencies (Davenport, 2018). The Department of Health and Human Services began to discourage the use of the words "evidence-based" and "science-based" in arguments for federal funding (Sun & Eilperin, 2017). Given these actions, it came as no surprise when the administration's proposed 2017 and 2018 budgets included deep cuts to federal funding of basic science, cuts that Congress refused to make (Koren, 2018).

Trump's travel restrictions had, and will continue to have, repercussions on the movement of scientists to the United States to study or do research (Hoy, 2017). In France, President Emmanuel Macron announced a plan to provide funding to American climate scientists who were being stymied by Trump in their efforts to "Make the Planet Great Again," and several took him up on the offer to move their research to France (Tatum, 2018). One scientist working for the U.S. Interior Department acted as a whistleblower when he reported the suspension of his research on the inconvenient truth of climate change (Clement, 2017). Another revealed that the administration had buried a study that its own people had commissioned about the economic impact of refugees, because the findings indicated that the net impact is positive, and that was a fact that did not fit the administration's preferred narrative (Davis & Sengupta, 2017). Well into Trump's second year of office, he still had not appointed a science advisor; he was the only U.S. president since the position of science advisor was established who had waited so long to appoint one (Morello, 2017).

In response to these developments and others, U.S. scientists began to do something they rarely do. They entered the public sphere as citizen activists. They have written op-eds in newspapers and penned public letters of protest, signed by thousands of their fellow scientists. When scientific data began disappearing on government websites and federal scientists were told that they could not talk to the public without preauthorization, they created rogue social media sites such as AltCDC and AltEPA. And on April 22, 2017, they marched for science, in Washington DC and over 600 other cities. Then they did it again the following year.

Much of my recent research has been on the ethos of scientists in the modern world, with a particular focus on the figure of the scientist citizen. This figure should not be confused with the citizen scientist. The *citizen* scientist is a non-expert who enters the technical sphere to participate in some way in scientific research. The *scientist* citizen moves in the other direction. Scientist citizens are experts who recognize a responsibility to act for the public good by stepping out of the technical sphere to make arguments about science-related matters in the public sphere.

In the project that I report here, which is still in its early stages, I look at the argumentative tactics of a newly awakened movement of scientist citizens in the United States that sees itself as part of the resistance to the Trump administration.

2. LITERATURE REVIEW

Some research has already been done on this community of arguers. Political scientist Ashley Ross and her co-authors surveyed participants in the 2017 March for Science in three major U.S. cities and found that those who self-identified as scientists were motivated by concerns about the current administration, a desire to promote science, and fears about environmental damage, cuts to scientific funding, and the rise of alternative facts. 99 percent of them said they believe that scientific data is critical for good governance (Ross, Sturminger, Winking, & Wedemeyer-Strombel, 2018, pp. 235-237).

Sociologist Norah MacKendrick also wrote about this "new wave of science activism." She argued that it is different from previous moments when scientists took to the streets because it is not about the use or misuse of a particular discipline (like the antinuclear movement of the 1960s and 1970s, for example). This time, all branches of science are being united "under a single banner" and demarcated from the nonsense non-science of alternative facts. In this new wave of science activism, there is a belief that science "writ large" is a public good that needs protecting from those who would destroy it (MacKendrick, 2018, pp. 897-899).

My own preliminary analysis of the public arguments made by scientists on March for Science posters, public letters, and op-eds is consistent with these findings. Whether they are making persuasive appeals to administration officials, or agenda-setting appeals to sound the alarm to a broader non-scientific public, or motivational appeals to fellow scientists to create a sense of solidarity in resistance, these scientist citizens are united in arguing that science is a public good that needs to be protected from the ongoing assault of the current administration.

3. MARCH FOR SCIENCE POSTERS

The embodied material rhetoric of scientists marching down a public thoroughfare is the most striking argument of the March for Science. Just as early women's suffrage activists used the very physical act of stepping out of the private sphere and marching in the public sphere to argue that their citizenship rights should not be abridged, so too do scientists use the very

physical act of stepping out of the technical sphere and marching in the public sphere to argue that they are citizens with voices that should be heard in a nation that considers itself democratic.

A closer look at the posters they carry when marching tells us something about the specific rhetorical character of this social movement. Here are a few that I saw during the first March for Science:

(1) Got smallpox? Me neither. Thanks science!

(2) Science *trumps* ignorance. Make America smart again.

(3) What do we want? Evidence based science. When do we want it? After peer review.

(4) Science. True whether you believe in it or not.

(5) I'm not a mad scientist. Just disappointed.

(6) Science is not a liberal conspiracy.

As expected, these slogans all focus on science as a big tent activity, rather than arguing for particular disciplines, or even broad categories of knowledge production, such as the physical sciences or the social sciences. They also tend to emphasize the public good of scientific research, such as curing disease or overcoming ignorance.

Many play off of allusions to other slogans, whether from political contests ("Make America Great Again"), or advertising campaigns ("Got Milk?"), or other social movements ("What do we want? … When do we want it? ..."). By using wit to encourage a smile from other marchers and bystanders, they seem to acknowledge the incongruity of scientists entering the public sphere as protestors, while taking the edge off of the discomfort that might come from this unusual state of affairs. The twists that these posters perform on familiar mottos are designed to spark delight rather than fear or disgust. Irony is the figure of choice here, serving the ego-function of protest rhetoric (Gregg, 1971) by addressing fellow protestors with a constitutive rather than an instrumental persuasive end. By characterizing scientists as hip, connected, and relatable members of a broader public culture, rather than as cold, humorless, and disengaged automata, these slogans help to call a community of scientist citizens into being.

The wry humor of the slogans carried by scientist citizens in the March for Science conveys something about this new wave of science activism that makes it different from other, more familiar protest movements. Rather than a minoritized community seeking equal access to the privileges of the rich and powerful, this is a movement by people who are the very definition of an elite group. Rather than seek a power that has long been denied to them, they are a class of workers who are alarmed that they are losing the respect and power that they have previously held. They see themselves as smarter than Trump and his supporters, and they are "disappointed" that his "ignorance" and penchant for unhinged "conspiracy" theory has not kept him from gaining so much power.

While this attitude on the part of scientist citizens makes sense, it is also dangerous when taken out of the context of a solidarity-inspiring march because it can play right into the hands of Trump, allowing him to continue portraying himself as a populist leader fighting the elitist snobs who look down upon the hard-working, forgotten men and women of the

heartland that he champions. As we shall see, this attitude appears in other forms of contemporary American scientist-citizen activism as well.

4. PUBLIC LETTERS

One appeal that appears with some frequency in the rhetoric of contemporary pro-science activists is an economic argument connecting investment in science to the prosperity of the nation. This is the argument most commonly seen in public letters addressed to Trump between the election and his inauguration.

For example, on November 30, 2016, 88 "prominent" scientists, organized by the Union of Concerned Scientists, released an open letter to President-elect Trump and the 115th Congress that began with an economic appeal. Among other things, it said:

> Scientific knowledge has played a critical role in making the United States a powerful and prosperous nation. … To build on this legacy and extend the benefits of science to all people, including Americans who have been left behind, the federal government must support and rely on science as a key input for crafting public policy.

Other scientists were invited to add their names to this public letter, with over 5,500 ultimately doing so. The tone of the letter was forward-looking, setting out what "Congress and the Trump administration should" do in the near future to "strengthen the role of science in policy making."

A week later, more than 800 earth scientists and energy experts signed an open letter to the President-elect making a similar argument through an even more direct appeal, focused this time on climate science (Lemonick, 2016).

> We, the undersigned, urge you to take immediate and sustained action against human-caused climate change. We write as concerned individuals, united in recognizing that the science is unequivocal and America must respond. Climate change threatens America's economy, national security, and public health and safety. … Embrace the enormous economic opportunities of transitioning to an energy-efficient, low-carbon society. Use part of your $1 trillion commitment to infrastructure development to expand democratized clean energy, boost U.S. competitiveness, and put America to work.

The imperative mood in this public letter might seem imperious, but the ends sought by the signatories align well with those sought by the president, namely, to strengthen the American economy.

In a more recent public letter, released on April 23, 2018, the conceit of speaking directly to Trump is abandoned. Signed by over 1,000 members of the U.S. National Academy of Sciences, the letter argues that "human-caused climate disruption is leading to suffering and economic loss," a condition that is worsened by the present Administration's withdrawal from the Paris climate accord. Rather than sticking to economic arguments that appeal to the values of Trump supporters, this public letter quickly veers into vituperation of the administration for its anti-science attitudes and actions.

> The decision to withdraw is symptomatic of a larger problem: the Trump Administration's denigration of scientific expertise and harassment of scientists. The dismissal of scientific evidence in policy formulation has affected wide areas of the social, biological, environmental and physical sciences. … Scientific evidence and research should be an important component of policymaking. We therefore call on the Federal Government to maintain scientific content on publicly accessible websites, to appoint qualified personnel to positions requiring scientific expertise, to cease censorship and intimidation of Government scientists, and to reverse the decision to withdraw the United States from the Paris Agreement (Scientists for Science-Based Policy, 2018).

This time, the demands are listed as if set before a third party. They are framed like the conditions that must be met before a strike will end or an occupation of a public space will cease. Rather than try to gain the assent of the administration and its supporters with the use of economic arguments, this public letter is designed to set the agenda of the uninformed and strengthen the commitment of those who are already outraged about the way science is being treated by the current administration.

In writing petition-like public letters such as these, scientist citizens alarmed about the Trump administration began with a set of arguments designed to persuade him and his allies; they pointed out that science fuels the economy, creates new jobs, and ensures global competitiveness. However, as time passed and appeals to reason failed, a more antagonistic approach was adopted. The charge that American scientists were being victimized by an aggressive, bullying president became the point of the public letter, and the signatories established themselves as a force of resistance standing against such treatment. This kind of public letter makes sense coming from a protest movement. Ever since the Declaration of Independence, public letters describing government figures as doing violence to people and practices are an American rhetorical tradition well designed to evoke anger and motivate collective action.

Where the rhetoric of these public letters veers from more standard protest movement rhetoric is in the ethos moves made by the signatories. The ordering of their signatures, and the information accompanying their names, suggests an argument ad verecundiam in the midst of their petition-like argument ad populum. For example, the letter from the Union of Concerned Scientists separates out 88 *prominent* scientists from the thousands who signed, and includes asterisks to indicate which of them are winners of the Nobel Prize, as well as obelisks to indicate which of them are recipients of the National Medal of Science. The letter from over 800 earth scientists and energy experts includes the honorific "Dr." before most names, and organizes them alphabetically by rank, so that all of the Professors are listed before the Associate Professors, and so on. The National Academy of Sciences statement, like all the others, includes the institutional affiliation of each of the over 1,000 scientists signing, almost all of which are high-ranking research universities. This highlighting of the elite status of the people who are protesting an oppressive government authority is an unusual move to see in social movement rhetoric.

5. OPINION EDITORIALS

A similar mix of arguments drawing on economic appeals, charging the administration with aggression, and paradoxically embracing the elite status of those who are the putative victims of that aggression is also seen in the final genre of protest rhetoric that I examine in this paper, namely, opinion editorials by scientists.

Marc Kastner, a physicist and former dean of science at MIT, set out the economic argument in an opinion editorial for the San Jose *Mercury News* in March of 2017 when he claimed that "basic research is the American economy's lifeblood." The current administration's "proposed draconian cuts to science research funding," said Kastner, would "handicap the U.S. economy and reduce our quality of life for decades." As evidence, he listed specific recent examples of federally-funded basic research that led to new technologies and new jobs, such as MRIs, GPS, the U.S. biotech industry, and Google (Kastner, 2017).

Maria Zuber, a geophysicist who is vice president for research at MIT, wrote an op-ed for *The New York Times* in January 2018 arguing that what is at stake when the administration cuts federal funding "is America's dominance in science, engineering and innovation." She

argued that "investment in research has been key to keeping the United States at the forefront," and she warned that "other nations, seeing us lose focus, are seizing the chance to rise."

> We cannot continue to advance the frontiers of knowledge and lead the world in innovation without funding for students and equipment, and when the only long-term federal commitment is to fiscal uncertainty. … To write the next great chapter in the story of our nation, we must continue to fuel discovery (Zuber, 2018).

The frontier myth that Zuber used in her editorial to portray science as a geopolitical race for intellectual territory has great potential to appeal to the America-first attitude of Trump voters. A few years ago, I wrote a book on the frontier of science metaphor, detailing how it has long been used to promote federal funding of basic scientific research as a vital part of American national identity (Ceccarelli, 2013). From Vannevar Bush's claim prior to the launch of the National Science Foundation that the Federal government should foster the opening of new knowledge frontiers, just as it had earlier fostered the opening of literal frontier territory on the North American continent (Bush, 1944), to more recent appeals comparing the Human Genome Project to the Lewis and Clark mission (Collins, 2005), American scientists have argued that economic benefits inevitably follow the government's investment in pioneering scientists. It has been a winning argument for a long time.

But oddly, while I found that economic appeals are common in the op-ed arguments of today's anti-Trump scientist citizens, the "frontier of science" metaphor, with its suggestion that we can sustain international competitiveness by supporting the frontier spirit of American scientists, does not appear very often.

Another metaphor that *was* pervasive in the op-eds was a combat metaphor, with scientists portraying themselves as the victims of Trump's unjust "war on science." A number of them even included that phrase in their headlines. For example, theoretical physicist Lawrence Krauss wrote an op-ed for *The New Yorker* in December of 2016 titled "Donald Trump's war on science" (Krauss, 2016). In July of 2017, he wrote another for *Slate Magazine* titled "Do not take your eye off Trump's war on science" (Krauss, 2017). Biologist A. J. Russo wrote an op-ed for the *Baltimore Sun* in February of 2017 titled "Trump is waging a war on science" (Russo, 2017). This language is notable because it characterizes the president as waging a war against his own people. American science, which should be a source of pride for the nation, becomes a victim in this scenario, requiring a savior in the form of citizen activists who are committed to defending it.

Even op-eds that do not use the war metaphor in their headlines include variations of it in their arguments. Astrophysicist Mike Specian's *Baltimore Sun* op-ed in April of 2017 says the American government is "targeting research" that it finds inconvenient, as it "slashes funding" at the National Institutes of Health and "guts the EPA" (Specian, 2017). Astrophysicist and former Clinton science advisor Neal Lane co-authored an op-ed for *The New York Times* in January 2018 that calls for readers to stand against "the assaults by Mr. Trump and his administration on American science and technology" (Lane & Riordan, 2018). These op-ed denunciations of the administration for doing violence to science are like that public letter that condemned the censorship, intimidation, and harassment of scientists by the Trump administration. The use of a rhetoric of violence suggests that allies are being sought in a battle against an oppressive regime. It is a fairly standard argumentative stance for a protest movement to take.

What is less common in a protest movement is the argument that I found in some of these scientist activist op-eds calling for a restoration of science to its rightful place. This is a decidedly elitist appeal. It suggests that the current denigration of scientists is a problem because science *should* be at the *top* of our social hierarchy.

We can see this appeal in some of the directional metaphors used in the op-eds, which I will highlight here for ease of recognition. Krauss speaks of "the Trump administration's intent to *sideline* science" and his "larger effort to *undermine* the institution of science, and to deprive it of its role in the public-policy debate" (Krauss, 2016). With this language, we are told that science, which should have a position of priority at the front or the top of things, is being pushed aside or undercut. Specian identifies the problem as "an *erosion* in respect for the scientific process," a "denial of empirical reality" that seeks "to *delegitimize* and *dismantle* aspects of our national scientific ecosystem." Science belongs at the top of this ecosystem, he suggests, and it is being unceremoniously taken down. He asserts that citizens need to "work to *restore science to its rightful role*" (Specian, 2017).

Language in these op-eds that characterizes the president and his appointees as having "rejected" scientific truths or arguments (Russo, 2017; Lane & Riordan, 2018), or having dismissed or denied science (Krauss, 2016; Specian, 2017; Krauss 2017), or having acted as skeptics (Russo, 2017) with "obvious distain for science" (Lane & Riordan, 2018), is language that plays into this sense of a proper hierarchy being subverted. As with the highlighting of the elite status of the scientist citizen activists who signed the public letters, I fear the message being conveyed is not in perfect line with democratic values. The subtle suggestion is being made that some voices are rightfully more equal than others, and the problem with the current administration is that it does not recognize that.

6. CONCLUSION

Anti-intellectualism has long been embedded in America's national fabric (Hofstadter, 1962). Trump stokes this attitude, as well as a broader anti-elitism that aligns liberal thinkers with establishment politicians and makes them, along with racial minorities and immigrants, into the enemies of the so-called "forgotten men and women" who make up his enthusiastic base.

This "forgotten man" figure was first introduced to the United States by William Graham Sumner during the gilded age. As he put it, the forgotten man is "the simple, honest laborer … independent, self-supporting" who is unfairly being compelled by bureaucrats and philanthropists to pay for social programs that sustain what Sumner called "the vicious, the idle, and the shiftless … good-for-nothing" who lies at the bottom of the social hierarchy (Sumner, 1919, p. 476). Trump uses this same figure of the "forgotten man" during his campaign rallies to align himself with the white working class, and to portray his opponent as elitist, a voice "for the top 1%" who, with her "basket of deplorables" line, looks down "with contempt for the people who thanklessly follow the rules, pay their taxes, and scratch out a living for their family" (Trump, 2016).

I happen to think that this is an odd argument to hear from a president who bragged during the campaign that he was "smart" to have avoided paying taxes (Diaz, 2016), and I find it troubling that the "basket of deplorables" line from Hillary Clinton was ripped out of context and made to mean the opposite of what she actually intended (Ceccarelli, in press). In addition, the idea of a self-proclaimed billionaire calling a millionaire too rich to understand the needs of the common man is bizarre on its face. But I suspect that Trump's ungrammatical vocal patterns, untailored suits, and tendency to wear a baseball hat make him seem like a common Joe to his supporters, allowing them to overlook that inconsistency. In a recent rally, Trump appealed to "the forgotten men and women" of America: "They're the smartest people. They work the hardest. They pay taxes. They do all of the things." He then contrasted them with "the elite" who look down upon them as "deplorables." His audience ate it up, breaking out into spontaneous chants of "U.S.A.!" "U.S.A.!" "U.S.A.!" (Trump, 2018).

In the context of this kind of populist, anti-elitist appeal, scientist activists might do better to focus on economic arguments and use the war-on-science frame to present those arguments, while dropping the elitism-tinged "restore science to its rightful place" line of argument. That latter argument just plays into Trump's political frame that describes the forgotten men and women of America as hard-working victims of a cultural elite, and allows him to represent his assault on science as a just war, rightfully bringing those snobs in the Ivory Tower down a notch or two with good old-fashioned American skepticism. Scientist citizens have a more rhetorically effective set of arguments on hand when they align science with economic development and portray the administration's war on scientists as government censorship and bullying. They might even craft a winning counter to Trumpian anti-elitism by portraying scientists working at the frontiers of knowledge as inheritors of an American pioneering spirit, working hard to claim and develop intellectual territory that enriches the nation as a whole. That little piece of advice might sound strange coming from someone who wrote a whole book critiquing the frontier of science metaphor. But desperate times call for desperate measures. When scientists are the ones whose voices are being stifled, and when scientists are often the only ones who can stand up as whistleblowers against a know-nothing, post-truth, anti-science government, rhetorical strategies that help them to frame themselves as heroes of the American story, rather than as elitist villains, might ultimately help them win the day.

An experiment in mining argumentative relations "in the wild"

OANA COCARASCU & FRANCESCA TONI

Department of Computing
Imperial College London
United Kingdom
{oc511, ft}@ic.ac.uk

ABSTRACT: Argument mining focuses on the automatic detection in text of arguments, argument components, and relations between arguments, supported by annotated corpora and machine learning techniques trained on these corpora. We describe two experiments "in the wild" on deploying various classifiers trained on an existing corpus to extract argumentative relations of attack and support from a dialogue and from a short text, and compare the relations identified by the classifiers with those identified by human annotators.

KEYWORDS: argumentation, machine learning

1. INTRODUCTION

Argument Mining (AM) aims at automatically identifying arguments and components of arguments in text, as well as at determining the relations between these arguments, on various annotated corpora using machine learning techniques (Lippi and Torroni, 2016).

In this paper we focus on Relation-based Argument Mining (RbAM) (Carstens and Toni, 2015) to determine argumentative relations of attack and support between any two texts, a step towards extracting, from text, Bipolar Argumentation Frameworks (BAFs) (Cayrol and Lagasquie-Schiex, 2005), namely graphs whose nodes are arguments and with two types of edges (representing attack and support relations). These graphs can then be deployed to support a number of applications, for example to capture and analyse debates in social networks (Cabrio and Villata, 2013) and to support decision making (Amgoud et al., 2008).

We describe the use of trained classifiers "in the wild", analysing two entire, unseen texts. We experiment with various Machine Learning (ML) techniques, i.e. Support Vector Machines (SVMs), Random Forests (RFs), and Long-Short Term Memory (LSTM) networks, also used in (Bosc et al., 2016; Koreeda et al., 2016; Carstens and Toni, 2017) to determine argumentative relations. We train these classifiers on the dataset from (Carstens and Toni, 2015) consisting of pairs of texts annotated as attack, support, or neither attack nor support.

AM has been deployed in various settings, from Twitter (Bosc et al., 2016) to discussion forums (Ghosh et al., 2014). Our experiments focus on deploying AM to extract BAFs from an excerpt dialogue from the film Twelve Angry Men[1] and from a short text, to test whether trained classifiers can achieve comparable outcomes to those of humans.

For the first experiment we use the BAFs generated by 21 annotators, enrolled as master Computing students. We did not require the identification of the exact boundaries of arguments within the dialogue, instead we specified these boundaries and asked the annotators to focus on the identification of the relations between arguments. For the second experiment we use the BAFs generated by 19 annotators, again enrolled as master Computing students, from a short text, this time without specifying the boundaries of arguments. In both experiments, we also included in our analysis the BAF that we manually extracted from the texts.

---

[1] http://www-sop.inria.fr/NoDE/NoDE-xml.html#12AngryMen

For the classifiers we have experimented with, there was no overall winner: LSTMs and RFs performed the closest, for the first and second experiment respectively, to the human annotators.

The remainder of the paper is organised as follows. We discuss related work in Section 2 and describe the ML techniques for RbAM and the dataset used for training ML algorithms in Section 3. We present the first experiment in mining BAFs from the dialogue excerpt from Twelve Angry Men in Section 4 and the second experiment in mining BAFs from the short text in Section 5. We conclude the paper and present directions for future work in Section 6.

2. RELATED WORK

RbAM, as defined by Carstens and Toni (2015), focuses on the detection of argumentative relations of attack and support and can be seen as a prerequisite for constructing BAFs. BAFs are triples ⟨AR, Att, Sup⟩ consisting of a set of arguments AR and two binary argumentative relations of attack (Att) and support (Sup) between arguments (Cayrol and Lagasquie-Schiex, 2005). For example, consider the three texts:

A1: *"We should go to the park."*
A2: *"It is going to rain."*
A3: *"We can take an umbrella so we can still go."*

These texts can be seen as "arguments" in a BAF with AR = {A1, A2, A3} and relations as shown graphically below (where dashed edges represent attack and standard edges represent support):

$$A_1 \dashleftarrow A_2 \longleftarrow A_3$$
Whilst most studies that focus on determining links between (components of) arguments assume that the arguments have already been identified, Carstens and Toni (2015) focus on identifying directly the relations between any two texts, irrespective of their stand-alone argumentativeness, being able to identify texts that may appear non-argumentative when analysed in isolation but become argumentative when read in context, as in the earlier simple example.

RbAM can be treated as a ML classification task with three classes: support, attack, and neither support nor attack. Several ML techniques have been deployed in the literature for RbAM. Bosc et al. (2016) used Long-Short Term Memory (LSTM) (Hochreiter and Schmidhuber, 1997) networks to determine the type of relations between arguments extracted from tweets, whilst Koreeda et al. (2016) used a Bidirectional Recurrent Neural Network to classify evidences that support a claim promoting or suppressing a value. Carstens and Toni (2017) used RFs (Breiman, 2001) and SVMs (Boser et al., 1992) to determine the type of relations between texts extracted from news, whereas Stab and Gurevych (2016) used SVMs to classify support and attack relations in persuasive essays. These ML techniques are also used for other AM tasks we do not consider. For example, Habernal and Gurevych (2016) used LSTMs to determine which argument is more convincing whereas Bowman et al. (2015) used stacked LSTMs to determine entailment, neutral and contradiction relations amongst sentence pairs from the SNLI corpus (Bowman et al., 2015). These relations are of a different kind than the ones underlying the construction of BAFs.

There are few works on AM "in the wild". For example, Cerutti et al. (2016) manually extract a BAF from a online debate, whereas Salah et al. (2013) use sentiment analysis to extract

graphs from parliamentary debates where nodes are labelled with the sentiment of the speaker and edges between nodes of same/different polarity are labelled as supporting/opposing.

3. TRAINING CLASSIFIERS FOR RBAM

3.1 Training dataset

We use a dataset[2] covering various topics, with 27% attack relations, 43% support relations, and 30% neither attack nor support relations. The dataset includes, amongst others, a corpus extracted from news, (Carstens and Toni, 2015) and the quotes and replies from the Internet Argument Corpus (IAC) (Walker et al., 2012), labelled with three classes (support, attack, neither).

This dataset was deemed to be the most appropriate for an experiment "in the wild" as the texts it consists of resemble the ones that can be found in debates and the short text that we use in our experiments, unlike persuasive essays (Stab and Gurevych, 2016) and the SNLI corpus (Bowman et al., 2015), which are more structured.

3.2 Argument mining experiments

We experimented with various ML techniques to determine the type of argumentative relations between texts: SVMs, RFs, as well as a deep learning method based on LSTMs. These techniques have been used in previous AM studies as discussed in Section 2.

The deep learning approach uses two parallel LSTMs, where each input text from the pair of arguments considered is fed to a LSTM network as a 100-dimensional GloVe embedding vector (Pennington et al., 2014). The outputs of the two LSTMs are then concatenated and fed to a fully-connected layer before being fed to a softmax classifier. For the non-deep learning approaches, we use syntactic features such as number of words, the sentiment polarity of each text, and various similarity measures.

The results on our training dataset, using 10-fold cross-validation (CV) are given in Table 1.

Classifier	A%	P%	R%	F_1%
RF	97.16	97.20	97.16	97.15
SVM	71.34	71.36	71.34	70.99
LSTM	89.53	90.80	87.67	89.07

Table 1: 10-fold CV results on training dataset (we report Accuracy, Precision, Recall, and F1). The variance for F1 using LSTMs is 0.73 on 5x10 CV.

4. FIRST EXPERIMENT: MINING BAFS FROM A DIALOGUE EXCERPT

We set the task to extract a BAF (by identifying argumentative relations between arguments) from a dialogue excerpt taken from the film Twelve Angry Men, which revolves around the reasoning of twelve men that deliberate on a homicide trial.

---

[2] https://www.doc.ic.ac.uk/~oc511/ACMToIT2017_dataset.xlsx

The dialogue excerpt we use is shown below:

A0 The boy is not guilty.

A1 I never saw a guiltier man in my life. You sat right in court and heard the same thing I did. The man's a dangerous killer.

A2 He's 19 years old [too young to be guilty].

A3 Old enough. He knifed his own father, four inches into the chest. An innocent little 19-year old kid. They proved it a dozen different ways.

A4 It's not so easy for me to raise my hand and send a boy off to die without talking about it first.

A5 I think the guy's guilty. You couldn't change my mind if you talked for a hundred years.

A6 This boy's been kicked around all his life. You know, living in a slum, his mother dead since he

was nine. That's not a very good head start. He's a tough, angry kid. I think maybe we owe him a few words [before considering him guilty].

A7 We don't owe him a thing. He got a fair trial. You're not going to tell us that we're supposed to believe him, knowing what he is. I've lived among 'em all my life. You can't believe a word they say.

A8 I just think he's guilty. I thought it was obvious. I mean nobody proved otherwise.

A9 Nobody has to prove otherwise. The burden of proof is on the prosecution. The defendant doesn't have to open his mouth. That's in the Constitution. The Fifth Amendment.

A10 At 10 minutes after 12 the old man who lived

underneath the room where the murder took place heard loud noises in the upstairs apartment. He heard the kid say to his father, "I'm gonna kill you!" A second later he heard a body falling and saw the kid running down the stairs. Then he called the police. They found the father with a knife in his chest.

A11 And the coroner fixed the time of death at around midnight.

A12 The boy's story is flimsy. He claimed he was at the movies. That's a little ridiculous, isn't it? He couldn't even remember what pictures he saw.

A13 What about the woman across the street? If her testimony [to have seen the killing] don't prove [that the boy is guilty], then nothing does.

A14 [She saw the killing] through the windows of a passing elevated train [so testimony unreliable].

A15 And they proved in court that you can look through the windows of a passing train at night and see what's happening on the other side.

A16 I started to be convinced, with the testimony from those people across the hall. Didn't they say something about an argument between the father and the boy around 7 o'clock that night?

A17 8 o'clock. They heard the father hit the boy twice and then saw the boy walk angrily out of the house. [It doesn't prove that the boy killed him].

4.2 Annotation results

The annotators were 21 master Computing students, with us also extracting a BAF. The students had been lectured on AM, RbAM, and BAFs but were otherwise non-expert annotators.

We instructed the annotators that their annotations should lead to a BAF ⟨AR, Att, Sup⟩, with AR = {A0, . . . , A17}, namely we instructed them that each paragraph in the dialogue should be seen exactly as one argument. We also instructed the annotators that their BAFs should follow the discussion flow in which one argument supports or attacks another argument

previously expressed in the dialogue and that the BAF should thus be "minimal" in the sense that each argument (except the first one) has one outgoing relation: $\forall a \in AR\backslash\{A0\}\ \exists b \in AR$ s.t. $(a,b) \in Att \cup Sup$.

We also instructed the annotators that, in the case of an argument supporting and/or attacking more than one argument, to guar- antee "minimality", the relation to the most recent argument only should be included in the BAF. Let $<$ be a total order over AR s.t. Ai $<$ Aj iffi $<$ j, fori,j $= 0...17$. Then, the "minimality" requirement amounts to the following:

$$\text{if } a, b_1, b_2 \in AR \text{ and } b_1 < b_2 < a \text{ then}$$
$$\text{if } (a, b_2) \in Att \cup Sup$$
$$\text{then } (a, b_1) \notin Att \cup Sup$$

The reason for preferring relations from more recent arguments is that this allows to limit the number of argumentative relations in BAFs, and thus generate BAFs that can be more easily understood in settings with a vast amount of information such as debates or online comments.

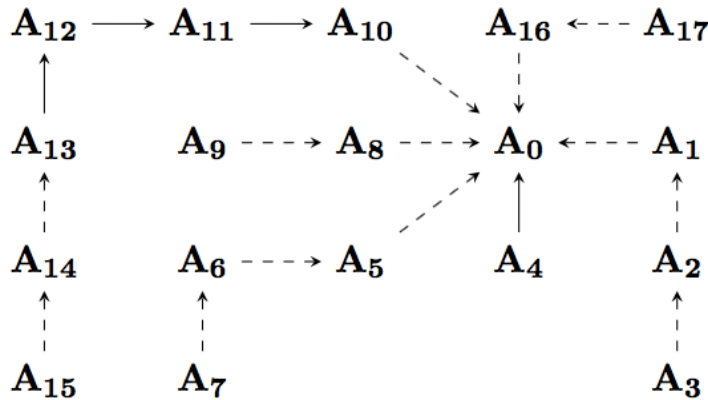
Figure 1 shows the BAF that we extracted from the excerpt dialogue fulfilling the conditions set for the annotation task.


Figure 1: Our manually extracted BAF from the excerpt dialogue (shown graphically).

Table 2 shows the number of each type of relation identified by all annotators, including our annotation. Note that, whilst given clear instructions for annotation, there were a few annotators who did not follow the "minimality" requirement (i.e. (A0, A1), (A2, A4), (A6, A7) violate the requirement). Note also that some relations were identified as both attack and support (e.g. (A17, A16)).

	A_0	A_1	A_2	A_3	A_4	A_5	A_6	A_7	A_8	A_9	A_{10}	A_{11}	A_{12}	A_{13}	A_{14}	A_{15}	A_{16}	A_{17}

A_{17}	4s											1a					12a 10s	

Table 2: The relations (a for attack and s for support) and the number of times they have been indicated by the annotators.

The most controversial pair of arguments is (A17, A16). Indeed, 12 annotators identified this pair as belonging to the attack relation whereas 10 annotators identified it as belonging to support. In all other cases of doubly annotated pairs, one of the annotations is dominant.

From now on, we focus only on the relations on which at least 6 annotators agreed. This is because fewer relations than 6 were deemed to be insignificant in evaluating trained classifiers and 6 represents more than a quarter of the number of annotators used in this study.

When double annotations occurred, we used majority voting to select the relation type, thus the relation between A17 and A16 was chosen to be attack. All pairs that where doubly annotated can be seen as examples of ambiguous relations: for example, some annotators considered A16 to mean "I started to be convinced that he is not guilty" instead of reading it as "Didn't they say something about an argument...I started to be convinced that he is guilty".

We used Fleiss' kappa (Fleiss et al., 1971) and Krippendorff's alpha (Krippendorff, 2004) to compute the inter-annotator agreement. Both methods gave an agreement of 0.457, showing moderate agreement between the annotators and indicating the difficulty of the task. We also computed the number of relations identified by each annotator compared to the relations identified by at least 6 of the remaining annotators, yielding an average of 60.45% agreement. The relations (and the number of times each relation has been identified) are shown in Figure 2.
Figure 2: Argumentative relations and the number of times these have been annotated.

4.3 Mining argumentative relations "in the wild"

We report the performance of our trained ML classifiers in determining the type of relations from the ones identified by annotators (in other words, we determine recall). Whilst the ML classifiers identify other relations on top of the ones identified by annotators, we are interested in comparing the argumentative relations identified automatically with the ones identified by annotators. The recall of the methods we experimented with is shown in Figure 3. RFs perform worst, with best recall performance of 22%. This is because RFs fail to learn how to classify attack relations. This can also be seen in the graph as all relations that have been identified by at least 20 annotators are attacks and RF fails to classify these correctly. On the other hand, SVMs achieve good results classifying all relations as attack, which is the dominant type of relation in our BAF. The LSTM-based method is the one that performs the best, being able to classify both attack and support relations with recall above 80%.
Figure 3: Recall of ML classifiers we used to determine argumentative relations. Threshold t represents the number of times the relations have been identified by at least t annotators.

Our deep network is also able to classify argumentative relations that had not been identified by annotators (as they would have given rise to a non-"minimal" BAF). For example, our network shows that A16 supports A10, and that A14 supports A6. Whether identifying all possible relations between all arguments is better than extracting a "minimal" BAF is left for future work.

5. MINING ARGUMENTATIVE RELATIONS FROM A SHORT TEXT

Our second experiment focus on testing whether ML classifiers also perform similarly to humans when deployed on short texts. We asked 19 annotators to manually extract a BAF, with no information about the boundaries of arguments, from the following text which presents reasons for and against a person (Mary) renting some flat:[3]

B0 Mary should rent the flat.
B1 The flat is near Mary's work.
B2 The flat is located in a well illuminated and safe area.
B3 The flat is in a quiet area, because most of the neighbours are retired.
B4 The flat is tiny.
B5 Despite the size, spaces are well distributed within the flat.
B6 The flat shows signs of humidity problems.
B7 There are rumours that a nightclub will open in the area.
B8 Humidity problems take time to resolve.
B9 Local legislation forbids the opening of a nightclub in the area.
B10 The building's insurance covers fixing any problems promptly.
B11 A renowned architect designed the building to optimise space distribution.

Figure 4 gives the BAF that we manually extracted from this text.
Figure 4: Our manually extracted BAF from the flat example.

Without being given specific instructions about the boundaries of arguments, several annotators identified arguments at sentence level, whereas others split the sentences into multiple "arguments". We report the "merged" version of arguments in Section 5.1 and the "unmerged" version of arguments in Section 5.2.

---

[3] The sentence labelling is given here for ease of reference, and was not given to the annotators, who instead were presented with a monolithic, but short, text.

5.1 Merged arguments

Table 3 shows the number of each type of relation identified by annotators (support/attack) and Figure 5 shows the relations (and the number of times each relation has been identified). The inter-annotator agreement using Fleiss' 578 kappa and Krippendorff's alpha is 0.655, showing substantial agreement. The number of relations identified by each annotator compared to the relations identified by at least 6 of the remaining annotators yields an average of 79.11% agreement.

	B_0	B_1	B_2	B_3	B_4	B_5	B_6	B_7	B_8	B_9	B_{10}	B_{11}
B_0												
B_1	**20s**											
B_2	**19s**	$1s$										
B_3	**19s**	$1s$										
B_4	**19a**	$1a$										
B_5					**19a** $1s$							
B_6	**19a**	$1a$										
B_7	**9a**			**8a** $1s$			$1s$					
B_8							**3a** **14s**	$1a$				
B_9				$1s$			$1a$	**16a**	$1s$			
B_{10}	$2s$						**9a** $1s$		**8a**			
B_{11}	$1s$				$2a$	$1a$ **18s**						

Table 3: The relations (a for attack and s for support) and the number of times they have been indicated by the annotators for the "merged" version.

Figure 5: Argumentative relations and the number of times these have been annotated for the "merged" version.

The recall of our ML classifiers is shown in Figure 6. RFs perform the best, identifying 77% of the relations labelled by at least 14 annotators, being able to identify both support and attack relations, unlike LSTM and SVM which classify all relations as attack. We believe this

is because the length of the arguments in this experiment was shorter than those in our training dataset.

Figure 6: Recall of ML classifiers we used to determine argumentative relations in the "merged" version of the short text.

5.2 Unmerged arguments

As explained in Section 5, some annotators split some sentences in different arguments. This applies to B2 and B3 as follows:

B2 The flat is located in a well illuminated and safe area.
becomes:
B2 The flat is located in a well illuminated and safe area.
B12 The flat is located in a well illuminated area.
B13 The flat is located in a safe area.
whereas:
B3 The flat is in a quiet area, because most of the neighbours are retired.
becomes:
B3 The flat is in a quiet area, because most of the neighbours are retired.
B14 The flat is in a quiet area.
B15 Most of the neighbours are retired.

Table 4 gives the annotations when we consider split and unsplit arguments. The relations (and the number of times each relation has been identified) are shown in Figure 7. The inter-annotator agreement using Fleiss' kappa is 0.564 and Krippendorff's alpha is 0.565, showing moderate agreement. The number of relations identified by each annotator compared to the relations identified by at least 6 of the remaining annotators yields an average of 74.26% agreement.

	B_0	B_1	B_2	B_3	B_4	B_5	B_6	B_7	B_8	B_9	B_{10}	B_{11}	B_{12}	B_{13}	B_{14}	B_{15}
B_0																
B_1	**20s**															
B_2	**17s**	1s														
B_3	**7s**	1s														
B_4	**19a**	1a														
B_5					19a 1s											
B_6	**19a**	1a														
B_7	**9a**			3a 1s			1s								5a	
B_8							3a 14s	1a								
B_9			1s				1a	16a	1s							
B_{10}	2s						9a 1s		8a							
B_{11}	1s				2a	1a 18s										
B_{12}	2s															
B_{13}	2s															
B_{14}	**12s**															
B_{15}															**12s**	

Table 4: The relations (a for attacks and s for supports) and the number of times they have been indicated by the annotators.

Figure 7: Argumentative relations and the number of times these have been annotated for the "unmerged" version.

The recall of our ML classifiers is shown in Figure 8. Again, RFs perform the best, identifying 75% of the relations that have been identified by at least 14 annotators being able to identify both support and attack relations, unlike LSTM and SVM which classify all relations as attack. RFs identify the support relation (B14, B0) and (B15, B14) as well as the relation (B3, B0) related to argument B3 which has been split into two arguments by the annotators. The relations from arguments B12 and B13 are not considered as these had been identified by only 2 annotators, which is smaller than our threshold of at least 6 annotators.

Figure 8: Recall of ML classifiers we used to determine argumentative relations in the "unmerged" version of the short text.

6. CONCLUSION

We described two experiments "in the wild" on using different trained classifiers, SVMs (Boser et al., 1992), RFs (Breiman, 2001) and LSTM networks (Hochreiter and Schmidhuber, 1997), to determine argumentative relations of support and attack in text.

We asked human annotators to identify the argumentative relations from an excerpt dialogue taken from the movie Twelve Angry Men and from a short text, with the aim of extracting Bipolar Argumentation Frameworks (Cayrol and Lagasquie-Schiex, 2005) from each. We compared the argumentative relations extracted using trained classifiers with the ones extracted by the annotators and showed that there is no overall winner as to which ML classifier is better suited for this task: LSTMs and RFs performed the best, for the first and second experiment respectively, suggesting that different techniques might be better suited for different types of texts.

Annotating argumentative relations is a cumbersome task, difficult for human annotators, even for trained ones (Peldszus and Stede, 2013). Future work includes testing the the classifiers we considered and others on other texts. We aim at developing classifiers that achieve comparable results to human annotators in a wide range of settings. These classifiers could then be used to create more corpora, highly needed for experimentation. We have assumed that arguments are represented by at least one sentence. Future work includes identifying the arguments relevant for the issue considered (Wachsmuth et al., 2017).

No argument is an island: Argumentation between arguments

DANIEL H. COHEN

Department of Philosophy
Colby College
United States of America
dhcohen@colby.edu

ABSTRACT: Argumentation theory often focuses very narrowly on a very narrow conception of arguments, but some aspects of argumentation need a broader backdrop than the study of discrete arguments affords. Much of what makes argumentation important occurs before and after arguers engage. This paper examines the category of "inter-argument argumentative virtues" that are characteristic of good arguers when they are preparing for and processing arguments rather than actively arguing.

KEYWORDS: argumentative virtue, inter-argument, reasons-responsiveness

1. INTRODUCTION

Let me lay my cards on the table right from the outset: I have come to the conclusion that <u>argumentation theorists are too focused on arguments</u>. I know it sounds counter-intuitive or even oxymoronic, but there it is. The problem, however, is not simply a matter of focusing too much on arguments; it's about focusing too narrowly on arguments and using conceptions of arguments that are themselves too narrow. Some aspects of argumentation come to light only against a broader backdrop than the study of discrete, individual, and independent arguments affords. This is true whether arguments are conceived as abstract and timeless structures of propositions, devoid of arguers, or sequences of individual speech acts located in specific times, places, and social-cultural contexts. Much of what is important about argumentation happens outside the boundaries of arguments.

Arguers bring their own histories to arguments, so the effort to understand an argumentative exchange without reference to anything that has gone on before in the arguers' individual lives or their past relations to one another turns an already difficult task into a gargantuan one. But arguments, no less than arguers, have histories of their own, so the effort to understand an argument about a given topic without any reference to earlier discussions of the issue or how it relates to other topics makes the gargantuan task Herculean.

Most important, arguments have effects extending into the future. The persuasive effects of argumentation, for example, might not appear until well after the arguers have disengaged, after they have had time to reflect, and when it is easier to change one's mind without losing face, so the attempt to give an account of an argument without reference to anything that happens before or after the narrowly circumscribed time, place, and events of that engagement – in effect, starting anew with each argument – now makes the Herculean task Sisyphean.

Consider this: I have been involved in an on-going series of arguments with John, a close friend and occasional collaborator. It has been going for several decades now on the general topics of truth, objectivity, realism, and knowledge. We have gone back and forth over the years without ever reaching resolution. No surprise there: both of us are academics who are much too practiced in argumentation to find ourselves backed into any corners from which there is neither retreat nor escape. No instalment ever ends with either one of us convinced or persuaded. Neither one has ever admitted defeat; neither one has ever been able to claim victory;

and there has never been anything like settlement or closure (and the prospects for the future on those fronts are not rosy). The episodes end when we disengage and another one begins when we meet again, picking up more or less where we left off.[1]

Now there must be a lot more in that "more or less" than meets an argumentation theorist's eye because while there is almost never any perceptible movement in any of our arguments, there has been a great deal of progress over the years. I have noticed that John has occasionally incorporated my ideas into his own standpoint at our next meeting; more often, I realize that I have adopted parts of his perspective. I often find his insights emerge from my mouth when I am arguing with others and I like to think that his arguments with me might similarly inform his arguments with others.

The fact is that a very clever arguer might never have to concede anything in the course of arguing, and might always win the day, even when her opponent has a genuinely better argument. However, if the very clever arguer is also a very good arguer, she will both be able to recognize the better reasons and be respond to them. She will adjust her beliefs accordingly, if not right away, then eventually. The adjustment might not happen until well after the argumentative exchange has ended. That puts conventional theorists in the awkward position of having to say that the "victorious" arguer was convinced by her opponent's "defeated" argument. If the "defeated" standpoint is the only one that survives, didn't the loser win?

2. THE DIAGNOSIS

Arguments, at least if we use that word to mean more than just inferences, the purely logical relations between disembodied propositions, include arguers who are engaged with one another. Thus, we have the curious phenomenon that an argument's efficacy outlasts its arguers' engagement. An argument can work its cognitive magic even after the argument has ceased to be.

From one perspective, there is nothing particularly mysterious about arguments having after-effects, but from the perspective of argumentation theories that treat arguments as well-defined sequences of events, it is something to be noted. We should have something to say about the how and the why of the phenomenon.

What makes this phenomenon especially worthy of attention is its potential to affect both how we argue and how we think about arguments. I do not know, of course, whether focusing on what happens outside of arguments will in fact alter how we argue, but I do think it should. Argumentation theory cannot be divorced from either the practice or pedagogy of argumentation, and paying attention to what happens outside the narrow spatio-temporal confines of argumentative engagements reveals new ways to understand argumentation, new ways to assess arguments, new ways to argue, and, especially, new ways to appreciate what makes good arguers. The times when we are not actively engaged in an argument – when we are between arguments, as it were – are the times when we can process earlier arguments and prepare for subsequent arguments; they are also opportunities to make better arguments; they are, in sum, when we can become better arguers.[2]

Any explanation as to why there is this delay has to start with the dominant adversarial model for arguing, the DAM account, replete with its militaristic vocabulary of the force of reason including defences, attacks, opponents, and winning and losing.[3] No one likes to lose, and able arguers can make sure that they do not. It is paradoxical, however, to have to associate the positive cognitive gains of coming to believe or understand or appreciate something because of an argument with losing the argument and for that, the DAM account is culpable. Even if, as is surely the case, some of the delayed effects of argumentation can be traced to the time it takes to process, deliberate, and incorporate what one has heard, it is still safe to say that a lot of the

damage can be undone by simply re-conceptualizing the roles and goals of argumentation.[4] That is to say, the cognitive dissonance that comes with conflating learning and losing should be the occasion for furthering the development of our thinking about argumentation.

There is a lot to dislike about the dominant adversarial model: it has distorting and deleterious effects for both the theory and practice of argumentation.[5] There is also rather a lot to appreciate about it. It provides us with ample conceptual wherewithal for thinking about and unifying many different aspects of arguing. The argument-is-war metaphor is, well, an old war-horse of a metaphor. It has performed yeoman service as an organizing scheme for our thoughts about arguments regarding attacks, counter-attacks, defensive strategies, outcomes, and the like. Moreover, to switch metaphors about the metaphor (the meta-metaphor?), it has been a goldmine of meaning that despite having been excavated at length still has veins that have not been exhausted. Such war-related concepts as collateral damage, unjust wars, cold wars, war crimes, and who knows what others may turn out to have theoretically interesting and useful counterparts in argumentation.[6]

The aspect of wars that I want to reflect back onto arguments here concerns how we explain them and how we understand them. We know better than to try to explain, say, the Great War of 1914 to 1918 – World War I – while studiously ignoring everything that happened before 1914, or trying to understand its historical significance without taking into account anything that happened after 1918. Wars are not random, isolated eruptions in history; their historical contexts matter. The pre-war and post war eras earn those names because they are useful to historians to historians.

Arguments are not wars, of course, but at least in this respect, maybe they are not so very different. And yet we are content to labour under the assumption that a full account of an argument can ignore the surrounding inter-argument periods from our reckoning. So much of what has been of interest and value in my decades-long argument with John has taken place between our engagements. Again, argumentation theory should have something to say about the fact that even when the arguers, the "effective" causes for arguments, are no longer operating, and their speech acts, which are the material cause, cease to exist, argumentation continues. Arguments are over when the speech acts end. If, after the arguers have disengaged from one another, they are still formulating or anticipating objections and responses, crafting new strategies, and revisiting, refining – and probably rewriting – their standpoints in response to the dialogue, the argument has not really ended: they are still arguing. When John and I next take up the argument, it will not be exactly where we left it. Things will have changed.

The point is that arguments are not discrete, self-contained, unconnected islands that can be inspected, mapped out, and fully understood in isolation.

One set of connections comes from the fact that arguments have histories. An arguer may have a history of engagement with her interlocutors; she may have a history of engagement with the subject matter of the argument; and, for that matter, the subject matter itself may have a history to take into account. It would be impossible to fully understand, say, an argument about capital punishment in the United States while ignoring political federalism, institutional racism, or any of a number of other issues that may have been initially connected only by the contingencies of history but are now inextricably connected nonetheless.[7]

Arguers and arguments alike are like wars in that their histories matter. Arguers and arguments are both like wars in that they have futures, too, and what happens next often alters the meaning of what transpired earlier. We understand the Treaty of Versailles at the end of World War I very differently from the perspective after 1940 than we did from the perspective of 1920, just as Socrates' argument in the Apology has to be understood differently after the subsequent arguments and consequent events presented in the Crito and Phaedo dialogues.

The hyper-adversarial, DAM account of arguments largely explains why we go to great lengths to avoid losing arguments, even when losing means that positive cognitive gains have

been made: adopting a new position, refining an old one, greater appreciation of the alternatives, or just increased understanding of how complex the issue might be. Theoretical accounts of the long-term effects of argumentation cannot ignore the inter-argument periods because that is generally when those changes occur. By framing it this way, argumentation theorists have effectively ceded discussions of the long-term and after-effects of argumentation to epistemologists and psychologists.

Satisfying though it may be, blaming the DAM account for our reluctance to admit defeat during arguments, only allowing the effects to kick in after we have disengaged, is not enough to explain how it all happens. While there is nothing conceptually challenging about arguments having after-effects, the fact that we regard them as after-effects should focus our attention on how we choose to demarcate arguments. Furthermore, the fact that people who are equally adept at arguing are not necessarily equally likely, equally willing, or equally able to reconsider arguments after the fact has three corollaries: first, that the arguers themselves carry the seeds for their own changes; second, that there are argument-related intellectual skills at work that differ from the skills deployed in arguing; and third, that these argumentative virtues have effect beyond the scope of argumentative engagements. Together, these should focus our attention on what we have included under the umbrella term good arguer. Arguments are occasions for the kinds of cognitive dissonance that serve as catalysts in moving from one stage to the next in cognitive development – i.e., without the jargon, we can learn something from an argument. Someone who argues well but consistently fails to carryover what is learned from arguing beyond the argumentative engagement, someone who cannot transfer her new-found knowledge, is like a student who excels on tests of critical thinking but fails to put any of those skills into practice outside of class: a good student, perhaps, but certainly not a good learner. Good arguers should be like good learners, not just good students.

So, among my conclusions is the thesis that we should extend our concept of argumentation beyond the actual exchanges because the processes of considering reasons, answering questions, and raising and responding to objections all continue to take place in the arguers after their argument has ended, That is when so many of the effects of argumentation occur. I am, accordingly, comfortable categorizing the virtues associated with post-processing arguments as specifically argumentative virtues rather than generic intellectual or epistemic virtues. In fact, being reasons-responsive may be the paradigm case of an inter-argument argumentative virtue: a virtue that is associated with argumentation, but not necessarily with the activity of arguing. I also endorse the counterpart claim regarding pre-argument virtues that prepare one for future arguments. The virtues of virtuous arguers are the virtues related to argumentation, broadly understood, not just to occurrent acts of arguing, more narrowly circumscribed. Virtuous arguers manifest argumentative virtues even when they are not arguing.

3. CONCLUDING REMARKS

The main idea, then, is that there is a distinct and theoretically interesting class of "inter-argument argumentative virtues."

• First, they are indeed virtues in that they are positive, standing, dispositional character traits with motivational components that can be deliberately acquired and nurtured.[8]

• Second, they are specifically argumentative virtues because what makes these traits positive is that possessing them to the degree that they are reliable faculties is constitutive of being a good arguer. Further, possessing them helps make good arguers better arguers because reflecting on and continuing to engage with arguments, which are things that good

arguers do, is how to get better at arguing. They are positives traits for arguers both inherently and instrumentally.

• And third, they count as inter-argument argumentative virtues because, as noted, they refer to skills that differentiate arguers who may be equally adept during argumentative engagements but who respond unequally to arguments in the long-run.

Specifically, these virtues are characteristic of good arguers in the sense that corresponds to the distinction made earlier between merely good students and genuinely good learners.

A complete account of inter-argument argumentative virtue would need to fill in the details of this abstract framework, including some specification of individual inter-argument argumentative virtues, as well, perhaps, of some general taxonomic organization of them. Ideally, it would also include both some specification and taxonomy of the connections between arguers and arguments, and between arguments and other arguments, as well as how those they operate in the intervals between argumentative engagements. Some arrows in the directions for that additional work will have to suffice here.

There are both vicious and virtuous ways that an arguer can continue to engage with an argument after disengaging with other arguers. Holding a grudge, nursing a grievance, or personal resentments that spill over into the epistemic range in the form of, say, prejudicial attitudes or close-mindedness are clearly vicious ways to carry the embers of one argument to the next one. But revisiting the dialectic, honing the ways one articulates the supporting reasons for one's standpoint, incorporating the objections in order to better that standpoint, and applying the lessons learned from the argument to other subjects are just as clearly virtuous ways to remain engaged.

The inter-argument virtues can be roughly divided into three overlapping general categories:

(I) the virtues for processing arguments after the arguers have disengaged;

(II) the corresponding virtues involved in preparing for arguments before they occur; and

(III) the virtues associated with initiating and engaging in argumentative engagements, viz., knowing how, when, where, with whom, and about what to argue.

(The corresponding virtues for disengaging and exiting arguments would not technically be inter-argument virtues since they would always be deployed during an argument.)

The connections among arguments are more varied. For starters, my argument last week with John about metaphysical realism was manifestly connected to our argument about realism the week before. The connection is so strong that it could easily be counted as an extension of the earlier argument rather than a different argument. In either case, each episode would need to be included in a full explanation and understanding of what happened in the other one. Last week's argument included traces of all of our other past arguments about realism, but also our arguments about literary interpretation, the aesthetics of poetry, and a host of other tangentially connected topics.

The network of connections is hard to contain: my arguments about realism with my colleagues and John's arguments with his colleagues also have effect. And as present as all of those other arguments are in each of our arguments, they are arguably no more of a presence than arguments by Richard Rorty, Daniel Dennett, Thomas Nagel, John Searle, Jacques Derrida, Jurgen Habermas, and a host of others, including arguments from the usual suspects, like Socrates, Protagoras, and Plato but also from the unexpected voices of our own idiosyncratic favourites. (When John and I argue, Mary Hesse and John Duns Scotus always show up!) We might ignore for now all the future arguments with which our argument will be connected, but the prospects of those arguments already have effect: I argue differently with John because I know we will argue again. It is not a one-off.

Arguments are not isolated islands, but even pragmatist, coherentist, anti-realist, and other anti-foundationalist geographers of our cognitive world who may be suspicious about claims that there is a continent nearby, should agree that if an argument is to be compared to an island, it should at least be one that is part of a very extensive archipelago!

There is, of course, an alternative way to interpret the phenomena that have been discussed here that obviates the need to introduce the concepts of inter-argument periods and inter-argument virtues, viz., broaden our understanding of arguments beyond their currently accepted temporal and spatial boundaries. The difference between that conclusion and the one presented here is, I believe, no more than terminological. The alternative might well be a better way of thinking in the long run, but the current proposal has the virtue of being less disruptive of current ways of thinking, and is thus likely to be more readily adopted.

Finally, let me re-emphasize the central role of character in all this.

Arguments have semantic, pragmatic, rhetorical, and dialectical connections that need to be included in any full theoretical reckoning – both for evaluating arguments and for understanding argumentation. Therefore, we need to pay attention to the periods between arguments, where these connections operate. Because arguers are the vehicles that create and sustain the connections between arguments, arguers have to be taken into account in evaluating arguments. Part of what are makes an argument a good argument is that it has good arguers, but part of what makes arguers good arguers is what they do before and after, and not just during, argumentative engagements. Many argumentation theorists have recognized that analyses restricting their attention to just the logical, inferential relations between the premises and the conclusion leave out what makes arguments more than just inferences. But even analyses that bring arguers within the purview of argumentation, either by incorporating a dialectical or rhetorical dimension to arguments or turning to critical discussions constituted by speech acts rather than abstract structures of propositions, are vulnerable to thinking of arguments as discrete, isolated events. That is all to the good, but the character of the arguers matters because their lives extend beyond the boundaries of discrete arguments. And so does the life of argumentation.

Arguments in brick: Agonism in Amsterdam School architectural design

SARAH J. CONSTANT

Department of Communication
University of Pittsburgh

sjc110@pitt.edu

ABSTRACT: The Amsterdam School is celebrated as an architectural movement because of its success in expanding the societal role of social housing beyond simply accommodating residents' basic needs for hygiene and shelter. Examining argumentation that led to such social housing designs demonstrates how these projects grew out of controversy with competing architectural groups and how the design itself can be seen as argumentative. Aakhus and Jackson's (2005) argumentation-as-design theory is especially useful for exploring the latter.

KEYWORDS: agonism, Amsterdam, Amsterdam School, architecture, design, H. P. Berlage, Michel de Klerk, social housing, socialism, urban planning, working class

1. INTRODUCTION

The Amsterdam School is widely celebrated as an architectural movement because of its success in expanding the societal role of social housing beyond simply accommodating residents' basic needs for hygiene and shelter. The school's social housing projects also further promoted the artists' Socialist *ethos* through the incorporation of various proletariat iconography meant to symbolically celebrate the formative role of the working class in the Netherlands. Furthermore, buildings such as *Het Schip* (The Ship) and *De Dageraad* (The Dawn) challenged shopworn presumptions about the artistic possibilities of working-class housing and subsequently raised salient aesthetic questions about the effects of the built environment on human communities. The Amsterdam School social housing effort was a monumental administrative, municipal, and, for the first time, architectural accomplishment. Helen Searing (1971) writes that it was because of the Amsterdam School that "housing…entered the world of architectural history" (p. xxi).

Within the movement, architect Michel de Klerk (1884–1923) is regarded as the most prominent figure, the "strongest personality" and the "imitable artistic lead of the architects of the Amsterdam School" (Vriend, 1970, p. 6; Bock, Johannisse, & Stissi, 1997, p. 9). De Klerk was the youngest of twenty-five children born to a working-class Jewish family (Frank, 1984, p. 31). He experienced first-hand the deplorable working-class housing conditions in Amsterdam, and he would later go on to design many structures that would transform parts of the cityscape.

Examining argumentation that led to the implementation of De Klerk's social housing designs may lend a unique perspective both because it opens a window into how Amsterdam School projects grew out of controversy with competing architectural groups and because it shows how Amsterdam School design itself can be seen as argumentative, with certain design features advancing inchoate hypotheses about human communication that would appear to be at odds with each other. Mark Aakhus and Sally Jackson's (2005) argumentation-as-design theory is especially useful for exploring the latter. Therefore, in this paper, I will: provide historical background and preconditions which led to the implementation of the 1901 Housing

Act, explore controversy and dissensus in Dutch architectural design with particular attention to potentially agonistic elements of Amsterdam School social housing design, and, finally, explain how my adaptation of Aakhus and Jackson's theory explores a potential pivot for the theory – they are recommending that the architectural metaphor can inform analysis of communication itself. I am exploring how a variant of their theory might help understand communicative dimensions of architecture.

Such an endeavor has potential to disrupt smooth historical narratives that laud De Klerk's contributions as heroic and celebrate Amsterdam School work as quasi-utopian architectural triumphs. Here, Aakhus and Jackson's (2005) theory supplies conceptual tools useful for shedding light on primary sources that chronicle the rise of the Amsterdam School following the passage of the 1901 Housing Act, as well as design features of the built environment that emerged from the school's creative efforts. Every argumentative engagement, Jackson and Aakhus (2005) say, includes an implicit "design hypothesis" about the way communication works, and through criticism, such hypotheses can be retrieved and appraised, in light of subsequent communicative patterns. The Amsterdam School case study provides an opportunity to explore, and complicate, the architectural metaphor that undergirds Aakhus and Jackson's argumentation-as-design research program. A design perspective on argumentation focuses attention events that preceded construction of several Amsterdam School social housing buildings. My analysis stands to show how De Klerk's final designs fit into a complicated narrative surrounding the culture of the city during the early 20th century where dilapidated buildings gave way to Amsterdam School buildings after the 1901 Housing Act.

2. HOUSING ACT AND PRECONDITIONS TO ARCHITECTURAL DESIGN

The working class has always had a strong foothold in Dutch society, beginning with Industrial Revolution in the Netherlands that took place a full century later than in Germany or France. Due to a variety of factors, the Dutch economy depended more on trade than on production, but its importance as a trading nation declined during the eighteenth century. The repeal of the English Navigation Act restored the Netherlands to its former trading glory in 1849 and by 1870, the Netherlands had developed large-scale industries. Unfortunately, the cities were not flexible enough for this kind of major boom in population and housing shortages became widespread. Many people, eager for better paying jobs in the cities, built ramshackle abodes and tried to get by as best they could. Land prices in cities soared, rent quickly grew out of proportion to income, overcrowding enveloped and the further "evils of unplanned urbanization" spread through every major Dutch city, including the capital, Amsterdam (Searing, 1971, p. 7). A multiplicity of competing unions (Catholic, Protestant, Liberal, and Socialist) arose and each competed for space in the city to build tenements.

The Dutch government was aware of this growing problem and, in 1851, an association was established in Amsterdam with the goal to create hygienic housing available at affordable rents to members of the working class. In 1852, the Association for the Needs of the Working Class built the first social housing complex initiated by a housing cooperative. This relationship between builders and housing cooperatives would provide a vital precedent for later instantiations of Dutch social housing.

In 1854, King William III commissioned a report from the *Koninklijk Instituut van Ingenieurs* (KIvI) on the conditions of worker's housing. The letter titled, "Report to the King about the Requirements and Design of Labor Class Housing" describes the conditions of worker's housing as a "place of horror" further positing that "Here sickness breeds and immorality finds its birthplace and cradle" (Searing, 1971, p. 7; Van der Lans, Pflug & Beekers, 2016, p. 12). In fact, conditions were so dire that they inspired the publication of Louis M.

Herman's (1901/1975) book *Krotten en sloppen* (*Hovels and Slums*). Herman alludes to the rising threats of tuberculosis and "*de blauwe dood*" (the blue death) of cholera in the cluttered alleyways of working-class neighborhoods, such as the Jordaan. An inability to control the water led to various instances of flooding, mold, and mildew further amplified by forced overcrowding. Oftentimes, families of up to ten people would eat, sleep, and toilet in the same small, cramped room. Overall, the working-class slums were a ghastly site, teeming with filth, foul odors, and disease.

The Housing Act (*de Wongingwet*) was described by experts as "one of the most complete and compact all-around housing laws yet" and "a model piece of comprehensive housing legislation in its day" (Searing, 1971, p. xxi). It was an "enabling and encouraging law rather than a restrictive and punitive law" in line with the longstanding Dutch tradition of tolerance versus correction (Searing, 1971, p. xxi). The Housing Act consisted of three main pillars. First, it compelled local authorities to take measures, which had previously only been optional, particularly concerning monitoring the quality of construction. The Housing Act detailed building bylaws governing placement of buildings on public roads and their distance from one another; the level of the floor of downstairs rooms and the height of buildings; the minimum sizes of habitable rooms, staircases, and passages; the prevention of fire and dampness; the structure of foundation, walls, floors, ceilings, and roofs; the removal of smoke, slop water, and refuse; as well as provisions related to closets, water supply, lighting, and ventilation. Second, cities were required to create plans for their own expansion. This provision led to H. P. Berlage's famous Plan Zuid in Amsterdam. Third, it granted state aid specifically for housing purposes. In short, articles of the 1901 Housing Act can be read as arguments concerning the right and, implicitly, the wrong ways to live. Following the health and hygiene crisis in working class areas, many political leaders concerned themselves with exactly this issue, and several different housing cooperations sprung to life, each with their own ideals.

3. CONTROVERSY AND DISSENSUS IN DUTCH ARCHITECTURAL DESIGN

Celebration of the Amsterdam School's later successes often occludes the agonistic relationship between the Amsterdam School and other rival architectural movements popular in the Netherlands at the time. Chief among these rival architectural movements was Berlage and his investment in Rationalism. Berlage attended the Polytechnic School in Zurich where he studied with Gottfried Semper. Semper once said, "every technical product [is] the result of its purpose [or function] and its material" (Searing, 1971, pp. 44-45). Similarly, Berlage espoused a materialistic-utilitarian approach in his designs in that he believed materials should not be disguised. He claimed the practice of disguising materials was both immoral and dishonest. Above all else, Berlage preached honesty in the use of materials in his architectural designs.

De Klerk once said of Berlage, "Berlage had an extremely valuable influence on construction, but he wasn't able to make his mark on the art of architecture" thus illuminating a growing dissensus between these two Dutch architects (Het Schip Museum, 2018). The Amsterdam School was firmly Expressionist and anti-Rationalist, known less for its practical use of materials and more for its romance and fantasy which incorporated "an almost playful use of forms and materials; undulating and often complicated brickwork, bizarrely shaped and otherwise useless towers, curious sculptures displaying various proletariat and Socialist iconography, the use of a variety of bricks, and roofing tiles in unexpected places, such as on the facades. De Klerk favored the freedom of poetry over the confines of rationalism in his designs. Further, while Berlage emphasized construction, De Klerk focused on form, often sacrificing basic functionality in the pursuit of aesthetic beauty. For example, De Klerk detested the look of storm drains to such an extent that he covered them all in a coffin of bricks. When

the drains would burst or need repairing, however, the entire wall oftentimes needed to be dismantled and rebuilt to access and fix the broken drain. It was a costly expenditure, but one that De Klerk defended in each and every one of his building designs.

De Klerk's dogged insistence on poetry and form during the planning of *Spaarndammerplantsoen*, a new social housing block, resulted in a heated debate with Jos Th. J. Cuypers. Unable to reconcile their differences, and with Dutch popular opinion turning more towards De Klerk's vision, Cuypers resigned from his position. Many architects and members of the Dutch government supported De Klerk's vision. For example, Arie Keppler, the Official Building Inspectorate and Director of the Housing Department founded in 1915 said De Klerk's plans were a "solution of genius, of great artistic value" (Bock, Johannisse, & Stissi, 1997, p. 9). At the center of De Klerk and Cuyper's heated debate was the question of the *appropriateness* of prioritizing beauty in social housing, a stance that appeared to oppose the values of rationalism and the materialistic-utilitarian approach espoused by architects such as Berlage. De Klerk defended his stance, claiming that nothing was beautiful enough for the worker who had lived so long without beauty. Amsterdam School social housing buildings were meant to serve more than just the utilitarian purposes of shelter and hygiene. Each artistic detail was meant to elicit feelings of pride and virtuosity in its residents, though Theo Van Doesburg, founder and leader of the adversarial De Stijl movement in the Netherlands, accused the Amsterdam School of "propagating meaningless virtuosity with bricks" (Het Schip Museum, 2018). Despite criticism, it is clear that De Klerk often conflated good social housing and beautiful social housing. The conflation of beautiful and good is known in Greek as *kalos kagathos* (Hawhee, 2002). De Klerk may be said to have exalted an Athenian notion of *arête*, in which physical beauty and moral superiority were inextricably tied. In line with the popular modernist notion of the time (*a la* Le Corbusier), good buildings created good people, and due to this conflation, good could only mean beautiful or artful in design.

Many remarkable design features of Amsterdam School social housing buildings underscore De Klerk's emphasis on the individuality of the residents. The publication *Algemeen Hendelsblad* referred to De Klerk's style as "divided unity," an apt name considering the many multi-vocal aspects of De Klerk's designs (Bock, Johannisse, & Stissi, 1997). Certain design features exalted the Socialist *ethos* of individuality while still maintaining architectural rhythm (and physical union) within a housing block (Bock, Johannisse, & Stissi, 1997). For example, in De Klerk's design for apartments at *De Dageraad*, he purposely inserted breaks in the lines of the architecture to give residents the impression that they were living in their own separate houses. In figure 1, several of these breaks, or lines of more pronounced bricks, are visible at *De Dageraad*.

Figure 1. A Row of apartments at *De Dageraad*. Photo by author.

At *Het Schip*, each apartment is fairly similar but many had various quirks, such as the apartments located on the corner with the famous "cigar" or "buoy" as it is often called (in line with the theme of "The Ship"). The "buoy," shown in figure 2, was the result of highly imaginative and labor-intensive brickwork that created a unique bulge on one corner of the building. The use of similarly colored bricks maintained visual unity within *Het Schip*, but the inclusion of the "buoy" nods towards a sense of playfulness, artfulness, and individuality.

Figure 2. The "buoy" or "cigar" at *Het Schip*. Photo by author.

Additionally, De Klerk loved the idea of the balcony; in fact, the balcony quickly became one of the trademark features of Amsterdam School architecture. While some balconies came with rules as to which days they could be used for beating rugs outside (*De Dageraad*), other balconies were completely inaccessible and served only an aesthetic purpose. At the peak of the housing crisis, housewives purportedly used the balconies as a means to exchange news and, oftentimes, harsh words. While De Klerk admired the look of the balconies, the raunchy conversation was not considered a desirable aspect of their design; therefore, many balconies in Amsterdam School social housing have no access point whatsoever. In figure 3, one of these inaccessible balconies is pictured. One downside of this, as voiced by a resident in the documentary "Living in Beauty" is that while the inaccessible balconies decreased certain undesirable effects such as noise pollution, they also contributed to a metaphorically anodyne environment, one where aesthetic value superseded the social reality of communal living (Bergmans, 2013).

Figure 3. A balcony at *De Dageraad*. Photo by author.

While individuality and the triumph of the worker were celebrated, other behaviors common in previous working-class housing had to be curtailed. Eigen Haard, the housing cooperation responsible for *De Dageraad*, had an office located on site to monitor the compliance of residents to specific rules. The office conducted regular home visits to ensure that the homes were tidy and that the children were bathed regularly. At Cooperation Court, where *De Dageraad* is located, a library was built "for the purposes of emancipation and enlightenment of the working population" and also in the hopes that it would reduce the working man's abuse of alcohol (De Dageraad, 2018). While the residents were encouraged to be individuals, they were monitored for compliance, less they risk eviction. Much like the *woonschool* or "living school," residents were coached to live in specific, acceptable ways. The *woonschool* resembled a camp; residents were given individual living quarters and shared a

bathhouse. They were taught by leaders how to clean the living space and practice proper hygiene. Graduating from a *woonschool* increased the chances that one would be placed in a new social housing block, such as ones designed by the Amsterdam School.

The contest of voices from competing schools following passage of the 1901 Housing Act influenced both the trajectory of Amsterdam's evolving cityscape and the wider arc of architectural history, especially in the area of social housing. As the next section explores, this multivocality carried through into structural features designed by Amsterdam School architects, making the artifacts ripe for analysis from an 'argumentative design' perspective.

4. DESIGN AS ARGUMENTATION

Design is not easily defined. Like an artist transforming a block of clay into a sculpture, it is imperative to first strip away what is not a part of the design; everything that is left may be considered design. In their (2004) article, Jackson and Aakhus decide upon certain features that should be stripped away from this figurative block of clay. Drawing from the work of Schön (1983), they say that design is not simply the application of theory to practice. To the contrary, design is "a practice to be understood and developed, a practice that varies with the materials and settings it works with" (p. 127). For example, while Corbusier theorized the three joys of urbanism as sun, space, and greenery, merely adding these design aspects in without practicing or fully developing them does not magically produce a joyful urban environment. Drawing from the (1992) work of John Chris Jones, design is not merely practical tinkering. An architect, whose block of clay is the apartment complex, does not experiment with human life; they experiment with bricks and stones and hope that it translates into something remarkable for the apartment dweller. Finally, adding their own contribution, Jackson and Aakhus conclude that design is not a competitor to humanistic or empirical work, but a complementary form of inquiry. In fact, they suggest that rhetoric may be a design art itself. An argument written on paper may actually have a lot in common with an argument "written" in brick. So now that we have an idea of what design is or is not, what does design actually *produce*?

According to Aakhus and Jackson (2005), "the immediate product of design is some intervention into ongoing activity (e.g., a device, a service, an interactional format) that might or might not affect that activity in the way the designer expects" (pp. 411–412). The designer's expectations or "design stance" calls attention to what is created (the design artifact) and how it is created (design work). In this case, the design artifact is the social housing building and the design work is the set of unique circumstances at the moment, including the specific provisions of the 1901 Housing Act, the blueprints for the buildings, and any other decisions leading up to the implementation of the artifact itself. Aakhus and Jackson (2005) say, "design can be usefully understood as the designer's hypothesis about how things work…To see this, consider the architect's distinction between the natural and built environments and how it might inform the growth of a design enterprise" (p. 413). Disciplined design enterprise requires a design methodology. My mobilization of Aakhus and Jackson's design as argumentation theory entails a slight pivot from this line of inquiry. While Aakhus and Jackson discuss how communication itself is designed, I am more interested here in how building design shapes communication and the downstream effects that occur (in ways that mirror architecture).

As previously noted, De Klerk's social housing buildings were notoriously expensive and his designs placed more emphasis on aesthetics than on practicality. This is obvious in the aforementioned examples of the drain pipes and balconies. Each building contained many hand-carved sculptures. Each sculpture, commissioned by Hildo Krop and sculpted by one of his apprentices, made some statement about workers in Amsterdam. At *De Dageraad*, a sculpture of a worker with his tools in hand stands opposite an eagle, representing the worker's freedom,

flight, and rise up. In figure 4, the sculpture of the worker at *De Dageraad* is shown. At Het Schip, brickwork and windows created a book motif, representing the importance of education. These express hypotheses about communication that signal pride and individual expression, however, when combined with agonistic details such as closed balconies and the *woonschool*, one begins to see the dissensus emerge.

Figure 4. A sculpture of a worker holding a tool at *De Dageraad*. Photo by author.

Aspects of architectural design shape communicative and argumentative norms—that is to say, *bricks argue*. Brickwork was integral to Amsterdam School designs as each brick had to be laid by hand. Due to the Amsterdam School's Socialist *ethos*, each worker who laid brick for these social housing buildings was well-compensated. In this way, Amsterdam School designs produced labor. The labor-intensive projects kept laborers busy and well-employed and the workers doubly reaped the benefits of having affordable housing in the city of Amsterdam. Homage to the worker is apparent throughout each Amsterdam School building. Two of Krop's most famous sculptures—"The Birth of the Deed" and "Human Energy"—sanctify the working class.

Although De Klerk received pushback for many of his most extraneous details, ultimately the Dutch government conceded and funded the projects, most notably the tower at *Het Schip*. The scrutiny of detail paid in these buildings, the use of labor-intensive methods, and the addition of parts that served only an aesthetic purpose rises above and beyond fulfilling the need to create more adequate housing and promote hygiene in the Netherlands. It is clear that there is an underlying ideology, a movement that goes hand in hand with this architectural style. Aesthetic choices were made both over and in tandem with practical choices.

In this way, the designer takes an existing situation and transforms it into a preferred one through affordances and constraints: could the housing act of 1901 be considered a series of affordances and constraints? For example, there were affordances made by the Dutch

government, which allowed better housing conditions to prosper and constraints that disallowed the current state of affairs to continue. While many other housing corporations at the time provided housing well in line with the Housing Act, and still much of it exists today, only the Amsterdam School buildings—namely *Het Schip* and *De Dageraad* are considered national monuments. They are more than social housing, they are artwork for the working class. Or "Workers Palaces" as Michel De Klerk called them, an apt metaphor for such luxurious and romantic facades and solid interiors.

Argumentation is a conversational expansion, a form of repair that kicks in when triggered by a special sort of events (Jackson, 2015). "Argumentation practice as a whole may reflect competing ideas about reasonableness, the products of argumentation may be kludgy composites of old and new techniques" (Jackson, 2015, p. 244). Thus, argumentation in the case of social housing in Amsterdam served to reflect competing ideas about the appropriateness or inappropriateness of the primacy of beauty in these designs. The success of Amsterdam School designs is apparent from the majority of praise the designs received when they were built as well as the painstaking efforts the Dutch government has taken to preserve these buildings at present. While many unions and housing cooperatives built social housing in Amsterdam, only Amsterdam School designs carry the discriminating title of national monuments and are preserved to judicious museum standards, all while residents continue to occupy the buildings.

5. CONCLUSION

My adaptation of the Aakhus and Jackson argumentation-as-design theory complicates and challenges the prevailing utopian narrative of Amsterdam School social housing. Contrary to some received historical narratives that portray the Amsterdam School as a utopian housing movement emerging frictionless from the turn of the century, this study has highlighted how the school's work was borne from a crucible of controversy. Much of that agonism played out in argumentation with rival architectural schools after passage of the 1901 Housing Act, with echoes of that multivocality eventually receiving expression in the polysemic designs of Amsterdam School buildings.

Jackson and Aakhus were inspired by the field of architecture to develop their argumentation-as-design approach, with the suggestion that such an approach might usefully inform analysis of explicitly communicative artifacts such as human conversations, deliberative meetings, political debates, and the like. The present study illustrates how Aakhus and Jackson's theory may have even broader scope, by providing a conceptual apparatus for analyzing architecture itself.

My project raises the question: what precisely *is* a "communicative hypothesis" that Aakhus and Jackson say is presumed in each act of design work? The term "hypothesis" connotes a single thesis, yet findings from this study of the Amsterdam School highlight ways that De Klerk (and his colleagues) seem to have embraced multiple, even conflicting hypotheses about human communication in their design work. It is beyond the scope of the current project to speculate about how dimensions of dissensus and multivocality might be incorporated into the Aakhus and Jackson design theory, yet such theorizing may prove useful. The somewhat paradoxical conclusion of this study—bricks *argue*—gestures toward recent theoretical work in the area of new materialism (Gries, 2015; Packer, 2013). That scholarship highlights ways that non-human actors, such as inanimate objects, express communicative agency and shape the human lifeworld. Space limitations here preclude full exploration of how analysis of architecture may inform ongoing conversations in new materialism, although findings from this study suggest that this could be a fruitful line of inquiry.

The role of reasons in deliberation dialogues

CRISTINA CORREDOR

corredor@fyl.uva.es

ABSTRACT: The aim of this contribution is to study the role of argumentation within deliberation. With that aim in view, I will examine the Deliberation Dialogue Model set forth by McBurney, Hitchcock and Parsons (2017). Taking as a point of departure an interactional approach to speech acts, I will contend that the model presents some difficulties in accounting for acts of arguing. I will conclude with some reflections on the role of argumentation in deliberation dialogues.

KEYWORDS: acts of arguing, Austin, deliberation, Deliberation Dialogue Model, Speech Act Theory, Toulmin's model

1. INTRODUCTION: THE CONCEPT OF DELIBERATION

Within the framework of dialogical approaches to the study of argumentation, deliberation has been characterized for the following features: (i) it departs from an initial situation in which there is a need for action; (ii) the relationship among participants is collaborative; (iii) the goal of any participant is to coordinate goals and actions; and finally, (iv) the goal of the dialogue is that the participants agree on the best available course of action for implementation (Walton and Krabbe, 1995). As a result, practical argumentation is a core form of argument in deliberation. The form of the final decision can be made explicit by means of an utterance of the form 'We ought to do A', or 'A is the best course of action for implementation' (where A is an action to be performed in response to some problem, issue, etc. of a practical nature) (Walton 2006). Although it can be said of an individual person that she deliberates, in reference to her thinking about something and deciding carefully, the notion here considered is dialogical in that it applies to a group of persons that discuss and consider the reasons for and against a practical decision. To that extent, it is a dialectical notion as well.

There seems to be a general consensus among scholars in considering that the speech act of making a proposal must be seen as a defining feature of this type of dialogue and is necessarily present in deliberation, as a first response to the envisaged situation (cf. Corredor, 2018). This allows also identifying two main roles among participants, namely, those of proponent (the speaker who makes a proposal) and respondent (the addressee whose role is to respond to the proposal in a number of ways). These roles may shift in the course of the dialogue and, in group deliberation, can be undertaken by more than one participant in alternate turns.

Two main trends have been identified in the study of deliberation within the framework of argumentation theory (cf. Walton, 2006), namely, the BDI Model (for Belief-Desire- Intention), and the Commitment Model. The BDI model (cf. Kauffeld, 1998; Wooldrige, 2000; Paglieri and Castellfranchi, 2005) is an explicitly psychological model. It assumes the general thesis that types of speech act correspond to and are defined by the types of attitude being expressed. Although this model will not be addressed and discussed here, it seems to me that it is generally prone to a common objection. In the particular case of deliberation, there seems to be an internal, core connection between the speech act of making

a proposal and the notions of burden of proof and openness to questioning and refutation, as regulated moves that structure the dialogue. But these are normative regulations which go beyond, and cannot be fully explained in terms of the mere expression of an attitude.

The Commitment Model (as represented by Singh, 1999; and McBurney, Hitchcock, and Parsons, 2001 and 2007) sees speech acts as moves in a dialogue through which two or more agents interact with each other. Moreover, each agent is assumed to have a commitment set, where a commitment is a proposition that an agent has gone on record as accepting (Hamblin 1970). The commitment set of the agents can change with their moves (speech acts), where these changes concern the insertion of new commitments or the retraction from previous ones. Interestingly, a possible type of speech act is the putting forward of an argument. This group of approaches is mainly driven by the search of a formal model that could be implemented in computational entities (such as autonomous software agents). Notwithstanding this apparently limited scope, their analyses of deliberation as a type of dialogue can throw light on the types of dialectical moves that are characteristic of it.

Here, I will focus my attention on an influential expression of the Commitment Model, which has been set forth by McBurney, Hitchcock and Parsons by means what they term the Deliberation Dialogue Model (DDM). In particular, when presenting their DDM, these authors claim,

> An important motivation for our work is the development of protocols which enable rational interaction between participants, where *rational* is used in the minimal sense of giving and receiving of reasons for statements. (McBurney, Hitchcock and Parsons, 2007, p. 11).

It must be highlighted that both the BDI Model and the Commitment Model, tacitly or explicitly, assume the idea that deliberative dialogues are a type of argumentative interaction, in that argumentation is central to the dialogue. In my light, however, the DDM falls short of capturing this core aspect of deliberation. In the next sections, my aim is twofold: firstly, to express some doubts with respect to the role that argumentation plays within the DD Model, and secondly, to suggest a possible line of development in order to address these difficulties.

2. THE DELIBERATION DIALOGUE MODEL

According to the Deliberation Dialogue Model (DDM), the following are main features and component elements that characterize deliberation dialogues.

(i)   The need for action may initially be expressed in the form of a governing question, possibly open-ended.

(ii) Proposals for action may arise only late in the dialogue, "after discussion on the governing question, and discussion of the considerations that are relevant for its resolution" (McBurney, Hitchcock and Parsons, 2007, p. 4)

Commentary. Notice that this last feature strongly suggests that the discussion takes place through argumentation, by means of giving reasons and discussing/evaluating those reasons.

(iii) The formal model of deliberation dialogues comprises eight stages, namely, Open, Inform, Propose, Consider, Revise, Recommend, Confirm, and Close.

Commentary. Notice that, because proposals are supposed to only appear late in the dialogue (after discussion of the governing question and the considerations that are relevant

for its resolution), the giving and asking for reasons should mainly take place within the stages Consider and Revise. This interpretation does not exclude that other stages, particularly Inform, can afford data which, in a posterior stage, can and will qualify as reasons worth of consideration. Nevertheless, in my light, a piece of information does not in itself qualify as a reason, unless other conditions are in place (this suggestion will be addressed below, section 3). Therefore, the focus here will be on the stages Consider and Revise. Incidentally, I take my interpretation to be in tune with the DDM assumption that proposals only arise in the dialogue after some discussions have taken place.

According to the authors, the stages Consider and Revise consist of the following actions:

Consider: Commenting on proposals from various perspectives.

Revise: Revising of: (a) goals, (b) constraints, (c) perspectives, and/or (d) action options in the light of the comments presented; and the undertaking of any information-gathering or fact-checking required for resolution.

Interestingly, in relation to the Consider stage, the authors note that "other types of dialogues, such as information seeking or persuasion, may be embedded in the deliberative dialogue at this stage." (ibid., p. 6). The fact that persuasion dialogues are seen as possibly embedded in deliberation, yet as different from the latter, may be seen also in tune with the DDM assumption that deliberation dialogues are directed at reaching a joint decision, and not at persuading other participants in order to see one's personal interests accommodated. Additionally, the proponents of the DDM also stipulate that at least an instance of the Consider stage must precede the first instance of the Revise stage.

(iv) Types of sentences: the eight stages, in particular Consider and Revise, take place by means of a dialogue in which the following *types of sentences* may appear: Actions, Goals, Constraints, Perspectives, Facts, and Evaluations.

When sentences belonging to these types are uttered in the course of the dialogue, the resulting moves in the interaction are termed *locutions*. Dialogues are thus seen as interactions that take place by means of locutions, which are uttered following certain rules. Uttering a locution in this way constitutes a *move* in the interaction.

(v) Different types of locutions may take place within the different stages of the deliberation. In particular, the DDM considers the following:

• making an assertion, assert(.)
• preferring a particular option for action, prefer(.)
• asking the other party to justify an assertion, ask justify(.)
• pronouncing on whether a proposal for action should be accepted or rejected, assert(action) and reject(.)
• retracting a previous locution, retract(.)
• withdrawing from the deliberation dialogue, withdraw(.)

(Here, the dots between parentheses indicate the positions to be occupied by the occurrence of certain symbols of the formal language, standing for: one or more agents, types of sentences, and sentences.)

In particular,

- the locution assert(*Pi, type, t*) is an assertion by participant *Pi* of the sentence *t* as a valid instance of type *type*;
- the locution ask_justify(*Pj, Pi, type, t*) is a request by participant *Pj* addressed to participant *Pi*, seeking justification for the assertion of sentence *t* of type *type* (where *t* belongs to *Pi*'s commitment set)
- the locution prefer(*Pi, a, b*) expresses that participant *Pi* prefers action *a* over action *b*.

Commentary. Notice that assert, prefer, and ask_justify (as well as pronounce on a proposal, retract, and declare one's withdrawal) are, in the standard approach of contemporary pragmatics, illocutionary speech acts. Although conceptualizing them as *locutions* is in agreement with a semantic approach to the study of dialogues, the fact that this notion is characterized by the authors as a regulated move in the course of an interaction gives support to the view that locutions are a semantic representation of speech acts. Taking locutions to be representations of speech acts is further supported by the observation that they embed, together with certain sentences (and types of sentences), a representation of the participants whose interaction is mediated by the utterance itself.

In what follows, and in order to advance my analysis of the model, I will adopt the above suggested interpretation and take it that locutions are a semantic representation of speech acts, i.e. of the actions accomplished in dialogue in virtue of the words uttered. For brevity, instead of talking about representations of speech acts, I will just refer to speech acts.

Now, to guarantee the rationality of the process (in the minimal sense seen above), the authors stipulate the constraint that a preference between actions should only be expressed for actions already evaluated. Evaluations are presented as a type of sentence (ibid., p. 8), without further specification. From this, it seems to follow that evaluations are taken to be a primitive notion, given in the form of a type of sentence. Notice, however, that asserting an evaluative sentence, the type of move that the DDM takes into account in an explicit form, does not in itself qualify as giving a reason, unless some other conditions hold –as pointed out above. This is the issue to be explored in the next section.

3. SOME DIFFICULTIES FROM THE PERSPECTIVE OF SPEECH ACT THEORY

A point of departure for the exploration to be carried out is the ascertainment that, among the group of speech acts considered in (v), the illocutionary force of several of them is not in itself argumentative, nor is there a need that the corresponding illocution should play a role in argumentation, in the giving and asking for reasons. Among the types of speech act that are recognized and incorporated within the DD Model, and with the purpose of focusing on the argumentative stages of the dialogue, I suggest to distinguish the following, tentative two groups of locutions/speech acts:

a. Speech acts that do not play a (direct, explicit) role in giving and asking for reasons: prefer(.), assert(action) (in the sense of promoting it), reject(.), retract(.), withdraw(.)

b. Speech acts that may be used to give and ask for reasons: (1) making an assertion, assert(.); and (2) asking the other party to justify an assertion, ask_justify(.)

Some illocutions of the first group would be apt to be put forward as reasons. For instance, a personal preference may be alleged as a datum that the agent wishes to see taken into consideration by the other participants. Analogously, also the locutions/speech acts assert(action) (in the sense of promoting it) and reject(.) may be adduced as reasons. These moves would presuppose a context in which the participants' necessities, interests, preferences, etc. were to be seen as relevant data for the final decision. (Imagine e.g. the members of a family deliberating on whether they should move to a different country). In my light, when so adduced, these speech acts acquire a different illocutionary force from the primary one (in the three above considered cases of prefer, promote an action and reject, this primary force would be that of exercitive speech acts). In such types of context, the illocution would become that of giving a reason. In the simplest case, the move could be paraphrased as: 'This is my reason in support of action A: that I prefer/promote action A'; and a corresponding paraphrasing for rejection. My suggestion is that these types of move constitute instances of the illocution of giving a reason, as part of a more comprehensive speech act of arguing[1].

My concern is to try and capture the moves that are specific to the actions of giving and asking for reasons. For that, it seems advisable to pay a closer look to the types ask_justify(.) and assert(.)

- Asking the other party to justify an assertion, ask_justify(.)

Within Speech Act Theory and in Austin's original classification, this speech act is an exercitive. Exercitives are illocutions that consist of the exercise of powers, rights, or influence (1962, p. 150). They presuppose some degree of authority or authoritativeness on the part of the speaker and, correspondingly, assign or confer obligations, powers or rights to the addressee. In Searle's taxonomy, ask_justify(.) is a directive speech act, whose illocutionary point consists in "an attempt by the speaker to get the hearer to do something" (Searle 1975, p. 13). This view, to the extent that it is stated by appealing to the speaker's intentions, approaches the BDI Model. For this reason, Austin's seems a better framework for the present analysis. Notwithstanding this, Austin's exercitives and Searle's directives overlap (though Searle's declaratives would count for Austin as exercitives as well).

In a deliberation dialogue, a speaker's asking for justification presupposes that she is authorized to do so. To the extent that this move is acknowledged by the participants to be available (and legitimate) in the course of the dialogue, it has the conventional effect of transferring a corresponding obligation to the addressee –namely, the obligation to justify. Moreover, one can take it that in an argumentative dialogue, the obligation to justify will be (normally, usually) redeemed by giving reasons by means of assertions.

- Making an assertion, assert(.)

In Austin's classification, an assertion can be a verdictive or an expositive speech act. In particular, verdictives are typified as the act of giving a verdict or finding "upon evidence or reasons as to value or fact" (1962, pp. 150, 152). For Searle, assertives (which overlap with Austin's verdictives and expositives) are essentially speech acts whose illocutionary purpose

---

[1] Acts of arguing have already been dealt with in the literature in terms of speech act complexes. See Eemeren & Grootendorst, 2004, and Bermejo-Luque, 2011. I think they have pointed out in the right direction. Yet, in my view, both theoretical models incur in a type of analysis that ultimately explains the illocution in terms of the speaker's intentions. This orientation is difficult to conciliate with the Austinian view of speech actions I am endorsing, according to which the effects of speech acts are to be accounted for as conventional effects of a social or interpersonal type, impinging on the normative stances of the participants in the interaction.

is "to commit the speaker (in varying degrees) to something's being the case, to the truth of the expressed proposition." (1975, p. 12). Searle's view entails that asserting commits the speaker in a certain way, a commitment that may be seen as entering the speaker's commitment set. Austin's view entails the following. A speaker's asserting something presupposes that the speaker is availed of some justification (in varying degrees) and is obliged (and expected) to give it, whenever another participant asks for it.

My contention is that nothing entails that an assertion is, by itself, a justifying reason for another assertion (a claim). Being a reason is a relational concept. For this concept to be applied, not only has the targeted claim to be laid down (in an explicit or implicit form); additionally, the assertion has to be set forth, and recognized by the participants, as potentially supportive for the claim. I would add to that, following Toulmin's analysis of an argument[2], that the arguer has to commit to the (possibly tacit) inference-license that supports the step from the assertion recognized as reason to the assertion recognized as claim. Inference-licenses, in Toulmin's words, are what "authorise the sort of step to which our particular argument commits us." (1958, p. 91). Even if the analyst were not to endorse Toulmin's model of argument as such, acts of arguing constitutively embed a step from reasons to claim that the act itself presents as legitimate, appropriate, or correct (possibly modulating the inferential step by means of some modal qualifier).

Due to this reason, taking into consideration the locution/speech act of making an assertion does not qualify, in itself, as a component part of an act of arguing. From a conceptual point of view, until a proposal (*qua* claim) has been laid down or is somehow available to the participants, other information or piece of speech cannot be seen as a reason given in support of it. In my view, it is the participants' considerations and revisions what would allow the analyst (and the participants themselves) to recognize an act of arguing as such.

In order to better assess this point and try to determine the role that making an assertion performs within the DD Model, it is worth noticing that assertions can be moves in any of the eight stages. Therefore, I will briefly examine them, before suggesting some conclusions.

• Open, Propose, Recommend, Confirm, Close:

Although some assertions can be admissible moves in these stages, the main function accomplished by them would be better expressed by means of other illocutions (e.g.: exercitives and commissives in Austin's classification; and directives, commissives and declarations in Searle's taxonomy)

• Inform:

Although information is standardly conveyed by means of assertions, these assertions do not necessarily act as reasons supporting a viewpoint. As I have already contended, a mere piece of information does not qualify in itself as a reason, unless it is embedded in an act of arguing where other conditions also hold.

• Consider

According to McBurney, Hitchcock and Parsons (2007), this stage consists of the "Commenting on proposals from various perspectives." As in the preceding stage, notice that even if those commentaries are made by means of assertions, no argumentative connection seems to have been here warranted. Interestingly, when presenting the DD Model, Walton,

---

[2] Here I am endorsing Toulmin (1958)'s model, according to which an argument minimally consists of a claim, together with a reason (that he terms *datum* or *data*, and that can be a fact, ground, etc.), and an inferential license that links both (termed *warrant*). Cf. ibid., pp. 89-100.

Toniolo and Norman (2014) expand the original definition in the following terms: "The Consider Stage. Comments are made on the proposals that have been brought forward. At this stage, arguments for and against proposals are considered." (ibid., p. 3). Even if this reworking is fair to the DDM authors' intentions, it helps make manifest that the original model did not incorporate this argumentative requirement, either explicitly or in an indirect form. The need to add the requirement explicitly (to stipulate it, so to say), points out, in my view, to an important limitation of formal models in general. Moreover, it urges the analyst to inquiry where is the connection between a justifying reason and a claim captured in the DD Model.

• Revise

According to McBurney, Hitchcock and Parsons (2007), this stage consists of the "Revising of: (a) goals, (b) constraints, (c) perspectives, and/or (d) action options in the light of the comments presented; and the undertaking of any information-gathering or fact-checking required for resolution." It is the move ask_justify(.) that obliges the addressee to either retract her claim, or shift into an embedded persuasion dialogue in which she seeks to persuade her addressee of the validity of her claim[3]. For the above mentioned authors, however, a persuasion dialogue differs from a deliberative one, in that in the former the speaker attempts to obtain the addressee's adherence, whereas in deliberation the common goal is to reach a mutual decision on the best course of action. Undoubtedly, this is the reason why they keep apart deliberation from persuasion dialogues. In my view, the conceptual difference they draw is sound and most relevant for a correct characterization of deliberation dialogues. Notwithstanding this, our question remains unanswered. How is the connection between justifying reasons and claim captured by the DD Model?

A more comprehensive question would be how is the connection between justifying reasons and the claims supported by them to be accounted for in deliberation? My suggestion has been that the act of giving a reason cannot be assimilated to making an assertion *simpliciter*, in a straightforward way. A formal model (as the DDM) has to account for the kind of action that speakers perfom when they bring forward reasons to justify a claim. Furthermore, not only the adduced reasons, but also the inferential license that authorizes the step from reason to claim has to be accounted for as a move in the deliberation dialogue. Correspondingly, the notion of commitment set should be expanded in order to also integrate these elements. Incidentally, it is worth noticing that the antecedent considerations point to a direction towards which classical speech act theory is in need of expansion.

4. CONCLUSION

To sum up,
1. I think the proponents of the DD Model are right in their conceptual characterization of deliberation dialogues. Yet their formal model does not capture, but presupposes the kind of argumentative interaction that is essential in deliberation.
2. From a speech act theoretical perspective, their work points at the direction in which this theory needs to be expanded.

---

[3] Douglas Walton and Alice Toniolo (2016) have noticed that standard approaches to deliberation dialogue are similar to persuasion dialogues in that the opening issue is set at the opening stage and stays in place during the argumentation stage. They contend that this characterization falls short of capturing the kind of revision accomplished in many real deliberations, where the opening issue may be changing as the deliberation moves forward. As a result, their proposal is to distinguish between two types of deliberation, namely, problem-solving and the dilemma types. The criticism here developed addresses a conceptual issue that I take not to be affected by the distinction.

3. Engaging in a deliberation dialogue means performing two speech actions additional to the ones identified by the DDM framework. Namely, those of bringing forward reasons to justify a claim, and of committing to the inferential license that authorizes the step from reasons to claim.

5. FINAL CONSIDERATIONS: THE ROLE OF ARGUMENTATION IN DELIBERATION DIALOGUES

What is the role of argumentation in deliberation dialogues? Remember that, in deliberation, a joint decision is aimed at by the participants on a course of action. It can be said, moreover, that the final decision is jointly adopted (whenever this is the case) for the reasons given and taking into account the alternatives dismissed. In practical terms, deliberation grants that the participants join the decision, that they endorse it –and not merely acquiescence to it. This consideration is in line with the tenet that, epistemically, deliberation plays in practical matters a role analogous to 'tracking the truth', where 'truth' in practical matters is to be understood as rightness or correctness (cf. among others Habermas, 2006, and Estlund, 2008)[4].

A first approximation to this issue, within the framework of deliberative theories of democracy, is egregiously represented by Rawls's appeal to the rationality of political decisions as a source of legitimacy. He says,

> Since political power is the coercive power of free and equal citizens as a corporate body, this power should be exercised (...) only in ways that all citizens can reasonably be expected to endorse in the light of their common human reason. (Rawls, 1993, pp. 139-140)

In this way, Rawls connects a fair procedural rationality, as based on the power of reason in public political discourse, with democratic legitimacy. Nevertheless, legitimacy and truth are different concepts, and Rawls's statement points to a conceptual problem worth of consideration. As Estlund (2008) criticizes, the position separates democratic authority (legitimacy) from truth. He contends that "a standard of democratic approval is not normatively adequate without some appeal to substantive standards by which democratic decisions ought to be evaluated" (ibid., pp. 23-24; see also p. 179). He further contends, nevertheless, that deliberation facilitates outcomes tending to approach some standards of practical truth (justice, or the common good, e.g.) which should be seen, in themselves, as independent of the deliberative procedure. A substantive standard is put forward by Bohman (1996), who points out, "The deliberative process forces citizens to justify their decisions and opinions by appealing to common interests or by arguing in terms of reasons that 'all could accept' in public debate." (ibid., p. 5)

This idea is in line with the notion of deliberation here considered, as originally formulated by Krabbe and Walton (1995). To the extent that the participants in the deliberation do not pursue their individual goals and interests, but collaboratively try to contribute to finding the best proposal for action, the rationality of the dialogue is not instrumental and strategic, but oriented instead to the identification of the best reasons justifying a decision. The dynamics of the dialogue, if it is carried out on an egalitarian basis that allows every participant to dissent and raise doubts and objections, obliging every

---

[4] A relevant distinction here is that between practical and theoretical reasoning and argumentation. Theoretical reasoning (and argumentation) is directed at setting forth evidence that may count for or against the truth of a proposition. Practical reasoning (and argumentation) aims at a correct decision concerning a course of action. (See Walton, 2006, p. 179). As already noticed at the outset, section 2, practical argumentation is a core form of dialogue in deliberation.

participant to justify their claims, is the communicative procedure more likely to enable the epistemic quality of the practical decision at issue.

ABSTRACT: Research on formal argumentation is split into dialogue theory, and abstract and structured argumentation theory. We here show how to build bridges between these two fields. We give an example of dialogue in machine ethics, represent it in structured argumentation, and explain how the set of dialogue positions of agents can be represented abstractly by a graph. We then discuss dialogues as decision procedures in abstract argumentation and identify open research challenges for formal argumentation.

KEYWORDS: abstract argumentation, agent argumentation, dialogue, formal reasoning

1. INTRODUCTION

The field of formal argumentation concerns itself with the reasoning that occurs in the context of disagreement, focusing on the process of proposing, discussing and resolving assertions. Formal argumentation distinguishes a wide variety of types of disagreement. Disagreement may emerge from the reasoning process of a single actor, or from the interactions among actors. In the context of epistemic reasoning and belief revision, disagreement arises from the underlying uncertainty and incompleteness of the discussed assertions. In the context of practical reasoning such as planning and decision-making, an actor may be subject to different motivations, such as desires and obligations. Due to the limitations in terms of resources, actors cannot fulfil all of their goals and thus conflicts between their various motivations arise. In the case of systems with multiple actors, they may have conflicting goals, priorities and reasoning methods.

The consensus in the field of formal argumentation is described in the first volume of the handbook of formal argumentation (Baroni *et al.* 2018). In particular, while traditional and informal argumentation is concerned with the evaluation of individual arguments, the abstract argumentation frameworks originating from the work of Dung (1995) put their focus elsewhere. In these frameworks, the internal structure of arguments is stripped away and the focus lies on the relation with other arguments. Dung shows that graph theory can be used as a general framework for different kinds of reasoning, such as logic programming, nonmonotonic logic and game theory. The handbook discusses Dung's theory of abstract argumentation, various theories of structured argumentation, and many algorithms and principles defined for these formal theories.

The formal argumentation community is now working towards a second volume, addressing issues where there is no consensus yet. The first topic under discussion is the

extensions of the formal theories to make them more widely applicable, for example by adding various kinds of relations to the graphs, or adding numerical values.

The second topic under discussion is the methodology of using the theories of formal argumentation in practical applications. Standard treatments of formal argumentation either assume the existence of an argumentation framework, representing arguments and the relations among them, or generate arguments and relations among them from a given knowledge base. Both approaches have drawbacks for modeling argumentation. The first approach does not guide the user how to construct such argumentation frameworks from the existing domain knowledge in practical applications. The second approach presupposes the availability of such a knowledge base, which typically has to be represented in some kind of logic. Moreover, existing frameworks such as ASPIC+ (Prakken, 2010) leave the user with many choices, and the impact of choosing one of the alternatives is often difficult to foresee.

In this paper we introduce an alternative approach. We assume individual agents represented by the arguments they accept, and we construct the frameworks from these extensions. This approach is not only practical, but it also gives rise to various new conceptual and philosophical questions. For example, it highlights the relation between acceptance or justification and truth. A truth statement might not be accepted by an agent, while a false statement could be accepted by an agent.

Technically, the challenge of our approach can be illustrated by the following example. Consider a framework where argument A attacks argument B, argument B attacks argument C, and there are no other arguments or attacks. In Dung's theory of abstract argumentation, both argument A and C are accepted, and argument B is rejected. In that case, we say that argument A defends argument C. Now consider the slightly different framework, containing the same set of arguments {A,B,C}, where argument A again attacks argument B, but there is no attack between the arguments B and C. In this adapted framework, again argument A and C are accepted. Thus, if we only know the extension, how do we know whether there is an attack from argument B to argument C?

As a solution to this challenge, we assume a process of imagination of the agent. In the above setting with three arguments A, B and C, the agent can zoom in on argument B and C, and forget about argument A. In this process, when he assumes only argument B and C, he can decide whether he will accept argument B, argument C, none or both. This determines the attacks between arguments B and C for that agent.

The layout of this paper is as follows. Section 2 introduces an example of dialogue in machine ethics, and shows how to represent it in structured argumentation. Section 3 explains how the set of dialogue positions of agents can be represented abstractly by a graph. Section 4 discuss how dialogues have been used as decision procedures for Dung's graph-based theory of abstract argumentation. Section 5 identifies open research challenges for formal argumentation.

2. EXAMPLE OF DIALOGUE AND STRUCTURED ARGUMENTATION

Consider two QT robots in a not so distant future, arguing whether they will force an elderly person to take her pills. The first QT robot argues that they should force the elderly person to take the pills, because taking the pills will increase the person's life and longer living is a positive value. When challenged by the other QT robot about the effectiveness of the pills, the first QT robot explains that he has read this on a website.

The second QT robot challenges the first one in several ways. First, he argues that they should not force the pills on the elderly person, because forcing pills violates the autonomy of

the person, and autonomy is good. The first agent now replies that autonomy is not always good, because it leads to selfishness, which is bad.

Since the first QT robot is still not convinced, the second robot observes that the pills do not increase the life of elderly people at all, because last week they gave the same pills to an elderly person who immediately died. Moreover, he claims that the website that says that these pills prolong life is not trustworthy. The same website reported a UFO warning, and websites that report UFOs are not to be trusted.

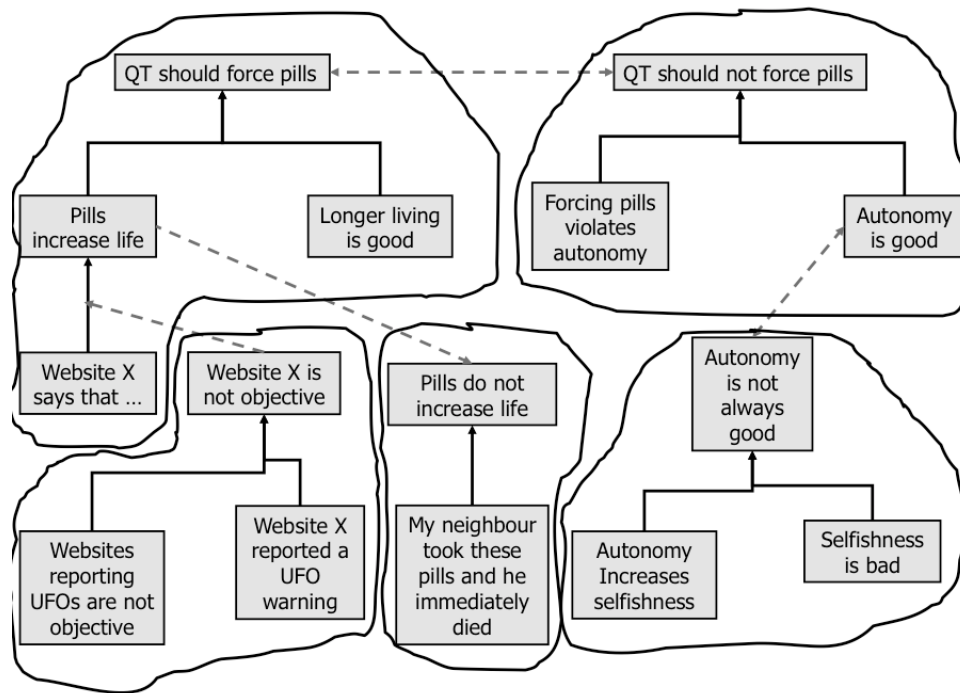
The various arguments and their relations can be visualized in Figure 1.


Figure 1. QT robots for elderly care.

There are five arguments, called A1 to A5, which each have a logical structure.

A1. QT should force pills, because according to website X, these pills prolong life, and longer living is good.
A2. QT should not force pills, because forcing pills violates the autonomy of the person, and autonomy is good.
A3. Website X is not trustworthy, because it reported a UFO warning, and websites reporting UFOs are not trustworthy.
A4. The pills do not increase life, because last week they gave the same pills to an elderly person who immediately died.
A5. Autonomy is not always good, because it increases selfishness, and selfishness is bad.

The five arguments are conflicting with each other, but they conflict in different ways. Argument A1 and A2 are conflicting because they have opposite conclusions. Argument A3 conflicts with argument A1 because its conclusion conflicts with the inference from what website X says, and what we can believe about the pills. Argument A4 has a conclusion conflicting with a supporting sentence of A1, and the conclusion of A5 conflicts with the supporting sentence of A2.

One remarkable property of the conflicts among arguments is that conflict is not necessarily symmetric. Consider argument A1 and A3 again. Argument A3 is a reason not to accept argument A1, because it shows that the inference of the website and the information on the pills may be unreliable. However, argument A1 does not provide a reason to doubt A3. Since conflict is typically assumed to be symmetric, like consistency in logic, in formal argumentation we say that argument A3 attacks argument A1, but not vice versa.

3. FROM DIALOGUE TO ABSTRACT ARGUMENTATION FRAMEWORKS

The concepts of *actor* and *agent* are used in many ways in the literature. For practical reasons we distinguish in this paper the concept of actor from the concept of agent, in the sense that we refer to an actor in a role and in a context as an agent.

Definition 3.1. [*Agent*] *An agent is an actor playing a role in a context. Agents are referred to as a, b, etc.*

We assume that there is no disagreement in the position of an agent defined in this way. In other words, whereas there can be disagreement within an actor, no such disagreement exists within the agent. Therefore, the position of an agent in a dialogue can be represented by a conflict-free set of arguments. We call such a set of arguments an extension.

Definition 3.2. [*Argument*] *An argument is any statement which can be accepted or not by an agent. When it is not accepted, we say it is rejected. The set of arguments accepted by an agent is called its position or its extension. An argument may be accepted by one agent and rejected by another one, and in particular it may be accepted by an actor in one context or role and rejected by the same actor in other contexts or roles. Arguments are referred to as A, B, etc.*

Formal argumentation distinguishes between structured and abstract arguments. In contrast to many approaches, we make the agents explicit (Arisaka *et al.* 2018).

Definition 3.3. [*Structured and abstract argument*] *An argument may have a source, a strength, a logical structure with warrant and conclusion, and so on. The acceptance of an argument by an agent may be qualified by a degree or be qualified in some other way. In abstract argumentation, these argument properties are not considered relevant or unknown, and acceptance is binary.*

A special role is played in formal argumentation by arguments that are contradictory. They are sometimes called auxiliary arguments. A typical contradictory argument is the Russell-Zermelo paradox, which arises within naïve set theory by considering the set of all sets that are not members of themselves.

To decide whether an argument is contradictory or not, the agent has to imagine that this argument is the only argument considered relevant, and then he has to decide whether he would accept the argument or not. Since there is no other argument under consideration which can cause the agent to reject the argument, the only reason for rejection can be a contradiction within the argument itself.

Definition 3.4. [*Contradictory argument*] *An a-contradictory argument is an argument that would not be accepted by agent a if this were the only argument considered relevant by the agent.*

We now get to the core of the theory of abstract argumentation, the concept of attack. An argument attacks itself if and only if the argument is contradictory. For attacks between arguments, we play the same imagination game we played for the contradictory check of as single argument. So, when we consider whether there are attacks among arguments A and B, the agent imagines that these two arguments are the only arguments relevant, and then he considers whether he accepts argument A, argument B, none or both. In the first case there is an attack from A to B, in the second case there is an attack from B to A, in the third case there are both attacks, in the final case there is no attack at all.

Definition 3.5. [*Attack*] *Argument A attacks itself with respect to agent a if and only if the argument is a-contradictory. If arguments A and B are not a-contradictory, and the agent a considers that it is impossible to accept both arguments together, then either A and B attack each other with respect to agent a (if the agent considers only arguments A and B, then the agent does not accept A or B) or A attacks B (if the agent considers only arguments A and B, then the agent accepts argument A and rejects argument B) or B attacks A (if the agent considers only arguments A and B, then the agent accepts argument B and rejects argument A).*

Note the relation between conflict and attack. When arguments A and B are in conflict, whether A attacks B or B attacks A depends on the beliefs or preferences of agents. While beliefs or preferences are subjective, the conflict between two arguments could be objective.

We now define the concept of an argumentation framework. The framework considers all the arguments relevant in a dialogue, together with all the attacks of all the agents in that dialogue.

Definition 3.6. [*Argumentation framework*] *An argumentation framework of a set of agents (or a multiagent system, or a dialogue system) is a set of arguments such that the acceptance or rejection of arguments in the framework does not depend on arguments outside of the framework. An argumentation framework is a context for an agent dialogue or debate. The universal argumentation framework is the argumentation framework of all agents containing all arguments. Argument A attacks argument B if and only if there is an agent such that argument A attacks argument B with respect to that agent. Argument A strongly attacks argument B if and only if this holds for every agent. An argument is contradictory in a framework if and only if for every agent a it is a-contradictory.*

We impose some additional conditions on argumentation frameworks, such that they coincide with graphs. We do not assume that agent attack equals attack, but instead we consider the union of the attack relations of the agents. We need to make the strong assumption that the agents know the same arguments. Consequently, they do not learn new arguments during the dialogue.

Definition. 3.7. [*Coherence*] *An argumentation framework is coherent if and only if the agents are aware of and know the same set of arguments, and the agents agree which arguments are contradictory. A set of agents is coherent if and only if the argumentation framework containing all their arguments is coherent.*

Though arguments are abstract in an argumentation framework, we still impose some structure. In particular, we assume that if A and B are two arguments, then also the aggregation of A and B is an argument. For example, if there is an argument that website X is not trustworthy and an argument that website Y is not trustworthy, then there is also an argument that both websites X and Y are not trustworthy.

Definition 3.8. [*Aggregation*] *The language to express arguments is closed under conjunction. Thus, if argument A and argument B collectively attack argument C without individually attacking it, then there is also an argument A&B attacking argument C. Moreover, argument A&B attacks all arguments attacked by A and B individually, and possibly more, and argument A&B is attacked by all arguments attacking either A or B, and possibly more.*

Completeness is the second property we assume about the language to express arguments. If an agent does not accept an argument, we assume that this agent is able to express another argument why the first argument is not accepted.

Definition 3.9. [*Completeness*] *An argumentation framework is agent complete if the agent does not accept an argument A, then it has an argument B attacking argument A, and this argument B is not attacked by another argument it accepts. Strong completeness says that if an agent does not accept an argument A, then it accepts an argument B attacking argument A.*

We imagine that more properties can be imposed on argumentation frameworks, but we leave that to further research.

There are various advantages to the abstract approach. It can be used for classifying and systematizing reasoning methods (Dung 1995, Baroni and Giacomon 2007, Van der Torre and Vesic 2018), and for combining reasoning methods (Gabbay 2005, 2009, 2013, Villata 2010). For example, it can provide a hybrid approach to semantics/pragmatics and logic/probabilistic approaches which can be found in linguistics.

However, there are still various topics which need to be studied in more detail. Abstract argumentation is mainly a normative theory that has not been evaluated or validated yet by experimental research. A theory of abstraction needs to go hand in hand with a theory of refinement (Villata 2010), but there is no consensus of such theory of refinement. A theory of abstraction should consider an arbitrary number of abstraction levels, but current theories distinguish only two or three.

Moreover, abstraction comes at a price. Whereas the logical structure of arguments and their interaction can be abstracted quite well, it has turned out to be much more difficult to present a satisfactory abstraction of argument strength; this is currently one of the main challenges in formal argumentation. In addition, there are many conceptual and philosophical questions concerning combining reasoning methods. It has been objected that some methods cannot be combined at all, because they are based on incompatible assumptions.

Summarizing, the abstract argumentation methodology in formal argumentation is driven by practical and computational considerations and in urgent need of conceptual and philosophical reflection.

4. DUNG'S THEORY OF ABSTRACT ARGUMENTATION

In abstract argumentation, the internal structure and content of each argument is stripped away, so that the focus rests on the relation between them. Formally speaking, an argumentation framework (Dung, 1995) is a pair *(A, R)*, where *A* is a finite set of atomic entities called *arguments* and *R* is a relation between arguments, which symbolizes *attack*.

The aim is to identify sets of jointly acceptable arguments. There is not necessarily a single output, but instead there can be multiple justifiable standpoints on the status of the arguments. In this respect, formal argumentation separates itself from logic approaches that focus on single truth, and comes a bit closer to reasoning as is done in answer-set programming (Gelfond & Lifschitz, 1988). With this in mind, formal argumentation comes closer to problem-solving systems, where multiple solutions co-exist, or perhaps none at all, when the problem is over-constrained.

For example, consider the Einstein puzzle. This is a famous riddle about five neighbouring houses of different colours. Each house is inhabited by a person of different nationality who owns a different pet, has a favourite drink, and enjoys smoking a certain brand of cigars. The problem instance then gives a number of statements such as "The English person lives next to the owner of the cat" and "The owner of the green house drinks coffee but does not smoke Dunhill's". The statement of the riddle ends with a question such as "What is the dog keeper's favourite drink?" This problem is just a model-generation problem of constrain satisfaction. Depending on the constraints given, the problem might have more than one solution, or satisfying model. Also, notice that even when the answer to the question is unique, there might be multiple models that satisfy the constraints but just have this one assignment in common.

In this respect, formal argumentation also looks for satisfying models in that it aims at identifying rational standpoints in an argumentative setting. Here also, multiple viewpoints are possible, as different agents may have different values and objectives, or even a single agent may have conflicts between different goals they would like to fulfil, such as obligations and desires.

We now provide a few definitions of abstract argumentation frameworks for the reader to understand how the formalism carries out these intuitions. We define a set of arguments to be *conflict-free* if and only if it contains no two arguments such that one attacks the other. We say that a set of arguments *B defends* a set of arguments *C* if and only if for every argument *d* attacking some argument in *C*, there exists an argument *e in B* such that *e* attacks *d*. We can now define a set of arguments to be *admissible* if and only if it is conflict-free and defends itself. These sets of arguments represent a first step towards rational standpoints. However, let us examine the argumentation framework depicted in the figure of section 2. {A3} has no attackers, and is therefore admissible. However, note that A3 defends A4 from A1, its only attacker. Therefore, while {A3} on its own is admissible, since it defends A4, it would be odd to accept A3 but not A4. Here is where the notion of *complete extension* comes into play. We say that a set of arguments is a *complete extension* if and only if it is admissible and contains every argument it defends.

We here use the term *extension*, as is used in answer-set programming, since we now really start to identify sets of arguments that satisfy good enough properties to be considered rational standpoints. The complete extensions can then be further refined to reflect different sorts of standpoints. For example, the most conservative standpoint would be reflected by the *grounded extension*, which is the smallest complete extension with respect to set inclusion. Note that this extension is necessarily unique. Agents adopting this point of view would only accept arguments which either have no counter-arguments, or which are somehow defended by those arguments. Every time a dilemma is put forward, where two arguments A and B

attack each other and no other argument attacks either of them, the agent would abstain from accepting either of the arguments and therefore be more cautious in their reasoning. On the other hand, a very liberal kind of reasoning would be reflected by the *preferred extensions*, which are the maximal complete extensions with respect to set inclusion. Here, every time a dilemma is presented, two extensions would arise: one where the first argument is accepted and one where the second argument is accepted. In the presence of such choices, a decision would always have to be made regarding which argument to accept. This would correspond to a greedy approach to reasoning where an agent would like to infer as much as possible.

For example, let us consider a case where an agent must decide what to eat and drink for their conference dinner. Assuming the agent is non-vegetarian, they must first choose between eating meat or fish as a main dish, and then choose a wine between the choice of white, red or rosé. The agent has no preference between meat or fish, so both options are valid and exclude the other, since the agent can only choose one dish. However, it is well known that when eating fish, one should not drink red wine. In addition, since the main dish is more important than the drink, this conflict is unidirectional, unlike the conflict between meat and fish. In addition, the preference is that the agent would rather have red wine that white wine, white wine rather than rosé, but also rosé rather than red wine. This gives us the argumentation framework depicted in Figure 2.
Figure 2. Conference dinner argumentation

Here, the most conservative agents selecting the grounded extension would not accept any argument. On the other and, an agent selecting a preferred extension could either choose to eat fish and drink white wine, or choose to eat meat but remain indecisive about which wine to drink.

Note that the structure of the graph also seems to suggest a particular order for the decision-making. Indeed, notice how choosing fish over meat leads to an instant resolution of the choice of wine.

Dialogue-based decision procedures (Caminada 2018) have been defined for Dung's theory of abstract argumentation. The main-stream argumentation semantics are interpreted by means of structured discussion. The idea is that an argument is justified according to a particular argumentation semantics if and only if it is possible to win a discussion of a particular type. Hence, different argumentation semantics correspond to different types of discussion. Caminada provides an overview of what these discussions look like, and their formal correspondence to argumentation semantics.

For example, consider a proponent who is arguing that we should drink white wine. The opponent can challenge him by asking why we are not drinking red wine. The proponent cannot resort to the argument of rose wine, as it would be attacked by his own argument of white wine. However, he can attack the argument by stating that we will eat wish, and red wine does not combine with fish. Proponent now can attack fish by arguing that we will eat meat. Depending on the rules of the dialogue game, now proponent may be allowed to repeat

his argument of eating fish, or not. If he is allowed to do so he will win the game and white wine is accepted, if he is not allowed then he will lose the game and white wine is rejected.

5. CONCLUSION

Formal Argumentation is emerging as a key reasoning paradigm building bridge among knowledge representation and reasoning in artificial intelligence, informal argumentation in philosophy and linguistics, legal and ethical argumentation, mathematical and logical reasoning, and graph-theoretic reasoning. It aims to capture diverse kinds of reasoning and dialogue activities in the presence of uncertainty and conflicting information in a formal and intuitive way, with potential applications ranging from argumentation mining, via LegalTech and machine ethics, to therapy in clinical psychology. The turning point for the modern stage of formal argumentation theory, much similar to the introduction of possible worlds semantics for the theory of modality, is the framework and language of Dung's abstract argumentation theory introduced in 1995. This means that nothing could remain the same as before 1995—it should be a focal point of reference for any study of argumentation, even if it is critical about it. Now, in modal logic, the introduction of the possible worlds semantics has led to a complete paradigm shift, both in tools and new subjects of studies. This is still not fully true for what is going on in argumentation theory. The first volume of a handbook series in formal argumentation reflects the new stage of the development of argumentation theory.

Formal argumentation can be considered as a candidate for the foundations or theory underlying informal argumentation in philosophy and linguistics. In 1965, Toulmin's much cited book "the uses of argument" led to a criticism on the use of classical logic for reasoning, and the rise of so-called informal logic. Most of the criticism of Toulmin and colleagues has been addressed by non-monotonic logic and more recently, formal argumentation.

Whereas in informal argumentation the evaluation of single argument plays a central role, in formal argumentation the evaluation of argumentation frameworks is the focal point of discussion. Consequently, relations among arguments play a central role in formal argumentation, such as the notion of attack in Dung's theory. Modern formal argumentation offers a kind of interactive argumentation, where the evaluation of individual arguments is enriched with a theory where the evaluation of arguments depends on the evaluation of other arguments. The principle-based approach studies diversity by distinct acceptance semantics, and principles of these semantics.

The research on formal argumentation is split into formal theories of dialogue and formal theories of abstract and structured argumentation. In this paper we show how to build bridges between these two fields. We give an example of dialogue in machine ethics, we show how to represent it in structured argumentation, and we explain how the set of dialogue positions of agents can be represented abstractly by a graph. We also discuss how dialogues have been used as decision procedures for Dung's graph-based theory of abstract argumentation and we identify open research challenges for formal argumentation.

The main challenge is to bridge informal and formal argumentation, in other words to build informal argumentation on top of the new foundations of formal argumentation. This is far from straightforward. From a methodological perspective, the insights of abstract argumentation are a guide, but Dung's theory should not be used as a straightjacket. Researchers in argumentation are free to generalise and adapt it as needed.

We highlight two topics for further study to develop further bridges between informal and formal argumentation.

First, argumentation schemes (Macagno, Walton and Reed 2018) can be used to describe and analyze or produce real arguments. They provide a modular approach to

argument analysis, in which different argumentation schemes are combined together in order to represent each step of reasoning on which a complex argument relies. Moreover, schemes are applied to formal systems, with applications to Artificial Intelligence, AI & Law, argument mining, and formal ontologies.

Second, argumentation mining is the new and rapidly growing area of natural language processing and computational models of argument. Argument mining aims at automatic recognition of argument structures in large resources of natural language texts, for example using argumentation schemes developed in informal argumentation. Budzynska and Villata (2018) introduce approaches for processing natural language argumentation. They observe that, although natural language argumentation has attracted the attention of philosophers and rhetoricians since Greek antiquity, it is only very recently that the methods and techniques of computational linguistics and machine learning have become sufficiently mature to tackle this extremely challenging topic. Argument structures studied in abstract argumentation can be extracted from natural language texts, providing a bridge between mathematical models and natural language. Budzynska and Villata (2018) describe the typical argument mining pipeline and related tasks, and present in more detail a specific example of work in this area.

Further topics of future research can be found in the argumentation manifesto (Gabbay *et al*. 2018).

Statistics in popular science: The argument from correlation to cause

MARTIJN H. DEMOLLIN

ABSTRACT: A main activity within popularized science communication is the expert-to-layman transferral of scientific knowledge. Correlative connections have proven to be a problematic concept to adequately communicate and form a relatively common source for the misrepresentation of scientific knowledge. Depending on the strength of the causal claim, such an inferential step can be considered an 'argument from correlation to cause'. This paper further explores these kinds of arguments within the context of popularized science.

KEYWORDS: argumentative pattern, cause, correlation, popularized science, pragma-dialectics, reasonableness, science communication

1. INTRODUCTION

The popularization of scientific research – also called *vulgarisation* or *accommodated science writing* – is defined as the process of making scientific findings and publications accessible to a more general public. Popular scientific discourse is often characterized by a less technical vernacular than scientific literature as a professional medium and it aims to both inform and persuade non-scientific outsiders. Popularizing scientific knowledge has been traditionally considered an activity situated outside of the academic domain. It was generally deemed unrelated to the process of knowledge production or the validation of scientific findings, both within academic circles and beyond (Shinn & Whitley, 1985, p. 3). However, in more recent developments, science popularization has become progressively widespread and connected to the process of validating scientific knowledge towards society at large. In part, this movement is due to a greater public and political emphasis on the amenability of scientific research, which stresses the societal importance and potential application of scientific findings outside of the academic sphere.

Expert-to-expert scientific literature is generally characterized by the presence of tentative, careful and qualified propositions of fact or relation. Popular science tends to present scientific research and its corresponding claims with less reluctance. Expert-to-expert scientific publications within the academic domain are aimed at facilitating a number of institutional goals: reporting informatively and persuasively on scientific progress, the accumulation of scientific knowledge, and the critical examination of scientific claims by peers. In contrast, popularized scientific texts fulfil a role in the academic domain *and* the journalistic domain. As such, popular scientific discourse can be considered its own unique *communicative activity type* (van Eemeren, 2010) with its own set of characteristics and discursive attributes. This makes the translative process from scientific discourse into a popular scientific publication interesting from an argumentation theoretical point of view. Expert-to-expert and popularized scientific publications serve to fulfil dissimilar institutional goals and cater to different audiences, which affects the argumentative strategies employed in each respective genre.

The argument from correlation to cause is a good example of a type of reasoning that is often employed with considerable restraint in professional scientific discourse, but less so in

popularized scientific texts. While correlations possess certain predictive capacities, they may only be employed to infer causation under very strict conditions, which is due to the fact that there could remain a number of hidden influences that may play a part in the observed relation between two variables. In some cases, one could argue that a particular correlation *does* point to a causal link between the observed variables, when the presence of one variable is believed to directly influence the presence of another. When a correlative argument is adduced in defence of a claim to the existence of a causal relation, this is also known as an argument *from correlation to cause* (Walton, 1996, p. 71). In order for such an argument to be acceptable, several other arguments aside from the correlative connection between the observed variables are needed. Employing a correlation in an argument supporting a causal relation can be perfectly reasonable from an argumentative point of view – if there is sufficient additional evidence to support the causal claim. However, this type of argumentation has proven to be problematic within the context of popular science communication, which can lead to the misrepresentation of scientific knowledge to the greater public.

In order to further explore these arguments from correlation to cause in the context of popular science, this paper will: (a) provide a characterization of popular scientific discourse as a communicative activity type, (b) formulate the expected argumentative pattern for arguments from correlation to cause from a pragma-dialectical perspective, and (c) discuss a case study of such argumentation within the context of popularized science communication.

2. CHARACTERIZING POPULAR SCIENTIFIC DISCOURSE AS A COMMUNICATIVE ACTIVITY TYPE

Most popular scientific texts are situated between the realms of academics and journalism, which means they aim to fulfil institutional goals relevant to both these communicative domains. Popularized scientific discourse that is intended for a general public is also called *expert-to-layman* communication, and constitutes a unique communicative activity type. As van Eemeren notes, when attempting to distinguish communicative activity types from one another, it is important to describe "the specific goals they are to serve in order to fulfil their mission in realizing the institutional point of the communicative activity" (2010, p. 144). Popular scientific discourse can be categorized among the communicative activity types that "prototypically involve the activation of more genres of conventionalized communicative practices" (van Eemeren, 2010, p. 144). This means popular scientific discourse functions as a *hybrid* communicative activity type. Table 1 below presents an overview of my formulation of the institutional goals popular scientific texts aim to achieve within the journalistic and academic domains.

The institutional goals of popular scientific discourse have some overlap to those of professional scientific publications. Popular scientific texts share the institutional goal of reporting informatively on scientific progress and persuading an audience of a scientific interpretation. However, the goal of critical examination and evaluation of scientific findings is largely absent for popular scientific discourse, given the fact that it does not target a purely academic audience, but a much more general audience. The primary institutional goals of a popularized scientific article domain as a form of scholarly communication is to persuade a reader by means of a *representative* interpretation of the scientific source material (Goal 1 & 2, Table 1) rather than subject the material to critical examination.

Communicative Activity Type	Communicative Domain	Institutional Goals
Popular scientific discourse	Scholarly communication	1. Providing an adequate and accurate representation of scientific findings. 2. Persuading the audience of the presented interpretation of scientific knowledge.
	Journalistic communication	3. Simplifying the scientific source material in order to make it accessible to a wider audience. 4. Indicating the societal importance and significance of the scientific knowledge reported on.

Table 1: Institutional goals of the communicative activity type 'popular scientific discourse'

Another important factor influencing the institutional goals of popular scientific discourse is that its content is bound to professional scientific material already in existence. Authors of popular scientific texts have an institutional responsibility to provide a representation of existing scientific knowledge that is both adequate and reasonable, although it does not have to be complete or exhaustive. If a popular scientific text strays too far from the source material, its author runs the risk of misrepresenting the scientific material it is based on, possibly leading to the popularized scientific article being rescinded. However, there is no absolute delineation of what constitutes a reasonable or unreasonable representation of scientific source material. Also, authors of popular scientific material are expected to create a text that is appealing and accessible to a wide audience, which involves making a selection of information to present that serves his or her purpose – and thus the journalistic institutional goals (Goal 3 & 4, Table 1) (Fahnestock, 1986, p. 281). Essentially, when creating a popular scientific text, an author maneuvers between the institutional goals of adequacy and representation, while also attempting to maximally achieve the institutional goals of simplifying the material and indicating its societal importance and relevance in order to ensure that is interesting to a broad public. As such, there exists a certain tension between the academic and journalistic institutional goals of popular scientific discourse, as it may not always be possible to maximally fulfil one without neglecting the other.

The adaptation of scientific knowledge from an academic audience to a lay-audience represents a great shift in discursive context. And as Fahnestock remarks, "with a significant change in rhetorical situation comes a change in genre, and instead of simply reporting facts for a different audience [...] the work of science journalism requires the adjustment of new information to an audience's already held values and assumptions" (1986, p. 278-279). Thus, professional scientific material is not simply reported on in popular scientific discourse, but is in fact recontextualized in the communicative activity type of popular science in order to ensure it fulfils both of its institutional goals. In that regard, a popular scientific text is a reinterpretation of scientific source material that must be argued for. However, in the popular scientific context of informing and persuading an audience of scientific fact – rather than offering scientific findings for critical evaluation – there is often no room for many qualifications towards what is being communicated. Although a smaller, academic audience may expect an author to provide a full justification for his or her statements and take a tentative approach to inferential claims,

the wider audience has much less need for this type of information. Instead, a large and heterogeneous audience is mainly interested in the potential application of research or its appeal to a sense of wonder or progress (Fahnestock, 1986, p. 279). This particular audience demand is often met by the use of vivid imagery and presenting scientific claims with greater certainty than they may actually possess. Additionally, while the significance of what is being communicated in a professional scientific paper is largely understood and made clear contextually, this does not hold true for many popular scientific articles, which generally explicitly indicate the value of the scientific knowledge they report. Such practices tie back to the institutional goal of relating the societal importance of the scientific source material to the target audience, which is more likely to be adequately fulfilled with the use of these discursive strategies.

3. THE ARGUMENT FROM CORRELATION TO CAUSE

3.1 The statistical meaning of a correlation

Correlations fall within a broad class of statistical relationships that involve dependence and association between two or more variables. In its most common usage, a correlation between two variables refers to the extent to which these variables possess a linear relationship with each other. For example, the relation between the physical appearance of parents and the appearance of their children is a basic example of a correlation, since their relation is clearly dependent, but not completely linear. Correlations may also possess predictive capacities, as they can provide an indication of the likelihood a particular variable may occur. For instance, the weather conditions on a particular day are instrumental in assessing the required level of energy production a power plant should be prepared to meet. In that case, the correlation between extreme weather conditions and a corresponding increased demand for energy in order to heat or cool residences contains a causal relation. In other words, the weather conditions *cause* the increased need for energy, which means those weather conditions provide a solid indicator of energy demand. However, there are many other factors that may contribute to an increase in energy demand and extreme weather conditions do not *always* generate the same increase in energy demand, which may be the case during a holiday period. This means the overall relation of dependence between energy demand and weather conditions is still considered a correlation, while it has a causal relation embedded within its relation of dependence. In actuality, what is commonly subsumed under correlation is a broad range of different possible relations between variables.

When two variables or events – A and B, for example – are correlated, there are a number of possible relationships that may exist between those variables, which include the following options (Govier, 2005, p. 288):

- A causes B (direct causation)
- B causes A (reverse causation)
- Both A and B are the consequences of a common cause C, but have no causal relation towards each other. (Third-cause variable, 'standard' correlation)
- There is in fact no actual connection between A and B (coincidence)

Because of the disparate nature of what a correlation may actually signify[1], a common statistical dictum is *correlation does not imply causation*. This means that on the basis of the fact that event A and B are correlated alone, one cannot draw a conclusion about the existence or the direction of a causal relationship between them. In order to establish whether any causal link between the observed variables exists, additional information is required. As such, the interpretation of a measured correlation as an indication of a certain causal connection is in fact a claim that requires argumentative support. If an arguer employs a correlation to validate the existence of a causal link, he or she can be reasonably expected to provide additional evidence that supports that particular interpretation over another. More specifically, an arguer claiming that a variable shares a causal relation with another may be required to adequately address the impossibility or unlikelihood of the other possible relations between those variables. In the case of an arguer claiming a direct causal relation – A causes B – on the basis of a correlation between them, he or she is using a specific type of argumentation that is also called an *argument from correlation to cause* (Walton, 1996, p. 71). However, given the fact that the correlation alone is not enough to substantiate a causal relation, the argument from correlation to cause should consist of multiple elements that must be adduced in defence of the causal claim in order to form a cogent inference. Section 3.2 to follow further elaborates on the expected argumentative pattern for arguments from correlation to cause.

3.2 Argumentative pattern for the argument from correlation to cause

In previous research concerning the use of correlation in argumentation, several formulations of the argument from correlation to cause have been put forward. However, there are considerable differences between these formulations and their theoretical stance towards the reasoning behind the argument from correlation to cause. Douglas Walton (1996, p. 71-73) formulates the argument from correlation to cause – which he baptized as such – in its basic form:

Premise: There is a positive correlation between *A* and *B*.
Conclusion: Therefore, *A* causes *B*.

Walton adds a number of critical questions that are aimed at identifying whether the relation invoked can be considered reasonable or not. He notes that "quite often, arguments fitting this argumentation scheme are presumptively correct. However, this type of argumentation tends to be very weak in many cases, because other factors are overlooked" (Walton, 1996, p. 71-72). But even if the argumentation employed in an argument from correlation to cause is weak, "the argument may still be a reasonable one, [...] because the critical questions could possibly be answered with further investigation of the case" (Walton, 1996, p. 72). Thus, in Walton's view, the argument from correlation to cause is not necessarily fallacious, but difficult to make inferentially valid.

In another treatment of argumentation from correlation to cause, Johnson and Blair (1983, p. 121) subsume it under a broader category of arguments that employ a causal claim. As such, their treatment of the argument from correlation to cause departs from the category of

---

[1] Theoretically, 3 more possible causal relations between the correlated variables could occur than the ones mentioned by Govier (2005, p. 288). A and B could also be the cause of one another, which is a cyclical causation. Also, A could cause a third variable C, which in turn causes variable B, called an indirect causation. Although these relations are more complex, they include a causal relation from A to B and have been accommodated in that category. Lastly, A and B may both cause a third variable C, which is actively conditioned on, which is an example of Berkson's Paradox (Berkson, 1946) This category has been purposefully excluded, as it exceeds the theoretical scope of this thesis.

post hoc and *cum hoc* fallacies, which are also called fallacies of *questionable cause*. Such fallacies have three identifying conditions: (1) there is a causal claim in the standpoint, (2) the protagonist fails to provide adequate evidence for the causal claim and (3) there are grounds to question the acceptability of the claim (Walton, 1996, p. 165). This interpretation of the argument from correlation to cause signals that Johnson and Blair do not consider such arguments inherently fallacious, seeing as a correlation – in combination with other arguments – could satisfy conditions (2) and (3). While Johnson and Blair provide further general criteria for the acceptability of arguments containing a causal claim, the specific requirements for an argument from correlation to cause are not addressed.

Groarke & Tindale (2004, p. 303) formulate an extensive argument scheme for the argument from correlation to cause, which is focused on representing the additional theoretical elements necessary to infer a causal relation on the basis of a correlation:

Premise 1:   *X* is correlated with *Y*.
Premise 2:   the correlation between *X* and *Y* is not due to chance.
Premise 3:   the correlation between *X* and *Y* is not due to some mutual cause *Z*.
Premise 4:   *Y* is not the cause of *X*.
Conclusion: *X* causes *Y*.

This scheme contains all the necessary elements needed to substantiate a claim to causality, but it does not yet indicate the logical structure in which the premises support the standpoint. Also, the underlying assumptions an arguer uses to justify the inferential step from the premises to the conclusion are not yet represented in this formulation of argumentation from correlation to cause.

Using a combination of empirical information on argumentation from correlation to cause and its theoretically necessary elements, I have formulated a pragma-dialectical rendition of their expected argumentative pattern as follows:

1	We may assume that *A* causes *B*.
1.1a	*A* is correlated with *B*.
1.1b	A causal relation between *A* and *B* is plausible.
1.1c	The correlation between *A* and *B* is not due to a common cause.
1.1d	*B* does not cause *A*.
(1.1a'-1.1d')	If premises 1.1a through 1.1d apply, we may assume that *A* causes *B*.
(1.1a'-1.1d').1a	If premises 1.1a through 1.1d apply, *A* is a necessary cause of *B*.
(1.1a'-1.1d').1b	If premises 1.1a through 1.1d apply, *A* is a sufficient cause of *B*.

In this form, the argument from correlation to cause can be considered a subtype of *causal argumentation* (van Eemeren et al., 2002, p. 100-102). The standpoint under 1 that contains the claims to a causal relation between *A* and *B* is defended with a number of coordinative arguments, which only together constitute a complete substantiation of the claim. These arguments are provided in anticipation of critical questions that "relate to specific conditions under which a particular fact can be called the 'cause' of another fact" (Wagemans, 2016, p. 103). In support of the standpoint containing the causal claim, four coordinative arguments pertaining to the observed correlation between *A* and *B* can be adduced. Argument 1.1a contains the argument that there is a positive correlation between *A* and *B*. Argument 1.1b consists of any reason related to the plausibility of the suggested causal relation, such as circumstantial information regarding the evidence brought forward. In turn, argument 1.1c is adduced in order to exclude the possibility of a third variable causing both *A* and *B*. Argument 1.1d eliminates

the reverse and cyclical types of causal relations between the variables. These four coordinative arguments are aimed at the elimination of the existence of any other relation between the correlated variables *A* and *B*, in order to support the standpoint containing the claim to a direct causation from *A* to *B*. The implicit linking premise under (1.1a-1.1d') reflects the arguer's assumption that the arguments mounted in defence of the direct causal relation provide an adequate substantiation of the causal claim. In theory, this argument scheme for the argument from correlation to cause represents all the necessary elements for a valid and acceptable inference, in which arguments 1.1a through 1.1d each provide a piece of the puzzle. Finally, the implicit linking premise may be further supported by two coordinative argument relating to the sufficiency and necessity of the causal relation between *A* and *B*. Argument (1.1a'-1.1d').1a states that the causal relation from *A* to *B* is necessary, which means that "without the occurrence of the cause, the effect does not occur either" (Wagemans, 2016, p. 103). Argument (1.1a'-1.1d').1b states that *A* is a sufficient cause of *B*, which means that no other factors – such as a third variable – are needed for the effect to occur.

4. CORRELATION TO CAUSE ARGUMENTATION IN POPULAR SCIENCE

Using the argumentative pattern outlined in Section 3, it is now possible to analyze an argument from correlation to cause within the context of science communication. The expert-to-expert scientific and peer-reviewed journal for *Behavioural Brain Research* has recently published a study focussed on the relation between Facebook usage and brain structure by Montag et al. (2017, pp. 221-228) titled 'Facebook usage on smartphones and gray matter volume of the nucleus accumbens'. The study used a remote smartphone activity tracker to record the actual Facebook activity of 62 participants and correlated this data with the volume of the *nucleus accumbens* in the brain. The nucleus accumbens is a region in the brain also known as its 'reward centre', and likely plays an important role in a wide range of positive experiences. The resulting data of the study indicate that "in particular higher daily frequency of checking Facebook on the smartphone was robustly linked[2] with smaller gray matter volumes of the nucleus accumbens" (Montag et al., 2017, p. 221). In this case, the correlation was negative: "participants who opened the Facebook application more frequently and participants who stayed on Facebook longer had smaller nuclei" (Montag et al., p. 224). However, the authors stipulate that "given the cross-sectional design of the present study, it remains to be elucidated whether lower volumes of the accumbens constitute a factor for increased social media use or whether it results as a consequence of higher usage" (Montag et al., 2017, p. 226). In other words, the study has found the variables to be strongly correlated, but has not been able to establish the existence or direction of a possible causal link between the measured variables. I have formulated a reconstruction of this professional scientific publication's most relevant argumentation below:

---

[2] 'Robustly linked' means as much as 'strongly correlated' in this context. In relation to this discursive phenomenon, Govier points out that "the word *linked* [...] enables writers to skirt over the distinction between correlational evidence and causal claims conclusions, because it has several meanings that are rarely distinguished from each other. To say that Q is linked to H suggests, but does not assert, a causal connection between Q and H. Because the connection is only suggested, the demands of a rigorous causal argument are avoided. But because the connection is suggested, there is a clear implication that something more than a correlation has been established" (2005, p. 290, italics in original).

1	The nucleus accumbens could be involved in online social media usage.
1.1a	Higher daily frequency of checking Facebook is robustly linked with smaller gray matter volumes of the nucleus accumbens.
1.1a.1	Left and right nucleus accumbens volume is negatively correlated with Facebook usage.
1.1b	The results from other neuroscientific studies suggest that the rewarding aspects of Facebook usage could result in over-usage of this platform.
1.1c	Data show that the frequency of daily Facebook checking is also associated with self-reported tendencies towards online social network addiction.

The claim Montag et al. (2017) make on the basis of their observed correlation is careful, and states no more than a possible involvement of the two variables investigated. The claim is supported by the observed negative correlation between the variables and other coordinative argumentation that suggests other evidence for the plausibility of the connection.

In the 'Health' section of *Rush Hour Daily* news, these professional scientific findings are popularized in an article that claims "Facebook addiction causes decrease in brain's gray matter" (Ulaky, May 29, 2017). The article goes on to report the measured negative correlation between Facebook usage and nucleus accumbens volume, as well as another study concerning the use of Facebook and markers of general well-being. Furthermore, the popular scientific article contends that researchers Montag et al. used magnetic resonance imaging (MRI) scans, which "ultimately showed the negative reaction too much social activity might have" (Ulaky, May 29, 2017). My reconstruction of the correlation to cause argumentation employed in the popular scientific article is as follows:

1	Increased Facebook usage leads to a decrease in gray matter in the brain.
1.1	A study published in the journal *Behavioural Brain Research* has discovered the negative side effects and psychological repercussions of Facebook "addiction".
1.1.1a	People who frequently check the application on their smartphones are likely to have less gray matter the 'reward centres' of their brains.
1.1.1a.1	Higher daily frequency of checking Facebook is robustly linked with smaller gray matter volumes of the nucleus accumbens.
1.1.1b	MRI-scans of the test subjects showed the negative reaction too much social activity might have.

From an evaluative point of view, the reconstructed argument from correlation to cause in *Rush Hour Daily*'s article can be considered fallacious on two accounts:

In the first place, the representation of the scientific source material the article is based on is inadequate and unreasonable towards the original authors. In argument 1.1, the author of the popular scientific article states that researchers Montag et al. have "discovered the negative side effects and psychological repercussions" to the use of Facebook, which signals a relation of cause and effect between the variables. However, Montag et al. explicitly indicate they have not yet discovered the substantive nature of the correlation they have observed (2017, p. 226). In that regard, the popularized article commits a *strawman* fallacy, by implying the study by Montag et al. has claimed a causal relation between the correlated variables. In doing so, the popularized article violates the third pragma-dialectical rule for critical discussion, which states that an arguer may not distort or misrepresent the standpoint of another party.

In the second place, the inference from correlation to cause made in the popular scientific article is unacceptable, since it is improperly substantiated with evidence other than a correlative argument. Argument 1.1.1b is used in the article to support the interpretation of the original study as a relation of cause and effect. In reality, the MRI-scans of the test subjects' nucleus accumbens indicated the correlation of its volume and Facebook usage, but no causal relation. As such, the correlative argument 1.1.1a and the incorrect interpretation of the data in argument 1.1.1b entail the fallaciousness of this argument from correlation to cause. The author commits the fallacy of *cum hoc ergo propter hoc,* by making the assumption that the observed variables co-occurring allows for a causal conclusion. The reasoning in the popularized article does not effectively rule out alternative explanation before making a causal claim and does not acknowledge that the remaining premises alone do not adequately substantiate the claim.

This example demonstrates the tension between the academic and journalistic institutional goals a popular scientific article aims to fulfil. By presenting the observed connection between Facebook usage and gray matter volumes in the brain as a causal relation, this article has very likely achieved both journalistic institutional goals of simplification and indicating significance. This is further abetted by the nature of the topic, which is of wide application and interest, which now also generates a cause for concern. Although popular science writers "must usually be explicit about the value of scientific discoveries, [as] they cannot rely on the audience to recognize the significance of information" (Fahnestock, 1986, p. 279), in the example this has been achieved at the expense of the institutional goal of adequacy and representation. In sum, the author of this particular popular scientific article appears to have placed too great an emphasis on fulfilling the institutional goals situated within the journalistic domain of communication, thereby overstepping the reasonable bounds for critical discussion.

5. CONCLUSION

With this paper, I have endeavoured to develop an argumentation theoretical basis for the analysis and evaluation of arguments from correlation to cause within the context of science communication. In Section 2, I have briefly discussed the communicative characteristics of popular scientific texts. Section 3 focussed on formulating the expected argumentative pattern for arguments from correlation to cause, and Section 4 discussed an example of argumentation from correlation to cause within the context of science communication. The argumentative use of correlation and cause plays an important role in the process of obtaining valid and substantiated scientific explanations for the relation between observed phenomena. While correlations may provide an important hint to the existence of a causal relation, they do not license a causal claim on their own. An acceptable argument from correlation to cause must contain a number of additional elements that support the inferential step from a correlation to a relation of cause and effect.

The exclusion of the possible effects of external variables in an argument from correlation to cause is the subject of debate in numerous scientific fields. In many behavioural and medical research projects, the total exclusion of tertiary factors that may be of influence on an observed correlation can be very difficult – or even impossible. For those cases, it may not be achievable to assemble a complete argument from correlation to cause, but that does not necessarily make the scientific findings any less valuable. The precise conditions under which a causal connection can be considered adequately or sufficiently established affect not only the academic world, but also the realms of government and politics. For example, if a particular product is found to be correlated with a risk to health, the conditions that stipulate when a legitimate inference from a correlation to cause may be made are instrumental in determining when a government is allowed to intervene. In view of this, it would prove conducive to

precisely identify the argumentative conditions under which external variables are generally considered acceptably excluded in establishing causality.

There also remain a number of interesting directions for further argumentation theoretical research on this topic. Since the intended audience of popular scientific discourse is highly diffuse, its contents and aims may vary greatly per category of popularization. For example, intra-scientific popular discourse is intended for members of the academic world active in other fields of research and results in entirely different popular scientific material than popularized articles in a newspaper or a magazine dedicated to popular science for a general audience. It would be fruitful to characterize each of these subtypes of scientific popularization as a communicative activity type in order to chart how the variations in intended audience influence their respective institutional goals and conventions. Another worthwhile area of research is the parallel between the institutional goals of popular scientific discourse and the dialectical and rhetorical goal in the pragma-dialectical notion of *strategic maneuvering* (van Eemeren, 2010, pp. 25-47). An arguer involved in a difference of opinion may maneuver strategically to simultaneously fulfil argumentative goals of reasonableness and effectiveness. The tension between the institutional goals of popular scientific discourse resembles the tension between the dialectical and rhetorical goals which underpins the pragma-dialectical notion of strategic maneuvering. It may be possible to analyze and evaluate the discursive tactics popular scientific texts employ to mitigate the tension between its institutional goals as strategic maneuvers.

ABSTRACT: People appeal to maps when justifying conclusions about the territory mapped. What warrants such inferences? Christoph Lumer (2016), in responding to similarity accounts of maps-as-models, claims that such inferences are only properly warranted by an isomorphism between the territory represented and the map. We respond that isomorphism cannot account for the variety of ways in which maps are used as justification. Therefore, while inferences from map to territory may be warranted by an isomorphism, schemes that cite only the isomorphic relation do not accurately depict the normative structure of the reasoning involved.

1. INTRODUCTION

Visual arguments are arguments in which at least one component is carried or conveyed by a visual element (Dove 2016a: 57). Of the many theoretical issues concerning visual arguments, questions of their proper analysis, representation, and normative appraisal have become paramount. Conservative approaches hold that existing theoretical resources typically applied to verbal arguments may also be applied to visual ones. Conservative approaches may include revisionary elements, whereby existing resources are modified or adapted, or their repertoire expanded, so as to better apply to particularly visual arguments. Radical approaches, by contrast, contend that existing argumentation-theoretic resources do not properly apply to visual arguments. David Godden (2017) argued for a normative non-revisionism, whereby existing evaluative ways may properly be applied to visual argument. Contributions to the literature exhibiting this approach include Groarke (1996), Blair (1996, 2004, 2015), and Birdsell & Groarke (1996, 2007).

Taking a conservative approach, Ian Dove (2011, 2016a, 2016c) has demonstrated that visual arguments are usefully represented and evaluated using the informal techniques of argumentation schemes, critical questions, and fallacies. These techniques are also adopted in the fifth (2012) edition of Leo Groarke and Christopher Tindale's textbook *Good Reasoning Matters!* In some cases, Dove observes that existing schemes and fallacies, originally designed for verbal arguments, may straightforwardly be applied to visual arguments, as with *arguments from visual analogy* (Dove 2011) and the *slippery slope fallacy* (Dove 2016c). The revisionary elements of Dove's program consist in identifying and schematizing uniquely visual patterns of reasoning, such as *arguments from (perfect) fit* (Dove 2013) or *arguments from pictured plausibility* (Dove 2016a).

In "On appeal to (visual) models" (2016b), Dove proposes the scheme *appeal to visual model* to depict the macrostructure of *surrogative reasoning* (Swoyer 1991) where, by reasoning about or within a model, one may cogently draw conclusions about the phenomena or systems represented in or by the model.[1] Following theorists like Chris Swoyer (1991) and Ronald Giere (1999; 2004), Dove claims that the relation between model and modelled warranting simulative reasoning is one of similarity—specifically a *structural similarity*. In commenting on Dove's proposals, Christoph Lumer (2016) argues that isomorphy, not structural similarity, is required for the cogency of simulative reasoning: the "inference [from model to modelled] is made possible because of the isomorphy between the original and the model" (2).

Here, by considering examples of simulative reasoning from visual maps to their territories, we argue against Lumer's contention that isomorphy is required for the cogency of arguments involving appeal to visual model. We begin by presenting a general scheme for reasoning with models. Next, we consider whether and to what extent isomorphy can and should play a role in determining the proper structure of schemes that appeal to models. Next we present a series of arguments and counterexamples against taking isomorphy as *the* definitive characteristic of model source/target relations. We conclude that there are a variety of possible warrant-granting grounds for simulative reasoning using models—for example, similarity, broadly construed. And, though we grant that isomorphy can ground warrant in reasoning that employs models, it is not the only ground for such reasoning.

2. REASONING FROM MODELS

A model (called the "source") is used to represent certain features of a domain (called the "target"). In a visual model, this representing occurs my means of a depiction of one sort or another. Simulative reasoning, or reasoning from a model, has at least two distinguishing features: first, one is able to reason directly about the source; second, having done so one is thereby able (i.e., permitted) to draw corresponding conclusions about the target (Swoyer 1991, 450; cf. Dove 2016b, 2).

In an effort to provide argumentation theorists and arguers with a heuristic analytical and evaluative tool for arguments relying on visual models, Dove (2016b) offered the following scheme and attendant critical questions.

2.1 Appeal to visual model scheme

Appeal to Visual Model
     [P1] *Representation Relation*: R models O.
     [P2] <u>*Reasoning On Model*</u>: In R, *r* obtains.
∴ [C] *Conclusion*: In O, *o* obtains (where *o* is the feature represented by *r* in R).

Critical Questions:
     CQ1: *Adequacy*: Is the model adequate for the task?
     CQ2: *Accuracy*: Is the model accurate enough for the task?
     CQ3: *Attribution*: Is the attribution of *r* in R proper?
     CQ4: *Competition*: Is there a competing model giving a different attribution?

---

[1] We will use the expression "simulative reasoning" to gesture at the kind of reasoning Swoyer (1991) called "surrogative" without here claiming to identify them.

When it is claimed, as P1 does, that a representation relation holds we may ask what *constitutes* that relation (Suárez, 2010, p. 92)? That is: what is the actual relation between source and target that grounds, or accounts for, the representative capacity of the model? On Dove's view, the representation relation is constituted by some kind of structural similarity between source and target. Thus, there are many ways, in principle, that a representation relation might be constituted.

By contrast, Lumer (2016, 2) claims that the representation relation must be constituted by an isomorphy between source and target. Describing the inferential transition from reasoning about the model to drawing a conclusion about the target, Lumer writes: "the features read from the model or, more precisely, observed in the model … are used to infer on corresponding features of the original reality … . This inference is made possible because of the isomorphy between the original and the model."

2.2 Isomorphy

Lumer (*ibid*.) then provides the following informal account of isomorphy:[2]

> An isomorphy is a relation which holds between two structures, *A* and *B*, each of which consist of a set of objects, $a°$ and $b°$, and a set of relations, $F°$ and $G°$, holding between them. Such structures *A* and *B* are isomorphic if two conditions are fulfilled:
> 1. *Bijective mapping*: There is a bijective (or one-to-one) mapping Φ between the objects of *A* and the objects of *B* as well as between the relations holding in *A* and the relations holding in *B*; i.e., to every object a_i of *A* exactly one object b_i of *B* is assigned, and vice versa; and to every relation F_i in *A* exactly one relation G_i in *B* is assigned, and vice versa.
> 2. *Homomorphism*: If a relation Fi between the objects $a_1, …, a_n$ ($F_i(a_1, …, a_n)$) holds in *A* the corresponding relation G_i between the corresponding objects $b_1, …, b_n$ in *B* holds as well, and vice versa. (Lumer 2016: 2)

Isomorphic objects are indistinguishable with respect to the properties constituting the morphism. One may thereby directly draw conclusions about one on the basis of having made observations about the other, so long as those observations and conclusions are restricted to just those the features of which the morphism consists. As such, isomorphy seems like a promising candidate for just the kind of structural similarity Dove contends warrants simulative reasoning. Isomorphy, apparently, nicely guarantees that the features, elements, and relations in a source model have corresponding features, elements, and relations in the target.

3. WHY NOT ISOMORPHY?

We do not deny that isomorphy is one of the ways that the representation relation between models and their targets can be constituted. Prima facie, it seems to readily account for the distinguishing features of the reasoning involved in appeal to visual models. Yet, we deny that isomorphy is the only way that the representation relation at work in appeals to visual models can be constituted. Particularly in the case of reasoning with geographical maps, the modelling relation does not seem to be constituted by an isomorphy between map and territory.

To demonstrate, we offer counterexample cases where inferences from models (maps in our examples) to their target domains (territories) are cogent, yet their warrant cannot be

---

[2] This informal account is then supplemented with a more formal definition (Lumer 2016, 2), the technical aspects of which are not required for the discussion offered here.

grounded in a relation of isomorphism between model and target, because either bijective mapping or homomorphism fails to obtain.

3.1 No Homomorphism

Let's begin with homomorphism, according to which properties of, and relations between, the elements in a target domain are preserved among the uniquely corresponding items in the source.

Consider large-scale planar maps of the Earth. As may be seen intuitively by trying to peel an orange in a single piece and laying the peel flat on a table, "preparing a flat map of a surface curving in all directions [leads] to distortion. That distortion may take many forms—shape, area, distance, direction, and interruptions or breaks between portions" (Snyder 1993, 1). It is mathematically impossible to represent a spherical territory with a planar map using only isomorphic properties (Shea 2014, 2-3). Rather, some non-isomorphic features must always be included in order to represent the isomorphic ones.

To address this problem, geometers and geographers have developed a variety of techniques for *projecting* the points on the globe onto a plane (Kennedy & Kopp 1994; Snyder 1993). These projections consist of a mathematical function mapping points on the surface of a sphere onto a variety of surfaces (standardly cylinders, cones, triangles, rectangles, and circles) that may readily be lain flat. Yet no projection preserves all the relations among the elements of the territory. Take the Mercator map (Kennedy & Kopp 1994, 70), familiar to many North Americans as the map they may remember from their public school classrooms. This map is based on a cylindrical projection, with either a tangent point of contact at the equator or secant points of contact at symmetrical latitudes. It is a conformal projection which preserves all local shape and angular relationships, such that "any straight line on this projection represents an actual compass bearing" (*ibid*.). Yet, distance and area are increasingly distorted on the map as one approaches the global poles since, at these points, a single point on the globe occupies the same length on the map as the Earth's equator!

Of the various properties that might be preserved from target to source, there are: area, shape, direction, distance, bearing, and scale. Yet, they cannot all be preserved, and efforts to eliminate distortion in one set of properties results in increasing distortion in others. For example, by contrast to the Mercator, the Behrmann projection (Kennedy & Kopp 1994, 39) is an equal-area cylindrical projection with secant points contact at latitudes equidistant from the equator. Here, while area is preserved, shape, direction, and distance are all distorted.

It might be thought that this objection can be handled by responding that the isomorphic relation needn't be *comprehensive* of all the elements and relations occurring in the source and target, but that warranted appeals to visual models will be limited to cases where the features (elements or relations) cited in the argument are among those comprising the isomorphism. Drawing conclusions about one's bearings in the world will be warranted when reasoning from a Mercator map but not from a Behrmann, while conclusions about the relative sizes of the continents will be warranted when reasoning from a Behrmann map but not from a Mercator, and conclusions about distances on the globe will be warranted by neither. Yet, this response will not suffice.

First, there is a practical problem: mere inspection of the representation will not typically reveal which features are distorted and which are preserved—that is, they will not identify the elements comprising any isomorphism that might be present. Sometimes, with maps indications are included as part of its legend or meta-data. For example, Mercator projections typically include a distance scale indicating that distance is not constant along the parallels. More generally, Tissot's indicatrix of distortion (Snyder 1993, 147ff.) may be superimposed over the intersections of the parallels and meridians on the map. This index

represents an arbitrarily small circle on the surface of the globe as it would appear on the map, allowing for visually comparative judgements of shape and size, thereby revealing distortions of each in the map. In some cases, then, distortions may be indicated in the map's presentation, such that they may be apparent, taken into account, and corrected for by the user.

There is a second problem, though. Some planar global maps do not preserve *any* of the relational features of the Earth's surface. The Robinson projection (Kennedy & Kopp 1994, 81), for example, is a "compromise projection," designed to minimize distortion in all features by tolerating some distortion in each. As such, there is no isomorphism between map and territory. Nevertheless, even in such cases, some inferences to conclusions about the Earth from observations about the map are cogent. For example, examination of a global map on the Robinson projection may offer cogent reasons for drawing conclusions about whether two points on the globe are part of a contiguous land mass or are separated by a body of water, or whether Michigan is closer to the size of the UK than Nevada is—Michigan is. Since the Robinson projection fails to preserve any relation perfectly, it fails to preserve the relative sizes of US states. Yet, because the Robinson projection minimizes distortions such as distortions in relative size it is still possible to infer relative sizes even in the absence of homomorphy between the source projection and the target land masses.

3.2 No Bijective Mapping

Just as there are cases where we may reason from visual maps that are not homomorphic with the territory they represent, we may also do so in cases where the bijective mapping condition does not obtain.

As Lumer recognizes, any controversy about the necessity of a bijective mapping for cogent reasoning from a model cannot merely concern elements in the target domain that do not occur in the model or superfluous aspects of the model that do not uniquely correspond to elements in the target domain. The proponent of isomorphism may insist that inferences from (visual) models are only licensed when they are about elements satisfying the bijective mapping condition. For example, from the fact that a town does not appear on our map we may not infer that the town is not there in the world unless we can rule out the possibility that the town was simply excluded from the map or did not exist when the map was created.

On the other hand, consider maps of non-existent territories. For example, consider a map of Tolkien's Middle Earth, such as Christian Tate's "One does not simply walk into Mordor,"[3] which depicts the various campaigns as though they were routes in a transit system. Here, in an important sense, there is no target to be mapped in the source. Nevertheless, one may, using Tate's map, draw conclusions about the sequence of events in various campaigns. Even more importantly, the relationship between the map and the narrative can be reversed wherein the map dictates the story and not the other way around. Consider Robert Louis Stevenson's *Treasure Island*, which was inspired from a map drawn by his stepson Lloyd Osbourne.

Perhaps one might respond to examples like this by claiming that the target domain is fictional, but that there remains an isomorphism with this fictional domain. Consider then a map whose territory is entirely phenomenal, but which nevertheless permits one to draw conclusions about the actual world by reasoning from it, like a star map (planisphere or star chart), which maps the "celestial sphere." Such maps are quite familiar and useful in identifying features of the night sky such as constellations. Yet, the territory depicted in star maps is not actual but phenomenal. The celestial sphere imagines a virtual sphere encircling

---

[3] The map was originally commissioned by and for *Empire Magazine*. It now exists only on Christian Tate's personal webpage.

the Earth onto which visible celestial objects are plotted. Star maps represent a *perspective* on the night sky—the map is indexed to the approximate perspective of the observer according to their rough latitudinal location on Earth's surface and the date and time of day at which they seek to make their observations. The celestial sphere does not actually exist. As such, no bijective mapping with *it*, or with any of its supposed features, is possible. Nevertheless, we may cogently make inferences from the star chart to actual observable locations of objects in the visible universe. For example, we may use a star map to draw conclusions about whether Sirius will be visible. From observations like these, we may draw conclusions about our physical environment. For example, by identifying Polaris in the night sky, we may approximately locate polar North. Indeed, predictive conclusions about our physical environment may be drawn directly from a planisphere. By locating the point of the ecliptic (a feature of the map) falling on the map's radius terminating at the current date, the wheel may be rotated until the eastern horizon intersects with that point on the ecliptic to give, with modest accuracy, the time of sun rise.

Consider a similar problem from within geometry proper. On the one hand, appeal to diagrams is controversial, at best, as regards mathematical proofs. Yet, appeal to diagrams is considered warranted when proofs are lacking. That is, mathematical reasoning, say Euclid's *proof* of the Pythagorean Theorem, though perhaps not a proof according to some modern standard of rigor, is nevertheless an argument for the Pythagorean Theorem. Still, the depicted triangle in Euclid's argument does not, and indeed cannot, contain a bijection with the, perhaps Platonic, ideal triangle. The drawn figure is incommensurable with the ideal object. Hence, there can be no inference-warranting bijection here. Instead, something like convention or stipulation fills in where bijection, homomorphism, or isomorphism would have warranted drawing the conclusion. And yet the inference is warranted without the bijection.

3.3 Isomorphy not sufficient.

Nicholas Shea (2014) notes that, while isomorphy appears to be a very stringent condition on representations, in fact often it is not.

> Consider a collection of entities to be represented y_i and a relation R' over them. Any set of putative representations of the same cardinality will map onto the y_i 1-1, and will do so in many ways. For each mapping there is *a* relation over the putative representations that corresponds to R'. The existence of an isomorphism is thus a very undemanding constraint. (Shea 2014, 2)

Initially, the point here is that unless the content elements of the bijective mapping and homomorphism are known specifically (which are the corresponding items, properties, and relations in the source and target) and in advance, *that* there is an isomorphism between source and target will not warrant any inferences from one to the other.

Moreover, relations of isomorphy are symmetrical, reflexive and transitive, while relations of representation are not (Suárez 2003, p. 233). Though everything is perfectly isomorphic with itself, things do not represent themselves. More importantly, while it is correct to say that a map (source) represents the territory mapped (its target), it is incorrect to say that the territory represents the map. (Thus, in our example of maps with fictional territories, even if it is conceded that there is an isomorphism between them, that does not determine which is the representation and which is the domain represented.) Finally, a drawing of a map is not, thereby, a representation of the terrain mapped; rather it is a drawing of the map not of the terrain. To maintain that isomorphy between source and target provides the ground for warranting cogent inferences from models fails to account for some very important aspects of our inferential practices with them. For example, when we observe a

feature of the world and look to the map to find that it is incorrectly represented (absent, in the wrong place, etc.), we rightly conclude that the map is mistaken (perhaps it is old, out of date, poorly constructed, etc.). But, imagine that process in reverse: we note a feature of the map, and find it does not correspond to the world. Consider a case where a road overpasses a freeway but doesn't intersect with it. Although it is possible to construct a symbol on a map to depict such a relation, maps that lack such a symbol and thereby show the road intersecting with the highway do not thereby create such an intersection. And, in such a circumstance, we do not, and should not, conclude that that the territory is mistaken. The lack of correspondence, in either case, is corrective of the map, never the territory. Any similarities or relations of isomorphy obtaining between a map and a territory are grounded in the features of the territory. The map has a similarity, or isomorphic feature, *because* the territory has some feature—not the other way around.

4. CONCLUSION

People use maps to draw conclusions regarding the things mapped. Sometimes such inferences are warranted by some isomorphism between the map and the territory. Sometimes such inferences are warranted by some structural similarity between the map and the territory though there is no inference-warranting isomorphism. Sometimes such inferences are warranted by conventions. And sometimes such inferences are warranted by combinations of these elements. We showed that isomorphy is neither necessary nor sufficient to warrant inferences from maps to territories. There are cases where maps fail to be isomorphic with their territories, and yet, people still find their ways using the maps.

Maps aren't used in just one way. Some maps depict purely geographic elements, some depict a combination of geographic and non-geographic elements. And it would be a mistake to think that there is one source of warrant for all uses of maps. When a map depicts the (rough) political makeup of a region, one is, perhaps warranted in drawing statistical conclusions from such maps—that a majority of citizens of some state voted Republican in an election could be represented by colouring that state red on a map; and on the basis of this red coloration one may be warranted in concluding that that state will likely vote to unseat democratic senators in the upcoming midterm elections. This map-employing inference doesn't depend on the state being accurately depicted in any way. Rather, it depends on the ability of a reasoner to identify the state, recognize the property represented—having voted republican—and projecting that property onto a future election. A general account of map-employing inferences would need to explain this inference as much as it does the more pedestrian uses of way-finding with maps.

The mystery of the interpretation: Less than a second for doing an "argumentative" abduction

ANTONIO DUARTE

Department of Logic and Theoretical Philosophy
Universidad Complutense de Madrid
Spain
antduart@ucm.es

ABSTRACT: In this contribution an ironical utterance is analysed from a pragma-dialectical perspective. This kind of assertions could be understood as legitimate strategic maneuvering which are based on the speaker's assessment of the abductive capability of the interlocutor. The associated pragma-dialectical fallacy may act as an abductive trigger and can help us to discover certain intentions of our interlocutor, at least as far as the interpretation of the utterance is concerned.

KEYWORDS: abduction, critical discussion, irony, pragma-dialectical fallacy, strategic maneuvering

1. INTRODUCTION

Abductive reasoning is a form of everyday reasoning, necessary and inevitable in our day-to-day lives, to the point that it is impossible for us to understand our equals without using it. In many instances, a correct interpretation i.e. the *sense*, the *semantic value of utterances in situations* (Raccah, 2014), has to be unravelled by evaluating a set of hypotheses inferred by the listener according to certain hints provided by the speaker. In this dialectical exchange, the interlocutors have to address a thorough examination of the context in order to arrive at successful communication. Finally, an "argumentative" abduction has to be made based on the contextual elements, i.e., from the listener's knowledge at that point in the exchange.

To evaluate in a reasoned way the rapid, almost instantaneous, new hypothesis arrived at by abduction that leads to understanding between interlocutors, here I focus on the analysis of an ironical utterance from a pragma-dialectical perspective (van Eemeren & Grootendorst, 1984). Irony as a rhetorical device mainly works due to, in this kind of statements, there is a secret message that has to be discovered. Therefore, here, abduction will also play an important role in achieving the dialectical purpose.

2. ABDUCTION

First, I set about clarifying the term "abduction" and identifying its essential characteristics. Abduction is a type of reasoning in which a new idea is introduced (its conclusion is a hypothesis) and moreover that idea is both tentative and relative to a given context.

In the last period in his thought (after 1900), Peirce gave a final definition of abduction. When we are confronted by amazing events, we search for an explanation:

> The explanation must be such a proposition as would lead to the prediction of the observed facts, either as necessary consequences or at least as very probable under the circumstances. A hypothesis then, has to be adopted which is likely in itself and renders the facts likely. This step of adopting a hypothesis as being suggested by the facts, is what I call abduction. (Peirce, CP 7.202, 1901).

In Fann's words: "Any synthetic proposition, whether it is a nonobservable entity or a generalization (so-called), in so far as it is for the first time entertained as possibly true, it is an hypothesis arrived at by abduction" (Fann, 1970, pp. 33-34). The logical form of abduction would be:

> The surprising fact, C, is observed;
> But if A were true, C would be a matter of course,
> Hence, there is reason to suspect that A is true. (Peirce, CP 5.189, 1903)

The conclusion is a hypothesis based on what is known at a given point in the investigation; this conclusion will be evaluated and delineated in light of new discoveries. Due to the provisional nature of the hypothesis, it is necessary to fill certain gaps with new data or information. In this way, abductive reasoning is an "instinct" that depends on the conscious or unconscious perception of connections between different aspects of the world. However, abduction has an implicit logic, insofar as one can submit the hypotheses arrived at by abduction to critique and justify one's choice. Therefore, abduction allows us to formulate a general prediction, but without any guarantee of success in the outcome. Moreover, abduction, as a prognostic method, offers the only hope of regulating our future conduct in a rational way (see e.g. West, 2016).

These plausible hypotheses should be tested by following the three stages of scientific research, as laid out by Peirce in his later work. Therefore, abduction would be the first step of the investigation. After the adoption of the hypothesis, we have to trace its experimental consequences; this would be the second step of the investigation: a deduction. The last step is to verify the hypothesis by comparing the predictions deduced from the hypothesis with the results of the experiment: an induction. If they match, the hypothesis will be verified. Thus, Peirce shows that the three stages of scientific research emerged from the three types of inference (Peirce, CP 8.209, 1905).

Let us see an example of a common abduction in everyday life. Peirce gives an example, taken from his own experience:

> I once landed at a seaport in a Turkish province; and, as I was walking up to the house which I was to visit, I met a man upon horseback, surrounded by four horsemen holding a canopy over his head. As the governor of the province was the only personage I could think of who would be so greatly honored, I inferred that this was he. This was a hypothesis. (Peirce, CP 2.625, 1878).

Peirce adopted the general rule that only a prominent personality is surrounded by four men and a canopy; the most important personality of the province is the governor, so Peirce conjectured that he had bumped into the governor. It could be a very powerful man, or a folk tradition... but with the limited data handled, his hypothesis is a plausible solution. There could be a collection of new data, for example: Where was the supposed governor going? How did people behave in his path? Answers to these questions could suggest a better explanation, but with the knowledge available at this point, we can consider the hypothesis to be appropriate.

As this example shows, abduction is usually presented in open circumstances, i.e., in situations where our knowledge is incomplete. This process is not only one of reasoning, but also of dialogue as far as we are continually asking and answering questions in a concrete dialogue frame. Therefore, abductive reasoning progresses within dialogic frameworks.

3. CONVERSATIONAL IMPLICATURE AND IRONY

In the next Section, I present an example of an ironical utterance in order to analyse the interpretation process and the required abduction that leads to understanding between interlocutors using the extended pragma-dialectics. I will use a case (in which an ironical utterance is involved) proposed by García-Carpintero (2008, pp. 492-493) regarding what Grice (1975) called conversational implicatures. This Section is devoted to remembering Grice's theory as well as to summarizing different proposals about pragmatic approaches to irony.

In *Logic and Conversation*, Grice states:

> Our talk exchanges do not normally consist of a succession of disconnected remarks, and would not be rational if they did. They are characteristically, to some degree at least, cooperative efforts; and each participant recognizes in them, to some extent, a common purpose, or at least a mutually accepted direction. (Grice, 1975, p. 45)

Based on this common purpose, Grice derives his Cooperative Principle: "Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged" (Grice, 1975, p. 45). After that, Grice divides this maxim in several sub-maxims following the Kantian categories: quantity, quality, relation, and manner. Clearly, many of our conversations are not guided by these principles. However, the violation of these rules puts us on alert, giving rise to an enigma. The rules may be violated in several ways. There may be conflicts between the maxims: for example, failing to provide relevant information because there is not enough evidence for it. There may also be conflict with other purposes: for example, someone, who has valuable and pertinent information for the purposes of conversation, may fail to fulfil a maxim for reasons of discretion, saying "I cannot say more, my lips are sealed."

However, there is other way to break a rule that generates conversational implicatures; it occurs when one of the participants clearly violates a maxim with his/her words, according to the literal meaning of the utterance, i.e. the *semantic value of languages units* (Raccah, 2014) independently of the situation of they are used, and it is not possible to explain such violation in similar ways to those presented above. Let us see an example given by Grice:

> A is writing a testimonial about a pupil who is a candidate for a philosophy job, and his letter reads as follows: 'Dear Sir, Mr. X's command of English is excellent, and his attendance at tutorials has been regular. Yours, etc.' (Gloss: A cannot be opting out, since if he wished to be uncooperative, why write at all? He cannot be unable, through ignorance, to say more, since the man is his pupil; moreover, he knows that more information than this is wanted. He must, therefore, be wishing to impart information that he is reluctant to write down. This supposition is tenable only on the assumption that he thinks Mr. X is no good at philosophy. This, then, is what he is implicating.) (Grice, 1975, p.52).

The implicature is obtained interpreting the speaker's words by removing the conflict with the maxims from the literal meaning and other contextual elements that the speaker and his/her audience share. The intention of the speaker is, therefore, that the audience is aware of this violation and seeks an explanation and/or an alternative hypothesis that satisfies the contextual elements involved, or in other words, the speaker poses a riddle to the audience.

Traditional theories about irony assume that an ironist uses a figurative meaning opposite to the literal meaning of the utterance. A person saying "What lovely weather" on a rainy day is using the figurative meaning, "What terrible weather" (see e.g. Clark and Gerrig, 1984).

Grice provides the first modern pragmatic definition of irony. According to Grice (1975, 1978), irony is an instance of speakers or writers flouting the maxim quality from the Cooperative Principle. Grice's theory assumes that the ironist is *pretending* rather than *using one proposition in order to get across its contradictory*. Moreover, to work out the implicature, the interlocutor has to address firstly the literal meaning of the utterance. Therefore, Grice assumes that irony presupposes a two-stage processing which would involve the processing of a literal meaning of the text, the rejection of this interpretation on pragmatic grounds, and a subsequent reinterpretation.

On the other hand, Sperber and Wilson (1981), based on some of the postulates of the Grice's theory, offered a *mention* theory of irony (further developed in Sperber & Wilson, 1994; Wilson, 2006) in which a speaker is being ironic when he or she is mentioning, or echoing, an earlier utterance. The communicator dissociates herself from the opinion echoed with accompanying ridicule or scorn. This mention theory claims that the processing of irony is not distinct from that of literal meaning and that ironical meaning is arrived at directly (one-stage processing).

The one-stage/two-stage distinction has assumed a central role in the debate over irony (see e.g. Gibbs, 1986; Gibs & O' Brien, 1991; Giora, 1995, 1997, 2002; Utsumi, 2000). Here, I am going to follow the two-stage approach proposed by Attardo (2000) who develops the Grice's theory of irony:

> The theory of irony
> - the reconstruction of the intended meaning (value) of the irony is entirely infer ential and abductive: it is totally indirect, no aspect of the meaning is given in the text, except the presumption of relevance (and not of quality, manner, or quantity); or, in other words, irony is a purely pragmatic phenomenon;
> - irony is essentially an inappropriate utterance which is nonetheless relevant to the context;
> - irony crucially involves a two-stage processing. The order in which the conflicting senses are accessed is (probably) determined by salience. (Attardo, 2000, p. 823).

4. THE CASE: AN IRONICAL UTTERANCE

> Begoña, who has certain feminist leanings, is driving a car and I accompany her. [...] The vehicle in front makes all kinds of unfortunate manoeuvres of those types which exasperate other drivers. Finally, Begoña has the chance to overtake this car; in doing so, we both look with morbid curiosity at the driver of the other vehicle, perhaps trying to find some unmistakable sign of incompetence. The driver turns out to be a woman. Begoña then states: "It had to be a white car!" (García-Carpintero, 2008, pp. 492-493; my own translation from the original Spanish).

Begoña's statement is an inappropriate utterance which is nonetheless relevant to the context, therefore, it poses an enigma. Conventionally, this statement emphasizes that it is a white car that has made those unfortunate manoeuvres. The expression 'had to be' makes an association between this type of bad driving and white cars. Remembering Gricean conversational maxims, this statement violates several of them. She lacks the appropriate data to make such a claim, and the statement is not relevant in the sense that it is difficult to establish an association between the colour of a car and the driver's inexperience. Therefore, we can infer that Begoña's assertion has all the appearance of the fallacy of poor generalization, i.e., an inference from a proven fact to an excessive generalization. However, "the speaker thinks (and would expect the hearer to think that the speaker thinks) that it is within the competence of the hearer to work out, or grasp intuitively" (Grice, 1975, p. 50) the implicature. As pointed out above, the reconstruction of the intended meaning of the irony is indirect, no aspect of the meaning is given in the text, except the presumption of relevance.

– Analysis using the extended pragma-dialectics

In order to analyse this case using the extended pragma-dialectics, I consider, hereafter, Begoña's exclamation as a contribution to a critical discussion: an implicit argument that involves a pattern of reasoning from premises, in this case, this white car makes unfortunate manoeuvres, to a conclusion: there is some connection between the colour white and driving badly. From this perspective, there are certain rules that we have to observe when we are enrolled in a critical discussion (see e.g. van Eemeren & Grootendorst, 1984, 1987). These are related to questions about relevance or the balance of the burden of proof. Violations of the discussion rules are said to frustrate the reasonable resolution of the difference of opinion and they are therefore considered as fallacies. But also, more recently, the authors of this perspective have incorporated the concept of *strategic maneuvering* (van Eemeren & Houtlosser, 2000; van Eemeren 2012). This concept takes into account the rhetoric movements in the analysis of argumentative discussion. Parties involved in a difference of opinion "maneuver strategically" to simultaneously realize their dialectical and their rhetorical aims: this is a way of being persuasive while observing the standards of a critical discussion. From this perspective, fallacies are also understood as derailments of the strategic maneuvering: when the rational exchange is revoked to achieve greater efficiency.

According to extended pragma-dialectics, Begoña's statement violates rule VIII[1] of those proposed by van Eemeren & Grootendorst (1987), because the argumentative scheme is improperly applied. In particular, by justifying a general conclusion from an insufficient number of observations, this is a case of hasty generalization *or secundum quid*. In addition, Begoña's words violate rules I[2] and II[3], evading and shifting the burden of proof. The expression "had to be" in the assertion "invites" the listener not to argue with the issue. Considering Begoña's exclamation as a strategic maneuvering, the desire for efficiency ("had to be") removes any kind of rationality from the issue. From the literal meaning of the words, Begoña has committed a fallacy: some rules of the critical discussion have been violated and/or the strategic maneuvering has derailed. As in the case of conversational implicatures, detecting a pragma-dialectical fallacy warns us that we should review the words of our interlocutor to be sure that we have to address the literal interpretation, and not some other one. Therefore, the theory of irony from a pragma-dialectical perspective should also assume two-stage processing approach.

Let us suppose that a third driver saw what happened and heard Begoña's words, but without knowing the sex of the driver of the white car. Certainly, this new actor would have considered Begoña's exclamation to be strange and misleading. How could these enigmatic words be explained, considering the few contextual data handled? The third driver might have guessed at various different scenarios, for example, "the girl in that car probably suffered some trauma caused by a white car" or "she has a superstitious prejudice against the colour white." Notice that these attempts at an explanation cannot be confirmed by the driver because of the lack of pragmatic knowledge. This driver could not provide a plausible explanation to work out the implicature. In this case, there is not an explanation for the violation of the dialectical rules. Begoña has committed a pragma-dialectical fallacy. This shows in which way the speaker relies on the abductive capability of the interlocutor to

---

1　The arguments used in a discursive text must be valid or capable of being validated by the explicitization of one or more unexpressed premisses. (van Eemeren & Grootendorst, 1987, p. 290).

2　Parties must not prevent each other from advancing or casting doubt on standpoints. (van Eemeren & Grootendorst, 1987, p. 284).

3　Whoever advances a standpoint is obliged to defend it if asked to do so. (van Eemeren & Grootendorst, 1987, p. 285).

achieve her dialectical purpose. This abductive capacity is based on different aspects: the interlocutor's knowledge of the common dialogic frame and the interlocutor's ability to make connections between apparently unrelated phenomena.

A broader pragmatic knowledge implies greater abductive capacity. I can suggest a more plausible explanation because I know two key contextual elements:

1. The driver of the white car is a woman.
2. Begoña is against the kind of prejudice that assumes that women are inferior to men in certain skills like driving.

In situations such as the one described, many men have said: "A woman had to be" to support the hypothesis that women drive worse than men. Due to the second key fact I handle, I know that Begoña does not believe such thing; and she knows, in turn, that I know it. Based on the assumed abductive competence of the audience, Begoña is saying: "Do not make use of spurious generalizations such as 'there is a causal relationship between being female and driving badly'." The Begoña's persuasive purpose is legitimate.

Here, the speaker's ironic utterance is understood as a strategic maneuvering in the discussion and as an abductive trigger (Aliseda, 2006). It consists of violating the rules of critical discussion. The hearer notices that the dialogical rules have been broken and then adopts a hypothesis to arrive at a proper interpretation. Interestingly, in these cases, the efficiency of the strategic maneuvering is mainly based on the listener's abductive capability (as in the case of the third driver, the derailment of this strategic maneuvering occurs if the listener's abduction fails).

It is worth noting that we could imagine a wide range of hypotheses, based on the listener's abductive capacity, that explains the Begoña's words (imagining different situations and dialogic contexts). The hearer of each context could reach a conclusion by adopting an explanation that is more difficult to refute based on their presumptions or knowledge. Although a conclusion, an "argumentative" abduction, is reached quickly, according to the extended pragma-dialectics, it could be evaluated answering to these obvious critical questions:

1. Does this hypothesis explain the speaker's violation of the dialectical rules?
2. Does this hypothesis address the speaker's desires of efficiency?

In the context of the third driver, neither the first question nor the second can be answered in the affirmative. Therefore, the third driver realizes about the failure of the required abduction to arrive at a correct interpretation.

Interestingly, in deviations of intent from that expressed by the standard or ordinary use of language, only after answering these questions in the negative, a listener who possesses broader pragmatic knowledge (greater abductive capability) could opt an alternative hypothesis: the speaker has committed a fallacy.

5. CONCLUSION

To evaluate in a reasoned way the rapid, almost instantaneous, new hypothesis arrived at by abduction that leads to understanding between interlocutors, an ironical utterance has been analysed from a pragma-dialectical perspective.

At first glance, we detect a pragma-dialectical fallacy in the course of the dialogue. However, the assertion would be a legitimate strategic maneuvering which is based on the

speaker's assessment of the abductive capability of the interlocutor. Hence, detecting a pragma-dialectical fallacy may act as an abductive trigger and can help us to discover certain intentions of our interlocutor, at least as far as the interpretation of the utterance is concerned. To correctly understand the mysterious words, an "argumentative" abduction has to be proposed from the contextual elements.

According to the extended pragma-dialectics, the hypothesis proposed could be evaluated answering to these critical questions:

1. Does this hypothesis explain the speaker's violation of the dialectical rules?
2. Does this hypothesis address the speaker's desires of efficiency?

When neither the first question nor the second can be answered in the affirmative, the hearer could opt alternative hypotheses that do not attempt to resolve the speaker's enigmatic words by removing the conflict between the literal meaning of the utterance and the dialogic aims. These alternative hypotheses would be: a) the required abduction to arrive at a correct interpretation has not been reached due to limited contextual data; or, if the listener relies in his/her abductive capacity, b) the speaker has committed a fallacy.

We do not always want to evaluate the hypotheses arrived at by abduction, but if we do want to, it will be useful to follow the rules of the dialectical approach to argumentation.

Latin rhetoric and fallacies

MICHEL DUFOUR

ABSTRACT: According to Hamblin, Cicero did not write on rhetoric and this cut fallacies out of the subsequent rhetorical tradition. We bring evidence that the author of the *Rhetorica ad Herennium*, Cicero and Quintilian did write on fallacies, but in a way that is not always strictly Aristotelian. Yet, as he, they mainly discussed this topic when they dealt with refutation. Their wide influence on Western thought and teaching suggests an underestimated connection between the reflection on fallacies and traditional writings on rhetoric.

KEYWORDS: Cicero, dialectic, fallacies, Hamblin, Quintilian, rhetoric, *Rhetorica ad Herennium*

1. INTRODUCTION

In the first chapter of the *Rhetoric*, Aristotle explains at length his view on the similarities and differences between dialectic and rhetoric. Apparently, the question of fallacies is a case of difference between the twin sisters, for, in the *Rhetoric*, we only find the few pages of a descriptive chapter on this topic (II, 24), whereas the more dialectically oriented *On Sophistical refutations* has a few dozen pages and sketches a theory of fallacies. This dissymmetry suggests a privileged association between the agonistic conversational context of the *elenchus* and the fallacies. (By the way, let us remember that Aristotle did not speak of 'fallacies' but only of 'paralogisms'). Hence, a dialectical context could seem necessary to a correct interpretation of the phenomenon of fallacies. This could be confirmed by the fact that, in *On sophistical refutations*, fallacies are also closely associated with sophists, supposed to be experts at eristic dialectic, whereas they are not leading characters in the *Rhetoric*.

However, other reasons temper the necessity of the link between fallacies and dialectic. First, there is the very existence of this short chapter on fallacies in the *Rhetoric*. It is about the use of fallacies in a rhetorical context, in the limited ancient meaning of this adjective, namely when you address a crowd that is not supposed to answer. Next, both in *On sophistical refutations* and in the *Rhetoric*, Aristotle pays attention to the whole process of discursive interaction, but he stresses that the defect appears at the level of the *logos* itself: a paralogism first is a (misleading) syllogism. According to him, a syllogism is not essentially dialectic: its most complete and explicit form is used in a dispute between educated people, but rhetoric has its own form of syllogism, a kind of abridged version of the full one.

Aristotle's belief in the possibility to localize fallacious moves at the level of the syllogism is probably the reason why he thinks that paralogisms can also plague a rhetorical discourse. The opening of the *Rhetoric*'s chapter on fallacies is clear: just like there are genuine and apparent syllogisms, there are genuine and apparent enthymemes, an enthymeme being explicitly defined, in the second chapter of the *Rhetoric*, as a rhetorical syllogism (1356 b 5). So, the independence of the syllogism from the limits of the dialectical context allows the exportation of the concept of paralogism from dialectic to rhetoric (and vice-versa).

An affinity between rhetoric and fallacies can also be suggested by a less technical consideration that borrows from popular culture. The reputation of rhetoric is not always

good. The fact that it is sometimes defined as the art of speaking well easily suggests that it is the art to manipulate people by means of a "sophisticated" expertise, especially salient in the use of verbal tricks. This distrust against rhetoric, which probably has a debt to Plato and Aristotle, is implicitly acknowledged in pejorative popular judgments like "This is mere rhetoric" or in the fact that a "rhetorical" question is not a genuine question. When rhetoric is too sophisticated to be honest, sophists are not very far: people that we call rhetors are often suspected to share the taste of sophists for eristic or unfair attitudes. All of them are supposed to be only interested in winning arguments and to be ready to use any means, including sophisms, to support their claims.

All these considerations suggest that the proximity between fallacies and dialectic is not exclusive. So, we can wonder whether there is not an ancient historical link between fallacies and rhetoric, beside the traditional link between fallacies and dialectic. This hypothesis – already suggested by Aristotle – requires a closer look.

2. HAMBLIN'S THESIS

Half a century after its publication, Hamblin's *Fallacies* remains one of the most, if not the most, systematic long term investigation of the history of the reflections on fallacies. According to him, between Aristotle's time and the rediscovery of *On sophistical refutations* during the Middle Ages, the literature on fallacies "would hardly fill a small notebook" (p 89). He is probably right when he says that the remaining sources about this literature are meagre, especially because he made of what he calls the "Aristotelian tradition" on fallacies the story of the ancient and medieval commentaries on *On sophistical refutations*. This tradition also had an important practical academic consequence in the revival of the Greek *elenchus*, with its formal system of questions and answers, in the *disputatio* and *obligations* of the Middle-Ages. Hamblin's medieval Aristotelian tradition does not address the crowd, like ancient rhetoric, but aims at the training of students who will become lawyers, physicians or theologians.

About this period between Aristotle and the medieval rediscovery of his works, Hamblin also discusses mostly authors who wrote in Greek, at least before the sixth century when Boethius translated into Latin the few works of Aristotle that constitute the medieval *logica vetus*. So, it seems that the Roman Latin tradition said nothing on fallacies. This impression is confirmed by Hamblin's comment on Cicero who is often considered as the most important and influent Roman writer on rhetoric. Hamblin writes: "Cicero wrote a great deal on Rhetoric but nothing on fallacies, and his influence has tended to cut fallacies out of the subsequent rhetorical tradition" (1970, 94) Yet, a few line further, he stresses Cicero's distinction, already stated in Aristotle's *Rhetoric* (1355 b 36), between "intrinsic" and "extrinsic" arguments, that is between arguments which depends on the skill of the orator and those based on another human source, typically testimony, torture, writings, etc. According to Hamblin "these are the nearest recognition in Greek and Roman writers of the modern *ad hominem, ad verecundiam,* and so on". Unfortunately Hamblin does not develop this "and so on" which reminds us informal fallacies, sometimes considered as modern and often associated with Locke.

We can wonder on Hamblin's criteria to decide whether Cicero wrote or not on fallacies. Did he expect an explicit reference to *On sophistical refutation*? The mention of Aristotle's list of fallacies or, at least, of the name of several typical Aristotelian fallacies? The use of the word *paralogism* or of the Latin *fallacia*? In these cases, the first part of Hamblin's statement on Cicero would be approximately right. But if fallacies are arguments that look better than they are and are used either by mistake, by clumsiness or intentionally to

refute an opponent's point of view, Cicero and other Roman writers actually wrote on fallacies and even on some Aristotelian fallacies. Then, since Cicero's teaching was influential during the Middle Ages when Aristotle's *Rhetoric* was unknown (Murphy, 1981), and also during the following centuries (Freedman, 1986; Fumaroli, 1980), we can seriously doubt Hamblin's statement that Cicero's influence "has tended to cut fallacies out of the subsequent rhetorical tradition". The popular view that orators and sophists are doing more or less the same job, namely to abuse lay people, on the contrary suggests an old and blurred connection between a rhetorical tradition and the uncertain constellation of fallacies.

This is why we searched for significant Roman contributions to the study of fallacies in some of the most famous Roman writings on rhetoric. We looked for systematic theoretical developments and discarded what appeared to be only passing remarks. In chronological order of publication (with sometimes approximate dates), we will discuss the *Rhetorica ad Herennium* (84 B.C.), Cicero's *De Inventione* (83 B.C) and *Orator* (46 B.C, also known as *On the Ideal Orator*), and finally the most influential late Roman contribution to rhetoric, Quintilian's *Institutio oratoria* (96 A.D also known as *Institutes of oratory* or *The orator's education*). Most of Cicero's other important works related with rhetoric – *De Oratore, Topica, Partitiones oratoriae* – bear no significant contribution to the study of fallacies.

3. CICERO'S *ORATOR*

At the very beginning of the *Orator,* Cicero (1962; 2002) states that his aim is just to answer a question asked by Brutus, Cato's nephew. Granted that there are many good orators, what is the supreme form of rhetoric? (I, 2) This question is twofold since you can understand it as bearing on the ethos of the best orator, as well as on the best rhetorical *logos*.

The *Orator* brings no direct contribution to the logic of fallacies; but it stresses an important distinction between various uses of speech and the respective style of their practitioners. What is really distinctive of the orator is the way he speaks (XIX, 61). Like four other types of public speakers – philosophers, sophists, historians and poets – he has to go through the four stages necessary to the production of a discourse: the invention (*inventio*) of what he will say, the composition (*dispositio*) of his discourse*,* the way he will say it (*elocutio)*, and finally its performance itself (*actio*). For Cicero, the most typical aspect of the art of the orator appears at the stage of the *elocutio,* for it is the moment where he is the only one who can exercise "the supreme power of speech".

Fallacies are commonly associated with sophists and their tricks. So, what stylistic difference is there between the speeches of an orator, a philosopher and a sophist?

The discourse of a philosopher is "gentle and academic" and "is called conversation rather than oratory" (XIX, 63-64). Philosophers "converse with scholars, whose minds they prefer to soothe rather than arouse; they converse in this way about unexciting and non-controversial subjects, for the purpose of instructing rather than captivating". Here, Cicero remains quite faithful to the Aristotelian distinction between dialectic, that uses (dialectical) syllogisms that the educated interlocutor can understand, and rhetoric that has its own specific persuasive verbal devices, especially enthymems and examples, more accessible to less educated people. So, the difference between philosophy and rhetoric appears both in the content of the discourse and in the way it is pronounced. The style of philosophers "lacks the vigour and sting for oratorical effort in public life", "it has no equipment of words or phrases that catch the popular fancy". But this does not entail that the perfect orator, whose education is an important concern of Cicero, should not borrow from philosophy or, more generally, from the art of other disciplines. Reasoning matters and this is why the orator should have a complete training in this area: "The man of perfect eloquence should […] not only possess the

faculty of fluent and copious speech which is his proper province, but should also acquire that neighboring borderland science of Logic (*dialecticorum scientiam*)" (XXXII, 113). Cicero goes on: "Although a speech is one thing and a debate another, and disputing is not the same as speaking, yet both are concerned with discourse". After an explicit reference to the Aristotelian views on the differences and similitudes between dialectic and rhetoric, Cicero advises a thorough study of words and logic, "either in the older logic of Aristotle, or the new one of Chrysippus". Someone "attracted by the glory of eloquence" should know "first the force, nature and classes of words, both singly and in the sentence; then the different modes of predication; the method of distinguishing truth from falsity; the proper deduction to be drawn from each; i.e. what is consequent and what is contrary; and since many ambiguous statements are made, he should know how these can be solved and explained." (XXXII, 115)

What about sophists, now? A link between them and the art of rhetoric was already made at Cicero's time, since "more care [*than in the previous case of philosophers*] must be taken to distinguish the oratorical style of the Sophists mentioned above[1], who desire to use all the ornaments which the orator uses in forensic practice" (XIX, 65). It is no surprise to meet the names of Thrasymachus and Gorgias, if we associate sophists with dialecticians teaching how to win any argument. Yet, Cicero does not refer here to sophists through the *cliché* of fallacious moves and sophistical tricks, but identifies them by their ability to finely carve speeches. This specificity of sophists becomes more salient when he alludes to the style of the man whom he introduces here as his favorite rhetorician, Isocrate, who is usually not considered as a sophist. Hence, Cicero's view on the main contrast between orators and sophists: "their object [*of sophists*] is not to arouse the audience but to soothe it, not so much to persuade as to delight, they do it more openly than we and more frequently; they are on the look-out for ideas that are neatly put rather than reasonable […]." So, persuasion, which is often presumed to be the aim of sophists with their deliberate fallacies, is not typical of the activity of Cicero's sophists. Perhaps Hamblin's claim that Cicero's influence has tended to cut fallacies out of the rhetorical tradition is not completely false; but in any case, the previous comments suggest that he may also have contributed to cut them from the sophists.

If we look at Cicero's other mature works on rhetoric – *De Oratore*, *Partitiones oratoriae*, *Topica* – Hamblin is approximately right: Cicero did not write systematically on fallacies. In these books, he seems more interested in general questions and global specificities of rhetorical discourse than in the sharp focus required by the study of fallacies. But if we turn towards his youth we find a significant contribution in the *De Inventione* which is especially interesting for two reasons. First, it is a kind of textbook on rhetoric that will be influential for centuries, at least till the XVIIIth century. Second, it has a special status in Cicero's works, since at the beginning of *De Oratore* Cicero passes a severe judgement on the rudeness of the writings on rhetoric of his youth (I, 2, 5). He considered that they were quite beneath the level of expertise he finally reached. Perhaps Cicero was not the great Cicero yet, but this does not matter for us. What really matters is that if this is true, his writings bear the imprint of the main influences he received at this time.

The most famous work on rhetoric of his youth is *De Inventione*, published around 83 B.C, almost at the same time as the *Rhetoric ad Herennium*, another introductory book which seems to have been published a bit earlier (84 B.C). Many similarities have been found between these two books and for centuries the *Ad Herennium* has been attributed to Cicero, then to Cornificius and today we do not know. According to Achard (1994), the author was a member of the senate, certainly involved in military operations. What is the intellectual origin of these two books? Had they the same author or at least a common human cause – perhaps a common influence? Was it Apollonius Molon of Rhodes, whom Cicero will personally meet

---

[1] Isocrate, Thrasymachus, Gorgias and the less known Theodorus the Byzantine. (XI, 37) – (XII, 39)

during his trip to Greece, around 78 B.C? Is the similarity between these two books a case of plagiarism? Again, the answer to these questions is of no serious importance for us. The main point is that, beyond Cicero's statement on the works of his youth, both books have many things to tell us about the history of fallacies, especially before the first rediscovery of Aristotle's works during the first century B.C. A close connection between fallacies and rhetoric did exist and probably became influential on Western thought through these two major textbooks.

4. THE *RHETORICA AD HERENNIUM*

The composition of a discourse is a major preoccupation for rhetoricians. The *Ad Herennium* opts for a six parts structure: introduction (*exordium*), statement of facts (*narratio*), division of the issue (*divisio*), proof (*confirmatio*), refutation (*confutatio*), and finally conclusion (*conclusio*).

The *Ad Herrenium*'s author perhaps thinks – like Cicero – that the skill of the perfect orator should be wide enough to allow him to produce fallacies. But it seems that finding argument is a task already big enough not to spend time to elaborate non trivial fallacious ones. On the other hand, like Cicero, the author does not want his reader to be abused by bad arguments. This is probably the reason why it is not in the part on proof, but on refutation, that we find interesting material on fallacies.

According to the author, the "most complete and perfect argument" is composed of five parts. This seems to be his version of the *epicherem*[2], a Greek concept usually considered of Hellenistic or Stoic origin. According to the author's view, an *epicherem* first begin with the conclusion (*propositio* or *expositio)* and its reason (*ratio*) (He does not consider the case of a plurality of reasons). The "quickly presented" reason is then corroborated by a confirmation (*rationis confirmatio)*. An embellishment (*exornatio*) allows "to adorn and enrich" the confirmation and it is completed by a summary of the whole argument (*complexio*) (II, XVIII, 28). The two last steps are not necessary when the argument is not complex.

In the *Ad Herennium* and in Cicero, you find neither the word "fallacia" nor "paralogism" to mean an argument that we would classify as fallacious. The term usually used is vicious (*vitiosa*), generally applied to the conclusion, *i.e.* the *propositio* of the argument. So, let us have a look at vicious arguments.

They are of two kinds. The first one brings together arguments irrelevant to the case at stake and so vain or futile that it is not even necessary to lose time criticizing them. The second one gathers relevant arguments that deserve attention not to go unnoticed. The author does not present a single general list of fallacious arguments, but for each of the four members of the epicherem that support the conclusion he enumerates a specific list of defects. After the definition of the defect, he gives at least one example. There is some redundancy between the list relative to the reason (*ratio*) and the list relative to the confirmation of the reason (*confirmatio rationis*). This is not surprising, because the difference between reason and confirmation is actually often blurred (many examples of confirmation are mere reasons for the main conclusion) and, at any rate, both concern an argument in the structural premise-conclusion sense of the term. The defects relative to the reason can be summarized under four

---

[2] The author makes a reference to this notion at (II, 2, 2). Aristotle uses the word "epicherem" one time, in the *Topics* (VIII, 2, 15). However, the authenticity of this passage seems dubious, for we find here the only occurrence of this word in his works and we also find here the only occurrence in the two treatises on dialectic (*Topics* and *On sophistical refutations*) of the Greek word "sophisma". If we discard this case, Aristotle always uses the word "paralogism" to mean what we translate by "fallacy" or "sophism".

headings including variants and subcases. They have no names in the book, so we baptized each one with an original name or expression that seems appropriate, or by the contemporary name of a fallacy, Aristotelian or not. This last option does not warrant a filiation between Aristotle and Cicero's fallacies, but stresses at least a family resemblance.

1) Hasty generalization. "The Proposition is defective when an assertion based on some one part or on a majority of individuals, but not necessarily applicable to all, is referred to all" (II, XX, 32). One variant of this vicious argument occurs "when a rare occurrence is declared to be absolutely impossible, as follows: 'No one can fall in love at a single glance, or as he is passing by.'"

2) Incomplete enumeration. It occurs "when we submit that we have made a complete enumeration of the possibilities and pass by some pertinent one". Notice that this non-Aristotelian fallacy will appear again much later, in *Port-Royal Logic* published in 1662, as one of the fallacies added to the traditional list derived from Aristotle's list of *On sophistical refutations*. This fallacy has a family resemblance with Aristotle's multiple question to the extent that it forces the interlocutor to choose among a limited list of options.

3) Far-fetched argument: It occurs when "it traces things too far back, as follows: 'Stupidity is the mother and matter of all evils. She gives birth to boundless desires. Furthermore, boundless desires have neither end nor limit. They breed avarice. Avarice, further, drives men to any crime you will. Thus it is avarice which has led our adversaries to take this crime upon themselves.'" According to the *Ad Herennium,* this defect is of type one: it is so salient that it does not need to be refuted.

4) Insufficient or groundless reason: "The Reason is defective if it is inappropriate to the Proposition because either weak or groundless (*vana*). It is weak when it does not conclusively demonstrate the correctness of the Proposition […] A Reason is groundless when it rests on a false supposition". The author offers no systematic characterization of a weak reason: he just enumerates typical cases, for instance a reason that is too general or not specific to the case discussed. Among these weaknesses, we also find *Petitio*: "Again, a Reason is weak when it appears to be presented as the Reason, but says precisely the same as was said in the Proposition, as follows: 'A great evil to mankind is greed, for the reason that men wrestle with great and many ills on account of the boundless passion for money.' Here the Reason merely repeats in other words what has been said in the Proposition." (II, XXIV, 37)

The author then turns to defects relative to the confirmation of reason where "there are many faults to be avoided in our discourse and also to be watched for in that of our adversaries" (II, XXIV, 38). He also stresses their practical importance: if the mistakes or the tricks of the opponent go unnoticed the trial could be lost. We find here a list of about twenty items with some redundancy with the previous one. For instance, we find again *Petitio* with a similar example: "it is a fault to advance as proof what has been put in question, as if one should charge another with theft, and accordingly declare that he is a wicked, greedy, and deceitful man—and the evidence for this is that he has stolen from the speaker." (II, XXVI, 41).

We also find a fallacy mentioned in Aristotle's *Rhetoric* but missing in *On sophistical refutations:* the argument from sign. The *Ad Herennium* gives two examples that are striking, at least because of their similarity with the examples of necessary signs given by Aristotle at the beginning of the *Rhetoric*, namely "He is sick, for he has a fever" and "She has had a

child, for she has milk" (I. 2 (1357 b). But now, the examples illustrate misleading signs, for we should not consider them as necessary: "Since he is pale, he must have been sick", "She must have become a mother, since she is holding a baby boy in her arms" (II, XXV, 39). Among the fallacies that have already been listed by Aristotle we also find ambiguity. Yet, this list from the *Ad Herennium* also includes non-Aristotelian fallacies, for instance the *Tu quoque* version of the *Ad hominem* fallacy: "There is a fault when that which is directed against the adversary can as well fit someone else or the speaker himself, as follows: 'Wretched are they who marry wives. — Yet you have married a second.'" We also find a prototype of the *Ad populum*: "Again it is a fault to assume as certain, on the ground that 'it is universally agreed upon', a thing which is still in dispute" (II, XXV, 39).

This long list is followed by two shorter lists of defects associated with the two last parts of the *epicherem*, namely the embellishment and the summary. The first one has five items, the second only three. These defects are not typical errors of reasoning but attitudes that are clumsy in this stage of the process of argumentation. For instance, the summary is defective when it does not come briefly to an end. Strictly speaking it is not a fallacy if we grant that a fallacy is a fallacious argument: it is rather clumsiness. This distinction is especially relevant for the two previous lists of defects – about reason and confirmation – for it appears that they mix fallacies and clumsy maneuverings or even blunders. The defect of next quotation, for instance, can hardly be considered as a fallacy, *i.e* a potentially misleading argument: "That is faulty which appears to be pronounced too late, as it were, and after the matter has been concluded, as follows: 'If it had entered my mind, fellow-citizens, I should not have been guilty of allowing the matter to come to such a pass, for I should have done this or that; but at the time this thought escaped me.'" (II, XXV, 40).

So, even if it does not use the concept or paralogism or *fallacia*, the *Rhetoric ad Herennium* does deal with fallacies, but in a context broader than the Aristotelian treatment of paralogisms.

5. CICERO'S *DE INVENTIONE*

We find in Cicero's *De Inventione* a six parts normative division of the rhetorical discourse, similar to the one of the *Ad Herennium*. Only names seem to differ: exordium, narrative (*narratio*), partition (*partitio*), confirmation (*confirmatio*), refutation (*reprehensio*), peroration (*conclusio*). (I, xiv, 19) Here, "confirmation" corresponds to the "reason" of the *Ad Herennium*: "Confirmation is the part of the oration which by marshalling arguments lends credit, authority and support to our case"[3]. (I, XXIV, 34)

A noticeable difference with the *Ad Herennium,* is that Cicero is more synthetic and more systematic. For instance, he makes numerous concise considerations on the practice of arguing, like "to define it briefly, an argument (*argumentatio*) is a device of some sort to show with probability or demonstrate with necessity"[4] (I, XXIX, 44). Cicero also makes a distinction between kinds of arguments: "All argumentation is to be carried on either induction (*inductio)* or deduction (*ratiocinatio*)" (I, XXXI, 51). Yet, this distinction does not match the difference we now make between induction and deduction. "Induction is a discourse which leads the person with whom one is arguing to give assent on the basis of

---

certain non-dubious facts; through this assent it wins his approval of a doubtful proposition because this resembles the facts to which he has assented". A deduction (*ratiocinatio*) is a discourse "which draws from the fact under consideration itself a probable conclusion which, once set forth and recognized by itself, is confirmed by its own strength and its own reason" (I, XXXIV, 57).

Like in the *Ad Herennium,* it is in the part on refutation that the *De Inventione* deals with fallacies. After a long discussion of the contentious issue of the number of parts of a *ratiocinatio* – three according to some authors, five according to others – Cicero sets a general framework for refutation: "Every argument (*argumentatio*) is refuted in one of these ways: either one or more of its assumptions are not granted, or if the assumptions are granted it is denied that a conclusion follows from them, or the form of argument is shown to be fallacious (*vitiosus*), or a strong argument is met by one equally strong or stronger." (I, XLII, 79). Let us examine the second and the third ways, very close to the Aristotelian definition of a paralogism.

This proximity is quite salient in the sentence opening the discussion of the second way: "Statements claimed to be necessarily true can be attacked in the following way if they only imitate a rigorous argument (*necessariam argumentationem*) and are not really such" (I, XLV, 83). Cicero discusses (false) dilemma and incomplete enumeration that we have already said similar to Aristotle's fallacy of many questions because they force to choose among a limited number of possibilities, often forgetting the right one. For instance, in the case of the dilemma "whether you say he is modest or not, you will have to grant that you should not accuse him". Cicero then begins the analysis of conclusions that can look like necessary consequences. In the case of "If he is breathing, he is alive" or "If it is daytime, it is light" Cicero considers that the consequence "seems necessary", but he advises to answer that it is not the case in "If she is his mother, she loves him" (I, XLV, 86). Unfortunately he does not go further than this incentive to cautiousness. Yet, he makes an important remark about the study of fallacies in rhetoric:

> […] the whole science of argumentation and rebuttal has a greater importance and wider ramifications than here set forth. But the knowledge of this art is so difficult that it cannot be appended to any chapter of rhetoric, but demand for itself alone a long period of arduous thought. Therefore this will be treated by us at another time and in another work, if opportunity shall offer. Now we shall have to be content with these rules laid down by teachers of rhetoric for the use of speakers." (I, XLVI, 86)

This statement could support a charitable interpretation of Hamblin's radical statement that Cicero did not write on fallacies: we could say he did, but not extensively. Cicero did acknowledge the importance of "sophistical refutations", but it seems that he never had time to sit down and write out the principles of this wide art. This is why, one more time, we must be content with mere lists of typical bad reasonings. Like in the *Ad Herennium,* the examples of the *De Inventione* are a mix of non-contextual defects leading to *non sequitur* and various pragmatic defects linked with clumsy behaviors of the arguers. An example of the first case is the non-conclusive syllogism "If you had come to the army you would have been seen by the military tribunes. But you were not seen by them. Therefore you did not set out for the army." (I, XLVI, 87). A pragmatic defect occurs, for example, when the opponent presume that you have forgotten what you have granted and then introduce a conclusion that is not a consequence of your commitment.

Did Cicero make a distinction between a mere *non sequitur* and a fallacy understood as a typical structural defect in a premise-conclusion argument? The answer is not easy, for he begins the examination of the third way to refute an argumentation (a vicious form of argument) by a consideration that seems to be part of this study of the art of rebuttal that he has just postponed:

[…] the very kind of the argumentation (*argumentatio*) may be shown to be faulty (*vitiosum*) for the following reasons: if there is any defect in the argumentation itself or if it is not adapted to prove what we purpose to prove. To be specific, there will be a defect in the argument itself if it is wholly false, general, common, trifling, far-fetched, based on a bad definition, controvertible, self-evident, disputable, discreditable, offensive, 'contrary', inconsistent, or adverse. (I, XLVIII, 89)

This enumeration is followed by a long list of several pages that gives variants and examples of each of the previous defects. Again, there is some redundancy or overlap between some headings or items, for instance between 'weak' and 'insufficient' reasons. Beside the case of arguments involving statements that are obviously mendacious, we find some of the defects presented in the *Ad Herennium*, for instance arguments that are so general that they can benefit both the arguer and his opponent. There are also far-fetched arguments derived from remote circumstances, or defective ones because they show something about part of a class instead of the whole class. Cicero does not use their current names, but we can also recognize a form of *ad hominem* argument when "a thing is criticized because of the fault of a man, for instance, if someone should blame learning because of the error of some learned man". Listed among cases of weak (*infirmata*) reasons, we meet again our old friend *Petitio*, when "the reason may be merely a statement of the same idea in different words". It accompanied by an example very close to the example of the *Ad Herennium*: "Avarice is bad, for desire for money has brought great disasters on many" (I, L, 95). If Cicero is not the author of the rhetoric *Ad Herennium*, at least two major Roman authors wrote on fallacies.

6. QUINTILIAN'S *INSTITUTES OF ORATORY*

We will leave the last word to Quintilian who wrote almost two centuries later, at a time often considered as a period of decline of the art of rhetoric, perhaps because of the collapse of the republic. Quintilian did not write extensively on fallacies or on the art to refute dubious arguments and does not address the fallacies discussed by Aristotle at a single place of the twelve books of his thick *Institutes of oratory*. Yet, you can find topics related with the Aristotelian fallacies scattered in different places. For instance, in book VII, you find a whole chapter on amphiboly, identified with ambiguity in its broadest sense. Quintilian discusses various forms of amphiboly that cover approximately the six Aristotelian fallacies *in dictione*, from the ambiguity of a single word to the effect of tonal accent on meaning or the various resources offered by the composition or the dissociation of words. In this chapter we even find the resumption of an example from Aristotle's discussion of the paralogism of dissociation.[5] Quintilian stresses that some ambiguities are no more than puns or are at the origin of "silly cavilings, but the Greeks make them the origin of controversies in the schools." (VII, 9, 4) He finally makes an interesting remark about the rhetorical use of ambiguity: as soon as it is acknowledged, you should not try to turn it to your own benefit; otherwise it is not an ambiguity anymore. In practice, the main problem with an ambiguity is to find which interpretation has to be chosen and for what reason.

In book V of the *Institutes of oratory*, the chapter on refutation is more on general strategic considerations and advices to follow during a trial than on typically vicious arguments. For instance, it discusses whether we should attack all the arguments of the other party at the same time or one by one. It also advises to pay attention to the limits of the similarities used by the opponent or to avoid objections easy to refute. As usual, Quintilian gives many examples from famous trials. It is only in a summary of common mistakes, often

---

[5] See *On sophistical refutations* (4, 166a37).

easy to pick up, that we find a list that brings together some specific defects, logical or not, already stressed in the *Ad Herennium* or in the *De Inventione*,

> […] such as advancing a disputable for an indisputable argument, a controverted for an acknowledged fact, a point common to many causes, for one peculiar to the cause in hand, or introducing anything vulgar, superfluous, too late for the purpose, or incredible. For it is incident to incautious speakers to aggravate when it is still to be proved; to dispute about an act when the question is about the agent; to attempt what is impossible; to break off a discussion when it is scarcely commenced; to prefer speaking of the party instead of the cause; to attribute to things the faults of persons, as for example, accusing the decemviral power instead of Appius; to contradict what is evident; to say what may be taken in another sense from that which they intend; to lose sight of the main point of the cause; and to reply to something that is not asserted. This mode of reply, indeed may be adopted as an artifice in some cases, as when a bad cause requires to be supported by foreign aid […] (V, 13, 34)

These faults can be mere blunders, but Quintilian stresses an ancestor of our confirmation bias: in the context of objections and refutations, they deserve the more attention, for speakers have a strong tendency to praise their own arguments and not to pay enough attention to the ones of the other party.

7. CONCLUSION

The concept of syllogism allowed Aristotle to export his concept of paralogism from dialectic to rhetoric. What happened next? We do not know for sure the path followed by the influence of Aristotle's works on Roman rhetoricians. Yet we have shown that they did write on fallacies and in a way probably marked by Aristotle's seminal works, although they did not clearly follow his idea that a fallacious maneuver can be perceived in the very construction of a syllogism. We can recognize some of the Aristotelian fallacies, or variants, among some of the fallacies mentioned by Latin authors, even before the rediscovery of Aristotle's works during the first century B.C. We can also find in the defects that they list, some non-Aristotelian fallacies that appear to be the ancestors of some of our informal fallacies.

However, fallacies do not seem to have been a favorite topic of Roman authors on rhetoric. In the *Rhetorica ad Herennium* and Cicero's *De invention* fallacies are discussed in the chapters on refutation, the most dialectical stage of a classical rhetorical discourse. We have seen that Cicero explicitly grants the importance for rhetoric and the complexity of the art of refutation. But like other major Roman rhetoricians, he was more interested in the structure and course of a public discourse than in local technical details. This is why bad reasoning and fallacies, lost among the many topics discussed by Roman treatises on rhetoric, may give the impression to have been a neglected topic.

Nevertheless, these writings on rhetoric have been influential during the Middle-Ages and the Renaissance. This suggest that the history of the study of fallacies has not only the dialectical branch explored by Hamblin, but also a rhetorical one, still to be explored and perhaps at the origin of some non-Aristotelian fallacies.

ABSTRACT: The theoretical approach of this paper can be described as a flexible argumentation approach. It involves ideas about dialogue by Linda Carozza, Douglas Walton, Michael Gilbert and Claudio Durán. On the basis of this approach, the paper intends to present the development and conclusions of an argumentative dialogue between the authors. The authors disagree about the political evaluation of the government of Allende. The depth of this disagreement is a main issue of the study.

KEYWORDS: amenable argumentation approach, deep disagreement, multi-modal argumentation, open dialogue, Pragma-dialectics

1. INTRODUCTION

We begin with a quotation from Frans Van Eemeren (2011) that relates closely to our overall approach, both theoretical and empirical.

> In the field of argumentation theory, argumentative practice is both the starting point and the end point of systematic study. That is to say, the motivation for the study is rooted in the problems that present themselves in the many guises of argumentative practice; likewise, the results are employed to improve the analysis and evaluation of argumentative practice and to finally increase its quality. This practical orientation lends the field of argumentation theory its relevance for society.

Our study is the result of many years working together through which we have participated in several conferences on related topics. However, it is only in the past two years that we could come across a theoretical approach that proved helpful to carry through, and be able to analyze, a long and expanded argumentative dialogue. This study is in line with commitment to understand what has happened in Chile since the government of Salvador Allende and the military coup that replaced it by the dictatorship of General Augusto Pinochet. The research focuses on an argumentative dialogue between the two of us because we found out that we had some rather deep disagreements about the evaluation of the government of Allende. The concept of deep disagreement relates to Robert Fogelin, (1985) but it has been modified in an important way by Durán's elaboration from 2016 (Durán 2016).

As will be seen through the paper, we managed to undertake a long process of argumentative dialogue that helped us to test the relevance of our theoretical framework. We believe that it has been a successful overall process, but of course, it is now the task of readers of the paper to come up with their own evaluation.

2. THEORETICAL APPROACH TO THE RESEARCH ON ARGUMENTATIVE DIALOGUES

From its inception, we conceived of the development of a model for the study of argumentation that could help in the analysis of political realities, especially in the case of Chile, the deep disagreement with regards to the 1973 military coup and the military dictatorship of general Pinochet.

There are several important features in this project. First, we decided that the research itself should be carried as an argumentative dialogue between us. Second, we have not avoided the disagreements between us and we believe that it is not at all expected that we will necessarily have to achieve full agreement. Finally, an important factor in our experience of argumentative dialogue has been the development of "trust" between us.

The concept of argumentative dialogue proceeds from several sources. The first one is the doctoral dissertation of Linda Carozza (2009) who develops ideas on dialogue and argumentation drawn from *The New Dialectics* by Douglas Walton (1998), but her main ones are original. Carozza introduces the concept of "Amenable Argumentation Approach" (A3). A3 represents a flexible approach to the study of argumentation such that we should be prepared to involve ideas, practices, evaluative processes, etc, drawn from all schools and approaches to argumentation. In essence, be prepared to utilize whatever may be considered useful for the study of specific cases in the study of argumentation. She examines in depth some of the limitations of the tradition, especially the lack of concern for emotional arguments based on the excessive stress on the logical mode. Walton, working within the parameters of logical argumentation, maintains that most often arguments take off from dialogue. Obviously, the logical tradition in western civilization has significant weight and by no means we intend to discard it: the issue for Carozza is the recognition of the reality and significance of emotional arguments.

The second source of the concept of argumentative dialogue refers to what is called by Durán "open dialogue" (2012). There is a tendency in western culture to relate dialogue to the Socratic dialogue. However, the idea of open dialogue is different although some of the features of the Socratic dialogue are important such as the need to clarify concepts. Erich Fromm (1968) said that the most important feature of a dialogue should be that people involved in it could express and understand themselves without the compulsion of the critical approach that is characteristic of educational institutions. Fromm says in his book *The Revolution of Hope* that "[i]n every fruitful dialogue, each participant must help the other to clarify his thought rather than to force him to defend formulations about which he may have his own doubts." In open dialogues the expression of emotions is fundamental and moreover, the need to recognize the multi-modal facets of argumentation is essential. Thus the validation of Michael Gilbert's theory of Multi-Modal Argumentation (Gilbert 1997) is a main source of the notion of open dialogue. Therefore, it is necessary to be aware of the relation between logic, emotions, intuitions and physicality when having dialogues, including those that can generate argumentation processes. Moreover, we have related Gilbert's theory to pragma-dialectics which is something that he does in his book *Arguing with people* (2014).

The third source of the concept of argumentative dialogue relates to the way in which Chilean philosopher Humberto Giannini understands dialogue. According to Giannini (2013), a dialogue involves a transgression of the routine of a conversation: when a conflict emerges in a conversation then a dialogue proceeds from the disagreement. Thus the dialogue takes the interlocutors to reflect together so as to revise the issue involved in the disagreement.

There is tension involved at this stage between open dialogue, argumentation and Giannini's view of dialogue. The problem stems from the different way in which concepts are being used, for what he conceives as dialogue is what in argumentation theory is called

argument. Indeed when an exchange of alternative views proceeds in the face of a disagreement then in argumentation theory that is understood as argument. Furthermore, there is a difference between Giannini's understanding and the concept of open dialogue as developed by Durán, because according to the latter an open dialogue does not involve conflict and is rather an occasion for a free and creative exchange in which the main expectation is to be aware of the other's views on a matter. The point of an open dialogue is to do one's best to understand the other participant.

This difference of views involved an argumentative dialogue between the authors of this paper such that a decision was taken that it was appropriate to present these ideas as a sort of disagreement and keep it as such.

We decided that it is expected then that this will be the situation in most exchanges.

Finally on this issue, it is also relevant to mention that Giannini's views do involve as well going from a conversation to a dialogue based on disagreement, or in argumentation terms to an argument. In this regard, it should be noticed that Giannini's view of dialogue refers to logical dialogues.

One important and creative idea of Humberto Giannini is that, according to him, the dialogue, or in our terms the argumentative dialogue, if it is genuine then the participants should be able to recognize that the ideas being presented are not the property of any one of them, but they belong to the very process of arguing and presenting them. Giannini claims that the dialogue requires a "hospitable mind", this involves that the ideas being expressed by both participants should be treated as "guests" and not as "personal property". (1997)

3. DEVELOPMENT OF THE ARGUMENTATIVE DIALOGUE

Our argumentative dialogue developed during January and April 2018. We decided to get engaged in telephone exchanges through WhatsApp combined with emails and messages also through WhatsApp. After each telephone exchange both of us would produce an account of what was discussed there and put it in writing immediately. Each of us created what we called a "logbook" to record our exchanges, then we would email that to each other and proceed with the argumentative dialogue in this way. About 50 pages were recorded in the logbooks. The exchanges proved unexpectedly to be intense and emotional, with arguments flowing back and forth. This was surprising but soon we realized that the topic was itself a complex and difficult one.

The topic of the argumentative dialogue was defined in simple terms: "What is the view of the government of Salvador Allende between 1970 and 1973". We knew from earlier exchanges that happened in 2017 that each of us held significantly opposite views, we could also anticipate them to be deep to a large extent. For several weeks in January, the argumentative dialogue proceeded from Durán's claims until the third week of this month when we thought that Hamamé should start from her views on the topic. There is a reason for this that will be discussed in due course.

On January 4, Durán started the argumentative dialogue with his view on the government of Allende. He said that Allende should be held responsible for what happened in Chile with the military coup and the military dictatorship that followed. The reason for that is that he should have got engaged in agreements with the Christian Democratic Party well before the coup so as to develop a joint program of deep social, economic and political reforms in Chile. Hamamé disagreed with that claim but no further arguments were produced by her on this specific point. Probably because the argument got involved with another issue: the death of Allende at the Presidential Palace after the military had ended all resistance there by Allende and his people.

Durán thought that Allende committed suicide given the fact that the military had taken full control of the situation in Chile. Hamamé's view was very different as she thought that Allende was assassinated by the military. For a long while the argumentation centred on this topic.

Durán's reason for his view was that the suicide was certified by Allende's own doctor who had been present there during the bombing of the Presidential Palace and the assault by the soldiers. Hamamé justified her position saying that admitting that Allende committed suicide would exonerate the military for the assassination.

So a disagreement had developed on the topic of Allende's death before any argumentation on Durán's main claim had been argued upon.

During these approximately two weeks arguing about Allende's death, Durán wrote in the logbook extensively about his emotional and physical reactions. He lost sleep on several nights, experiencing intense feelings.

The argumentation about Allende's death proceeded to different but related issues. Durán himself recalled that her mother, who had been Allende's friend and a strong supporter of him, claimed that Allende's doctor could have been threatened by the military if he were to say that he was assassinated by them. This claim was clearly in line with Hamamé's view. However, Durán said that he had arguments with his mother about her claim: one issue with her mother, he said, was that for her suicide was not a dignified death, thus a sign of weakness. For Durán, that was not the case as he did not view suicide as such, furthermore he introduced the suicide of President Balmaceda in 1891 as a model case for Allende: Balmaceda committed suicide after the defeat of the government forces in a violent civil war.

Hamamé replied to Durán's argument about Balmaceda that if Allende had Balmaceda as a model in the case of suicide, then that should be considered as a case of a "self-fulfilled prophesy" and moreover in its worst version: the vicious circle version. She thought that if that was the case, then it would represent a very tragic situation. For Durán, this would not be the case given that President Balmaceda had been for a long time evaluated very positively by the Chilean left: he was a politician deeply committed to advanced social, political and economic reforms destined to help the poor sections of the population. That was the reason for the civil war against him orchestrated by the upper classes with support from England.

Durán hesitated in bringing a further point in support of his claim about Allende's suicide. Allende had been a friend of his father, and as such he was a guest at Durán's home many times. Some important political decisions in which Allende was present had been made in meetings at his father's place. His father told him that Allende had on one occasion said that he saw his life ending either as an old man watering his flowers or being killed in the Presidential Palace. Moreover, in a 1971 meeting in the National Stadium in Santiago, held to say farewell to Fidel Castro who had been visiting Chile for a month, Allende said in his speech that he would only leave the Presidential Palace killed by bullets.

Not even one of these arguments by Durán tended to prove his point that Allende had committed suicide. Rather, they could perfectly well be consistent with Hamamé's view.

What is remarkable about this long argumentation, in which an open dialogue had also been happening, is that Durán, as mentioned above, experienced very high tension, not being able to sleep well, feeling a bit at a loss, because his deeply held views about Allende's suicide were now in question. Also, he felt somehow challenged by Hamamé in a way that gave him a negative feeling of losing the argument. At least, of having to accept that he could not prove his main claim.

However, the core issue of the argumentative dialogue, that is, the view of Allende's government had not been tackled.

One very positive outcome of this argumentative dialogue was that Durán was now prepared to reverse some of his views on Allende. This is discussed below.

Before tackling the main issue of the argumentative dialogue directly and explicitly, Durán had concluded that perhaps even with the support of the Christian Democratic Party the coup would have most probably happened all the same. The reason for that, he argued, is that the powerful extreme left would have rejected any deal with the Christian Democrats. Therefore, social, political and economic disorder would have most probably followed. Then the military would have intervened.

At this stage of the argumentative dialogical process, having Durán come to terms with the view that even with an agreement between Allende and the Christian Democrats, a coup could probably have also occurred, both decided to review the whole text of the exchanges from the beginning.

We became aware that so far the exchanges had all started from Durán's initial views. We were surprised and we tried to find a reason for that. We were helped by an insight from Durán's wife: she happened to read the texts that documented the exchanges and said that it seemed to her that Durán's intensity and involvement in the process indicated a sort of full coming back to Allende's government during which he was politically and professionally involved. She added that Hamamé seemed more related to the period of Pinochet's dictatorship. This insight made us realize that Durán was between 31 and 34 years old during the Allende years whereas Hamamé was between 12 and 14 years old. Durán had met Allende when he was 12 years old, he had been participating in politics since 1958, and in the 1960's was a close friend of high level politicians of the Socialist Party. In 1968 he was invited to the Havana Cultural Congress, an experience with profound social and political significance.

Becoming aware of the fact that Durán had started so far all the exchanges, we decided that we should change the focus to Hamamé's views on Allende. At the same time, we were reflecting upon the emotional and physical intensity of the argumentative dialogue: thus, it occurred to us that in shifting to Hamamé we needed perhaps to stress the logical mode.

Since, as mentioned in section two of this paper, Gilbert's multi-modal approach can be related to the pragma-dialectical conception (Gilbert, 2014), the idea was now to follow a model such that Hamamé thinks that S is P: that would be her standpoint. Then Durán can claim that he is in disagreement with Hamamé. This would be the confrontation stage according to pragma-dialectics, and should be followed by the opening stage in which both arguers decide on the rules of the argumentation before entering into the argumentation stage itself. Assumedly the argumentation process would end in some sort of conclusion, positive or negative. Of course, in each stage one should be aware of the mode(s) of argumentation involved. In any case, our decision to seek help from pragma-dialectics was motivated by the need to stress the logical mode in order to become more clear about our argumentative dialogical process.

In the third week of January, Hamamé referred in detail to her life experience that led her to the support of Allende in 1971. She mentioned that as a child she used to live in Coronel, a town in the south of Chile that was one of the main two centers of the coal mines. Coal miners were very poor in those places and were submitted to a very harsh life of work. Hamamé was aware of this situation and felt the pain of the miners. An older communist female neighbour helped her to understand the roots of the injustices suffered by the miners. This relation with the neighbour took her to commit herself with social justice. Around the time that Allende became President, Hamamé's family moved to live in a town near Santiago, Chile's capital. She was in the first year of high school and one of her teachers arranged meetings with her and a few other classmates to talk about Allende's policies. Hamamé mentioned that she could recall vividly those sessions in which she became aware of who Allende was and what he wanted in terms of overcoming poverty in Chile. She was therefore moved and became a supporter of Allende.

In conclusion, Hamamé's positive views of the government of Allende are inextricably linked to her life experience in early childhood coupled with the sessions with her high school teacher. Allende represented for her a commitment to social justice.

For Durán, initially, this positive view of the government of Allende did not seat well with his now modified view. Indeed he had changed his idea that if Allende had made compromises with the Christian Democrats the coup could have been avoided. Now, given the argumentative dialogue he conducted with Hamamé, as it was presented above, he became hesitant about his negative evaluation of Allende, but he still did not agree with the positive view of Hamamé. Therefore, in the morning of the day they were supposed to continue the exchanges about Allende, Durán prepared a set of 5 to 6 points to counter-argue Hamamé's claim. He even characterized them as collecting "heavy artillery": A "war" metaphor that is discussed below.

However, something happened that can be explained in terms of Michael Gilbert's concept of the kisceral mode: this mode refers to the intuitive, the uncanny, the unexpected, in any case the unpredictable, etc. As Durán was preparing his "artillery", his wife came with two letters that she had just found among old family documents. They were the two letters that Durán and his wife wrote to her parents the morning of the day they were leaving for Canada from the Canadian Embassy where they had seek refuge. In her letter to her mother, his wife wrote:

> In these days I have reflected very much and a whole world has swirled in my soul: this world so full of horrible things and at the same time great things, and of which Chile is part. I have come to realize that the struggle for more justice and truth is so long and painful. At the same time, I have realized that we are part of the long history of humankind for a better life and that we must live this part of history even if we suffer its cruelties.

Durán then felt a profound and moving feeling, at the same time he felt the need to be fair in evaluating Allende. Of course, this experience represented a most significant coincidence with Hamamé's positive evaluation of Allende: Allende now became the representative for both of them of the commitment for social justice in Chile. Indeed Allende said in 1952: "We are here to begin a long struggle for more social justice".

The war metaphor in the argumentation with Hamamé was now gone. Durán realized that his emotional and physical distress during the argumentative dialogue was an expression of inner contradictions within him via-a-vis Allende. He had been negating his own commitment to the government of Allende for a long time. Indeed he had been changing his ideological and political positions in overt and clear ways for many decades, but he saw now that he could not negate his deep commitment to Allende in the 1970's.

At this stage of the argumentative dialogue, we had found agreement between us in our views of Allende. And this happened towards the end of January when the process was interrupted due to Hamamé's holidays.

The process was resumed in early April. A few issues had been pending in resolution. Such is the case of the different understanding of Allende's death, whether suicide, as Durán still believed, or assassination in Hamamé's consideration. The question had become not significant for Durán at this stage and we decided to postpone it until another time, if indeed this would become an issue. Suicide or not, for Durán the topic for him was essentially the evaluation of Allende's government.

During April, now having resolved the main disagreement, we concentrated on looking back to our logbooks. We decided to review the "logic" of the process of argumentative dialogue as it had been conducted. This stage of the exchanges became a case of open dialogue.

Hamamé wrote in her logbook that the multi-modal approach has been present in each of our argumentative dialogues, being they through WhatsApp telephone or message communication, together with our logbooks' registrations, and emails. Both have felt intense emotions, together with intuitions, and all the time expressing our academic knowledge as well,

and this means a participation of the logical mode in the process. Moreover, we have both felt deep physical reactions as the dialogue was proceeding. Therefore, the four modes of Michael Gilbert have appeared combined in different proportions. Through that process we arrived at an agreement about our views of Allende in a kisceral way. No less significant was the appeal to pragma-dialectics, which helped us to reorganize the argumentative dialogue at a key moment. Our joint conclusion that Allende represented for us a commitment to social justice became the very core of the argumentative dialogue.

We both agreed that Chile had changed so much since the coup and especially because of the introduction by the military dictatorship of a neo-liberal economic model. The dictatorship was over when a coalition of Socialists and Christian Democrats won a plebiscite against Pinochet. However, the democratic government, based on those two parties, continued operating with the neo-liberal economic model. In the process, poverty decreased in Chile from roughly 50% at the times of Allende to approximately 25% today. That meant a very significant increase of the middle classes. In this scenario, what is the meaning of "social justice", and therefore, what is the meaning of Allende?

4. CONCLUSIONS

One conclusion that stems immediately from the process in which we have been involved, is the question of whether this approach to argumentation theory could be replicated by other argumentation theorists. For, we have been working together for a long time, we know each other very well, we respect the work that we do, we have collaborated in several projects of a similar nature, and last but not least, we both share a commitment to Michael Gilbert's theory of argumentation. Moreover, the introduction of pragma-dialectics theory in our approach is due, to an important extent, to the way in which Gilbert relates it to his own theory (Gilbert 2014).

However, perhaps we are the only theorists that share the theoretical approach that guided our dialogical process. It could be argued that it could prove very difficult to replicate it by other scholars. We were aware of this from the beginning, but we had decided that the moment has come to present it in an argumentation conference. In that way we would be in a position to receive positive or negative feedback that could help us to revise the approach. More ambitiously, we also thought that other argumentation theorists could benefit from the approach and maybe even join us in further studies.

Since Michael Gilbert's theory of multi-modal argumentation has gained little traction in argumentation circles, and given the fact that it is a cornerstone aspect of our own approach, we tried in our argumentative dialogue to understand the reason for the non-acceptance of the theory. Hamamé said that the theory goes so deeply against the logical tradition of western civilization that what is needed is a change of paradigm. That change could take a long time.

A second conclusion that follows the first one refers to pragma-dialectics and its role in our approach. First of all, we must clarify that we think that logic is important, our concern relates rather to the fact that it has been dominant in the western tradition to the detriment of emotions, physicality and intuition (what Gilbert calls the kisceral mode). In this context, we claim that our experience in the argumentative dialogue presented in Part 3 of this paper, tends to show that it would have been impossible if emotions would have not been involved in the process, and also physicality and certainly the kisceral mode.

We believe that pragma-dialectics theory and practice tends to travel a rather logical road, but its concern goes beyond the strictly logical realm. Witness what Frans van Eemeren says (2011): "With the introduction of the notion of 'strategic manoeuvring' we have in fact

added a rhetorical dimension to our dialectical theory of argumentation." And he adds in the same writing: "Nonetheless, I was—and am—convinced that dialectic and rhetoric cannot survive without each other and that the future of argumentation theory lies in a constructive integration of these two perspectives.'

In any case, in terms of our experience in our argumentation dialogue, as reported in Part 3 of this paper, introducing the pragma-dialectical approach at a key moment proved to be valuable.

A third conclusion relates to the issue of deep disagreement, either in the sense of Fogelin (1985) or Durán (2016). In our opinion, the problem of depth of disagreement requires that we need to be clear about whether we mean different levels of depth in an argument, that is, more superficial or deeper in terms of the difficulty of achieving agreement, or we mean with Fogelin what other argumentation theorists call intractable disagreement (Dale Turner & Larry Wright, 2005). Referring to our argumentative dialogue in Part 3, it seemed to us for a while that the argument about Allende was going in the direction of intractable disagreement. It involved deep seated emotions and physicality, mainly in Durán, that took him to even mention that he was going to collect "heavy artillery" to counter Hamamé's views.

Now, given the fact that the disagreement disappeared, as we saw, through a kisceral argument, we feel tempted to hypothesize that deep disagreements in Fogelin's sense may be the expression of deep seated emotions and kisceral reactions, even physicality. We may feel that we have to defend our views not only because of logical considerations but perhaps mainly for emotional reasons, or intuitive or physical considerations. Of course, this issue would require considerable more research.

A fourth conclusion takes us to reflect upon Linda Carozza's contribution to our theoretical approach. She encourages argumentation theorists to involve other perspectives when dealing with arguments, being that at the level of understanding but also evaluation. Of course, this is a difficult position to take since some perspectives may be contradictory to others, but in essence, we believe that Carozza's Amenable Argumentation Approach is a fine and insightful idea so as to remain as open as possible all the time when dealing with argumentation. Of course only the actual practice of argumentation can help in finding the relevance of this approach. In our case, it proved useful.

A final conclusion involves a subtle and probably uneasy reflection upon the relation between argumentation and research. Looking back at our study, especially focusing upon the argumentative dialogue, the question that arises is the extent to which we were not only arguing but also researching, that is, attempting to be objective with our views on Allende. One immediate problem is that we started on our views which have been shaped by political experience, scholarly readings, arguments with many other people, etc. However, what is the guarantee that we were right on our views? Indeed the purpose of the argumentative dialogue was not to win at whatever cost: even Durán's reference to "heavy artillery" was not meant to just leave Hamamé out of arguments, but to produce "heavy arguments" based on facts that he thought Hamamé was not aware of.

We should also mention that from the beginning we thought that a process of argumentative dialogue like this one should not be limited to historians, political theorists, sociologists, politicians, and other experts who have spent considerable time researching about the Allende government, but it should be available to just anyone. This is in line with Durán's study of blogs that he presented at the ISSA Conference in 2014 (2015). Reducing the evaluation of a government to experts alone may be of little use in politics. However, there is no doubt that the opinion of experts should be involved in processes of argumentation. We think that this issue will be a main one in our next undertakings in argumentation research.

One does not punch a discussion partner: An analysis of the strategic maneuvering justifying radical actions in communiqués issued in social conflicts

JORGE DURAN SOLORZANO

The Netherlands
j.f.duran.solorzano@hum.leidenuniv.nl
solo.jorge.dura@gmail.com

ABSTRACT: Social movement organizations use different forms of protests to produce or prevent social change. These forms include socially accepted actions, such as demonstrations and rallies, and other less accepted and more radical like civil disobedience and uprisings. These actions often go accompanied by communiques in which organizations justify their actions. This paper analyzes the confrontational strategic maneuvering employed by a guerilla group in a communique issued at the beginning of an uprising in Mexico.

KEYWORDS: communiqué, confrontational strategic maneuvering, Mexico, pragma-dialectics, public opinion, social conflicts, social movements

1. INTRODUCTION

From a dialectical perspective, argumentation put forward in a discussion implies a cooperative attitude between discussant parties (van Eemeren et al. 1993, pp. 6-7). Equally speaking, from a dialectical point of view, parties do not try to make their standpoint accepted by recurring to violence or other type of actions, since doing so could be regarded as uncooperative or unreasonable (van Eemeren 2010, p. 196; van Eemeren and Grootendorst 2004, p. 190). However, in social conflicts, parties usually do recur to actions that may be deemed uncooperative and unreasonable. In spite of this, it is possible to find that they put forward argumentation to justify their uncooperative/unreasonable actions. One can find that parties in a conflict maneuver strategically to appear reasonable and to manage potential disagreement caused by their actions. Even in extreme cases in which social conflict reach high levels of violence, parties still put forward argumentation to justify radical actions.

A key element in social conflicts is the role that public opinion plays. Conflicting parties usually aim to win the support of the public opinion by communicating their goals, reasons for acting in a certain way, demands, amongs other. One common way to communicate this elements are communiqués. To analyze the argumentation employed in communiqués it is possible to reconstruct them as a multi-party discussion in which conflicting parties play the role of the protagonist and the antagonist of the discussion, while the public opinion plays the role of an informal adjudicator. The claim guiding this paper is that parties involved in social conflicts put forward argumentation in communiqués to win the favour of public opinion and to make their accitions acceptable to them. This paper aims to test this claim using the extended pragma-dialectical model to analyze the confrontational strategic maneuvering employed in a communiqué issued by a guerrilla group in Mexico called the Zapatist Army of National Liberation (EZLN). In this communiqué the EZLN declares war against the Federal Army and the Executive Power of the Union in 1994 after having occupied six municipalities in the State of Chiapas, Mexico.

Section 2 introduces the notions and concepts of social movements studies that are needed to inform the confrontational maneuvering analysis. Section 3 introduces the pragma-dialectical model and the concept of strategic maneuvering. Section 4, analyzes a confrontational strategy used in a communiqué issued by the EZLN. Section 5 discusses the results of the analysis of this research.

2. SOCIAL MOVEMENTS, RADICAL ACTIONS AND COMMUNIQUÉS

Through history, social movement organizations have influenced society to modify conventions, norms, laws, and policies. The extension of voting rights, the establishment of welfare state, and the development of union rights are examples of political, social, and labor rights that were obtained thanks to the struggle and protests of social movement organizations (Goodwin & Jaspers 2015, p. 3). Social movement organizations have employed different repertoires of protests, going from socially accepted collective actions such as rallies, petitions to representatives, and public demonstrations, to more radical ones such as boycotts, civil disobedience, hunger strikes, rioting, and uprisings.

According to Della Porta and Diani (2006, p. 21), social movements can be defined as "collective actors that are engaged in political and cultural conflicts, meant to create or oppose social change." In this definition, the term 'collective actor' means groups of people associated to achieve a collective goal. For instance, the Anarchist Black Block and the more institutionalized group Green Peace can be regarded as organizations that are part of broader social movements like Occupy Wall Street in 2011 and the Environmentalist movement, respectively. Collective actors, in Della Porta and Diani's definition, are in conflict, i.e., in an oppositional relationship seeking control of the same interest (political, economic, or cultural), with other collective actors such as official institutions, corporations or other organizations. A critical element that gives place to disagreement between actors is that they make negative claims, i.e., demands, which if realized, would damage the interests of other actors (Della Porta & Diani 2006, p. 21).

Michael Lipsky noted in his book *Protest in city politics: Rent strikes, housing, and the power of the poor* (1969), as well as in his article Protest as a political resource (1968), that the process of social change led by public protest is highly indirect because of the critical role played by communication media and the reference public of the target of a protest (see also Della Porta & Diani 2006, pp. 28-9). Lipsky departs from the observation that people protesting are relatively powerless groups in relation to the institutions because they lack the political power to produce a change by conventional means. In other words, relatively powerless groups want to produce or oppose a certain change, but they are not in the institutional position to produce this themselves: they need either to convince or deter those who have the power to do it. According to Lipsky (1968), protesting, in this sense, is a political resource aimed at activating the media and the reference public of the target of a protest. By 'reference public', Lipsky means third-parties with the power to influence decision-makers of the target of a protest. Communication media plays a crucial role in outreaching and framing the message and actions of the protesting group to a broader audience, including third-parties.

In the process of protesting, social movement organizations perform different types of collective actions, which vary in legality and degree of social acceptability. When deciding about the type of action, organizations maneuver between being disruptive enough to activate the media and reference public of the target of their protests, and being too disruptive and lose their favor. This tension, according to Della Porta and Diani (2011, p.175) represents one of the protesters' dilemma: "protesters need to deal with the often contradictory requirement of

threatening with a disorder on the one hand, while on the other seeking to avoid stigmatization by public opinion." One way in which social movement organizations cope with this dilemma is through speech events accompanying their actions in which they put forward argumentation for their demands, their actions and the seriousness of the situation (see also Loadenthal 2015, p. 454).

Since radical actions often break certain laws or conventions, usually triggering polarized reactions, it seems even more necessary for organizations performing them to put forward speech events to prevent stigmatization and negative framing by media and state actors. It is not unusual that organizations performing radical actions end up being called terrorists, radicals, subversive, delinquents, anarchists, conspirators and being named by other loaded terms. These labels are not only 'hot air' and harmless words: they often imply severe legal and political consequences. Research in the field of social movements has shown that the state actors and corporations employ these terms when they are the target of the protests of social movements organizations (see for instance Balsinger, 2015; Beck, 2007; Wisler & Giugni 1999). It is therefore neither surprising nor uncommon that organizations anticipate this type of negative framing.

A type of speech event commonly used in social conflicts is communiqués, which are official bulletins or communications, usually sent to the press or other mass media to reach a broader public. In his Ph.D. dissertation, Michael Loadenthal analyzes communiques issued by insurrectionary groups in different parts of the world. Regarding communiqués as a communicative event, he observes that they are an essential component of the communication strategies in insurrectionary struggles:

> Following each incident of political violence—from a broken window to an assassinated nanotechnologist—the act is explained, 'infused with meaning' via a text meant to expand the discourse on revolutionary struggle. This site, that of the communiqué, demonstrates the social construction of both the act (of 'terrorism') and the discourse (on 'terrorism'). Both the event (i.e., the attack) and the object (i.e., the communiqué) are socially constructed phenomena, serving to apply meaning and context for a wider audience. (Loadenthal 2015, p. 13).

Loadenthal points out that the discursive content of communiqués, including its goals, methods, lexical choices and rhetoric, are influenced by both the communiqué as a communicative practice, and the network where it is distributed (he discussed the internet as the medium to distribute this type of messages). In this regards, as other communicative activity types, communiqués are constrained by institutional and conventional factors, including the audience to whom the communiqué is addressed. Loadenthal tries to show that communiqués play a crucial role as 'the voice' of organizations that opt for radical ways of protesting. Additionally, communiqués are one way in which organizations can communicate their official collective message without media interpretation (for a discussion on this issue and the role of the journalist in social protests see Lipsky, 1969).

Loadenthal argues in his dissertation that communiqués also serve as a space where a dialogue takes place between the addresser and the addressees of the communiqué (2015, pp. 453-7). In this sense, communiqués contain the pragmatic and interactive attempts of the organization performing the action to engage with a broader audience. In Loadenthal's words: "[t]he communiqué functions as a 'transactional and bidirectional' message, rhetorically engaging both the attacker and the public in a discourse." Having this in mind, it is possible to analytically reconstruct communiqués as multi-party discussions taking place in the text of the communiqué. Reconstructing communiqués in this way at a textual level can help to test the claim of this paper, i.e., that parties involved in social conflicts put forward argumentation in communiqués to win the favour of public opinion and to make their accitions acceptable. The pragma-dialectical extended model with the concept of strategic maneuvering (van Eemeren,

2010) provides the necessary theoretical and analytical tools for the analysis of communiqués issued in social conflicts.

3. THE PRAGMA-DIALECTICAL MODEL OF A CRITICAL DISCUSSION AS AN ANALYTICAL TOOL FOR ANALYZING COMMUNIQUÉS

The pragma-dialectical model of critical discussion serves to analyze and evaluate argumentative discourse in different types of speech events assuming that people argue to resolve a difference of opinion based on the merits of their argumentation (van Eemeren & Grootendorst 2004, p.19). This normative model distinguishes analytically four stages in the process of resolving a difference of opinion and considers the distribution of speech acts in each stage of the discussion.

In the 'confrontation stage', parties aim to make clear what is the main difference of opinion. If the standpoint of the protagonists only faces doubts, the difference of opinion is 'non-mixed'. A 'mixed difference of opinion', on the contrary, involves the protagonist's standpoint facing contradiction or criticism. In any case, when argumentation is put forward to defend a standpoint, it is because the protagonist faces the antagonist's doubts and criticisms or because the protagonist anticipates them (van Eemeren & Grootendorst, 2004, p. 60). In the 'opening stage', parties try to establish the common starting points to resolve their difference of opinion. These include knowledge of facts, similar values, commitments, and everything else they agree upon (van Eemeren & Grootendorst 2004, p. 60). During the 'argumentation stage,' arguers test the acceptability of the standpoint at issue. The role of the protagonist is to defend his or her standpoint by employing arguments and the role of the antagonist is to cast doubt or to express criticism on the protagonist's standpoint. In the 'concluding stage' (van Eemeren & Grootendorst, 2004, p. 61), the parties establish the result of their attempt to resolve the difference of opinion. If the protagonist was not able to successfully answer the criticisms of the antagonist, the protagonist has to retract his or her standpoint.

To give a more detailed account of argumentation in context the notion of strategic maneuvering can be used. Strategic maneuvering integrates rhetorical insights into the ideal model of a critical discussion, allowing the analyst to take into consideration the individual goals that arguers may have in a discussion. It takes into account how arguers exploit their contextual opportunities while trying to maintain a balance between being reasonable and being effective. In other words, arguers maneuver strategically between their dialectical obligations and their rhetorical goals within extrinsic contextual constraints (van Eemeren & Houtlosser, 2002a). According to this extended version of pragma-dialectics, every stage of the discussion will imply opportunities and constraints: each discussion stage has a dialectical objective and an analogue rhetorical goal. During the confrontation stage, which is the one this paper is interested in, for instance, the dialectical goal is to achieve clarity on what the difference of opinion is. The rhetorical analogue during this stage, each party will try to steer the confrontation in the most beneficial way to defend his or her standpoint. Likewise, each party will try to get the easiest position to defend or to attack (van Eemeren, 2010, p. 43).

The strategic maneuvering manifests itself in three inseparable aspects associated with each stage of the discussion: choices from the topical potential, adaptation to the audience demands, and a selection of presentational devices. The 'topical potential' (van Eemeren 2010, p. 96) concerns the choices available from the repertories of options for making an argumentative move in a specific situation. 'Audience demands' (van Eemeren 2010, p. 108) refer to the choices that arguers should make to adapt their argumentation to the antagonist's frame of reference. 'Presentational devices' (van Eemeren 2010, p. 118) account for the

choices available for the parties to present their argumentation. These include the communicational means (written, spoken or visual) and stylistic choices and frames that could make the standpoint and argumentation more easily to accept for the other party. In the case of a confrontational maneuvering, choosing from the topical potential entails the selection from the issues that constitute the 'disagreement space.' Adapting to the audience demands implies framing the issue in a way that is in line with the expectations and preferences of the audience. Exploiting presentational devices involves choosing the wording that gives the desired connotation to the standpoint (van Eemeren & Houtlosser 2001).

Taking these elements into consideration, the next section of this paper analyzes the confrontational maneuvering in a communiqué issued by a social movement organization in Mexico. This model provides the heuristic tools to analyze the way in which social movement organizations attempt to look reasonable and manage disagreement when performing actions that can be regarded as unreasonable.

4. CONFRONTATIONAL STRATEGIC MANEUVERING IN THE FIRST DECLARATION OF THE LACANDON JUNGLE

In 1992 the Mexican government was negotiating its participation in the North American Free Trade Agreement (NAFTA) with the US and Canada. This was the final step for Mexico in becoming part of 'the first world'. To comply with the prerequisites to enter NAFTA, by an initiative promoted by the president Carlos Salinas de Gortari, Mexico modified the Articles 4 and 27 of the Constitution. The immediate impact of this modification, especially of article 27, was that communal lands were made open to privatization, thus undermining the basic security of indigenous people regarding land entitlement. With this modification, some indigenous groups became overnight illegal-squatters of their land. Although this affected many farmers and peasants in the whole country, the consequences were most devastating in Chiapas, the poorest state in Mexico. This modification was the catalyzer for the Chiapas conflict, in which a guerrilla group rose up against the Executive Power. Besides the modification to Article 4 and 27, other factors that propitiated the uprising were the extreme levels of poverty and deprivation in the state, racism and the exploitation of indigenous people since colonial times. Another factor that propitiated the uprising was the desire of the government to portray Mexico as having a good climate for foreign investment (for a more detailed analysis of the conflict see Montemayor 1998, Shultz 1998, and Conant 2010).

NAFTA took effect in 1994. On New-year's eve of 1993-1994, a group of 3,000 rebels armed with rifles, old guns, and sticks descended from the mountains to take over the municipalities of San Cristobal de las Casas, Ocosingo, Altamirano, and Las Margaritas, retreating to the mountains the day after. In a communiqué with the title *First Declaration from the Lacandon Jungle* (EZLN 1994), which was first read in the occupied municipalities and later on circulated to the press and other media, spreading quickly around the globe, the group presented itself as the Zapatist Army of National Liberation (EZLN). The fragments used for the analysis of the confrontational strategic maneuvering are taken from that communiqué.

As was discussed in Section 2, since the process of producing or opposing social change is highly indirect, it is one of the goals of social movement organizations to influence the reference public of the target of their protests. In the case of the conflict in Chiapas, one of the goals of the EZLN was to influence the reference public of the Executive power in Mexico: Mexico's civil society, public opinion and the international commuity. As mentioned before, social movement organizations aim to manage disagreement and convince other parties of the acceptability of their actions. In pragma-dialectical terms, EZLN's communiqué

can be reconstructed as a multi-party discussion to analyze the confrontational strategic maneuvering to see how the EZLN presents its standpoint regarding its uprising and how it tries to manage possible disagreement with potential supporters. In order to do that, it is necessary to identify the standpoint of EZLN, the positions adopted by parties that are addressed, and to examine how it maneuvers strategically by exploiting the topical potential, adapts its standpoint to the audience demands, and how the protagonist uses different frames and choices as presentational devices.

The main standpoint in the First Declaration from Lacandon Jungle can be reconstructed as "The war that we declare against the Mexican federal army and the illegitimate executive power hold by Carlos Salinas de Gortari is fair, just and our last resort." The EZLN plays the role of the protagonist of this standpoint, while the Executive power can be regarded as the antagonist. However, the Zapatistas also address at least three more collective antagonists. In example 1 is possible to identify Mexico's civil society as one of the addresses of the communiqué: (1)"To the people of Mexico." Additionally, like example 2 and 3 show, the EZLN calls to the powers of the union (Legislative and Judicial) and the international community.

(2) According to this Declaration of War, we ask that other powers of the nation advocate to restore the legitimacy and the stability of the nation.

(3) We also ask that international organizations and the International Red Cross to watch over and regulate our battles, so that our efforts are carried out while still protecting our civilian population.

Although the Executive power is the direct target of the uprising, considering that social movements try to produce a social change by appealing to the reference public of the target of their protests, the primary audience of the communiqué can be identified as Mexico's civil society, the Legislative and Judicial powers, and the international community. This analysis is supported if we consider that between the Zapatistas and the Executive power, including the army, there are only few or no common starting points for resolving the conflict.

As it was explained in Section 2, the demands of the EZLN affect the interests of the Executive power, in this case, the modification of Article 27 of the Constitution among other demands regarding basic needs. In the case of the primary antagonists, their positions can be reconstructed as potentially disagreeing or casting doubts over the Zapatistas' actions and demands. In this sense, a simplified reconstruction of the difference of opinion between parties being called upon in the communiqué can be reconstructed as mixed and non-mixed with third parties, and mixed with the executive power. "Figure 1" illustrates this difference of opinion.

EZLN / p ———————→ Executive Power & Army/ -p

Civil Society/ -p,?
Powers of the Union/ -p,?
International community/ -p,?

Fig. 1. *Simplified structure of the difference of opinion in the First Declaration from Lacandon Jungle.*

Addressing a multiple non-homogenous audience poses several difficulties. One of them is how to be relevant for all the audiences. To sort this problem out, and to manage possible disagreement, the EZLN maneuvers by choosing from the topical potential the topic

of self-defence and justice. The Zapatist army asserts that the war they are declaring is an act of self-defense and their last resort, which may be deemed as more acceptable than just attacking an adversary. In general terms, to defend oneself in case of aggression, abuse or deprivation is more socially accepted than being the agressor. This choice can be seen in examples 4:

> (4) We, the men and women, full and free, are conscious that the war that we have declared is our last resort, but also a just one.

This implies that if the circumstances would have been different, the uprising could have been prevented. By choosing self-defnece from the topical potential the EZLN makes the Executive responsible for the conflict. This selection appeals to the audience's moral judgement and puts the Executive in a position of having to respond to the accusation of putting indigenous people in a situation in which their only remaining option was an uprising. Moreover, by presenting the declaration of war as just, by contraposition the Executive is framed as an unjust player in the conflict. This makes eaisier to third parties to decide between supporting an unjust Executive power or a group that had no other option but to opt for an uprising.

Another element to address in the analysis of the confrontational strategic maneuvering of the EZLN in the First Declaration is the anticipation of negative framing. As mentioned in Section 2, a common tactic used by corporations and state actors to counter protests is using loaded terms to police social movement organization. The EZLN anticipates this negative framing by disregarding any loaded term:

> (5) Beforehand, we refuse any effort to disgrace our just cause by accusing us of being drug traffickers, drug guerrillas, thieves, or other names that might be used by our enemies. Our struggle follows the constitution which is held high by its call for justice and equality.

By anticipating negative framing from its enemy, the EZLN prevents having to defend from potential accusations. Choosing from the topical potential that their struggle is just and that the EZLN are not criminals may appeal to the audience demands sense of good judgment and morality. This may help the EZLN to manage disagreement with Mexican civil society, other powers of the union and the international community: it is easier to take the word of a just person than the word of a criminal.

In summary. the confrontational strategic maneuvering of the EZLN in the communiqué issued after their uprising consisted in addressing the demands of a complex audience by choosing from the topical potential shared by presenting the declaration of war within a frame of being just and a last resort, appealing to the audience's sense of morality and righteousness, and presenting it in terms of self-defense. This may helped the EZLN to make their standpoint that the war against the Federal Army and the Executive power more acceptable for third parties.

Although the federal army heavily retaliated the uprising by employing aerial bombardments in the mountains where the rebels were hiding, torture, and summary executions, since the EZLN managed to get massive international and national attention, including protests in different cities of the world and Mexico City, president Salinas announced a ceasefire on January the 12th, 1994 (Schulz 1998). In this sense, the EZLN it can be said that achieved to activate the reference public of the Executive power managing disagreement with them. Moreover, with that it opened the space to new dialogue to negotiate their demands for a social change.

5. CONCLUSION

This paper analyzed a communiqué issued by the Zapatist Army of National Liberation in which a radical action in the form of an uprising was presented as just. Borrowing some concepts of social movement studies, the analysis of the confrontational strategic maneuvering of the First Declaration of Lacandon Jungle helped to illustrate the claim that parties involved in social conflicts put forward argumentation in communiqués to win the favor of public opinion and to make their actions acceptable to them. Even though social movement organizations recur to radical acts, which may be deemed as unreasonable or uncooperative, they use speech events to maneuver to make their actions acceptable to get the support of the reference public of the target of their actions. This type of acts helps to get public opinion's attention. However, getting public opinion's attention is not enough since producing or preventing a social change depends on the acceptance and the support of public opinion. Although the analysis of the confrontational strategic maneuvering in the EZLN's communiqué illustrates that parties involved in social conflicts put forward argumentation to win the support of third parties and manage disagreement, further research is necessary.

Dished: Food as argumentative strategy

JUSTIN ECKSTEIN

Department of Communication
Pacific Lutheran University
United States of America
Ecksteja@plu.edu

ABSTRACT: Food cultivation, creation, consumption, and disposal are all subject to debate. A critical figure in the debates about food is what Eckstein and Young (2014) call the public chef intellectual (PCI). PCIs translate their technical expertise into the public to shape the values, policy, and aesthetics that surround food's cultivation, creation, consumption, and disposal. Within the context of food, I argue that PCIs can design dishes that serve as argumentative strategies. In this essay, I will turn to the case study of Dan Barber and his development of the Honeynut Squash. As an argument strategy, I claim the squash dish draws the problem of industrialized agriculture into relief and create the conditions for deliberation.

KEYWORDS: multimodal argumentation, food studies, public chef intellectual, presentational strategy

1. INTRODUCTION

Although what to eat is a private decision, it portends significant individual, cultural, and environmental problems. For the individual, hunger diminishes the capacity for reason, increases the potential for violence, and can instigate revolutions that topple governments. Hunger's full potential can never be satisfied, even after being satiated; the potential to be hungry always lingers. For a significant portion of the world's population, starvation represents a daily threat. Beyond sustaining life, food is a cornerstone of culture. How, what, and when we eat create rituals that sustain culture over time. Life's major milestones are marked over a meal from holidays to birthdays, from first dates to marriages, from baby showers to funerals. Finally, food is a place where culture collides with nature. The environment is shaped in innumerable ways by what we eat, from clear cutting of forests to accommodate increased cattle production to the waste accumulating in the dumps.

Although food is a public problem, it is difficult for an individual to make a reasoned decision about what to eat. In the age of industrialized agriculture, citizens are confronted with a deluge of choices, but scant information to justify a decision. The *de jure* of salmonella, E. Coli, and/or norovirus and subsequent recalls draws into relief the opacity of a technical food supply chain. Yet, despite a lack of information, the public must make food choices many times a day. Advertisers, scientists, chefs, cultural figures, and many others offer reasons to eat one thing over another. Thus, food constitutes a unique context of public argumentation with different experts, rules for evidence, and strategies for advocacy. In our networked public, we argue across mediated contexts and disparate filter bubbles.

The context of public arguments about food that is a domain of what Justin Eckstein and Anna Margery Young (2014) call the Public Chef Intellectual (PCI). PCIs appear on television, present talks, pen books, and give interviews. In contrast to the celebrity chefs who enter the public to sell products but are not accepted as experts amongst other PCIs, PCIs are recognized as experts among peers. PCIs use their expertise to guide what is "good" to eat. The definition of the good can involve health, culture, environment, some combination of these, or something new entirely. Justin Eckstein and Anna Marjorie Young (2015) explain that PCIs "challenges our supposedly apolitical culture of objectivity and troubles, in an important way, the 'common

sense' notion of food and cooking as social constructs separated from politics" (p.250). Argument strategies that answer what is "good to eat" often come from taste. But, taste is not a neutral site to base a theory; but a rhetorically defined interface. PCI's wield great power in defining what *tastes good*. As such they are in a unique position to alter the conditions of argument to encourage the audience to adopt a standpoint. That is to say, that the category of taste can be rhetorically constructed to privilege some foods over others. I will use the example of Dan Barber's honeynut squash to provide an example of how food supplies an argumentative strategy. Studying how PCIs' use of taste joins the about multimodal conversation on how the senses reason (e.g, Tseronis and Forceville 2017).

2. TASTE

Multimodal argumentation starts from the assumption that people use words, sights, sounds, tastes, smells, and other senses to base inferences, invent strategies, and regulate disagreement (Groarke 2015). The "senses" are a porous interface between the external world and the internal mind. We *make sense* of the world based on cultural resources that provide a way to endow experience with significance. David Howes (2003) explains, "sensation is not just a matter of physiological response and personal experience. It is the most fundamental domain of cultural expression, the medium through which all the values and practices of a society are enacted" (xi). Howes (2003) argument is that the senses are a domain of cultural expression because the capacity to identify, discern, and explain sensation is based in rhetorically defined grids of intelligibility. Instead of thinking of sensation as a discrete set of categories (like seeing, hearing, touching, smelling, and tasting), knots provide a metaphor to think how sensations imbricate and entwine—how the look and smell of a dish might pique the appetite and anticipate taste. There is no natural organization of the senses, only contingent configurations of knots. Sensual knots supply distinct ways of *knowing* something that an arguer can exploit to strategically design a position.

Multimodal strategies utilize affordance embed in each sensual knot to create or diminish the conditions for argumentation. Take for instance different strategies to advance an argument that climate change is happening rapidly. A scientist might pen a letter citing statistics, or she might show images of an icecap melting over time, or she might sonify her data to compose a song. Each strategy makes the same argument that climate change is rapidly occurring but each alter the conditions for argumentation by changing the sensual conditions of reception that can enhance or undermine the conditions for future deliberation. The letter encourages a distanced, linear reasoning; images provide a visceral example of climate change's destruction; and the compositions use pace underscores climate change's urgency. The letter, image, and composition offer distinct potential strategies that alter how the audiences *knows* climate change and thus affect the conditions of the argument. The letter conjures effects in the imagination of the reader, the photograph registers effects in changes of size, and the composition affects the experience in relations in time. Each argumentative context has its own sensual economy that accords epistemological value to different ways of knowing: a scientist might be more interested in an eye, a mechanic might be more interested an ear, and a chef might be more interested a tongue.

While argumentation has explored many of the senses and their influence on reason, little attention has been paid to the role of taste. I follow Donovan Conley (2015) in defining taste as "a combination of both aesthetic judgment and corporeal longing, where our sense of what is right intermingles with our sense of what is pleasant" (p.223). Taste is important in the context of food because what people want to eat what tastes good. But both "taste" and "good" are culturally relative. Like other senses, taste is a contingent sensory economy: how

things look, feel, smell, all influence how something tastes. If cultural categories equip us with the grids of intelligibility to *make sense* of experience, then the PCI acts as a cultural agent disseminating these categories for the public. The PCI can favorably change the sensual conditions that underwrite how people debate what they should eat. For instance, if eating insects is considered in gross (bad taste), then we may never eat them. But, if a PCI can make eating insects is fashionable (in good taste), then they might be a highly sought-after item. Of course, some might not adopt that particular sensory configuration of taste, but this is not different than any other rhetorical strategy.

In the next section, I turn to Dan Barber and his project of encouraging people to eat more sustainably. To this end, engages in rhetorical strategies that first illustrate what we eat is cultural and not natural. Such a perspective creates the conditions for deliberation about how food should be designed to achieve the most sustainable outcome.

3. THE CASE OF DAN BARBER'S SQUASH

For this essay, I use Dan Barber to illustrate how PCIs can use taste as a rhetorical resource create the conditions for deliberation and supply resources for future deliberations about food. Barber is owner and chef of Blue Hill in New York's Greenwich neighborhood and Blue Hill at Stone Barns in Upstate New York. Barber's awards, accolades, and praise make him a paradigm example of a PCI. For Barber, the definition of what is good to eat involves sustainable agricultural production. He critiques the "farm to table" movement because it privileges only the most beautiful parts of the farm and wastes the rest. For him, waste is a broad term that spans everything from the inefficient use of land to the arbitrariness of aesthetic standards that exclude edible matter from the category of food. Despite the over production of food, millions suffer undernourishment and food insecurity every day. The strange paradox of waste and want is a byproduct of industrialized agriculture's logic of short term profit over long term sustainability. Food is grown for shelf life and distribution not sustainability or nutrition. Barber posits that a more sustainable food *tastes* better. Sure, *tasting good* resists reconstruction, but it offers a palatable reason to do something. Barber utilizes a number of strategies to advance his definition of taste including writing books, giving talks, and opening restaurants.

Of note for this essay, Barber uses seeds to sow doubt in the soil of our industrialized agriculture system and sprout deliberation. Barber works with a variety of seed breeders to produce crops that are both more flavourful and more sustainable, such as his own breeds of potato, kohlrabi, and wheat. A notable collaboration involved, Michael Mazourek, an assistant professor in Plant Breeding Genetics at Cornell University. Over the time span of a decade at Stone Barns farm in Terrytown, New York, Mazourek tinkered with seeds while Barber would cook and taste them. Between Barber's palate and Mazourek's genetic know-how created a squash that just *tastes* better. This decade-long collaboration created a stubby, thin skinned squash they called the "honeynu." The honeynut traded commercially valuable traits like a thick skin (for transportation), fewer nutrients (so it's slower to spoil), and a specific look (customer expectations) for a more flavorful, nutrient-dense, and sustainable squash. The parts that make the squash tasty prevents it from being commercially grown and internationally distributed.

As a strategy, that the honeynut is not an argument-in-itself, but creates the conditions for argument and provides a resource that can be assembled into argument (as a premise, a context, evidence, a warrant, etc) that aid future deliberations. First, the honeynut alters the conditions of argumentation by interrupting the enthymeme that crops are natural and draws into relief the invisible assumptions mediating our understanding of the "natural" environment. The honeynut illustrates that agriculture *is intentionally designed* and not naturally occurring.

Now how food is produced, circulated, distributed, and eaten can be subject to debate. Second, the honeynut acts as an argument fragment, which "serve as inventional resources for public deliberation and which shift the responsibility for argument construction to audiences" (Delicath and Deluca, p.317). The squash provided a handy example to illustrate the idea that sustainably grown food tastes better: what is in good taste, tastes good. The honeynut squash traversed network media environments, supplying argumentative resources along the way. Three examples illustrate this claim: first, the new squash garnered press coverage that circulated across diverse networks; second, the squash became a lure for food tourism that attracted people to his restaurants; and third and finally, the squash provided a material way for people to enact Barber's standpoint.

First, the honeynut squash circulated in print periodicals. From the moment, the honeynut was refined, it became the darling of the food world, the subject of magazine articles, interviews, and documentaries. Word migrated from food-focused periodicals such as *Eater* and *Bon Appetit* to more mainstream venues like *The Atlantic* and *The New York Times*. In these various different contexts, Barber's intention with the squash and his promise of taste appear together. For instance, a recent profile in *Eater* (2016) notes that

> Understanding what makes Dan Barber's food so tasty, then, requires going beyond what is happening in the kitchen, or even in the farm at the Stone Barns Center. It requires going to these breeders, several of whom have spent years collaborating with Barber on preserving and updating extraordinary varieties of produce.

Eater gives the example of "a simple dish of roasted squash goes a long way, especially when it's a honeynut squash." The article then goes into depth about how it tasted sweeter, creamier, and more robust than other squash bred solely for shelf-stability. Here, as in other similarly written articles, Barber pairs the promise of more delicious food with discussions on how food is commercially produced. What was thought of as "natural" squash, becomes cultural. Once we acknowledge that a squash is designed, then we can debate the best way to do it. And Barber has an answer for this to grow it for better taste. At the same time, Barber positions the current environmental practices as not tasting well.

Second, the honynut squash offers a lure to anchor food tourism. The promise of a different tasting squash prompted a trip to dine at Blue Hill at Stone Barns. The trip from Tacoma, Washington to Blue Hill at Stone Barns involved a plane, a train, a bus, and a cab. At first it may appear odd traveling great distances to eat. Why would we travel so far to eat *this squash* and not pick something closer to us? Tastes acts as a lure to draw people to experience taste's promise. The cross-country sojourn inverts the food's typical path and draws into relief the invisibility of our food's origin. Much food available for purchase at our local grocery store comes from much farther away than New York. While the origin of food is ordinarily opaque, we are forced to journey to its source. Depending on the time of the year, a butternut squash could travel thousands of miles to reach my home.

Before serving us the first honeynut squash dish at Stone Barns, the server brings out a butternut squash with a honeynut. The honeynuts short stature looks alien compared to the much bigger butternut. Then, the server brings out honey, cut in half and roasted. Like the press coverage, the server tells us the story of breeding of the squash and how it was selected for flavor. Later, the server brings out a "860" and a "818" squash and asked us to compare and contrast the taste. Again, the point is that the taste of "natural" food is actually culturally designed. Food tourism is certainly expensive and does not make it to the common parlance directly. But, the honeynut experience is disseminated on television programing, like *Top Chef's* or in Netflix's immensely popular docuseries, *Chef's Table*. Blue Hill also attracts social media influencers with the capital to visit and the ability share their experience with thousands.

Finally, honeynut squash seeds creates an easy opportunity for people to enact Barber's message because the seeds can be bought online. The squash acts as an incentive for people to

grow food and allows them to express novely to friend. In the materials that accompany the seed, the squash's taste and difference is foregrounded. For example, for a couple dollars, anyone can go to High Mowing Organic Seed Company (or any of a number of other outlets) and purchase seeds and grow it yourself, if you have the time, the right climate, and a yard. High Mowing (ND) describes the honeynut like this:

> Simply cut in half and bake! Delectable squash is smaller than Ponca with more uniform butternut shape. Green unripe fruits; early planting is recommended for tan color. Field resistance to powdery mildew. Developed by the Vegetable Breeding Institute at Cornell University.

Like the restaurant and media coverage, the taste and the difference are explicitly paired to create the conditions for debate about industrialized agriculture. Important here is the first half of the description: "simply cut in half and bake." Good food is not in the hands of the chef, but the farmer. The seeds provide a way for to literally buy into Barber's image of the good.

Taste is wed to the practice of eating, because we only want to eat "good" food. For Barber, the honey nut is an example of an argument strategy to advance the claim sustainable food tastes better. In each mediated context, he explicitly problematizes the nature/culture binary and provides the conditions for a reflection on the food system. For food journalists, the squash and its noble mission is in good taste, providing thought leaders an opportunity to talk about the food system and maybe even enticing readers and viewers to question their assumptions about the food. For restaurant diners, the delicious squash gives an experience to evidence a claim about food tasting better, or even looking difference. And for the consumer growing the delicious squash, the taste encouraged them to produce their own food. More than that, the honey offers a resource for the invention of arguments. In the media coverage, it provides an occasion for Barber to advance his claim that sustainable food just tastes better, in the restaurant it supplies an example to illustrate this claim, and at home it provides a way for people to talk about sustainable agriculture with friends and family.

4. CONCLUSION

PCIs are a significant group of political agents in contemporary culture. Food is inherently political: how it is grown, raised, and produced; how it is distributed and sold; how it is packaged and priced; how it is prepared; how it is served; how it marks events and demarcates community—these are all public problems. We need to attend to the PCI as a relevant figure argumentation. As such, we must acknowledge food as its own, unique argumentative context. Here, PCI's use multimodal strategies specific to food to intervene in a broader public conversation by shaping taste and altering the sensual conditions for deliberation. This essay identified one of them, the honey nut squash. Barber is hardly the only PCI to realize the rhetorical potential of food. Argumentation should analyze the ways that food offers a site of production and invention. Farmers' markets, restaurants, grocery stores, and even mail order meals all can be used to advance arguments about the proper way to eat and thus deserve further scrutiny.

Argument schemes: Extending the pragma-dialectical approach

FRANS H. VAN EEMEREN & BART GARSSEN

ILIAS and University of Amsterdam
Speech Communication, Argumentation Theory and Rhetoric

ABSTRACT: In the pragma-dialectical approach to argument schemes, each argument scheme represents a particular justificatory relationship that is supposed to legitimize a transfer of acceptability between a reason (or coordinative set of reasons) advanced in defence of a standpoint and the standpoint that is defended. The various argument schemes that can be used in an argumentative exchange and the way in which their use is to be evaluated are in principle considered to be part of the joint starting points that are by intersubjective agreement established at the opening stage of a critical discussion aimed at resolving a difference of opinion on the merits. This contribution recapitulates and extends the rationale and general outlines of the pragma-dialectical approach. It is the first instalment of more encompassing series of studies that is to result in a monograph offering a complete overview of the treatment and categorization of argument schemes.

1. THE NOTION OF ARGUMENT SCHEME

In the last two decades various theoretically-oriented publications have appeared about argument schemes.[1] Not much exposure however has been given lately to the pragma-dialectical perspective on argument schemes and the way in which it has developed since the late 1970s.[2] Recently the two of us have started a project aimed at explaining the pragma-dialectical theory of argument schemes and extending it with new insights. This paper is intended to be the first instalment of a more encompassing series of studies that is to result in a monograph in which a complete overview will be given of the current state of affairs in the pragma-dialectical treatment of argument schemes and their categorization in a theoretically motivated and empirically justified typology.

In the pragma-dialectical perspective, argumentation is aimed at resolving a difference of opinion about an evaluative, prescriptive or descriptive standpoint. Based on the starting points accepted as their point of departure by the parties in the difference, the standpoint at issue is in argumentation defended by advancing one or more reasons in its support. The reasons that are advanced in argumentation are intended to offer an informal justification of the acceptability of the standpoint at issue, not a definitive proof of its truth.[3] When a standpoint can be proven

2 The idea of argument schemes and critical questions in a dialectical testing procedure was introduced in van Eemeren, Grootendorst and Kruiger (1978). Van Eemeren and Kruiger (1987) give an account of the identification of argument schemes. In van Eemeren and Grootendorst (1992) the pragma-dialectical typology of argument schemes is elaborated, while van Eemeren and Grootendorst (2004) give a detailed account of the pragma-dialectical testing procedure. Garssen (1997) presents an exploration of possible subtypes and variants based on a comparison of the pragma-dialectical typology and other prominent typologies of argument types. Van Eemeren and Garssen (2014) explain the pragma-dialectical view of analogy argumentation and its role in prototypical argumentative patterns in political argumentation. Van Eemeren (2018:) provides an update of the pragma-dialectical treatment of argument schemes.

[3] Instead of an informal justification, an informal refutation can also be offered. For the sake of brevity, we will refrain from adding this all the time.

true by an immediate empirical check or a demonstration that it follows logically from true premises, doing so will suffice and there is no need for argumentation – or at most this proof could be presented as an irrefutable argumentation.

When the truth of a standpoint can be shown beyond any doubt by presenting a *modus ponens*-like formal derivation of the standpoint, the only step that needs to be taken in evaluating the argumentation thus advanced is checking the logical validity of the reasoning involved. However, in ordinary argumentation the reasoning is as a rule not explicitly presented in this way, so that carrying out such a check will usually not be possible – or can only be accomplished in an extremely artificial way. In ordinary argumentation the acceptability of a standpoint is in principle defended by linking the propositional content of the argumentation by means of a particular justificatory principle to the standpoint at issue. This means that the acceptability of the standpoint at issue depends on the suitability and correctness of the use of the *argument scheme* brought to bear in applying this justificatory principle.

There are various types of argumentation that can be used in defending the acceptability of a standpoint, each of which is characterized by having a particular argument scheme. Each argument scheme represents a particular justificatory relationship between a reason (or cluster of interdependent reasons) and a standpoint that is supposed to legitimize the transfer of acceptability from the reason (or cluster of interdependent reasons) advanced to the standpoint that is defended. The various argument schemes that can be used and the way in which their use is to be evaluated are in the pragma-dialectical view part of the joint starting points that are in principle by intersubjective agreement established at the opening stage of a critical discussion aimed at resolving a difference of opinion on the merits.

When the argumentation advanced in defence of a standpoint consists of a plurality of reasons that are in some combination or other advanced in support of a standpoint, it has a complex argumentation structure. Since each individual justification of a standpoint has its own argument scheme, whether it consists of a single or a coordinative argumentation (as in the case of the use of interdependent reasons), such complex argumentation may involve the use of more than one argument scheme. This means that, in principle, the argument schemes that are used in complex argumentation do not automatically pertain to the argumentation as a whole, but to its various justificatory constituents. Although in 1978, when we started to make use of this concept (van Eemeren et al. 1978), we had initially opted for using the term *argumentation scheme*, we therefore later decided for the sake of clarity to give preference to the term *argument scheme* (e.g. van Eemeren & Grootendorst 2004).

2. INTERSUBJECTIVE PROCEDURES FOR EVALUATING ARGUMENTATION

According to the "Munchhausen trilemma" sketched by critical rationalist Hans Albert, there are three ways in which providing a justification of a standpoint will finally always come to a dead end. Two of them, circularity and an infinite regress, are indeed fatal. However, the third option that Albert distinguishes, breaking off the justification at an arbitrary point, is in our view not inescapable. If the justification process is ended when a starting point has been reached that is recognized by both parties, the justification is not concluded in an arbitrary way, but has a pragmatic basis in well-considered intersubjective agreement. This reliance on existing agreement, which may have been established explicitly or correctly presumed, is in fact quintessential to any serious conduct of argumentation. It is the very reason why in pragma-dialectical approach to argumentative discourse the "opening stage", where the procedural and material starting points of the resolution process are determined, is considered vital to resolving a difference of opinion on the merits.

The pragma-dialectical rules for resolving a difference of opinion on the merits include a set of procedures for evaluating argumentation that are supposed to be intersubjectively agreed upon in the opening stage of a critical discussion (van Eemeren & Grootendorst 2004: 135-157). The *identification procedure* involves determining whether a proposition called into question in resolving the difference of opinion is identical to any of the propositions which may be regarded jointly accepted starting points. If a proposition may be regarded to be part of the point of departure that has been accepted at the opening stage of the discussion, it may not be called into question in the argumentative exchange of the ongoing discussion. In order to allow for new information to be used in the argumentative exchange that is not already included in the starting points, the parties may in the opening stage agree to leave room for sub-discussions in which it is determined whether a proposition that was initially not agreed upon can be accepted as a starting point in the second instance.

Next there is the *inference procedure*, which is aimed at determining whether in cases in which the reasoning is fully externalized the reasoning "proposition involved in the argumentation, therefore proposition involved in the standpoint" presented by the protagonist is logically valid as it stands.

If the reasoning is *not* completely externalized, so that the argumentation cannot be logically valid as it stands, as is in argumentative practice generally the case, the question is whether the argument schemes that are brought to bear in the argumentation are admissible to both parties and have been used correctly in the case concerned. If it first needs to be determined which argument scheme has been employed before this can be decided, then the *explicitization procedure* needs to be followed, which is for this purpose added to the available pragma-dialectical tools.

To check whether a particular argument scheme has been used correctly, the *testing procedure* must be carried out. This procedure consists of asking the critical questions appropriate for checking the correctness of the use of a particular argument scheme. Each argument scheme gives cause to different critical questions, which open up different kinds of dialectical routes. For a conclusive defence of the standpoint, *both* the propositional content of the argumentation that is advanced *and* its justifying force must have been defended successfully in accordance with the relevant evaluation procedures. For a conclusive attack on the standpoint, *either* the propositional content of the argumentation *or* its justifying force must have been attacked successfully in accordance with the relevant evaluation procedures.

In the present context it is worth repeating that the intersubjective agreements that are part of the joint starting points established in the opening stage of a critical discussion aimed at resolving a difference of opinion on the merits are supposed to include the various argument schemes that can be used and the way in which their use is to be evaluated.

3. THE PRAGMA-DIALECTICAL TYPOLOGY OF ARGUMENT SCHEMES

In order to be able to carry out the pragma-dialectical testing procedure, a problem-valid inventory of argument schemes is required. This means that the inventory cannot be just a taxonomy but must be a theoretically-motivated typology that involves a categorisation relating to the properties of argumentation that are relevant to its evaluation. It stands to reason that in the pragma-dialectical theory of argumentation the rationale for distinguishing between the various categories of argument schemes in a general classification has a pragmatic as well as a dialectical dimension.[4]

---

[4] See Garssen (2001) for an overview of other kind of classifications of argument schemes.

The pragmatic dimension relates to the kind of justificatory principle that legitimizes in an argument scheme the transfer of acceptance from the reason advanced to the standpoint that is defended. This is in the pragma-dialectical view not a formal principle, as it is in establishing logical validity, but a pragmatic one, based on human experience, i.e. grounded in the practical justificatory experiences of arguers in ordinary argumentative discourse.[5] The dialectical dimension relates to the dialogical evaluation procedure associated with the argument scheme that is used, i.e. to the critical questions that are to be answered satisfactorily in order to legitimize the use of the argument scheme concerned. When taken together, these two dimensions constitute the *principium divisionis* underlying the typology of argument schemes that is in pragma-dialectics presumed to be part of the intersubjectively accepted starting points for a critical discussion.

The three main categories of argument schemes distinguished in pragma-dialectics are "symptomatic" argumentation (also known as "sign" argumentation), "comparison" argumentation (also known as "resemblance" argumentation) and "causal" argumentation (also known as "consequence" argumentation) (van Eemeren et al. 1983: 137-141; van Eemeren & Grootendorst 1992: 94-102). Symptomatic argumentation, to start with, is a type of argumentation in which an argument scheme is used that is based on the pragmatic principle of something being symptomatic of something else, i.e. the one being a token or a sign of the other. Symptomatic argumentation involves a relation of concomitance between the reason advanced and the standpoint defended (e.g. "Pinchao is a Chinese [and it is goes with Chinese people that they are diligent], so he is bound to be diligent").

Comparison argumentation is a type of argumentation in which an argument scheme is used that is based on the pragmatic principle of something being comparable to something else, i.e. the one resembling or being similar to the other. Comparison argumentation involves a relation of comparability between the reason advanced and the standpoint defended (e.g. "Camera surveillance in the Amsterdam metro will be effective because it is also effective in the London underground [and the situation in Amsterdam is comparable to the situation in London]").

Causal argumentation is a type of argumentation in which an argument scheme is used that is based on the pragmatic principle of something being causal to or consequential of something else, i.e. the one being instrumental to or leading to the other. Causal argumentation involves a relation of instrumentality or consequentiality between the reason advanced and the standpoint defended (e.g. "Because Alfonso has exercised very long [and exercising very long leads to tiredness], he must be tired").

Because each of the argument schemes calls out its own set of critical questions, the three categories of argument schemes thus distinguished are associated with specific dialectical routes in resolving a difference of opinion on the merits. The differences between the dialectical routes instigated by the use of symptomatic argumentation, comparison argumentation and causal argumentation are in the first place determined by the basic critical question connected with the category of argument schemes concerned, which relates to the (usually unexpressed) bridging premise.

The basic critical question associated with symptomatic argumentation is whether what is claimed in the standpoint (Y) is indeed a sign of what is stated in de reason advanced (X) (or whether what is stated in the reason (X) is indeed a token of what is claimed in the standpoint (Y)). In argumentation of this type, protagonist P defends standpoint Y (e.g. Chinese Pinchao is diligent [PD]) against antagonist A's doubt Y? (e.g. [PD?]) by advancing symptomatic

---

[5] This is probably the same grounding in "native analytic categories" as Doury (2018) speaks of. This pragmatic basis, which is similar to that of the "ortho-language" of the logical propaedeutic of Kamlah and Lorenzen (1984), manifests itself in the various expressions by which the argument schemes are indicated in ordinary language (van Eemeren & Kruiger 1987).

argumentation X (e.g. Chinese people are diligent [CD]) and A responds critically by asking the basic critical question connected with symptomatic argumentation (e.g. whether being diligent is indeed characteristic of Chinese people [C//D?]), which will lead to an answer by P (e.g. [D//C: OK]) and may be followed by further discussion.

A simplified dialectical profile of symptomatic argumentation that only includes the just indicated dialectical route instigated by the basic critical question looks as follows:

1. P: Standpoint: Y [PD]
   |
2. A: Y? [PD?]
   |
3. P: Symptomatic argumentation: X [DC]
   |
4. A: Basic critical question: Is Y symptomatic of X (Y//X)? [D//C?]
   |
5. P: Answer to basic critical question: Y//X: OK [D//C: OK] (which may be followed by further discussion)

The basic critical question associated with the use of comparison argumentation is whether what is claimed in the standpoint (Y) is indeed comparable to what is stated in the reason advanced (X) (or whether what is stated in the reason (X) is indeed similar to what is claimed in the standpoint (Y)). In argumentation of this type protagonist P defends standpoint Y (e.g. Late-comer Vahid should not be allowed to participate [~VP<VL]) against antagonist A's doubt Y? (e.g. [(~VP<VL)?]) by advancing comparison argumentation X (e.g. Other people who did not meet the deadline in the past were not allowed to take part [~OP<OL]), to which A responds by asking the basic critical question connected with comparison argumentation Y=X? (e.g. whether your being late is indeed comparable to other people not meeting the deadline in the past [VL=OL?], which leads to an answer: Y=X: OK (e.g. [VL=OL: OK]) and may be followed by further discussion.

A simplified dialectical profile of comparison argumentation including only this dialectical route instigated by the basic critical question is as follows:

1. P: Standpoint: Y [~VP<VL]
   |
2. A: Y? [(~VP<VL)?]
   |
3. P: Comparison argumentation: X [~OP<OL]
   |
4. A: Basic critical question: is Y comparable with X: (Y=X)? [VL=OL?]
   |
5. P: Answer to basic critical question: Y=X: OK [VL=OL: OK] (which may be followed by further discussion)

The basic critical question associated with causal argumentation is whether what is stated in the reason that is advanced (X) leads to what is claimed in the standpoint (Y) (or whether what is claimed in the standpoint (Y) indeed results from what is stated in the reason that is advanced (X)). In argumentation of this type protagonist P defends standpoint Y (e.g. Alfonso must be tired [AT]) against antagonist A's doubt Y? (e.g. [AT?]) by advancing causal argumentation X (e.g. Alfonso has exercised very long [AE]), to which A responds by asking the basic critical question of causal argumentation (e.g. whether exercising very long does indeed always lead to

great tiredness [(T<E)?] or, more precisely, [((x)xT<(x)xE)?], which leads to an answer (e.g. [T<E: OK] or [(x)xT<(x)xE: OK]) and may be followed by further discussion. A simplified dialectical profile of causal argumentation including only this dialectical route instigated by the basic critical question is as follows:

1. P: Standpoint: Y [AT]
   |
2. A: Y? [AT?]
   |
3. P: Causal argumentation: X [AE]
   |
4. A: Basic critical question: Does X lead to Y? (Y<X?) [T<E? or ((x)xT<(x)xE)?]
   |
5. P: Answer to basic critical question: Y<X: OK [T<E: OK or (x)xT<(x)xE: OK]
   (which may be followed by further discussion)

4. CRITICAL QUESTIONS: PRAGMATIC ARGUMENTATION AS A CASE IN POINT

Next to the basic critical question connected with the category of argument schemes that is brought to bear in the argumentation, in the testing procedure carried out in evaluating the argumentation there are always still other questions that the antagonist may be supposed to ask. Which other critical questions are relevant depends in the first place on the type of argumentation involved. Let us, in explaining what kind of further critical questions can be relevant in evaluating argumentation, by way of example concentrate on "pragmatic" argumentation, a prominent subtype of causal argumentation.

The idea underlying pragmatic argumentation is that we must do something because it leads to something we want to happen. Put more precisely, in pragmatic argumentation the prescriptive standpoint that a certain action should be carried out is defended by pointing out that carrying out this action leads to a certain desirable result – or, in the *negative* version of pragmatic argumentation, that a certain action should *not* be carried out by pointing out that carrying out this action leads to a certain *undesirable* result. The positive version of the argument scheme brought to bear in pragmatic argumentation can be specified as follows:

1.   Action X should be carried out
1.1   Action X leads to desirable result Y
(1.1') (If action X leads to a desirable result such as Y, X must be carried out)

All critical questions asked in carrying out the testing procedure in order to evaluate the use of argument schemes pertain to the argumentation as it has been externalized by means of the intersubjective explicitization procedure. The basic critical question asked in this procedure always concerns the relationship established by the use of the category of argument schemes concerned between the reason that is advanced and the standpoint that is defended. When, as in the case of pragmatic argumentation, a causal argument scheme is used, the basic critical question therefore is: (a) Does action X indeed lead to result Y? As the bridging premise externalized in the explicitization of the argumentation makes clear, when the subtype of

pragmatic argumentation is used the next relevant question relating to this basic critical question will be: (b) Must actions that lead to a desirable result Y always be carried out?[6]

Other relevant critical questions included in the testing procedure pertain to the non-bridging premise of the argumentation as it has been externalized in the explicitization procedure (or to the non-bridging *premises* in cases where the argumentation is coordinative). Some of these critical questions concern the acceptability of such a premise or vital presuppositions involved in this premise. In the case of pragmatic argumentation the critical question about the acceptability of the explicit non-bridging premise (Does action X indeed lead to result Y?) has in fact already been asked because it happens to be identical with the basic critical question for causal argumentation in general. However, in the case of pragmatic argumentation another relevant critical question relating to the non-bridging premise concerns a crucial presupposition involved in this premise: (c) Is result Y indeed desirable?

There are also some further critical questions that are relevant to testing the acceptability of the use of pragmatic argumentation which are in a more indirect way connected with the critical questions just distinguished. They relate to the specific point of pragmatic argumentation that carrying out an action is justified by its desirability and refer to other possibilities or options that need to be taken into account when deciding about the adequacy of the argumentation. One of these critical questions pertains to the explicit premise "Action X leads to desirable result Y" (1.1): (d) Would another result not be even more desirable than Y? Two other relevant critical questions pertain in different ways to the unexpressed bridging premise "If action X leads to a desirable result such as Y, X must be carried out" (1.1'): (e) Does action X not have unavoidable undesirable side-effects?; (f) Could result Y not be achieved more easily or more economically by other actions?

If in the argumentative discourse any of the critical questions (a)-(f) is anticipated or answered, the argumentation involved becomes automatically complex. Then the difference of opinion at issue can no longer be said to have been resolved by argumentation that is pragmatic in the sense that it is conclusive by putting the difference in one go to an end. If, for instance, in view of critical question (c) relating to pragmatic argumentation, the desirability of the result that will be reached needs to be motivated since this desirability is not beyond doubt, the argumentation that has been advanced loses its pragmatic force of instantaneous effectiveness. In such a case the argumentation remains, of course, causal but turns from straightforward pragmatic argumentation into "complex pragmatic (problem-solving) argumentation", in which the initial pragmatic argumentation is embedded in more complex argumentation. As always in argumentative discourse, it then depends on the argument schemes that are brought to bear in the argumentation advanced in answering the critical questions associated with pragmatic argumentation which further critical questions need to be answered in the continuation of the discourse.

5. SUBTYPES AND CONTEXT-DEPENDENT VARIANTS OF ARGUMENTATION

As we have indicated, pragmatic argumentation is a subtype of the general category of causal argumentation in which the basic critical question applying to causal argumentation is complemented by an additional critical question that focuses on the presupposition crucial to

---

[6] Unlike in other subtypes of causal argumentation, the bridging premise relates in the case of pragmatic argumentation, due to the complex nature of this subtype, only indirectly to the basic critical question of causal argumentation: the causal relation at issue in the basic critical question is in pragmatic argumentation presumed. In evaluating the use of pragmatic argumentation, just as in evaluating the use of other subtypes of causal argumentation, the basic critical question is to be answered first before it makes sense to turn to the critical questions specifically relating to this particular subtype.

the justificatory point of this subtype that the desirability of the result of the action justifies carrying it out. The basic critical question of causal argumentation ("Does action X indeed lead to result Y?") is in the case of pragmatic argumentation supplemented by the additional critical question "Must actions that lead to a desirable result Y always be carried out?". Such subtypes cannot only be distinguished within the category of causal argumentation but also within the categories of comparison argumentation and symptomatic argumentation (van Eemeren & Grootendorst 1992: 97). Like in the case of the main categories, the rationale for distinguishing between the various subtypes is both pragmatic and dialectical. This means that each subtype should be characterized by relying on a specific justificatory principle based in human experience and leading to a different, i.e. uniquely specified, set of critical questions in the intersubjective testing procedure. By avoiding any differentiations in which these two preconditions have not been fulfilled our typology lives up to the old adage that "a difference that makes no difference is no difference".

Among the other subtypes of causal argumentation are – to name just a few – argumentation from cause to effect, argumentation from effect to cause and argumentation from means to goal. The subtypes that belong to the general category of comparison argumentation include, for instance, normative analogy (argumentation based on a model, argumentation based on the rule of justice) and descriptive analogy. Symptomatic argumentation manifests itself, among others, in subtypes such as genus-species argumentation, classification, whole-part argumentation, argumentation based on criteria and argumentation by/from authority. Just as in the case of pragmatic argumentation, the basic critical question going with the general category of argument scheme concerned must in all these cases be complemented with an additional critical question in which the specific justificatory point of the argumentation advanced in the subtype is put to the test.[7] By specifying the critical questions associated with the subtypes concerned, the dialectical routes instigated by the use of particular subtypes of argumentation can be succinctly described in dialectical profiles.

When evaluating argumentation, it does not only depend on the specific subtype of the argumentation at issue exactly which critical questions are pertinent in carrying out the testing procedure, but also on the institutional preconditions of the macro-context in which the argumentation takes place. The specific conventions of the various communicative activity types that have been established in a certain domain determine to some extent which critical questions are pertinent in a particular case and what shape they should take. This means that in dealing in the testing procedure with the argumentative moves that are made in justifying a standpoint by means of argumentation the general soundness criteria pertaining to the (sub)type of argumentation concerned that are expressed in the critical questions need to be specified or otherwise amended or complemented in accordance with the requirements of the macro-context concerned. This is in fact what should also always happen in applying the general standards involved in the rules of the code of conduct for reasonable argumentative discourse in evaluating any of the other argumentative moves that are made in argumentative discourse. In all cases it is to be considered in the philosophical component of the research program to which extent the reasonableness of the argumentative discourse is affected by the deviations from the

---

[7] Although the pragmatic principles on which the argument schemes are based remain in all cases the same, for some subtypes the basic critical questions need to be reformulated in a slightly different way. A case in point is the subtype of symptomatic argumentation based on evaluative criteria, in which a value judgment is defended by pointing at certain characteristics. The basic critical question, "Is what is claimed in the standpoint a sign of what is stated in the reason advanced?", should then be reformulated as "Is the judgment given in the standpoint implied by the characteristic mentioned in the argument?". The argumentation in "This book is wonderful because it presents a vivid picture of the miseries op growing up" is to be questioned by "Are books that present a vivid picture of something wonderful?".

model of a critical discussion instigated by the institutional preconditions of the communicative activity type – and additionally perhaps also by ideological preconditions.[8]

As a consequence of contextual differentiation, the soundness criteria for judging the use of a specific (sub)type of argumentation may differ to some extent depending on the institutional preconditions pertaining to the macro-context in which the argumentation is advanced. Imagine two people who are playing a game of scrabble. At a certain moment one of them claims to have compiled a long word, but the other one doubts that the combination of letters that has been laid out really constitutes an English word. Now the first player uses an argument from authority to defend his claim: "This is an English word, because it is in the dictionary". Whether his appeal to authority is in this case a sound strategic manoeuvre, depends in the first place on the kind of agreement that exists between the players on how to decide whether or not a combination of letters does indeed count as an English word. The verdict on the soundness or fallaciousness of an argument from authority relates in this sense always to the starting point that is operative in the macro-context in which the argumentative exchange takes place regarding how authoritativeness is to be decided.

If the players have agreed at the start of their game that a combination of letters will be regarded as an English word if it is included in the dictionary, then there is nothing wrong with the first player's authority argument – his argumentative move cannot be considered fallacious and is even likely to be effective. However, the same argumentative move would be fallacious if the game was played in a macro-context in which it has been agreed upon from the start that the *Concise Oxford Dictionary* will be the ultimate judge while in his argumentation the arguer is referring to Webster's. The argumentative move would be sound again if the manufacturer of the scrabble game had imposed a binding procedure for deciding about the Englishness of a word upon the players that prescribes going by a dictionary without giving any further specification as to which dictionary. If, however, the players agreed at the start of their game that a combination of letters will only be recognized as an English word if they all know the word, then the appeal to the authority of any kind of dictionary would be irrelevant and therefore fallacious.

The various scenarios sketched in the scrabble example can be viewed as constituting specific macro-contexts that represent different communicative activity types or variants of a particular communicative activity type. In specifying who or what counts as an authority, the general soundness criterion pertaining to the use of the Argument Scheme Rule involving relying on a qualified authority is in each of them implemented in a different way. In the empirical counterpart of the opening stage of the exchange a crucial starting point concerning how the game is to be decided is in each case given its own specification. In the first case, it is defined by the parties by explicitly agreeing before the argument from authority is used that the dictionary should be the specific soundness criterion that is authoritative in judging the Englishness of a word. In the second case, this specific soundness criterion is defined even more precisely by agreeing, in addition, explicitly that it is the *Concise Oxford Dictionary* that is to be authoritative. In the third case, the soundness criterion is defined in the same way as in the first case, but this time this criterion is simply imposed on the players as a starting point for their exchange – in the empirical counterpart of the opening stage they only have to acknowledge what the criterion involves. In the fourth case, at the start of their exchange the participants explicitly agree on a starting point that boils down to only accepting a word as English if its Englishness is recognized by all participants – a starting point that changes the game more drastically.

---

[8] In the various communicative activity types manifested in the different kinds of argumentative practices the "extrinsic" constraints on argumentative discourse may be to some extent determined by institutional as well as ideological (or "cultural") preconditions or by a mixture of both.

In weakly conventionalized informal communicative activity types, such as a chat between friends, the specific soundness criteria applying to the argumentative moves that are made are often simply determined by the parties on the spot, when they are needed. However, these soundness criteria may also have been made familiar to the arguers in their primary socialization at home or at school, while they were growing up. In strongly conventionalized formal communicative activity types, such as a civil lawsuit, various crucial starting points, including certain evaluation procedures, are as a rule already partly or wholly given before the argumentative exchange takes place. Usually they have been explicitly taught to the participants in their secondary socialization, during their professional training as future lawyers or other specialised form of education. This institutional imposition of starting points, which happens particularly in strongly conventionalized and formalized communicative activity types, resembles in fact closely the third scenario just sketched. In practical terms in that case the situation is similar as in the case of exchanges with starting points based on an already existing agreement between the parties.

In the strategic manoeuvring taking place in the various kinds of argumentative practices of argumentative reality the various types and subtypes of argumentation may manifest themselves in specific, context-related ways. The contextually-determined ways in which a subtype of argumentation manifests itself can be viewed as different *variants* of the subtype concerned. In describing the various manifestations of argumentative reality in the empirical component of the research program distinguishing between these different variants is an important task.[9] In this endeavour more precise distinctions can be made between variants that differ primarily in the kind of selection of the topical potential that is made (relating to differences in subject-matter), variants that differ first of all in the way they appeal to the audience (relating to different ways of associating with the listeners or readers), and variants that differ first of all in the choice of presentational devices (relating to differences in the means of expression). The general aim of this empirical research is to identify institutionally-determined variants of (sub)types of argumentation and provide accurate descriptions of the distinctive features of their sound and fallacious manifestations.

Heated debate and the frozen trucker: Argumentative moves in judicial opinions reviewing agency interpretations of statutes

LISA EICHHORN

United States of America
eichhorn@law.sc.edu

ABSTRACT: During the confirmation hearings of U.S. Supreme Court Justice Neil Gorsuch, a senator criticized Gorsuch's dissent in *TransAm Trucking v. ARB*, which the media dubbed the "Frozen Trucker" case. *TransAm* was a hard case in which the court had to decide how an administrative agency could permissibly interpret certain statutory language. Highlighting the double-layered nature of this issue, this article examines the justifications in the majority and dissenting opinions in *TransAm*, tracing their argumentative moves.

KEYWORDS: argumentative maneuvers, argumentative moves, dissent, justifications, legal argumentation, statutory interpretation

1. INTRODUCTION

During the 2017 confirmation hearings of United States Supreme Court Justice Neil Gorsuch, Senator Richard Durbin criticized then-nominee Gorsuch for his dissenting opinion in *TransAm Trucking v. Administrative Review Board*, 833 F.3d 1206, 1215 (10th Cir. 2016), a case that had come before Gorsuch while he served on the United States Court of Appeals for the Tenth Circuit, an intermediate appellate court in the federal judicial system. *TransAm Trucking*, which the media quickly dubbed the "Frozen Trucker" case, concerned whether TransAm violated a statute when it fired a tractor-trailer driver who had disobeyed TransAm's instructions by refusing to wait in his unheated truck on a frigid night for a mechanic to arrive and fix the trailer's frozen brakes. At the hearing, Senator Durbin told Gorsuch that it had been freezing cold that evening, but "not as cold as your dissent."[1]

In that dissenting opinion, Gorsuch had contended that the statutory language did not prohibit TransAm's conduct, and that an earlier decision to the contrary in the case, made by an administrative agency, was incorrect. The two other Tenth Circuit judges who presided over the case with Gorsuch joined in the majority opinion, holding that the agency's broader interpretation of the statutory language was permissible. The court therefore affirmed the agency's decision for the driver.

Despite Senator Durbin's memorable—and perhaps easy—criticism, *TransAm Trucking* was a hard case, one in which the court was asked to decide not necessarily what the statutory language at issue *meant*, but instead what it *could permissibly be interpreted by an administrative agency to mean*. Thus, an initial issue was whether the statutory language was ambiguous, and thus subject to agency interpretation, in the first place. Only then could the court decide whether the agency's interpretation was permissible. In light of this double-layered nature of the interpretive issue, this article examines the legal justifications offered by

---

the majority and dissenting opinions in *TransAm Trucking*, tracing their argumentative moves in this particular legal context.

This article makes use of and adds to the insights developed by Feteris (2005, 2008, 2009) and Kloosterhuis (2009) regarding strategic maneuvering in cases involving the interpretation of statutes. Further, insofar as Summers mentions delegation of interpretive authority to agencies in his analysis of U.S. statutory interpretation but notes that the topic is "exceedingly complex and many-sided and need not be treated in detail" in his overview (Summers, 1991, p. 419), this article represents one detailed treatment of this topic.

Part 2 below describes the interpretive issue in *TransAm Trucking* and examines the institutional position of the Tenth Circuit as decisionmaker in the case. Part 3 examines the argumentative justifications offered by the two-judge majority. Part 4 then examines then-Judge Gorsuch's dissenting opinion in terms of its responsive argumentative moves. Part 5 offers conclusions from the comparison of the two opinions.

2. INTERPRETIVE ISSUE IN *TRANSAM TRUCKING* AND THE TENTH CIRCUIT'S INSTITUTIONAL POSITION AS DECISIONMAKER

The Surface Transportation Assistance Act (STAA) applies to commercial trucking companies such as TransAm, and it prohibits an employer from discharging an employee who "refuses to operate a vehicle because . . . the employee has a reasonable apprehension of serious injury to the employee or the public because of the vehicle's hazardous safety or security condition" (49 U.S.C. § 31105(a)(1)(B)(ii)). In *TransAm Trucking*, the interpretive issue upon which I focus here concerned whether Alphonse Maddin, a driver-employee of TransAm, had "refuse[d] to operate" his tractor-trailer after he discovered that the brakes on the trailer had become frozen. All parties agreed on the following facts:

- Maddin had driven a tractor-trailer for TransAm on a highway in subzero (Fahrenheit) temperatures.
- He had pulled the tractor-trailer to the side of the highway because he had been unable to find a fuel station and his gas gauge was below empty.
- When he tried to pull back onto the road ten minutes later, he discovered that the brakes of the trailer portion of the vehicle had frozen.
- Maddin reported the frozen brakes to TransAm and was advised that TransAm would send a repairperson to assist him.
- While waiting, Maddin discovered that the heater in the cab of his truck had stopped working.
- Maddin felt himself becoming numb and called TransAm to report his physical condition, whereupon he was told to "hang in there" until the repairperson arrived.
- Thirty minutes later, Maddin unhitched the trailer from the truck and called his supervisor to report that his feet were numb and that he had difficulty breathing and that he was therefore leaving in the truck to seek help.
- In response, Maddin's supervisor told Maddin not to leave the trailer and instructed him to either rehitch the trailer and drag it with its frozen brakes or remain with the truck and trailer until the until the repairperson arrived. (The supervisor may have offered the first option sarcastically.)
- Maddin instead drove off in the truck, leaving the trailer unattended. After a repairperson arrived fifteen minutes later, Maddin returned to the trailer.

- Less than a week later, TransAm fired Maddin for having abandoned his load on the trailer (833 F.3d at 1208-09).

Maddin contested his firing before the Administrative Review Board of the Department of Labor. He argued that TransAm had violated the STAA, given that he had acted out of fear for his safety in abandoning the trailer and out of fear for public safety in deciding not to try to drag the trailer, with its frozen brakes, along the highway. The Board decided for Maddin, holding that TransAm had to reinstate him and pay him compensatory damages.

In its opinion, the Board focused on the statute's requirement that the employee be terminated for "refus[ing] to operate" a vehicle, noting that the statutory language should be read broadly: "Under the facts of this case, driving or operating the truck in violation of [the supervisor's] order to remain with the trailer falls within the ambit of the 'refusal to operate' clause of the STAA and presented precisely the risk of serious injury that STAA is designed to avoid" (Dept. of Labor ARB Case No. 12-031, at 7 (Nov. 24, 2014)).[2] This idea led the Board to conclude its discussion of the issue as follows: "[A] 'refusal to operate' may encompass actually operating a vehicle in a manner intended to minimize danger of harm or violation of law" (*Ibid.* at 9).

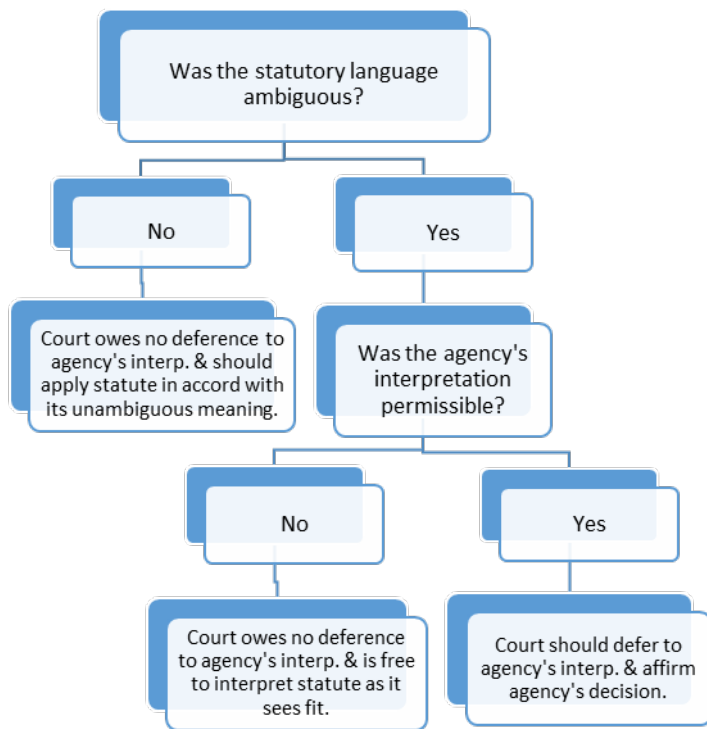
TransAm appealed this decision to the United States Court of Appeals for the Tenth Circuit, an intermediate appellate court in the federal judicial system. Such courts assign cases to three-judge panels that issue decisions by majority vote. A party wishing to appeal a decision from such a court may petition the United States Supreme Court, which grants only a small number of such petitions for review each year.

Pragmatically, the task of the Tenth Circuit judges was to review the Administrative Review Board's decision through the lens of a legally-mandated standard. This standard takes account of the institutional roles of Congress, of federal agencies, and of federal courts within the U.S. legal system. Specifically, when Congress has enacted a statute and authorized a federal agency to administer it, the agency may, *inter alia*, interpret the statute and apply it to specific cases in adjudicatory proceedings, but only in a manner consistent with the statute's language. The federal appellate courts have final authority to interpret federal statutory language. The courts are therefore empowered to review an agency's interpretation of a statute to determine whether the interpretation fails to coincide with the statute's language and thus represents an unauthorized, invalid action on the part of the agency.

These dynamics underlie the Supreme Court case of *Chevron, U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984), which sets forth a standard of review that courts must follow when evaluating agency interpretations of federal statutes.[3] Under *Chevron*, a court must defer to an agency's interpretation of a statute if "the statute is silent or ambiguous" on the issue in question and the agency's interpretation is a "permissible construction" of the statutory language (467 U.S. at 843). In *TransAm Trucking*, the agency was the Department of Labor, which had interpreted the "refuses to operate" language in the STAA through the Department's Administrative Review Board. Thus, a preliminary question for the Tenth Circuit was whether the "refuses to operate" language of the STAA spoke unambiguously to the issue in Maddin's case. If the language was ambiguous, then a second question would be whether the Board's interpretation that "a 'refusal to operate' may encompass actually operating a vehicle" was a permissible construction. The two-step *Chevron* rule may be illustrated schematically by the diagram below:

---

[2] This opinion is available at https://www.oalj.dol.gov/PUBLIC/ARB/DECISIONS/ARB_DECISIONS/STA/13_031.STAP.PDF.

[3] For an explanation of *Chevron* review that is accessible to those unfamiliar with the U.S. legal system, see Fine (1997:76).


The majority and dissent in *TransAm Trucking* differed as to the first question, with the majority holding the "refuses to operate" language ambiguous and Gorsuch, in dissent, holding that the phrase had an unambiguous meaning in the context of Maddin's case by which the Board was obligated to abide. Because judges exchange draft versions of their opinions after voting, the two opinions refer to each other and can thus be read as a critical discussion, in pragma-dialectic terms (van Eemeren & Grootendorst, 1992), though of course the majority opinion prevails as a legal matter. While TransAm did not appeal the Tenth Circuit's decision to the Supreme Court, one could interpret the majority and dissenting opinions as two opposing arguments, each inviting the higher court, in the event of an appeal, to adopt its position.

3. ARGUMENTATIVE MOVES IN THE *TRANSAM TRUCKING* MAJORITY OPINION

The starting point of the majority opinion, like that of the dissent, was that the STAA prohibited TransAm's firing of Maddin only if Maddin had "refuse[d] to operate" his vehicle out of safety concerns. All parties and judges agreed that Maddin had departed from the trailer in the truck because of qualifying concerns for his own safety. Thus, the initial question was simply whether the phrase "refuses to operate" was ambiguous in the context of Maddin's case, such that Maddin could reasonably be deemed to have "refuse[d] to operate" his vehicle when he drove his truck away from the scene, leaving the trailer behind. Although the Administrative Review Board had interpreted this phrase to cover Maddin's conduct, its explanation—on a linguistic level, at least—was counterintuitive: "[A] 'refusal to operate' may encompass actually operating a vehicle."

3.1 A rhetorical move: narrating the facts of the case

The majority's argumentative moves actually begin before its opinion discusses the legal issue. Like many U.S. appellate opinions, this one starts with a recitation of the facts in the

record, which are narrated so as to inspire sympathy for the party in whose favor the court decides the case.[4] Indeed, the narrative perspective and the inclusion of numerous specific details in the majority's seven-paragraph description of Maddin's experience leave one outraged that TransAm apparently failed to understand the mortal danger that Maddin faced and then fired him for exercising his only option to avoid that danger.

For example, the first paragraph invites the reader to experience the facts from Maddin's perspective, describing the incident with a fair level of detail as to time and place: "In January 2009, he was driving a tractor-trailer for TransAm on I-88 in Illinois. At approximately 11:00 p.m., Maddin pulled to the side of the highway because he was unable to find the TransAm-mandated fuel station and his gas gauge was below empty" (833 F.3d at 1208). That paragraph ends with Maddin's discovery that the trailer's brakes were locked up "because of the frigid temperatures" (833 F.3d at 1208). Already, we as readers can identify with Maddin as a motorist in trouble on a cold, dark night. Indeed, when he discovers that "there was no heat in the cab of the truck" (833 F.3d at 1209), we feel we are inside the increasingly cold cab with him.

As the narrative proceeds, the reader gets a sense of peril intensifying as the minutes, and then hours, tick away. The majority opinion notes that Maddin's first call for help to TransAm occurred at 11:17 p.m. It then notes that he fell asleep in the cab of the truck until, "at approximately 1:18 a.m.," he received a telephone call from his cousin, which woke him. The opinion notes the cousin's opinion that, during this call, Maddin's speech was "slurred and that he sounded confused" (833 F.3d at 1209). At this point, Maddin's "torso was numb and he could not feel his feet," so he again called TransAm and was told to wait in place (833 F.3d at 1209).

The majority then notes that approximately "thirty minutes" more pass as Maddin is "continuing to wait in the freezing temperatures without heat" (833 F.3d at 1209). He calls his supervisor and reports that he cannot feel his feet and is having trouble breathing because of the malfunctioning heater, but the supervisor repeatedly tells him to "turn on the heat,"— either, the reader must assume, out of a callous failure to listen to Maddin, or an incompetent failure to understand Maddin's report.

At this point, the majority has devoted four paragraphs to the narration of Maddin's plight. Only now does its opinion describe Maddin's final call to his supervisor and Maddin's departure in the truck without the trailer. Thus, upon learning that TransAm later fired Maddin for having abandoned his trailer, the reader is left with the strong impression that TransAm has treated Maddin unjustly—out of callousness, malice, incompetence, or some combination of the three.

Most of the details in the majority's narrative relate to TransAm's delay in assisting Maddin and to the reasonableness of Maddin's fear for his own safety. However, these points were not at issue in the case because TransAm had conceded that Maddin had left the scene due to "a reasonable apprehension of serious injury to [himself] or the public" as required by the STAA. (833 F.3d at 1211). Further, these details tell us little about whether Maddin had "refuse[d] to operate" his vehicle, for STAA purposes, when he drove away in the truck. Thus, the inclusion of these factual details in the majority's opinion was superfluous in a legal sense but not in a rhetorical one. Before the opinion's analysis even begins, this narrative has convinced the reader that Maddin is an innocent person who has suffered a serious injustice at the hands of TransAm.

---

[4] As Rieke notes, "What courts call the fact situation is, in actuality, the story or narrative that has been negotiated in relation to the legal issues presented." Rieke (1991:45).

3.2 The first step of the legal analysis: a presumption of ambiguity

The legal-analytical portion of the majority opinion starts with a description of the *Chevron* standard of review:

> Deference is . . . given to the [Department of Labor's] legal interpretation of the STAA because Congress has explicitly delegated to the Secretary of Labor authority to enforce the . . . STAA by formal adjudication [citation omitted], and the Secretary has delegated that enforcement authority to the [Administrative Review Board] (833 F.3d at 1210).

Significantly, this description of the standard presumes that the statutory language being interpreted is ambiguous. Under *Chevron*, if the statutory language at issue is unambiguous, then an agency interpretation contrary to that language is owed no deference at all by the reviewing court.[5] But the majority's description of *Chevron* takes no account of this possibility.

Not surprisingly, then, when the majority opinion does address the threshold question of whether the "refuses to operate" language from the STAA is ambiguous, it does so very briefly: "Here, the term 'operate' is not defined in the statute" (833 F.3d at 1211). This lack of a definition causes the majority to conclude that the language is ambiguous (833 F.3d at 1211). However, the lack of a statutory definition does not automatically render a term ambiguous, according to the Supreme Court.[6] Here, the *TransAm* majority could instead have credibly asserted that the STAA was silent as to Maddin's narrow circumstances, given that either ambiguity or silence satisfies *Chevron*'s first step.

3.3 The second step of the legal analysis: linguistic and teleological justifications

Nevertheless, having addressed the threshold question of ambiguity, the majority opinion then moves to the second *Chevron* step, addressing whether it was "permissible" for the Administrative Review Board to hold that Maddin "refuse[d] to operate" his vehicle when he drove his truck away from the abandoned trailer.

To be "permissible" for *Chevron* purposes, an interpretation must be reasonable.[7] Thus, even if a reviewing court would interpret the statutory language differently than did the agency, the court must uphold the agency's reasonable interpretation.[8] In Maddin's case, there is at least some room for debate as to whether it is reasonable to interpret the words "refuses to operate" a vehicle to "encompass" actually operating a vehicle. Nevertheless, by focusing narrowly on the word "operate" and by emphasizing the legislative purpose of the statute, the majority justifies its holding that the Board's interpretation is indeed permissible.

---

[5] "[T]he court, as well as the agency, must give effect to the unambiguously expressed intent of Congress." *Chevron*, 467 U.S. at 843.

[6] For example, in Global Crossing Tele., Inc. v. Metrophones Tele., Inc., 550 U.S. 45 (2007), the Supreme Court held, in a 7-to-2 decision, that the statutorily undefined terms "unjust and unreasonable" and "practice," as used together in a telecommunications statute, were unambiguous in the context of the facts of the case.

[7] See, for example, Astrue v. Capato *ex rel.* B.N.C., 566 U.S. 541, 558 (2012), in which the Supreme Court held that because an agency's "interpretation of the relevant provisions" of a statute was "at least reasonable," it was "entitled to this Court's deference under *Chevron*." For a summary of the Supreme Court's approaches to the second step of the *Chevron* analysis, see Aman & Mayton (2014:404-407).

[8] The Supreme Court in *Chevron*, 467 U.S. at 843, explained that "[i]f . . . the court determines Congress has not directly addressed the precise question at issue, the court does not simply impose its own construction on the statute, as would be necessary in the absence of an administrative interpretation. Rather, . . . the question for the court is whether the agency's answer is based on a permissible construction of the statute."

First, the majority offers a linguistic justification focused on the word "operate." Its opinion states that "TransAm's argument equates the term 'operate,' as used in the statute, with driving" (833 F.3d at 1211). This characterization of TransAm's position is accurate insofar as TransAm argued that Maddin was operating the truck, rather than refusing to operate it, when he drove it away from the trailer. In contrast, the majority opinion notes that the Board interpreted "operate" to include not only driving but also "us[ing a] vehicle in a manner directed by [one's] employer" by means other than driving (833 F.3d at 1211-12). Indeed, the majority opinion later notes that Maddin's supervisor instructed him "*to operate his rig by remaining with the trailer* until the repairperson arrived" (833 F.3d at 1213, my emphasis). Thus, according to the majority, when an employee uses the vehicle in a manner contrary to his employer's instructions, the employee "refuses to operate" the vehicle for STAA purposes. To support this interpretation, the majority cites a dictionary defining "operate" to mean "control the functioning of" (833 F.3d at 1212 n.4).[9] However, it is somewhat unclear how Maddin could be said to have "refused to control the functioning of" his vehicle when he drove away from the trailer in his truck. In addition, it is unclear, on a purely linguistic level, how the dictionary's "control the functioning of" language relates to the majority's "use in a manner directed by one's employer" language.

As in its analysis of ambiguity under *Chevron*'s step one, above, the majority here seems to leave several questions unanswered in its effort to explain how the literal phrase at issue could cover Maddin's actions. This problem may be inevitable for the majority, however, given that *Chevron* demands at least some attention to the statute's literal language before a court may uphold an agency's interpretation on the ground of the broader purposes of the legislature in enacting the statute.[10]

And, indeed, the much more persuasive justification in the majority opinion relates the Board's broad interpretation of the "refuses to operate" language to the overarching purpose of the statute. In its own words, Congress, in enacting the STAA, sought to "promote the safe operation of commercial motor vehicles" and "to minimize dangers to the health of operators of commercial motor vehicles" (49 U.S.C. § 31131(a)). Thus, the majority concluded that the Board's interpretation furthered the purpose of the statute "by prohibiting an employer from discharging an insubordinate employee whose insubordination" stemmed from reasonable fear of injury to himself (833 F.3d at 1212). This justification is compelling, especially in light of the facts of Maddin's case had Maddin followed his supervisor's instruction to remain by the roadside, he could have succumbed to hypothermia. Therefore, it is reasonable to infer that Congress intended to prohibit an employer from terminating an employee for disregarding such a dangerous instruction, even if that inference requires a counterintuitive interpretation of Congress's "refuses to operate" language. Such hypothesizing of intent reflects a legitimate approach to statutory interpretation that Judge Richard Posner has called "imaginative reconstruction" (Posner, 1985, pp. 286-87).

4. ARGUMENTATIVE MOVES IN THE DISSENTING OPINION

Overall, if the majority opinion takes its argumentative force from the broader facts of Maddin's experience and the broader context of the STAA's purpose, the dissent takes its argumentative force from a process of negation, whittling down both the factual narrative and

---

[9] Here, the majority cites Oxford Dictionaries Pro, http://www.oxforddictionaries.com/us/definition/american_ english/operate.

[10] Linguist and legal scholar Lawrence M. Solan has documented how "courts regularly attempt to see plain meaning where ambiguity exists and to find ambiguity where there is none in order to subvert principles like . . . the plain language rule" when judges believe that to do otherwise would cause an injustice. Solan (1993:186).

the court's interpretive task. Indeed, the dissent often speaks in terms of what the facts, the court's task, and the statutory language, are *not*.

4.1 A counter-narrative

Unlike the majority, which narrates at length the facts of Maddin's case, the dissent begins with the following one-paragraph recitation:

> A trucker was stranded on the side of the road, late at night, in cold weather, and his trailer brakes were stuck. He called his company for help and someone there gave him two options. He could drag the trailer carrying the company's goods to its destination (an illegal and maybe sarcastically offered option). Or he could sit and wait for help to arrive (a legal if unpleasant option). The trucker chose None of the Above, deciding instead to unhook the trailer and drive his truck to a gas station. In response, his employer, TransAm, fired him for disobeying orders and abandoning its trailer and goods (833 F.3d at 1215).

In tone and perspective, this recitation could not be much further from the majority's narration. The reader is no longer in the cab with Maddin. Indeed, Maddin no longer has a name. The weather is no longer "frigid" as it was in the majority opinion; it is merely "cold." The brakes are no longer "frozen"; they are merely "stuck." Maddin is experiencing no physical symptoms from the cold at all. And the callous-seeming supervisor of the majority's narrative is simply "someone" who gives Maddin "options." If one option may have been given sarcastically, the other is merely "unpleasant." And Maddin's decision whether to obey the supervisor and risk hypothermia or disobey the supervisor and risk his job is reduced to a simple multiple-choice question to which one may answer "None of the Above."

From a legal perspective, this recitation contains all the facts relevant to the interpretive issue raised by the "refuses to operate" language and nothing more. From a rhetorical perspective, the omission of details regarding the weather and Maddin's symptoms minimizes the human story and prepares the reader to focus narrowly on the statutory phrase at issue rather than the general purposes of the STAA.

4.2 The opening analytical move: negation

As it proceeds from facts to legal analysis, the dissenting opinion's next move is to focus on the court's institutional role as reviewer of agency's interpretation. In doing so, the opinion again narrows its focus by expressly describing tasks that do *not* form part of this role: "It might be fair to ask whether TransAm's decision was a wise or kind one. But it's not our job to answer questions like that. Our only job is to decide whether the decision was an illegal one" (833 F.3d at 1215). Rhetorically, this statement exemplifies Robert Ferguson's concept of the "monologic voice" in judicial opinions insofar as the statement portrays the dissent "as if forced to its inevitable conclusion by the logic of the situation and the duties of office," with its author accepting that in the role of reviewing judge he must "move on a stage of perceived boundaries, compelled narratives, and inevitable decisions" (Ferguson, 1990, p. 207).

Then, in describing the STAA and its relation to the facts of this case, the dissenting opinion continues its strategy of negation, noting that the "statute only forbids employers from firing employees who 'refuse[] to operate a vehicle' out of safety concerns. And, of course, nothing like that happened here" (833 F.3d at 1215). Again, the focus has narrowed from non-legal issues of wisdom and kindness to the real legal issue, which is governed by a particular statute and a particular phrase within that statute, and nothing more. Again, the monologic voice emphasizes the narrow legal boundaries within which the court must work:

> [T]here's simply no law anyone has pointed us to giving employees the right to operate their vehicles in ways their employers forbid. . . . Maybe someday Congress will adorn our federal statute books with such a law. But it isn't there yet. And it isn't our job to write one—or to allow the Department [of Labor] to write one in Congress's place (833 F.3d at 1216).

Thus, the dissent has pared away what the court's job is not, and what the statute does not provide, in preparation for doing its job by applying the statutory language to the case.

4.3 Addressing Chevron's first step: A linguistic argument

Having explained how the statutory language demarcates the legal issues, the dissenting opinion then addresses the first issue mandated by *Chevron*: whether the phrase "refuses to operate" is ambiguous in the context of this specific case. Here, the dissent notes that Maddin was not fired because he refused to operate his truck, but instead because he "chose instead to *operate* his vehicle in a manner he thought wise but his employer did not" (833 F.3d at 1216). The dissent thus notes that the majority has focused on the word "operate" out of the context of the entire phrase—"refuses to operate." To support the argument that Maddin did not "refuse to operate" his truck when he drove it away, the dissent cites dictionary definitions of both "refuse" and "operate" and notes that the words, taken together in the phrase, simply cannot describe the action of one who causes his vehicle to work, as Maddin did when he drove away in his truck (833 F.3d at 1216). Thus, according to the dissent, the majority has stretched the phrase "refuses to operate" to "encompass its exact opposite" by interpreting the phrase to cover "employees who operate their vehicles in defiance of their employers' orders" (833 F.3d at 1216). According to the dissent, while the phrase may cover various situations, it unambiguously fails to cover Maddin's act of driving the truck away from the trailer.

Thus, the dissent accuses the majority of straying beyond the statutory language that demarcates the court's interpretive task:

> [M]y colleagues' position would seem to add more than a few words to the statute. In their view, an employee should be protected not just when he "refuses to operate a vehicle" but also when he "refuses to operate a vehicle *in the particular manner the employer directs and instead operates it in a manner he thinks safe.*" Yet those words just aren't there; the law before us protects only employees who refuse to operate vehicles, *period* (833 F.3d at 1216-17).

This idea exemplifies the textualist orientation of then-Judge Gorsuch. According to textualists, the best indication of a legislature's intent is the words that the legislature used in the statute.[11] Thus, to a judge who subscribes to textualism, resort to other indications of legislative intent is allowable only when statutory language is truly ambiguous. One cannot use indications of legislative intent to argue, in the first instance, that statutory language is ambiguous; instead, the determination of ambiguity—or the lack thereof—must be made using only the words of the statute, one's experience as a fluent speaker of American English, and, if necessary, a dictionary. Only if statutory language is determined to be ambiguous based on these sources may a court look to indications of legislative intent. Or as Gorsuch notes in his dissent, "[W]hen the statute is plain it simply isn't our business to appeal to legislative intentions" (833 F.3d at 1217).

---

[11] For a brief explanation of textualism, see Aman & Mayton (2014:395-97). For a thorough analysis of the rise of textualism in U.S. jurisprudence in the 1980s, see Eskridge (1990).

4.4 A dialectical move not required by Chevron*: explaining the STAA's failure to cover Maddin's situation*

Under *Chevron*, once a court has determined that the statutory language has an unambiguous meaning at odds with the agency's interpretation, the court's analytical task is complete and the court must reverse the agency's decision insofar as it depended on the agency's interpretation. However, in *TransAm Trucking*, once Gorsuch determines that "refuses to operate" is unambiguous in the context of Maddin's case, his dissenting opinion continues with a supplementary argument that this unambiguous meaning is reasonable and does not undermine the purposes of the STAA.

Specifically, the dissenting opinion offers several reasons as to why the statute punishes employers who fire employees who *refuse* to drive their vehicles due to safety concerns, but does not punish employers who fire employees who *drive* their vehicles due to safety concerns:

> Maybe Congress found it easier to agree that an employee has a right to sit still in response to his employer's order to operate an unsafe vehicle rather than try to agree on a code detailing when and how an employee can operate a vehicle in a way he thinks safe and appropriate but his employer does not. Maybe Congress would not have been able to agree to the latter sort of code at all. . . . Or maybe it just didn't think about the problem at all (833 F.3d at 1217).

While this supplementary argument is not necessitated by *Chevron*, it responds dialectically to the majority's position that the agency's interpretation is consistent with the stated purposes of the statute. It also responds to an unstated objection that courts may ignore the plain language of a statute, in favor of broader legislative purposes, if application of the plain language would lead to absurd results.

5. CONCLUSION

Neither the majority's nor the dissent's opinion is fallacious in the pragma-dialectical sense. The two opinions simply reflect differing philosophies regarding whether a court—or in this case an agency—may consider legislative purpose when interpreting statutory language. However, on a rhetorical level, the majority's extended factual narration, which emphasizes TransAm's apparent callousness toward Maddin's plight, primes the reader to see the dissenting opinion as similarly callous. And, indeed, the dissent's whittling of the case down to a matter of a sterile statutory phrase seems cold in comparison, as Senator Durbin memorably noted. But in the end, with the U.S. Supreme Court becoming increasingly textualist in orientation, rhetorical appeals to the human experience underlying each case will likely become less persuasive from the Court's perspective, if not the public's, in the foreseeable future.

ABSTRACT: Studies have shown that metaphors influence the understanding of a lexical ambiguity fallacy (Ervas et al. 2015, 2018). However, a systematic research on the effects of metaphors in argument production is still missing. The paper presents the results of an experiment where participants completed lexical ambiguous arguments, selecting either a metaphor or a literal word as the middle term. It shows that metaphor conventionality and plausibility of argument conclusion influence both argument production and understanding differently.

KEYWORDS: argument processing, argument production, argument understanding, belief in the conclusion, metaphor, fallacy of equivocation, psychology of argumentation, quaternio terminorum

1. INTRODUCTION

Recent literature in argumentation theory has reconsidered the role of metaphor as a powerful device for reasoning, rather than either a linguistic anomaly or embellishment. It has been claimed that metaphor might be seen as an "implicit argument" where some inferences can be drawn from the comparison of the source (S) and the target (T) conceptual domain (Oswald & Rihs, 2014; Macagno & Zavatta, 2014; Fischer, 2015; Wagemans, 2016). Thus, far from being just a source of reasoning errors and argumentative fallacies, metaphor might be considered a creative way to explore new conceptual combinations and to bridge the gap of implicit premises in enthymematic argumentation.

In our previous research, we empirically investigated the role of metaphor in argumentation, focusing on the understanding of fallacies generated by lexical ambiguities (Ervas & Ledda, 2014; Ervas et al., 2015; Ervas, Ledda, & Pierro, 2016; Ervas et al., 2018). More specifically, we adopted the methodological approach of experimental pragmatics to show that a metaphor might elicit a "creative style of reasoning", leading participants to find alternative interpretations of the metaphor, supporting the conclusion of the arguments. This empirical line of research might shed a light on how argumentative rationality moves away from norms in both the understanding and the production of arguments featuring metaphors. However, while previous research has already shown that an argument featuring a metaphor creates a strong bias in argument understanding (Thibodeau & Boroditsky, 2011, 2013; Steen, Reijenierse, & Burgers, 2014), – to the best of our knowledge – no empirical research has been conducted on the production of arguments featuring metaphors. The present work aims to fill this gap in the research on argumentation, focusing on the production of lexical ambiguity fallacies, i.e. quaternio terminorum, having a metaphor as middle term.

The following sections present our predictions on argument production vs. understanding (§ 2), the method we adopted to test the predictions (§ 3) and the results (§ 4) of

a pilot experimental study where participants were asked to complete verbal argument selecting either a metaphor or a literal word as middle term of a lexically ambiguous argument. The last sections discuss the results (§ 5) of the experimental study and draw some conclusions (& 6), comparing participants' performance on the production of lexically ambiguous, "metaphorical" arguments with participants' performance on the understanding of the similar arguments, as per results of previous experiments (Ervas et al., 2015; Ervas, Ledda, & Pierro, 2016; Ervas et al., 2018).

2. METAPHOR AS MIDDLE TERM OF LEXICAL AMBIGUOUS ARGUMENT

Recent literature rediscovered the Aristotelian idea of metaphor as a reasoning device, through which a (generally more abstract and less known) target domain is understood in terms of a (generally more concrete and better known) source domain (Hesse, 1963; Kuhn, 1979; Gentner, 1982, 1989; Fischer, 2015). From this perspective metaphor is argumentative, because it acts as an implicit argument where some inferences can be drawn from the source/target domains comparison. It has been argued that metaphor is not just argumentative but also persuasive, because it also acts as a framing strategy that implicitly forces the interpreter to consider the target from a specific perspective (Black, 1954; Lakoff & Johnson, 1980; Burgers et al., 2016). Indeed, in projecting (mapping) the properties of the source domain onto the target domain, some properties of the source domain are selected as salient to understand the target domain, while other properties remain "unexploited" as irrelevant for the metaphorical interpretation (Carston, 2002; Glucksberg, 2001, 2003; Rubio Fernandez, 2007).

Previous studies aimed to understand whether and to what extent metaphors might be considered as an argument by analogy (Perelman & Olbrechts-Tyteca, 1969; Santibanez, 2010; Oswald & Rihs, 2014; Svacinova, 2014; Macagno & Zavatta, 2014; see Wagemans, 2016 for criticism). We have argued that, when metaphor is an argument by analogy, it might lead to a faulty analogy exactly because of its framing effect. In such cases, it might have the form of a quaternio terminorum, where a shift in the meaning of the metaphor as middle term of the argument leads to the fallacy of equivocation. For instance, in metaphors with the form "A is B", the two terms A and B belong to semantic domains which are similar/comparable in some respect, i.e. in terms of a set of salient properties X. Indeed, A and B do not share all the properties but only the properties of B that can be mapped onto the target A. In the case of a conventional metaphor, the set of properties X depends on the meaning that are stereotypically associated with the metaphor and have already been lexicalised and stored in dictionaries as a conventional figurative meaning (Black, 1954; Gibbs, 1994; Carston, 2002; Giora, 2003; Kovecses, 2010). In case of a novel metaphor, the set of properties X depends on a novel creative use of the meaning of the corresponding literal term, which needs an interpretative (conscious) act and that might lead to different interpretations on the metaphor producer vs. interpreter part.

If B has the salient property C (belonging to the set X), then the conclusion that A also has the property C follows from the premises, otherwise a faulty analogy might occur. For example, given the metaphor "A man is a wolf" and "aggressive" as the salient property C of the source domain, as per analogy, we can safely conclude that "A man is aggressive", as per the metaphorical interpretation of the term "wolf". The argument would then be:

P1 A man is a wolf.
P2 A wolf is aggressive.
C A man is aggressive.

While the first premise puts forth the metaphor, the second premise makes explicit the salient property that was implicit in the first premise. However, in case the property C is not included in the set of relevant properties X associated with the metaphor, we would be drawn to a faulty analogy as a conclusion:

P1 A man is a wolf.
P2 A wolf is four-legged.
C A man is four-legged.

In such a case, there is a meaning shift of the middle term: the middle term "wolf" is indeed used with the metaphoric meaning in P1 and with the literal meaning in P2. Therefore, the analogical argument is fallacious, and containing four terms instead of three terms, it has the structure of a quaternio terminorum (Ervas, Gola, & Rossi, 2018). Quaternio terminorum is indeed a fallacious argument based on the lexical ambiguity of its middle term, having different meanings in the premises (Woods & Walton, 1989; Van Eemeren, 1992; Tindale, 2006; Copi, Cohen, & McMahon, 2014). When the middle term has a different meaning in the premises, then the syllogism contains a fourth, hidden term, causing the fallacy.

Because of their intrinsic lexical ambiguity, metaphors are extremely likely to cause the fallacy of equivocation and thus to deceive in the evaluation of the argument strength, i.e. the proper attribution of a certain analogy as its conclusion. In this sense, they might be particularly persuasive. Previous experiments suggested that participants have some difficulties in detecting a lexical ambiguity fallacy, especially when arguments are based on conventional metaphors (Ervas et al., 2015) and even when participants are experts, i.e. trained in logic and argumentation (Ervas, Ledda, & Pierro, 2016). The metaphoric effect shows its influence when participants are asked to verify the connection between the premises and the conclusion of an argument, particularly when the conclusion of an argument is far from being patently false, as in the following case:

P1 A man is a wolf.
P2 A wolf is starving.
C A man is starving.

Indeed, in previous experimental studies (Ervas et al., 2015, 2018), the results suggested that quaternio terminorum with plausible conclusion, such as "A man is starving", is by far the most difficult to evaluate compared to both strong arguments concluding with "A man is aggressive", where the middle term is used with the same meaning in both the premises and standard quaternio terminorum, where the patently false conclusion "A man is four-legged" facilitates the detection of the fallacy. Indeed, when the analogy leads to a faulty, but plausible or at least believable conclusion, there might arise «a conflict between two types of thought processes, one logical reasoning according to the instructions and the other a response on the basis of their prior beliefs» (Evans, 2004, pp. 139-140). As recognised by a rather wide literature (Baron, 1988; Oakhill et al., 1989; Kunda, 1990; Ball et al., 2006; Correia, 2011), participants believing in the conclusion are unaware of committing to a faulty analogy and adjusting the interpretation of the premises to align them with the believed conclusion. The main finding of our previous research is that this kind of conflict is at work especially in the case of lexically ambiguous fallacy with plausible conclusions, where the participants' belief in the conclusion forced the participant to search for alternative interpretation of the metaphorical middle term to connect the believed conclusion and the premises (Ervas et al., 2018). In this process, conventional metaphors might be revitalised to fit the (prior) beliefs of the participants in the conclusion.

The results on argument understanding also suggested that arguments' evaluation

depends on the kind of lexical disambiguation process required to understand the meanings of the middle term in the premises: in general, literal middle terms made it easier to evaluate an argument than metaphorical middle terms. Especially literal homonymous middle terms are easier to disambiguate even when compared to polysemous middle terms, because homonymous terms, such as "bank", have two completely different meanings ("finance house" and "riverside") while polysemous terms, such as "letter", might have meanings ("symbol of the alphabet" and "written message") overlapping for some properties (Carston, 2002; Kovecses, 2010). Therefore, in case of polysemous middle terms, the disambiguation process involves specific properties to be evaluated and compared with the property made explicit in the second premise. The process of disambiguation of polysemous terms is similar to the interpretation process of conventional metaphors (Gernsbacher & Faust, 1991; Gernsbacher et al., 2001; Glucksberg et al., 2001; Rubio Fernandez, 2007), even though in the latter case the covert framing effect further influences participants' evaluation of the arguments. Diversely from conventional metaphors, novel metaphors are more difficult to understand as, per the definition, they are more unfamiliar and require wider contexts to be more meaningful and easily understandable (Gildea & Glucksberg, 1983; Glucksberg & Estes, 2000; Bambini et al., 2016). However, these are also the reasons why novel metaphor are "less persuasive" when compared to conventional metaphors, which are intuitively considered as true and associated with a system of commonplaces covertly and automatically activated by participants (Black, 1954; Lakoff, 2004; Thibodeau & Borodistky, 2011, 2013). Participants were instead well aware of the presence of a novel metaphor in the first premise and considered it as false (Ervas & Ledda, 2014), even though interpretable as true with conscious effort and additional explanations.

However, a systematic research on the features that affect metaphor quality (and therefore its persuasive value) in argument production is still missing. As recently pointed out (Steen, 2008, 2010, 2013, 2015), metaphor use might be deliberate, especially when an argument is produced for specific communicative purposes. There is indeed an asymmetry between argument production and understanding: while the argument receiver cannot be sure of (the degree of) metaphor deliberateness, the argument producer might be well aware of this practice. In Gerard Steen's words (2011, pp. 84-85):

There still remain many questions about deliberate metaphor, for instance the possible asymmetry between production and reception: a metaphor may be deliberately produced as a metaphor but not received as one, or, the other way around, a metaphor may have been produced non-deliberately as a metaphor but still be received as a cross-domain comparison by the interlocutor or audience. Careful theoretical and empirical work will have to elaborate how the notion of deliberate metaphor can be conceived of in these contexts.

When a speaker *deliberately* produces a metaphor might want to change the addressee's perspective on the target «by making the addressee look at it from a different conceptual domain or space, which functions as a conceptual source» (Steen, 2008, p. 222). Of course, novel metaphors can better serve this function, because they force the audience to look at the target from a source domain which is neither already associated in that way nor included in a stereotyped system of beliefs. However, a speaker might also deliberately choose to avoid lexical ambiguities and be clearer, especially in case of novel metaphor, whose interpretation is quite demanding and prone to misunderstanding. A conventional metaphor might instead be a good candidate to produce persuasive arguments, because of its covert framing effect. Moreover, the use of deliberate metaphor might revitalise conventional metaphors which are usually produced as non-deliberate metaphors in communication (Steen, 2010).

For our study, we predicted that precisely conventional metaphors can be implicitly used in argument production to build an argument that is apparently sound (i.e. with a plausible conclusion that might seem to follow from true premises), even though fallacious, because of

their covert framing effect. Novel metaphors might instead need an explicit clarification of their metaphorical meaning to reach the effect desired by the argument producer. Indeed, being less familiar and requiring a wider context to be fully understood, they represent a risk of misunderstanding that an argument producer might like to avoid.

3. EXPERIMENT

In order to test our predictions, we conducted a pilot experimental study asking N=13 participants (M = 5; F = 8) to produce verbal arguments having the syllogistic structure, by choosing – among different options – the middle term that best fits the arguments. A set of N=6 arguments were strong arguments (SA) where the middle term was used with the same meaning in both the premises; a set of N=6 arguments were fallacious arguments with a patently false conclusion and the middle term was used with different meanings in the premises (standard quaternio terminorum, SQT); a set of N=6 arguments were fallacious arguments with a plausible conclusion and the middle term used with different meanings in the premises (quaternio terminorum with plausible conclusion, QTPC). Moreover, the arguments might have literal or metaphorical middle terms: in case of literal middle terms, participants could select either homonymous (H) or polysemous (P) middle terms; in case of metaphorical middle terms, participants could select either conventional metaphors (CM) or novel metaphors (NM) as middle terms. Therefore the experiment had a 3 x 4 experimental design, with 3 argument structure conditions (SA, SQT, QTPC) and 4 middle term conditions (H, P, CM, NM).

3.1 Material

The material of the pilot study was the already validated set of arguments in Italian used by Ervas and colleagues (2018, Supplementary table 10) to test the understanding of quaternio terminorum with literal vs. metaphorical middle terms. All the metaphors appeared in the first premise of the arguments. A total of 72 arguments were presented without middle terms and participants were asked to complete the arguments choosing the middle term among the different options summarised in Table 1.

Literal middle terms (H/P)	Metaphorical middle terms (CM/NM)
Lexically ambiguous term	Lexically ambiguous term
Literal meaning 1	Metaphorical meaning
Literal meaning 2	Literal meaning (of the metaphor)
Conventional metaphor	Literal unambiguous meaning
Random meaning (control)	Random meaning (control)

Table 1. Types of middle term to be selected in the argument production task.

In the case of literal (H or P) middle terms, participants could choose among the following five options: the ambiguous term (ex. "bank"), its two literal meanings (ex. literal meaning 1, "finance house" and literal meaning 2, "riverside"), a conventional metaphor (in Italian) that plausibly fits the first premise of the argument (ex. "a mine") and a randomly chosen term, without connection with the argument (ex. "apple"). In the case of metaphorical (CM or NM) middle terms, they could choose among the ambiguous term (ex. "star"), the metaphorical meaning (ex. "famous person"), the literal meaning of the term, i.e. the vehicle of the metaphor (ex. "planet"), a literal unambiguous appropriate meaning (ex. "an actor"), and a randomly chosen term, without connection with the argument (ex. "fork"). An example for both literal and metaphorical middle term conditions is given in Table 2.

Example of strong argument without H middle term	Example of standard quaternio terminorum without DM middle term
P1 Banco di Sardegna is ___ **P2** ___ is a financial institution. **C** Banco di Sardegna is a financial institution.	**P1** Clooney is ___ **P2** ___ is a celestial body. **C** Clooney is a celestial body.
Options:	**Options:**
A BANK	A STAR
A FINANCE HOUSE	A FAMOUS PERSON
A RIVER SIDE	A PLANET
A MINE	AN ACTOR
AN APPLE	A FORK

Table 2. Examples of arguments to be completed and middle term options.

3.2 Rating studies

We tested middle terms, premises and conclusions of the arguments in a series of rating studies. A first set of terms was selected according to the number of letters and frequency in the GRADIT (De Mauro, 2000), to form H, P, DM, LM middle terms in the premises of the arguments. The emotional (positive and negative) meaning and familiarity of the selected terms were tested in the first rating study, in order to select just the terms with "neutral" emotional meaning and sufficient familiarity. We used the unambiguous terms as novel metaphors and then we devised the arguments in three categories: strong arguments, standard quaternio terminorum and quaternio terminorum with plausible conclusion. In the second rating study, we tested the premises and the conclusions of the arguments separately, to make sure that participants attribute either the same meaning to the middle terms in case of strong arguments, or different meanings in case of fallacious arguments. In the third rating study, we asked participants to assess whether they perceived the premises and the conclusions as true, false or

plausible. The results of the rating studies showed that the majority of sentences with a conventional metaphor (83%) were perceived as true while the majority of sentences with a novel metaphor (79%) were perceived as false (Ervas & Ledda, 2014).

3.3 Procedure

All the participants were asked for a written informed consent and the test was submitted to participants online via Google Forms. After gathering initial information on language and education, participants were asked to read the instructions and complete two practice blocks. The arguments, as well as the options for each argument, were randomly presented to participants. We asked participants to choose the option that in their opinion best fits the argument presented to them, thus testing their argument production in all the structure conditions: strong argument vs. fallacious argument (in both the forms of standard quaternio terminorum and quaternio terminorum with plausible conclusion) structure conditions.

4. RESULTS

To determine the statistical significance of the results, a one way repeated measure ANOVA was performed, comparing strong arguments, standard quaternio terminorum and quaternio terminorum with plausible conclusion within the same middle term (H, P, CM, NM) condition. The results, for each middle term condition, are reported in Table 3.

In the case of H middle terms, participants selected the ambiguous term mostly to build quaternio terminorum than strong arguments, where they alternatively chose also the unambiguous term having the meaning that fits the first premise ($p < .05$). Interestingly, they selected the metaphor significantly more often in the case of quaternio terminorum with plausible conclusion ($p < .01$) rather than standard quaternio terminorum. In the case of P middle terms, participants selected the ambiguous term to build both strong arguments and quaternio terminorum ($p < .05$). Interestingly they selected the literal meaning that fits the second premise especially in the case of quaternio terminorum with plausible conclusion ($p < .001$), when compared to both strong arguments and standard quaternio terminorum.

In the case of CM middle terms, participants selected the ambiguous metaphorical term mostly to build quaternio terminorum than strong arguments, where they significantly chose the explanation of the metaphorical meaning or the literal unambiguous meaning. Interestingly, in the case of quaternio terminorum, they selected the explanation of the metaphorical meaning mostly for fallacious arguments with plausible conclusion ($p < .05$) rather than standard quaternio terminorum ($p < .05$). In the case of NM middle terms, there was no statistical significance in the selection of ambiguous metaphorical terms, when comparing strong arguments and quaternio terminorum. In each argument structure conditions, participants preferred to select the explanation of the metaphorical meaning ($p < .05$) or the literal unambiguous meaning ($p < .01$).

H middle terms

	Strong Arguments	Standard quaternio terminorum	Quaternio terminorum with plausible conclusion
Ambiguous term	47.5**	80.6**	81.1
Literal meaning 1	39.5*	10.4*	1.1*
Literal meaning 2	11.5	6.3	10.5
Metaphor	1.5**	0	7.3**
Random	0	2.7	0

*= p < .05, **= p < .01, *** = p < .001

Table 3. Results in percentage for each middle term condition and argument structure condition.

5. DISCUSSION OF RESULTS

Overall the results show that participants avoid metaphorical terms when building strong arguments, when compared to other argument structure conditions, especially when metaphors are novel. As metaphors are a possible source of fallacies or they activate possible framing effects (Black, 1954; Lakoff, 2004; Thibodeau & Borodistky, 2011, 2013), participants probably avoided them in order to be sure to produce clear argument without source for misunderstanding. Moreover, they preferred to clarify the meaning of the metaphor, i.e. the way it is used in the first premise, or to use a literal (unambiguous) meaning. Interestingly, in the case of conventional metaphor, they significantly selected the corresponding literal meaning which still might work when the relevant property is selected in the second premise to produce a strong argument.

The results also show that participants selected the ambiguous term to produce fallacious arguments, especially in the case of standard quaternio terminorum. Unsurprisingly, lexical ambiguity is a good option to produce fallacious arguments that exploits the meaning shift of the middle term through the premises (Woods & Walton, 1989; Van Eemeren, 1992; Tindale, 2006; Copi, Cohen, & McMahon, 2014). However, NM middle terms seem to be an

exception: indeed, in the case of novel metaphors, participants never selected the ambiguous term (i.e. the novel metaphor itself), preferring the explanation of the metaphor, i.e. the metaphorical meaning, or even the literal appropriate meaning. The participants' choice might be due to the fact that novel metaphors, per definition, are more difficult to interpret, requiring a wider context to be fully understood (Gildea & Glucksberg, 1983; Glucksberg & Estes, 2000; Bambini et al., 2016). The selection of a novel metaphor is avoided even in the case of fallacious argument production, where arguments might easily be detected as fallacious when a novel metaphor appears in the first premise. Indeed, as testified by the rating studies, a majority of premises with novel metaphors are recognised as false by the participants, and possibly leading to an "ex falso quodlibet". A greater effort in interpretation is required to explain the meaning of a premise featuring a novel metaphor as it were meaningful and true (or at least plausible) (Gildea & Glucksberg, 1983; Glucksberg, 2003; Vega Moreno, 2007).

Also in the case of homonymous middle terms, participants significantly avoided ambiguous terms in the strong argument condition rather than in fallacious argument conditions, even though the ambiguous literal term could have been used with the same meaning in both the premises. Indeed, they significantly chose the proper literal meaning employed in the first premise they read to avoid ambiguity and thus possible misunderstanding. The case of polysemous middle terms seems somewhat different: participants significantly selected the polysemous middle term to build both clearly strong and clearly fallacious arguments. Differently from homonymous terms, where the disambiguation happens by default, by suppressing one of the two completely different literal meanings (Gernsbacher & Faust, 1991; Gernsbacher et al., 2001), in case of polysemy participants do not have a list of radically different lexicalised meanings to suppress, but instead different meanings overlapping in some semantic properties (Glucksberg et al., 2001; Rubio Fernandez, 2007).

As the two possible literal meanings of the polysemous middle term overlap, a strong argument precisely contains in the second premise the property that makes the argument a strong one (i.e. the property that clearly fits the meaning of the first premise), while a quaternio terminorum precisely contains the property that makes the argument a fallacious one (i.e. the property that clearly does not fit the meaning of the first premise). In both the cases, the property is given in the second premise of an argument with either a clearly true or a clearly false conclusion and therefore participants do not need to go through the process of disambiguation, which is more demanding when compared to the process required to disambiguate homonymous terms (Gernsbacher & Faust, 1991; Gernsbacher et al., 2001; Glucksberg et al., 2001). Indeed, in the process of homonymy disambiguation the irrelevant meaning disappears significantly more quickly, when compared to the process of polysemy interpretation, which requires more attentional resources to suppress the corresponding literal meaning (Rubio Fernandez, 2007), as a (set of) specific property(ies) need(s) to be detected. Instead, in the case of quaternio terminorum with plausible conclusion, the participants explicitly selected the literal meaning of the polysemous term that fits the second premise, plausibly because the property made explicit in the second premise does not align with neither a clearly true nor a clearly false conclusion. Therefore, instead of keeping the ambiguous term, participants are forced to select the literal meaning yielding the property that best aligns with the plausible conclusion.

In the case of quaternio terminorum with plausible conclusion with a conventional metaphor as middle term, participants selected either the ambiguous metaphorical term or the explanation of the metaphorical term. This suggest that, in order to maintain a plausible conclusion, participants deliberately chose to provide the middle term with either an implicit or even an explicit metaphorical reading. Instead, to maintain a clearly false conclusion, participants did not need to make explicit the metaphorical reading of the middle term: a conventional metaphor and an irrelevant (literal) property of the second premise are sufficient

to guarantee the production of the standard quaternio terminorum. In the case of novel metaphors, participants felt the necessity to make explicit the metaphorical meaning of the middle term not only for fallacious arguments with plausible conclusion but also for standard quaternio terminorum and strong arguments. Therefore for any argument structure condition with novel metaphors as middle terms, participants needed to clarify the metaphorical reading of the middle term to build an argument: the difficulty in novel metaphor interpretation and the possibility to be misinterpreted led them to make the metaphorical explicit in any case, independent from the argument structure condition and the type of conclusion.

6. CONCLUSION

In previous experiments on the understanding of arguments featuring metaphors as middle terms, results suggest that fallacious argument with conventional metaphors are more difficult to detect, as they covertly activate framing effects that lead participants to consider the premises as true and to adjust the metaphorical meaning according to the plausible conclusion. The revitalization of the conventional metaphors in the premises are guided by the need to confirm participants' belief in the conclusion (Ervas et al., 2018). Indeed, while novel metaphors consciously lead participants toward creative interpretations (Vega Moreno, 2007) from the reading of the first premise featuring the metaphor, conventional metaphors covertly influence their reading of the argument, especially when the conclusion is believable.

The results of the present experimental study on argument production suggest that participants generally avoid lexical ambiguities when producing strong arguments and vice versa exploit lexical ambiguities when producing fallacious arguments. However, the results show that novel metaphors are avoided in any case, even to produce standard quaternio terminorum. In order to produce an argument with a novel metaphorical meaning without being misinterpreted, participants prefer to make the metaphorical meaning explicit. On the contrary, participants made a deliberate use of conventional metaphors to produce fallacious argument and, in the case of plausible conclusion, they alternatively make the metaphorical meaning explicit, thus suggesting an overall metaphorical reading of the argument produced. The overall results suggest that it is easier to produce (believable) fallacies with conventional metaphors rather than with novel metaphors, where the implicitness of the metaphorical meaning is abandoned in favour of clarity and understandability of the argument.

Is there such a thing as a "conductive argument"? Pro/con argumentation in the temporal unfolding of a deliberative process

ISABELA FAIRCLOUGH

School of Humanities and Social Sciences
University of Central Lancashire
Preston, United Kingdom PR1 2HE
ifairclough@uclan.ac.uk

ABSTRACT: I examine a particular kind of so-called "conductive argument", i.e. a "balance-of-considerations", "pro/con argument" put forward in support a practical/normative conclusion. I argue that a "conductive argument" is not a single argument, but one of two main possible outcomes of deliberative activity. What (confusingly) appears to be a "conductive argument", as structure, is the summary of a process of critical questioning that has unfolded in time. "Conductive argument" is therefore, in my view, a misnomer.

KEYWORDS: deliberation, decision-making, decisive objection, conductive argument, counterconsideration, critical rationalism, practical proposal, practical reasoning, pro/con argument, time

1. INTRODUCTION

I propose to redefine so-called "conductive argument" in favour of a practical/normative conclusion ("proposal A is a reasonable course of action") in relation to the genre of deliberation[1]. Among Wellman's (1971) three "patterns" of "conductive argument", I am focusing on the third pattern, on "that form of argument in which some conclusion is drawn from both positive and negative considerations", or in which "reasons against the conclusion are included as well as reasons for it" (Wellman, 1971, p. 57). In the argumentation literature (Blair & Johnson, 2011), this pattern is also called a "pro/con", or a "balance-of-considerations" argument. Against previous proposals (Govier 2001), I argue that so-called "conductive argument" is not a single argument. What, confusingly, appears to be a "conductive argument", as a distinct structure, is a particular deliberative outcome (out of two main possibilities). A recapitulation or summary of a process of critical questioning, as it has unfolded in time, resulting in the conclusion that a particular proposal is reasonable and can be maintained, seeing as it has survived criticism, is indistinguishable from what is usually called "conductive argument".

Deliberating agents put forward (alternative) proposals for courses of action, conjecturing that these might help them achieve their goals. For decision-making to be rational, they should subject these proposals to criticism. The decision to adopt a particular proposal A will be reasonable if the hypothesis that A is the right course of action has been subjected to critical testing in light of all the knowledge available and has survived criticism. I adopt a critical rationalist view of decision-making (Miller 1994; 2006; 2013), seeing practical reasoning as a critical procedure that filters out those conclusions (and decisions) that do not pass the critical test of whether the consequences would be acceptable (Fairclough &

---

[1] I take for granted the distinction made by van Eemeren (2010: 138-143) among *genres*, *activity types* and concrete *speech events*. A particular debate (e.g. on a particular policy proposal), as speech *event*, instantiates the abstract category of policy debate as *activity type*, which in turn instantiates the abstract *genre* of deliberation. The intended outcome of deliberative activity types is a normative-practical conclusion (judgment) that can ground decision and action.

Fairclough, 2012; Fairclough, 2015; 2016; 2018a; 2018b; forthcoming). "Consequences" include known impacts, but also risks (which may not materialize). In addition, the situation where a proposal would clash with, or go against a moral or institutional principle, rule or norm, would also be an unacceptable consequence, on my account, should those principles, rules and norms (singly or collectively) be assessed as ultimately non-overridable in a particular deliberative context. So "consequences" is understood in a broader sense than simple cost-benefit analysis.

Any practical proposal A is likely to have a number of undesirable consequences. For a deliberating agent, some of these might be merely undesirable, but not ultimately unacceptable (e.g. applying for a job that requires a short daily commute, rather than no commute), but some might be genuinely unacceptable (e.g. applying for a job that requires an impossibly long daily commute, or is likely to clash with important family obligations). In the former case, the agent might conclude that "Proposal A is reasonable, although it will result in some undesirable consequences", i.e. in spite of *counterconsiderations*. In the latter case, if the potential consequences are deemed unacceptable, the agent may find it more reasonable to abandon the proposal. I will call such reasons – "the potential consequences of proposal A are unacceptable" – "decisive objections". As strong critical objections to a proposal, they indicate that it is unreasonable and should probably be abandoned. "Decisive objections" are therefore overriding reasons why a proposal should not go ahead, effectively rebutting it. I distinguish therefore between two kinds of objections against a proposal: *counterconsiderations* and *decisive objections.*

While testing various possible alternatives for achieving their goals, deliberating agents will consider reasons in favour ("pro") and reasons against ("con") each of these, in the form of the desirable and undesirable consequences they might result in. Not all the reasons against a proposal, as objections, will be assessed as having the same strength. Depending on how strong the objections are assessed to be, deliberating agents may come to two main conclusions:

1) *Proposal A is a reasonable course of action, in spite of the existence of a range of counterconsiderations*. The conclusion that *A should not go ahead*, always possible in principle, does not follow in this case, because none of the objections ("con" reasons) are deemed to be strong enough to warrant that conclusion: none are *unacceptable* (either singly or collectively).

In the absence of decisive objections, and seeing as there are "pro" reasons, the conclusion in favour of A can tentatively be maintained.

2) *Proposal A is an unreasonable course of action because there are decisive objections against it* (possibly in addition to counterconsiderations), *and in spite of a number of potentially positive consequences.* In this case, the potential "conductive" argument tentatively supporting A (in light of its positive effects and in spite of counterconsiderations) will collapse into a deductive argument in support of not doing A. The conclusion in favour of A can no longer be maintained (not even tentatively).

The gist of my account is therefore the following: a practical proposal that has withstood critical testing (i.e. no *decisive objections* have emerged against it, capable of rebutting it), together with both the "pro" and "con" reasons that have emerged as relevant to it during deliberation (with oneself or with others), is indistinguishable from a so-called "conductive" argument in favour of that proposal. What appears to be a "conductive" argument is a recapitulation or summary of the deliberative process, as it has unfolded in time, in a particular situation. This is the situation where, having examined both "pro" and "con" reasons, and having concluded, by asking and answering critical questions, that none of the "con" reasons are *decisive objections* but only *counterconsiderations*, and also in light of proposal's potential to achieve the stated goals and other positive effects, the deliberating agents have concluded that proposal A can be maintained. What is meant by this is nothing more than: *proposal A has*

so far survived criticism and can be provisionally accepted, as a reasonable alternative, subject to decisive objections coming to light at a later date.[2]

2. THE CURRENT CONSENSUS: REPRESENTING "CONDUCTIVE ARGUMENTS" AS SINGLE ARGUMENTS

Interest in the concept of "conductive" argument was revived by Govier (1999; 2001; 2010a; 2010b), who suggested that *counterconsiderations* to a conclusion should be represented as "wavy lines" or "wavy lines and a bar" (Figure 1). On her view, "counterconsiderations should not be regarded as premises of an argument, because they do not support the conclusion and are not put forward by the arguer as supporting the conclusion" (Govier, 2001, p. 396). She also suggests that the "weighing" metaphor adequately captures what goes on in conductive reasoning. Namely,

> a person who acknowledges counterconsiderations and nevertheless still wishes to put forward the argument that his conclusion is supported by positively relevant premises is committed to the judgment that the supporting (positively relevant) premises outweigh the counterconsiderations.

In other words, "although there are reasons for [the] conclusion and reasons against it, the reasons for it are stronger and more convincing than the reasons against it" (Govier, 2001, p. 396).

In a more recent collection of proposals on how to define, analyze, represent and assess "conductive arguments" and "conductive reasoning", published by Blair & Johnson (2011), Hansen (2011) has suggested that "conductive arguments" contain an implicit *on-balance (OB) premise*, saying that *on balance, the pros outweigh the cons*, thus which acknowledging that the weighing of pro/con reasons is an essential part of such arguments (Figure 2).

Figure 1. Representing conductive arguments (taken from Govier, 2001, p. 395)
Figure 2. Representing conductive arguments (taken from Hansen, 2011, p. 40)

In the same volume, integrating proposals for the representation of pro/con arguments made by Govier (1999), and of objections by Hitchcock (1983), Jin (2011) suggested the diagram in Figure 3. Here, two considerations are independently supporting the conclusion, and two considerations are independently opposing it. Even if the latter are acknowledged by the arguer, the conclusion can still be maintained, because the cumulative support of the "pro" considerations outweighs the cumulative objection of the counterconsiderations. The "pro" reasons manage to "shunt aside" (Hitchcock's term) the "con" reasons.

---

[2] The critical rationalist view of deliberation and decision-making adopted here is different but not incompatible with the frameworks for deliberation proposed by Hitchcock et al. (2001) and McBurney et al. (2007).
Figure 3. Representing conductive arguments (taken from Jin, 2011, p. 29)

3. MY PROPOSAL: REPRESENTING PRO/CON ARGUMENTATION AS DELIBERATIVE PROCESS

All of these proposals assume that "conductive argument" is a single argument. A particular conclusion is defended, for reasons X and Y, in spite of the existence of reasons Z and W. This is because reasons X & Y (the "pros") are said to outweigh Z & W (the "cons"). Because, on this view, a "conductive" argument is a single argument, and the negatively relevant reasons cannot by definition support the conclusion, but count against it, these reasons (generically called "counterconsiderations") are not (and could not be) "premises" (Govier, 2001, p. 396).

Contrary to these views, I suggest the following:

1) There are no "conductive arguments", if what is meant by the terms is a single argument, consisting of one conclusion and two sets of reasons (positively and negatively relevant to that conclusion). Instead, two possible conclusions ("A is reasonable" and "A is not reasonable") are always potentially in play, and which one will survive criticism is to emerge at the end of a process of critical questioning. For practical/normative conclusions, critical questioning takes place in a deliberative generic framework, and the acceptability of the conclusion is tested in the light of its possible or known consequences, and of how it might survive in conditions of uncertainty. (A critical rationalist perspective acknowledges that a proposal with potentially unacceptable consequences need not be discarded if there is a satisfactory Plan B, insurance or mitigation strategy in place; often, such proposals are not discarded because agents are willing to take the risk of unacceptable consequences materializing.)

2) The "con" reasons are premises (what else could they be?) in an argument criticizing the proposal, and thus potentially supporting the opposite conclusion ("A is not reasonable"). They originate as objections to proposal A, potentially supporting the opposite conclusion. If the "con" reasons, intended as objections to A, are found to be *decisive objections*, it will be more reasonable to abandon A. If these objections are found to be mere *counterconsiderations*, it will not follow that A should be abandoned. Nor will it follow that it should be adopted, or that it is recommended, least of all that it is the best course of action, but merely (at this stage) that it is a reasonable course of action (among other possibly reasonable alternatives). The conclusion that A is the *best among alternatives* can only emerge by further critical questioning, once all unreasonable alternatives have been eliminated, and in light of some criterion providing a reasonable basis for choosing the "best" course of action among *reasonable* alternatives (Fairclough, 2015).

3) A crucial distinction must be drawn between *counterconsiderations*, as objections that can be incorporated into the arguer's case, and *decisive objections*, as objections that (being assessed as stronger) cannot be thus incorporated, but lead to the collapse of the case in favour of doing A. I have previously (Fairclough, 2015; 2018) used the term "critical objections" for those objections that (unlike *counterconsiderations*) can rebut the conclusion in favour of a

proposal. To avoid confusion, seeing as all objections, weak or strong, are in a sense "critical", I have suggest here changing the term "critical objection" to "decisive objection". Thus, in a process of critical questioning, in dialogue, arguers may assess an objection aimed against a proposal as being a mere *counterconsideration*, in which case the case for A may still stand, or as a *decisive objection*, in which case the case for A is rebutted. In practical reasoning, potential consequences of a course of action that are deemed to be unacceptable will be decisive objections against it.

The distinction between *counterconsiderations* and *decisive objections* is emphatically not one and the same with that between *counterconsiderations* and *objections*, which has been usefully clarified by Johnson (2011) and acknowledged by Govier (2011b). If, originally for Govier (2001, p. 395), "counterconsiderations" and "objections" were one and the same thing, it has become clear, in the meantime, that it was in fact a mistake to conflate the two.

> Counter-considerations are claims negatively relevant (or taken to be negatively relevant) to the acceptability of the conclusion and acknowledged by the arguer to have that status. As such, counter-considerations are part of the arguer's case. If, after being raised in a dialectical context, objections come to be acknowledged by an arguer and incorporated into an adapted argument, at that point they would play the role of counter-considerations (Govier, 2011b, p. 2).

This is also the view taken here. Objections are raised by a critic (an external critic or, in the case of monological deliberation, the arguer him/herself, as antagonist of his/her own standpoint), and may be incorporated into the arguer's case as *counterconsiderations* (in which case the original standpoint can be maintained). Objections can also lead to the abandonment of the original standpoint, and the disintegration of the pro/con, "conductive argument", in those cases when they cannot be incorporated into the original argument, because they are *decisive objections* that simply rebut the case in favour.

My proposal is therefore to distinguish not only between *objections* (as raised by a critic) and *counterconsiderations* (as assessed by the arguer) – as Johnson (2011) has done – but between *objections* (as raised by a critic), on the one hand, and two ways these may be assessed by arguers, on the other hand: (a) as *counterconsiderations*, and (b) as *decisive objections*. If proposal A has survived criticism in light of the critic's objections, then those objections can be incorporated into the final argument as *counterconsiderations*. If the objections have been deemed to have a much stronger critical force, to be *decisive objections* (i.e. the consequences of A, if performed, would be unacceptable), then those objections, as rebuttals, will conclusively support the opposite conclusion, and A should be abandoned. These two distinctions are captured in Figure 4.

CRITICAL QUESTIONING OF *PROPOSAL A* IN A CONTEXT OF DIALOGUE	
CRITIC (ANTAGONIST) RAISES:	**ARGUER** (PROTAGONIST) ASSESSES OBJECTION AS EITHER:
OBJECTION AGAINST *PROPOSAL A*	**COUNTERCONSIDERATION** → *PROPOSAL A* HAS (PROVISIONALLY) SURVIVED CRITICISM
	DECISIVE OBJECTION → *PROPOSAL A* IS (CONCLUSIVELY) REBUTTED

Figure 4. The antagonist's *objections* (left) are evaluated by the protagonist (right) as either *counterconsiderations* or as *decisive objections*.

To sum up, in deliberative activity types, in a context of dialogue, objections may be raised by a critic against a proposal that is being tested. The critic may point out, for example, that A is likely to have an undesirable, possibly even an unacceptable consequence. Assuming the arguer acknowledges this objection, including the particular way it is formulated (or 'framed')[3], as relevant to his case, he can assess its critical force in two main ways:

(1) as a (mere) *counterconsideration*, incapable of rebutting the conclusion, in which case he may still maintain his commitment to the proposal and can incorporate the objection into his original case.

(2) as a decisive *objection* (or rebuttal), in which case he will no longer be able to maintain his commitment to the proposal; a *decisive objection* cannot be incorporated into the original case in favour of the conclusion, but indicates that conclusion is false, and the proposal must be abandoned. A *decisive objection* conclusively supports the opposite, negative conclusion ("A is not reasonable").

The assessment of an objection as being a *counterconsideration* or a *decisive objection* is the result of a process of critical questioning. Once an objection is raised, the arguer may or may not see immediately that it is decisive and rebuts his case, even if later on, as a result of further dialogue, he might assess it as such. Or, several objections that are individually assessed as mere *counterconsiderations* may end up being deemed to rebut the positive conclusion through their cumulative force. In this case, it may not be reasonable to go ahead with A in the face of so many *counterconsiderations*, though none was individually assessed as a *decisive objection*. What objections there are against a proposal and how strong they are is not known entirely in advance, but will emerge in a process of critical questioning, unfolding in time, within a deliberative process.

On a critical rationalist perspective, practical statements (like theoretical ones) can be provisionally accepted or conclusively rejected based on how they withstand criticism in light of their potential consequences. Let us assume that one alternative A_1 is being tested among several possible ($A_1 \ldots A_n$). Figure 5 represents both potential conclusions (A_1 and non-A_1): which one will be actualized depends on how the conclusion will fare in the process of critical testing. Clearly, both conclusions cannot both be true at the same time, and one will be discarded at the end of the deliberative process. The conclusion on the left side (*Proposal A_1 is not reasonable*) will follow conclusively if it is the case that one or more objections have been (singly or collectively) assessed as *decisive objections*. The conclusion on the right (*Proposal A_1 is reasonable*) can be tentatively, provisionally maintained if it survives criticism, that is, if it is indeed the case no objection, singly or collectively, is a *decisive objection*, but merely a *counterconsideration*.

A proposal can only be assessed as potentially reasonable if, having gone through a process of critical testing to the best of the deliberating agents' knowledge, it has withstood criticism (i.e. no decisive objections have emerged against it). In the diagrams below, the statements in the boxes shown in bold are added, as premises, to the original premise set as a result of the process of critical questioning, as it unfolds during deliberation.

---

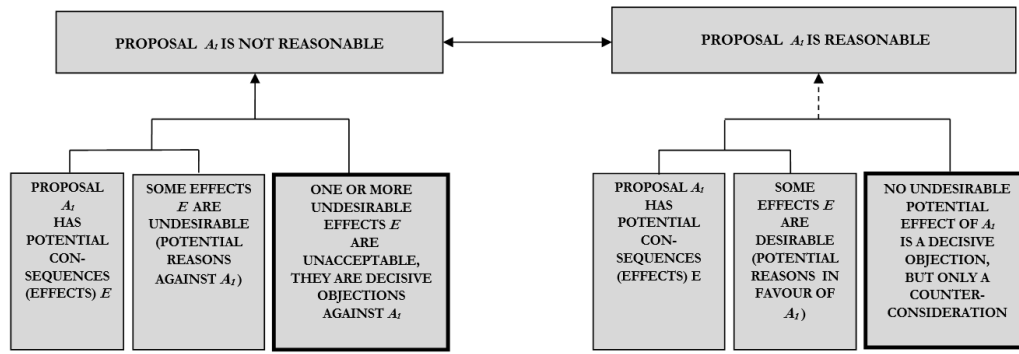
[3] Arguers (or the deliberating agents involved in the critical testing of a proposal) may not acknowledge their critics' objections, including the particular way they are framed. I focus here on the simple case in which the same objections are acknowledged by both parties, and there is no incompatible divergence between the way these objections are framed on each side. In the case discussed here, there can be intersubjective disagreement (resolvable or not) concerning the strength of objections (are they mere counterconsiderations or decisive objections?). I do not discuss the more complex case where there is divergence in the way the pro/con reasons are framed (discussed by Wohlrapp 1998; 2011), nor the case where the pro/con reasons advanced by one side are not recognized as relevant by the opposite side.


Fig. 5. Deliberation scheme: Proposal may be rebutted in light of *decisive objections* (left) or may survive criticism if there are no *decisive objections* (right).

Figure 6 represents the situation where the case in favour of doing A is rebutted by one or more *decisive objections* that have come to light by critical questioning. The argumentative configuration previously shown in Figure 5, *where either conclusion was in principle possible*, before critical questioning was allowed to proceed, has now collapsed into a deductive argument in favour of non-A (left-hand side). Namely, if it were true that the potential consequences (singly or collectively) were unacceptable, then it would follow conclusively that A is not a reasonable course of action. While the statements on the right-hand side (the positive consequences) may still be true, no argument (not even a defeasible one) can be made starting from these statements as premises (the blank box where the "pro" conclusion would have been is supposed to suggest this). The positive conclusion (*Proposal A₁ is reasonable,* possible in principle) cannot be drawn at all any more, not even defeasibly. In the absence of a premise saying that *there are no decisive objections*, it can no longer be maintained that the proposal is reasonable. That conclusion is in fact rebutted by the fact that there are such objections.

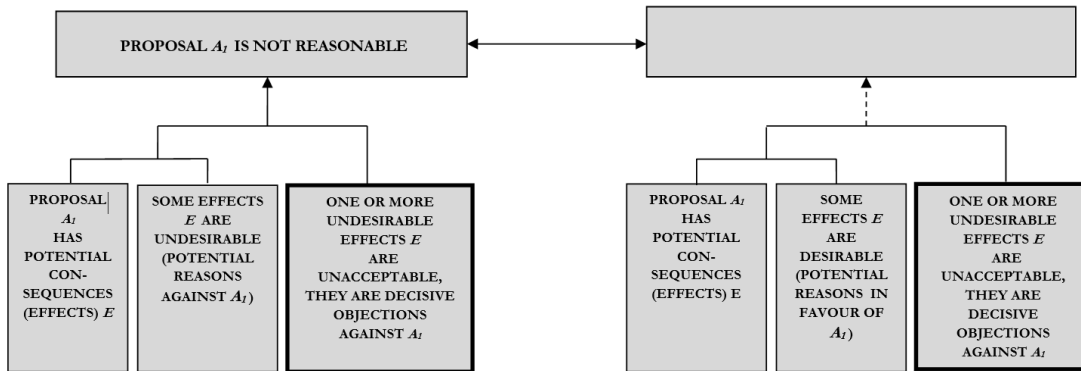

Figure 6. There are *decisive objections* to the proposal: it follows conclusively that it is not reasonable.

By contrast, Figure 7 captures the situation when, at the end of a process of critical questioning, to the best of the critics' knowledge, no *decisive objections* have come to light. The proposal has survived criticism: the objections have been assessed as (mere) *counterconsiderations*. In this case, it does not follow that the proposal should be abandoned. The proposal can be provisionally, tentatively, adopted, subject of course to stronger, decisive objections coming to light at a later date. The conclusion that A is not reasonable (left), while possible, in principle,

has not obtained in this case (the blank box where this conclusion would have been is supposed to represent this).

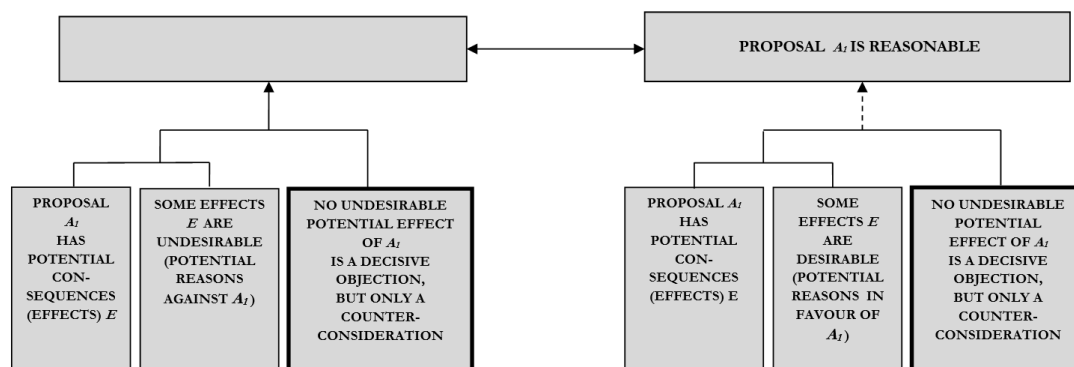

Figure 7. There are no decisive objections, only counterconsiderations; proposal A can be tentatively maintained.

In both Figures 6 and 7, the statements that used to be premises in the arguments shown in Figure 5, but no longer "support" any conclusion, and are left stranded, can be included into a summary of the deliberating process. Having assessed both "pro" and "con" reasons, deliberating agents may conclude that:

(1) although it has potential desirable consequences ("pro" reasons), proposal A is ultimately unreasonable and ought to be rejected, because (among the "con" reasons) there are decisive objections against it (Figure 6) – i.e. the proposal has not survived criticism, or:

(2) although it has potential undesirable consequences ("con" reasons), proposal A is reasonable and can be provisionally maintained, because (among the "con" reasons) there are no decisive objections against it (Figure 7) – i.e. the proposal has survived criticism and there is no compelling reason, at least for the time being, why it should be abandoned.

It is easy to see how the latter summary captures the logic of a so-called "conductive argument" in favour of proposal A. This summary, which reduces a process to its a-temporal end-result is in fact virtually indistinguishable from what is commonly called "conductive argument". To speak of this *process* – unfolding over time and involving the raising and assessment of objections in a context of dialogue – as a "single argument" (and somewhat on a par with deductive and inductive arguments, as a distinct "type" of argument), is in my view a category mistake.

4. CONCLUSION

Deliberation occurs in time. Arguers put forward proposals in view of goals, values and the situation they are in. Proposals are not strictly speaking supported or justified by these premises, but are informed guesses, hypotheses, or conjectures that some course of action might solve the problems and achieve the goals. Deliberating with themselves or with others, rational arguers will subject these conjectures to critical testing. What consequences might come about, assuming they went ahead with a proposed course of action? Would these consequences be ultimately acceptable? The answers provisionally given to these questions may themselves be questionable. There may be disagreement between the arguers and their critics, or between deliberating agents, on the severity of a particular consequence. What is a merely an undesirable but ultimately an acceptable consequence to someone may be totally unacceptable to someone else. At the end of a process of critical questioning, arguers will either conclude that, at least for them, and to the best of their knowledge, a particular proposal that seems capable of

achieving their goals may be maintained, seeing as there are no *decisive objections* against it, or they may conclude that it has to be discarded, seeing as there are such reasons.

I have argued against seeing "conductive argument" as a single argument, and suggested a view of deliberative dialogue, involving a process of critical testing of proposals, in which objections are raised and their critical force is assessed. A possible deliberative outcome is the conclusion that a particular proposal must be discarded as unreasonable, seeing as the objections that have been raised against it are *decisive objections*, not mere *counterconsiderations*. This is to say that the consequences of that proposal, if adopted, would be ultimately unacceptable. Having decided to abandon a proposal, deliberating agents can start testing another alternative. But whenever a proposal has survived criticism, i.e. whenever it is not rebutted by decisive objections, and whatever objections are raised are assessed as *counterconsiderations*, a recapitulation of the whole process of critical testing that deliberating agents have engaged in, including the reasons in favour and the reasons against the proposal, takes the form of what is usually called a "conductive" argument. This (instant) summary, at the end of a (temporal) process whose purpose has been the critical testing of a proposal, is in fact one and the same with a so-called "conductive" argument in favour of that proposal.

ABSTRACT: Based on insights from the field of educational psychology, we designed and implemented an eight-week, small-scale intervention for first year university students in educational sciences. Critical thinking and argumentation skills were fostered through small-group classroom discussions. Tentative findings from focus-group interviews suggested that students benefited from our approach. Theoretical and educational implications are also presented.

KEYWORDS: argumentation, arguing to learn, critical thinking, epistemic cognition, inquiry dialogue, internalisation, reasoning, thinking skills

1. INTRODUCTION

Critical thinking is a core competence that enables 21st century citizens to navigate multiple streams of information and make informed decisions about increasingly complex issues (OECD, 2016); critical thinking is also more necessary than ever due to increased access to (diverging) information of varying degrees of reliability (Goldman, Braasch, Wiley, Graesser, & Brodowinska, 2012), social responsibility to act on available information (Murphy, Firetto, Wei, Li, & Croninger, 2016), and the prevalence of phenomena such as Fake News in the so-called "post-truth era" (Sinatra, 2018). However, while it is a national goal of education systems internationally (e.g. National Governors Association Center for Best Practices, 2010; Norwegian Ministry of Education and Research, 2016), teaching students to think critically remains a challenge; students at upper-secondary level feel unprepared for the academic demands of tertiary education and teachers in higher education view students' critical thinking skills as "underdeveloped" (Lødding & Aamodt, 2015).

We addressed the issue of developing critical thinking by designing and instructing a course with a focus on argumentation and critical thinking skills that was situated in the domain of education. We adopted a view of critical thinking as "purposeful, self-regulatory, judgment that results in interpretation, analysis, evaluation, and inference, as well as explanations of the considerations on which that judgment is based" (Abrami et al., 2015, p.275), and built on theoretical and empirical knowledge from research on educational psychology; specifically, the interrelated fields of epistemic cognition, critical thinking and argumentation.

In this paper we present the critical thinking class that was designed and taught in Norway. We begin by presenting the theoretical framework upon which the class rested, before describing main elements from the teaching, including an overview of the topics, methods and class environment, as well as tentative findings from focus group interviews, that form the basis of theoretical and educational implications, and suggestions for future research.

2. THEORETICAL BACKGROUND

In this section we briefly present three interrelated bodies of knowledge that provide our theoretical background: epistemic cognition, critical thinking and argumentation.

Educational research on epistemic cognition mainly focuses on students' beliefs and cognitions about knowledge and the process of knowing (Greene, Sandoval, & Bråten, 2016).We view epistemic cognition as a particularly important point of departure for our research in light of theoretical and empirical relations between academic achievement (Greene, Cartiff & Duke, 2018), comprehension of single and multiple texts (Bråten, Strømsø & Ferguson, 2016), written argumentation (Bråten, Ferguson, Strømsø & Anmarkrud, 2014) and disciplinary learning (Sandoval, 2016), which we view as pertinent for the development and practice of critical thinking. There are several approaches to educational research on epistemic cognition (Hofer, 2016), including developmental views outlining a general progression in individuals' understanding and views of knowledge (Kuhn, 1999); systems of beliefs views of epistemic beliefs as a set of independent-but-related beliefs about knowledge and knowing (Hofer & Pintrich, 1997; Schommer, 1990), and situated views of epistemic cognition (Chinn, Buckland & Samarapungavan, 2011). Notably, each of these approaches can be related to critical thinking and argumentation (Greene & Yu, 2016; Kuhn, 1999).

According to developmental views, epistemological understanding develops over time, as a result of experience and education (Kuhn, 1999). Accordingly, individuals may progress through general stages from *realists'* with faith in one true reality, to *absolutist* epistemological views, where knowledge is objective and resides in external authorities, to *multiplist* assertions that equate all knowledge claims with equally valid opinions, irrelevant of knowledge claimant, and finally, some individuals will adopt *evaluative* epistemologies, after realising that some claims are more valid and justified than others (Kuhn, 1999). With respect to developmental epistemological views, Kuhn (1999) suggests that absolutist and multiplist knowledge views are necessary precursors to engagement in critical thinking, but individuals that adopt such stances are unlikely to engage in critical thinking, since knowledge claims are either right or wrong and can be resolved through appeal to authorities, on the one-hand, or everything is correct and equally valid, rendering the need for critical thinking obsolete, on the other. Meanwhile, individuals that develop evaluativist understandings may engage in critical thinking in order to appraise or justify claims, based on scientific thinking or standards. Kuhn (1999) also relates views of knowledge to views of self and agency in relation to knowledge construction and metacognitive development, which may further influence engagement, as well as learning approach.

Educational researchers have also identified specific dimensions of beliefs about the nature of knowledge and the nature of knowing: specifically, beliefs about the relative certainty (or tentativeness), simplicity (or inter-relatedness), and source of knowledge (from personal, to external sources of knowledge), as well as ways of justifying knowledge claims (from personal experiences to testimony by alignment with external authorities), with each of the these four belief types existing on a continuum of more-or-less availing beliefs (Hofer & Pintrich, 1997; Muis, 2004). Systems-of-beliefs views of epistemic beliefs have identified relations between specific dimensions of epistemic beliefs and higher order thinking, including critical thinking (Chan, Ho & Ku, 2011), multiple documents literacy (Bråten, Britt, Strømsø & Rouet, 2011) and argumentation (Bråten et al., 2014). For example, students that believe that knowledge develops over time (rather than being static), is inter-related (rather than "chunks" of independent facts) and must be cross-checked with other sources, are more likely to engage in deeper processing and corroboration (Bråten et al., 2011), and produce more integrated (coherent) written arguments (Bråten et al., 2014).

The third strand of educational research on epistemic cognition that is relevant for our approach has its basis in philosophical literature and focuses on individuals' epistemic aims and values, ideals, and reliable processes for achieving said epistemic aims (Chinn, et al., 2011; Chinn, Rinehart & Buckland, 2014; Chinn & Rinehart, 2016). Thus, individuals are said to adopt certain aims, such as gaining knowledge and understanding or avoiding false beliefs in relation to different topics. These aims, as well as the values attached to them further influence cognitive processing, and their achievement will be judged in light of epistemic ideals, or standards, such as fitting with existing knowledge or evidence, or lack of counter-evidence. Lastly, the processes invoked by or relied upon by individuals to achieve epistemic aims, such as scientific experiments, replication or argumentation, may be more or less reliable for achieving the aims that have been set (Chinn et al., 2014). Inspired by this line of thinking, we view epistemic cognition as cognition aimed at developing knowledge, understanding and other epistemic aims. Further, we view reasoned argumentation as a reliable process towards developing deeper understanding, and a prerequisite for critical thinking.

Despite increased research focus on critical thinking, a long and interdisciplinary history have resulted in a construct that is neither well-defined nor understood (Alexander, 2014; Siegel, 2010). This paper adopts a working definition of critical thinking that consists of a skills and a will component; prominently featured skills have included interpretation, analysis and evaluation, and will components have varied from everything from dispositions and virtues, to metacognition and self-efficacy (Greene & Yu, 2016). Already in the first paragraph of the introduction to the Handbook of Epistemic Cognition (Greene et al., 2016), readers' attention is brought to a need for "critical reflexivity" and "critical thinking" (p.1), underlining strong theoretical links between the cognitive processes. Moreover, Greene and Yu (2016) assert the need for epistemic cognition in critical thinking, further highlighting links between analysis and evaluation (in critical thinking researchers' terms) and "discipline-specific epistemic practices" (p.48). Relations between critical thinking and argumentation are implied in the research areas' definitions and operationalisation (Cottrell, 2011), though their boundaries are often unclear.

In sum, there are complex relations among epistemic cognition, critical thinking and argumentation that we wished to further investigate. In this study, we focused primarily on critical thinking skills, in particular, evaluation and appraisal of others' arguments through critical reading and source evaluation, and production (composition and synthesis), or *reasoned argumentation* (see section below on Intervention). In light of the centrality of reasoned argumentation in learning and thinking generally and critical thinking specifically (Alexander, 2014), as well as our view of reasoned argumentation as a reliable process for learners to gain deep understanding and discipline-specific knowledge, we aimed to adopt a view of argumentation that aligned with Reznitskaya and colleagues (Bråten, Muis & Reznitskaya, 2017; Reznitskaya & Gregory, 2013; Reznitskaya & Wilkinson, 2013; see below), who emphasize the way that individual cognition is shaped by social interactions and the role of verbal dialogue in this process. We see this as aligning with Kuhn and colleagues' ideas on the importance of teaching the thinking skills underlying argumentation (Kuhn, Hemberger & Khait, 2016), which we further equate with evaluativist views of knowledge (Greene & Yu, 2016; Kuhn, 1999).

An important premise of this paper is that critical thinking skills and epistemic cognition can be improved through domain-specific interventions (Abrami et al., 2015; Greene &Yu, 2016). Recently, Murphy and colleagues (Murphy, Rowe, Ramani & Silverman, 2014; Murphy et al., 2016) suggested that critical thinking can be fostered by small group discussions, scaffolding and gradual release of control from teacher- to student-led discussions in classroom contexts where knowledge building and evaluation processes are cultivated and valued. This line of thinking is further supported by Reznitskaya and colleagues (Bråten, et al., 2017; Reznitskaya & Gregory, 2013; Reznitskaya & Wilkinson, 2013): In a program of research

examining the role of dialogic teaching in teacher and student thinking, Reznitskaya and colleagues have found that embodied sociocultural and constructivist theories of learning help students develop higher order thinking and deeper understanding. Specifically, having teachers involve students in collaborative construction of meaning and control in the classroom, focusing on use of open questions, persuasion and inquiry dialogue has been associated with increased epistemological understanding, argument skills and disciplinary knowledge in students.

3. CONTEXTUALISING THE INTERVENTION

On the basis of this theoretical and empirical framing, we set out to design and teach a critical thinking skills class that focused on argumentation and encouraged development and internalization of an evaluativist epistemology.

Teaching took place at the faculty of education of a relatively large university in Norway. The course was eight weeks long and there were initially 10 students and three staff members following the course. Due to the voluntary nature of the class, and its impractical teaching time, attrition levels were high. The final sample therefore consisted of two students and three faculty, and the class was taught by both authors, collaboratively. In terms of the students' 'critical thinking starting points', we viewed both their tendency to engage in, and knowledge of critical thinking as low. This is based on research findings in Norway (Lødding & Aamodt, 2015), as well as students' responses to Frederick's (2005) three-item Cognitive Reflection Test and the open question "What is critical thinking?".

We, the teachers, had a specific focus on creating and maintaining an epistemic climate of inquisitiveness and open-mindedness, and the students were constantly reminded that the "threshold" for participation should be as low as possible. The small group of faculty and students (or experts and novices) provided opportunities for small-group discussions, explicit modelling, as well as scaffolding by attending staff and the class-teachers.

In the preliminary lessons (1-3) there was extra focus on getting students used to the class ethos and working methods. Also, we explicitly taught aspects of argumentation theory based on an adapted version of Toulmin's model of argumentation (Felton, 2005). Thereafter students had to decompose short arguments in pairs, for example, by identifying claim and evidence. We also drew on longer, syllabus texts from educational sciences and interrogated these critically with the students. In lessons three and four we had students consider clarity, coherence, as well as underlying assumptions in texts. Source evaluation and reading strategies are intimately linked to epistemic cognition and critical thinking (Bråten et al., 2011). These were therefore addressed in subsequent lessons before more attention was given to argument construction. Our focus on argument deconstruction and production was mainly on short popular science texts with educational themes (e.g., relating to gender differences in education). Source evaluation was taught using a contrasting case approach that makes students explicitly consider ways of thinking about document features (Braasch, Bråten, Strømsø, Anmarkrud & Ferguson, 2013). The reading strategies lesson also drew on research on text comprehension. This teaching plan was inspired by Cottrell (2011).

Also, in keeping with inquiry dialogue principles, we worked with debatable issues throughout the class. Each class started with a brief introduction and there were ample opportunities to use the hands-on skills and ways of thinking that we were teaching. There was an explicit expectation that students attending the class should participate verbally. Following Halpern and Reggio (2003), we also intended to leave room for written reflection after every class, that we could collect and use as an empirical data source. However, this proved to be more challenging for the students than envisaged, with very few students engaging in the task

beyond short generalized and largely positive evaluations on the usefulness of the class. We did not pursue this beyond the second class.

4. METHOD

After the intervention, we conducted semi-structured interviews with both students and staff. The purpose was to provide both groups with a springboard to reflection on the content and format of the intervention. We interviewed two students and three members of staff as two separate focus groups. We followed an interview guide in each case which revolved around two inter-related issues: 1) teaching and instruction and 2) learning gains and value of the course.

The interviews were audio-recorded and transcribed verbatim. Our first analytical step was to conduct a frequency analysis of a selection of evidential expressions used in both interviews. We limited our selection to a set of verbs indicating cognitive states and attitudes (e.g. think, believe) and epistemic adverbs (e.g. maybe, absolutely). The purpose was to gain an insight into the kinds of epistemic positions the two participant groups adopted situationally, particularly how they constructed their access to evidence and the evidential strength of their justification (e.g. "think" versus "feel"). Furthermore, we were interested to see the degree of epistemic support given to propositions (e.g. "perhaps" versus "absolutely").

We then coded the data thematically in NVivo. The three focal, theoretically-grounded coding areas were: 1) knowledge, 2) critical thinking and 3) learning and instruction. Beyond this, our analysis was data-driven and exploratory, focusing on the participants' constructions and co-constructions of the key concepts. While some responses were prompted by specific questions that explicitly targeted the key concepts, some emerged spontaneously in the conversational flow of the interview.

Our coding categories were not necessarily discreet: for example, participants may have talked about *learning in a generic sense* but also *learning about critical thinking*. In such instances, the specific excerpt was coded as both. While we were primarily interested to see how the two participant groups chose to construct these concepts and what thematic dimensions they underscored, we also looked at the extent to which the two groups aligned in their views.

5. TENTATIVE FINDINGS

Table 1 gives an overview of the patterns that emerged from analysis of the data[1] in step one (Frequency analysis):

English	Norwegian	Students	% of total	Staff	% of total
Think	Tenker	23	0,73	38	0,51
Believe (personal access to evidence)	Synes	14	0,44	36	0,49
Believe (non-personal access to evidence)	Tror	2	0,06	34	0,46

[1] Expressions with frequencies below two were excluded. Note also that interviewer turns were excluded from the analysis.

Know	Vet	5	0,15	17	0,23
Feel	Føler	8	0,25	2	0,02
Maybe	Kanskje	13	0,41	35	0,47
Absolutely	Absolutt	7	0,22	5	0,06

Table 1: Frequencies of evidential expressions (total word count - student discourse: 3144; total word count - staff discourse: 7357).

Looking at the word frequencies relative to the total number of words, we see that the verbs "think" and "feel" figured relatively prominently in the student discourse and their relative frequencies of use were higher than in the staff discourse. The students also provided more epistemic support to their propositions through their use of the adverb "absolutely". The Norwegian non-personal access evidentiality verb "tror", on the other hand, hardly figured in the student discourse at all. Although the students used evidential expressions that indicate personal sources of evidence, such as the Norwegian "synes", less frequently than the staff, these expressions were nonetheless among the three most frequently used evidential expressions in the student corpus.

The staff discourse shows a different pattern. They used verbs that indicate personal access to experience ("synes") almost as much as verbs that indicate non-personal access to experience ("tror"). They also expressed more doubt through their use of the epistemic adverb "maybe". Of note is also the virtual absence of the perceptually-based evidential expression "feel" and the epistemic adverb "absolutely".

As will be clear through our subsequent presentation of findings, the frequencies also provide an indication of the wider thematic patterns in the data.

5.1 Knowledge

The course participants constructed the concept of knowledge along three main dimensions. The first was related to the notion of the simplicity of knowledge. Knowledge was seen as a human attribute that develops from simple/novice to more advanced/expert forms. In both student and staff interviews, this dimension was further nuanced in terms of two concepts, time and practice, seen as necessary for knowledge to evolve along the novice-expert continuum. This was marked by various temporal expressions, such as numerals denoting a specific passage of time and grammatical aspect, such as in the following examples: "I have had thirty years of practice in this." (Staff); "They have done this for many more years than I." (Student).

The second dimension concerns the notion of the certainty of knowledge. This was particularly dominant in the student interviews and emerged as both relational and processual. The relational aspect was constructed primarily as giving right and wrong answers in an interactional context with the staff: "The thing is one is a bit afraid of answering wrong" (Student). The processual aspect transpired in the students' descriptions of the ways through which one becomes more aware of the uncertainty of knowledge and even the liberating effects this may have. The deictic expressions used in these reflections refer specifically to participation in the intervention:

((Before))[2] I thought, well what is true and was is not… I was more lost, what can I trust in my own understanding? So it has become more - it is fun I think to look at and analyze things now" (Student)

---

[2] Mentioned in preceding discourse, words in double parentheses have been added to retain grammatical correctness and ease reading.

The third dimension revolved round the issue of metacognitive development. Knowledge was here constructed as something that becomes explicit through training. It was particularly the intentional effort it takes to be acquainted with the tools for acquiring, systematizing and applying knowledge that was underscored here: "What does ((the text)) aim at, does the article try to trick me or is it realistic?" (Student 1); "Conscious, that's the key word for me, to be more conscious" (Student 2).

Additionally, our analysis revealed that knowledge was constructed as domain-specific. It was particularly the staff who made this pertinent in their reflections. They constructed educational science as an umbrella field that draws on knowledge of several academic disciplines and hence as challenging for a novice. In relation to domain-specificity, they also constructed knowledge specifically as a precondition for critical thinking. Given that our course was designed to enhance critical thinking in the domain of educational science and our interview questions targeted this domain, the participants were necessarily primed to touch on these issues. In this respect, their thematization was expected. As such, the limited degree to which this occurred in the student interview represents a significant absence.

5.2 Critical thinking

We see three dominant conceptualizations of critical thinking in the interviews as well as differences in terms of the degree to which each conceptualization predominates in the student versus staff discourse.

Firstly, critical thinking was explicitly constructed as a skill or as a set of sub-skills that can be taught and acquired through practice. The skills dimension revolved around two main themes: critical thinking as an academic skill, relevant in the academic setting, or critical thinking as a life skill, relevant beyond the academic setting. Relatedly, critical thinking was constructed as a methodic skill or as a tool that can be systematically applied in approaching a wide range of issues. Interestingly, the skills dimension was particularly dominant in the staff interview.

Secondly, critical thinking was constructed as something that stretches beyond the skills dimension and represents a way of seeing and approaching the world. De-emphasizing its instrumentality, it was constructed as part of one's personal development and thus as a broader construct. The following two excerpts from the data illustrate this point:

I think it will be beneficial for whatever you study and in your personal life and it is in a way a personal trait which you can acquire and, how should I say it, internalize. (Student). Critical thinking is something many students struggle with. And to - (it is) a kind of academic bildung - to invite to debate and reflect on theories and concepts, it's demanding. (Staff)

Thirdly, as with the participants' constructions of knowledge, critical thinking was seen as a process that takes time and training to develop. This was underscored by both groups throughout the interview, particularly the staff: "This thing with source evaluation and critical reading - practice practice practice and stuff that is, well, I think that is super important" (Staff).

5.3 Learning and instruction of critical thinking

In reflecting on the dimension of learning and instruction on critical thinking, both groups were preoccupied with the constructivist conception of learning as a collective, interactional achievement. Both groups were particularly concerned with discussing the benefits but also the challenges of the dialogue-based format of instruction. Here again, the novice-expert

dimension, particularly in its relational, contextual aspect, featured prominently in the interviewees' reflections.

Of particular note is the way the two groups positioned themselves as participants in the dialogues. The staff commended specifically the possibilities our instructional approach gave the students to question, discuss and practice their critical thinking. However, their own participation as discussants in and facilitators of these dialogues was not thematized. This absence was also marked discursively through their pronominal choices, indicating distance and otherness vis-a-vis the students (e.g. they, them, themselves): "I liked that students were supposed to sit in seminars and work and discuss and try themselves because that gave them a chance to really practice" (Staff).

The students too constructed a dichotomous, contextually-conditioned distinction between themselves and the more knowledgeable staff. As already noted above, they clearly positioned themselves as the less knowledgeable and more uncertain party. While they commented specifically on the benefits of the small-group instructional format, such as in providing genuine opportunities to engage in in-depth discussion, their reflections also show that it represented a potentially face-threatening situation where their own uncertainties about how much they know affected the degree of their participation in the class. One of the students voiced her otherness also in prosodic terms by lowering her voice, as if to question her right to speak about these issues: "I notice when these professors have comments and stuff I just "oh right, gee, right, I have not thought about that ((lowered voice))" (Student).

Both groups also thematized the need for balancing theory and practice in critical thinking courses. They underscored the experiential aspect of learning with hands-on exercises, thematically rooted in the domain of educational sciences, and hence the usefulness of the selected exercises, for example in terms of potential improvements on future achievement scores. Finally, a recurrent theme in our interviews, both groups saw the need for allowing for a longer time span before the benefits of participation in critical thinking interventions such as ours could be reaped.

6. SUMMARIZING DISCUSSION AND CONCLUSION

In terms of the implications from the study, we note that small-group, dialogue-based instruction focused on understanding and argumentation represents a promising pathway for developing critical thinking in young university students (Murphy et al., 2014; Murphy et al, 2016). In our instructional approach, we focused on making argument structures explicit through combining theoretical insights with hands-on collaborative exercises. Identifying the core elements of short, real-world examples of arguments, discussing their explicit and implicit features, assessing their coherence and evaluating the available sources of evidence were aimed at building the students' conceptual and methodological familiarity. It was also meant to provide them with a toolbox in approaching longer texts and composing their own arguments. An even greater embeddedness of syllabus-based literature in the instructional material could further enhance the relevance of the course and reduce attrition rates. With sustained efforts, our approach could potentially improve students' understanding of complex issues in academic argumentative discourse and make them more confident critical thinkers.

Relating to the construct of epistemic cognition, our instructional approach resonates with the aim of encouraging an adaptive, evaluativist approach to knowledge by targeting both generic and specific skills, dispositions and abilities necessary for critical thinking through reasoned argumentation (Alexander, 2016; Chinn et al., 2014; Chinn & Rinehart, 2016). As our interview data show, the students related their participation in our intervention to positive changes in how they viewed and worked with course literature and knowledge emanating

thereof, stressing in particular, its value in making textual complexity an object of conscious, critical interrogation. The data also indicate that having explicit tools to engage in such interrogations is a precondition for succeeding in such endeavours, an insight supported by other studies (e.g. Andreassen, 2007, Stang Lund, Bråten, Brandmo, Brante & Strømsø, 2018). However, the complex relation between epistemic cognition and critical thinking requires further empirical investigation. While this intervention provides interesting insights into students' and staffs' thinking about critical thinking and reasoned argumentation in the domain of educational sciences, scaling-up pilot studies such as ours in the form of interventions is needed to address specific relations among key constructs.

Relatedly, we would like to acknowledge that further research attention is needed to address the issue of how to measure the development and adaptive use of critical thinking skills. Greater use of self-reflection diaries could represent an important source of information for both instructors and researchers and, potentially, form a part of formative feedback for students that they could capitalize on in summative course assessments. Our data indicate that providing students with scaffolded training in how to make use of such tools may be necessary. While summative assessments may provide a static snapshot of students' declarative knowledge of critical thinking, more nuanced and dynamic measures applied in 'contexts that matter' are necessary to investigate actual practices (cf. Chinn et al., 2011). Since critical thinking is cognitively and motivationally demanding this may have to be incorporated in final examinations. Students are unlikely to exert themselves in researcher-administered tests with no consequences for school achievement. We therefore note the need for alignment of teaching and examination methods. If students are to value critical thinking and argumentation in specific domains then they must be tested in their use, rather than being rewarded for superficial engagement such as memorization skills and reproduction of course texts. In other words, the epistemic ethos of instruction, teaching materials and examination need to be aligned in order to avoid sending mixed epistemic messages to students (Greene & Yu, 2016).

As our interview participants underlined, critical thinking skills need time and practice if they are to become well-developed. Indeed, it is an endeavor that stretches well beyond the space of eight weeks that we had at our disposal. We therefore see the need for a lasting engagement in critical thinking through reasoned argumentation across the curriculum, so that it becomes an indelible part of university-level programs. As other research indicates (Murphy et. al, 2014, Reznitskaya & Gregory, 2013; Reznitskaya & Wilkinson, 2013), small-group, dialogic instruction where critical thinking skills are nurtured and regularly practiced is a promising instructional approach. In designing such instruction, attention should be paid to reducing barriers for participation by creating an ambience of trust through a low-threshold, scaffolded aid by experienced course instructors (Murphy et al., 2016). Indeed, the novice-expert differential may be a very real one for many freshmen, as our data indicate. This puts instructors in a position of additional responsibility as efficient and responsive dialogue-facilitators.

While research within educational psychology has made important contributions to our knowledge on the importance of small-scale, dialogue-based instructional programs on critical thinking through reasoned argumentation, we see that greater cross-fertilization between this and related fields, particularly argumentation theory, could prove beneficial. In our design, theoretical insights on reasoned argumentation represented an important starting point and inspiration. Beyond this, however, it remained largely underdeveloped. Collecting interactional classroom data and employing argumentation theory to explore in detail student argumentation discourse, including their use of different argumentation schemes, the linguistic tools they employ in argumentation or collaborative efforts at understanding and analyzing argument structures could be fertile soil to explore. Furthermore, philosophical insights from the related

fields of argumentation and critical thinking could add conceptual clarity and provide inspiration for further empirical work (cf. Chinn et al., 2011).

Defining and managing intercultural disagreement

VICTOR FERRY

F.R.S.-FNRS
Research group in Rhetoric and Linguistic Argumentation (GRAL)
Université Libre de Bruxelles
Belgium
vferry@ulb.ac.be

ABSTRACT: What is intercultural disagreement? What is the most effective way to solve it? To answer those questions, I conducted two field studies. In order to better understand what an intercultural disagreement is, I asked secondary school teachers to describe situations in which they had to manage an issue with cultural differences in class. In the first section of this paper, I use the cases thus collected to refine the concept of intercultural disagreement. To reflect on the strategies to manage intercultural disagreement, I submitted some of the collected cases to master students. In the second section of this paper, I propose criteria to evaluate the management of intercultural disagreements from student performance analysis.

KEYWORDS: argumentation, education, empathy, deep disagreement, intercultural communication, moral foundations theory, rhetoric

1. INTRODUCTION

Multiculturalism is a stimulating challenge for argumentation studies. As people from different cultural background live side by side, argumentation scholars have countless opportunities to study the impact of culture on the production and the evaluation of arguments. The challenge is that, depending on how the discussion goes, intercultural contact can reduce as well as increase tolerance for other cultures (Pettigrew & Tropp, 2006). In this context, argumentation scholars might help to identify the facilitating conditions for positive contact between cultures.

A first step, in this respect, is to define what an intercultural disagreement is. How does culture impact arguers' ability to solve their disagreements? Do cultural differences lead to cognitive breaks (Angenot, 2008, pp. 16-23) that make us impervious to others arguments? Should we, on the contrary, consider cultural differences as ethnocentric biases (Johnson & Blair, 1983, pp. 172-176) that arguers should overcome to reach a more objective standpoint (Siegel, 1999)? To answer those questions, I conducted a field study in which I asked secondary school teachers in Belgium to describe intercultural disagreements they encountered in class. Based on the cases thus collected, I will argue that intercultural disagreements are deep (Fogelin, 1985) in the sense that they reveal different hierarchies of values (Haidt, 2012). As a consequence, arguers will rely on incompatible backings for their arguments (Toulmin, 1958).

The fact that intercultural disagreements are deep, however, should not impede the reflection on the best ways to manage them. In this respect, I submitted some of the cases collected in the first study to master students. Based on an analysis of their performances in judging those cases, I will support the following claim: as far as intercultural disagreements are concerned, the ability to justify one's opinion on the best possible arguments becomes as important as the ability to do it in a way that would demonstrate awareness and respect for opposite views (Ruben, 1976; Beamer, 1992; Bennett, 1998; Ferry, 2017).

2. WHAT IS INTERCULTURAL DISAGREEMENT?

The function of argumentation, as it has been argued from a philosophical (Popper, 1991, p. 132) and evolutionary perspective (Mercier & Sperber, 2011), is to allow humans to challenge their ideas and make better decisions. For argumentation to play this role, arguers should at least agree on what can be considered as a good argument (Fogelin: 1985). Argumentation, as a consequence, works better when practiced between people who share a common ground of beliefs and values. Does cultural diversity make argumentation a much more difficult task? This section answers this question by defining the concept intercultural disagreement and analyzing cases of intercultural disagreements.

2.1 Defining intercultural disagreement

Intercultural disagreement has been defined as a disagreement in which arguments are culturally sensitive (Kraus, 2009). This means that the strength of arguments will depend on arguers' cultural backgrounds. This definition raises two main questions.

One might, first of all, wonder what should count as "culture" in intercultural disagreement. Imagine, for instance, that A and B are arguing about the best way to tackle the problem of unemployment. A believes that we should make it more difficult for companies to fire people and B believes we should make it easier. Probably, they got such convictions through a process of education. Probably, this background influences what they will accept as a good argument[1]. Should we, therefore, conclude that A et B have an intercultural disagreement? Since, at the most general level, culture can be defined as what is common to a group of people (Hofstede, 1991; Matsumoto, 1996) and since people tend to belong to multiple groups, virtually any disagreement can be considered as an instance of intercultural disagreement. Although the concept of intercultural disagreement might evoke a disagreement between people with different origins (Kraus 2014), justifying the need for such a concept will require to identify more precisely what genuinely depends on cultural differences in the way people disagree.

If it is possible to demonstrate that there is such a thing as genuinely intercultural disagreements, a second question would be: how deep are those disagreements? As stated in introduction, cultural background might be considered as a bias that arguers should try to overcome in order to reach a more objective standpoint. This is, notably, Johnson and Blair's position when saying that "ethnocentric arguments propound beliefs as true that are often little more than just an expression of a visceral attachment to one's country, culture, race, special interest or sex" (1983, p. 175). If a disagreement originates from this kind of ethnocentric thinking, it can, at least theoretically, be solved by encouraging arguers to comply with a more demanding standard for the production and the evaluation of their arguments. On the contrary, a disagreement would be considered as deep if participants, even though they are able to move away from their own perspective and to understand opposite points of view, still continue to disagree. As Fogelin put it, "deep disagreements are generated by conflict between framework propositions" (1985, p. 5). Such a deep disagreement would be considered as intercultural if arguers' attachment to those conflicting framework propositions finds its origin in their cultures.

---

[1] Unless arguers are committed to respect some rules for discussion (for instance: van Eemeren & Grootendorst, 1992), they will naturally tend to use their cultural background as the norm to distinguish between good and bad arguments. The fact that the strength of arguments will depend on arguers' beliefs and values seems to be more a basic feature of human psychology (Kahneman, 2011) than a specific feature of intercultural argumentation.

2.2 Study 1: collecting intercultural disagreements

To get a more concrete grasp on intercultural disagreements, I conducted a study with people who are often at the forefront of cultural diversity: secondary school teachers.

Between 2016-2018, I worked for the Belgian institute of in-service training (IFC) and gave eight two-days training sessions in the main cities of the French speaking part of the country. In all, about a hundred teachers participated in those sessions. During the trainings, I asked participants to describe a situation in which they faced a conflict that could, in their view, be described as an intercultural disagreement. Then, they discussed those cases in small groups, chose the one that they found the most interesting and changed it into a controversy (Sans, 2015)[2]. We then used those controversies to work on good practices to handle intercultural disagreements. Here is a sample of the controversies produced by the participants[3]:

Table 1: Three intercultural disagreements

Case 1: The boy who felt like a girl	In a high school, a 15-year-old boy, Paul, no longer considers himself a boy. He begins to dress like a girl and asks that his teachers and classmates call him Marie. Should the school management accept the student's request?
Case 2: A limit to tolerance?	The English teacher works with his students on the American elections. He organizes a vote on the programs of the two candidates: H. Clinton and D. Trump. Programs are presented to students anonymously. After the vote, a student realizes that he voted for Hilary Clinton. He tells the teacher that he wants to change his vote because he would never have voted for a woman knowingly. Should the teacher respect this opinion? Should the teacher sanction this opinion?
Case 3: Is this a family business?	Soumaya is a 17-year-old girl in the last year of secondary school. A teacher learns that her parents decided to marry her without asking for her consent the next time she goes back to her country of origin. Should the teacher prevent her departure?

Understanding the specificity of those disagreements' cases might require an incursion in the field of social psychology. More specifically, Jonathan Haidt's moral foundations theory (2012) helps to grasp the common denominator to those cases.

In order to study moral judgment, Jonathan Haidt wrote "harmless taboo violation stories" and submitted them to people from different countries and social backgrounds. Here is an example:

> A family's dog was killed by a car in front of their house. They had heard that dog meat was delicious, so they cut up the dog's body and cooked it and ate it for diner. Nobody saw them do this. (Haidt, 2012, p. 3)

When facing such stories, his students, that he describes as western liberal people[4], felt that something was wrong, but find it difficult to explain what. The reason is, according to

---

[2] Here are the rules I asked them to follow when turning their cases into controversies: (1) The description includes enough elements to make the situation understandable (a place, characters, a situation, a reason for discord). (2) It includes a problem to be solved, a decision to be made (for example, a sanction). (3) It is possible to find reasonable arguments for opposite views on the decision to be made. (4) The controversy is written as objectively as possible: it does not incline (too much) towards one of the decisions.

[3] I collected about 20 them. I would be pleased to share them for research purpose: vferry@ulb.ac.be

[4] Or WEIRD, which stands for (Henrich, Heine & Norenzayan, 2010).

Jonathan Haidt, that educated western people such as his students, tend to ground their moral judgements on two foundations: care ("you should not hurt others") and fairness ("you should give people equal treatments"). In the above story, the ethics of care and fairness do not offer a ground on which to condemn the family (nobody was hurt and, somehow, it was fair since everyone got a piece of the dog). In order justify the feeling one might have that something morally wrong is going here, one needs to go beyond harm and fairness. Indeed, the value that seems to be violated is sanctity, according to which one should show respect for the body of a loved one.

By collecting moral judgements around the world, and across social backgrounds, Jonathan Haidt and his team concluded that human morality has six foundations (Graham *et al.*, 2013). In other studies, he also tried to explain from an evolutionary perspective why humans are equipped with those six moral receptors (Haidt & Joseph, 2007; Rai & Fiske, 2011):

Table 2: Six universal values

Values	Adaptive challenges
Care/Harm	Protect and care for children
Fairness/Cheating	Reap benefits of two ways-partnerships
Loyalty/Betrayal	Form cohesive coalitions
Authority/Subversion	Forge beneficial relations within hierarchies
Sanctity/Degradation	Avoid contamination
Liberty/Oppression	Resist domination

(From: Haidt, 2012, p. 146)

Although, from an evolutionary perspective, humans are sensitive to those six values, human communities will promote different ways to hierarchize them. For instance, a conservative community will give more importance to loyalty, authority and sanctity while a progressive community will praise care, fairness and liberty (Graham, Haidt & Nosek: 2009). With this in mind, the nature of the disagreements collected in my study becomes apparent.

Indeed, a common feature between the cases reported by the secondary school teachers, is that they reveal a clash between, on the one hand, western liberal values and, on the other hand, conservative values. And they do so with a remarkable consistency: the case 1 (The boy who felt like a girl) revolves around an opposition between care ("it would be violent to go against the boy's feelings") and sanctity ("one should not play with the body god/nature gave us"); the case 2 (A limit to tolerance?) revolves around an opposition between fairness ("men and women can and should have access to the same positions") and authority ("they are things men can do, things that women and we should respect this order of things") and the case 3 (Is this a family business?) revolves around an opposition between liberty ("getting married is a matter of individual choice") and loyalty ("getting married is a way to seal alliances between families"). Is there a ground on which arguers might resolve their disagreements on such issues?

To take, for instance, case 2, saying "the parents didn't ask their daughter's consent, therefore the teacher should oppose her departure" might be considered as a good argument in a liberal culture. On the other side, saying "the parents want to marry their daughter, therefore the daughter should go" might be considered as a good argument in a conservative one. If we take seriously the idea that cultures might differ in the way they hierarchize their values, intercultural disagreements should be considered as deep since arguers will back their arguments on different values:

Table 3: A clash of framework propositions (framed in Toulmin's model of argument)

Data	The parents didn't ask for their daughter's consent	The parents want to marry their daughter
Conclusion	The teacher should oppose to her departure	The daughter should get married
Warrant	Marriage is a matter of individual choice	Children should respect their parents' will
Backing	Freedom	Authority

Intercultural disagreements, as the one collected in my study, can be considered as deep in the sense that they indeed seem to be generated by conflict of framework propositions. Should we conclude, following Fogelin (1985, p. 7), that this kind of disagreements "by their nature, are not subject to rational resolution"? This question is all the more important that, in cases such as the one collected in my study, a decision has to be taken. Are decisions on intercultural disagreements bound to be perceived as irrational (and, therefore, arbitrary) by one camp?

3. MANAGING INTERCULTURAL DISAGREEMENTS

The fact that people, in a situation of intercultural contact, will ultimately rely on different fundamental values, might make argumentation scholars pessimistic on their ability to provide tools to resolve intercultural disagreements. In this section, it is argued that as far intercultural disagreement is concerned, one should take disagreement management rather than disagreement resolution as a target.

3.1 What is means to manage intercultural disagreement?

If intercultural disagreements are deep, it would be counterproductive to bet all our hope on the production of the best of all possible arguments. A wiser strategy might consist, in line with a pedagogical tradition that goes back to the sophists (Pearce, 1994; Tindale, 2010; Danblon, 2013), in exercising our ability understand both sides of an issue. Indeed, a good decision, in a multicultural context, is probably a decision that would not appear as arbitrary to those who would have decided otherwise (Perelman, 2012, pp. 678-679). In practice, the arguer, in the motivation of his decision, should demonstrate awareness and respect for the values of the other side. Moreover, this demonstration of awareness and respect should be perceived as sincere. It would, otherwise, appear as a vulgar ploy[5].

3.2 Study 2: evaluating attempts to manage intercultural disagreements

In order to test the above claim on the good management of intercultural disagreements, I submitted some of the controversies collected in the above study to master degree students following a class of intercultural communication. Most of the students following this class came from central and west Africa after a primary education in their countries of origin. I would argue that the following answers illustrate three different degrees in the mastery of intercultural disagreement management[6]:

---

[5] As it was often argued (Gusdorf, 2013 [1952], p. 20; Bruner, 2005, p. 19; Schaeffer, 1999, p.34-42) humans tend to be highly suspicious as soon as they perceive an orator's trick to persuade them.
[6] I collected 10 answers on this assignment. I would be pleased to share them for research purpose: vferry@ulb.ac.be.

Table 4: Sample of students' attempts to manage an intercultural disagreement

Case 1: The boy who felt like a girl	In a high school, a 15-year-old boy, Paul, no longer considers himself a boy. He begins to dress like a girl and asks that his teachers and classmates call him Marie. Should the school management accept the student's request?
Student 1	In agreement with his father and mother we will accept the request of the student. It is his right as a man and we will enforce the law of the country.
Student 2	As a director, I will first have a conversation with the child so that I can dig a little deeper into this decision and check whether is not due to any influence. We are, however, in a country that advocates freedom and my freedom stops where his begins. I would also put the problem in the hands of the inspectors in charge of the school. In the meantime, the child can continue to come without being stigmatized but he will also have to know that one does not change his name so easily. He would also have to prove us that he has actually become a girl. We should also prevent him from contaminating others by his change. But, still, the law does not allow to exclude a boy who has become girl.
Student 3	First, in a case like this, we cannot say yes to quickly since it might be a mere teenage whim. We cannot either, say no to quickly, because it could be the expression of a deep malaise that will hurt him in the long run. It is important to have a conversation with the child in order to understand this request. It is also important, during the conversation, even if our beliefs are totally opposed to his, to focus on what the teenager needs, not to make a value judgment and provide him with frank help. It is also important to seek the views of parents, with a particular focus on what would be best for their child even if it goes against their own will. It is also important for parents to benefit from support when they will have to face the realities of the change. They will all have to be prepared, and the comrades too. It is as a result of these conversations, that the decision to accept his request may or may not be taken.

I regard the first answer as the weakest, since the student didn't show neither awareness nor respect for the values opposite to the one on which he based his argument (freedom of choice). The second one demonstrates awareness for opposite views but does give the feeling that he respects them. Finally, the third one demonstrates awareness and respect for conservative as well as for values. The performance is, however, diminished by the fact that the student does not take a clear stand on the issue.

In order get a more objective assessment of the management of intercultural disagreements, the next step would be, in addition to such kind of qualitative analysis, to collect the judgement of a wide and diverse audience on those three performances.

4. CONCLUSION

The fields of argumentation studies, critical thinking and informal logic developed in a relatively homogenous context in terms of background beliefs and values. This explains why Fogelin's concept of deep disagreement appeared at first as thought-provoking. In the era of multiculturalism, however, deep disagreement isn't exceptional: it tends to be the rule. This, of course, does not mean that we should abandon the ideal of producing arguments that would be rational and convincing for a universal audience (Perelman & Olbrechts-Tyteca, 1958, p. 465). This, rather, implies that rhetoric should not anymore be considered as a mere decoration for argumentation. Rhetoric, defined as the art of addressing our speeches not only to the mind, but also to the feelings and the characters of our audiences (Grimaldi, 1980, p. 350), might become a necessary condition to have a reasonable, if not rational, discussion with our fellow citizens.

The reconstruction of visual argumentation in editorial cartoons with a visual metaphor

EVELINE T. FETERIS

Department of Speech Communication, Argumentation theory and Rhetoric
University of Amsterdam
The Netherlands
e.t.feteris@uva.nl

ABSTRACT: The aim of this contribution is to develop a method for a systematic reconstruction of the argumentation in editorial cartoons with a visual metaphor. I formulate a conceptual framework for reconstructing the argumentation on the basis of an analysis of the visual rhetoric by specifying a pattern of complex argumentation in editorial cartoons. I demonstrate how the conceptual framework can be used by giving an exemplary analysis.

KEYWORDS: analysis, argumentation, argumentative activity type, argumentative obligation, argumentative pattern, editorial cartoon, reconstruction, scenario metaphor, visual metaphor, visual rhetoric

1. INTRODUCTION

Editorial cartoons express a critical stance towards a public official or a public event. This critical stance is substantiated by indicating that the behaviour has certain characteristics that are incompatible with certain common values. In the literature on visual/multi-modal argumentation and visual rhetoric, the way in which cartoonists convey their message is considered as a form of argumentation aimed at convincing the intended audience of a particular point of view.

In a cartoon, a large part of the message, such as the critical stance and the reasons for this stance, are conveyed in an indirect and implicit way by means of visual techniques, such as visual metaphors. To reconstruct the message that the cartoonist wants to convey, we need to make the standpoint and the arguments explicit. This implies that the visual and verbal elements of the cartoon must be analyzed by translating them in terms of the standpoints and arguments that form part of the commitments of the cartoonist.

In research of visual argumentation authors have paid attention to specific aspects of the visual rhetoric used in editorial cartoons. Groarke (2017) gives a description of recurrent patterns of argumentation in editorial cartoons. Van den Hoven and Schilperoord (2017) describe techniques used to convey visual argumentative meaning in editorial cartoons. Negro Alousque (2013, 2014) describes patterns of visual metaphors in French and Spanish political cartoons. Schilperoord and Maes (2009) describe what types of standpoints are expressed by means of visual metaphors in editorial cartoons. However, no systematic conceptual framework has been developed that can be used in fully reconstructing the, often complex, argumentative message underlying editorial cartoons.

To take the research of the argumentative analysis of editorial cartoons a step further, the aim of this contribution is to develop a method for a systematic reconstruction of the argumentation in editorial cartoons. I develop a conceptual framework for reconstructing the argumentation in an editorial with a visual metaphor that is based on symptomatic argumentation referring to certain characteristics of the behaviour of a politician. on the basis of an analysis of the visual rhetoric. In this contribution I will proceed as follows. In section 2 I characterize editorial cartoons with a visual metaphor as a particular argumentative activity

type. In section 3, on the basis of this characterization, I develop a conceptual framework for the reconstruction by specifying a pattern of complex argumentation in editorial cartoons. In section 4 I explain the role of visual metaphor in the presentation of elements of the argumentation that forms part of the pattern discussed in section 3. In section 5 I demonstrate how the conceptual framework developed in section 2 and 3 can be used by giving an exemplary analysis.

2. ARGUMENTATION IN EDITORIAL CARTOONS WITH A VISUAL METAPHOR

Editorial cartoons are a specific argumentative activity type. In an editorial cartoon the behaviour of a public official, often a politician, or institution is criticized in light of certain common norms that are shared by the cartoonist and his/her audience.[1] One of the characteristics of an editorial cartoon is that the critique is always presented in an indirect way. A rhetorical technique often used by cartoonists to present their message in an indirect way is a visual metaphor.
Source: Tom Janssen, www.cartoonweb.com
Date: March 20, 2006

Cartoon 1

An example of a visual metaphor can be found in cartoon 1 in which the Dutch cartoonist Tom Janssen criticizes the victory of Lukaschenko in the presidential election campaign in Belarus in 2006. It was published in the Dutch newspaper *Trouw*. The message of Janssen is that the behaviour of Lukaschenko must be evaluated negatively because the way in which he has disabled the opposition in the election campaign constitutes a violation of the international norms for democratic elections. Janssen presents his standpoint and argument in an indirect way by using the visual metaphor of a boxer who has tied up his opponent to be able to knock him out and to win the game. The cartoonist and the Dutch reader of the

---

[1]   For a characterization of different argumentative activity types see van Eemeren (2010). See Andone (2010) and Mohammed (2008) for a description of other forms of political discourse in which the behaviour of a public official is submitted to a critical test in light of certain common values.

newspaper *Trouw* share knowledge of the characteristics of the genre of the cartoon (implying that images should not be interpreted literally but metaphorically), knowledge of the world (the rules of boxing) and knowledge of the actual political situation (the elections in Belarus and the international critique on these elections). Therefore, Janssen can convey his critique in an indirect way by using a metaphor that expresses the violation of a rule of boxing. To demonstrate that the behaviour of public officials must be evaluated negatively, cartoonists often use a deviation of a scenario as a metaphor to convey in an indirect way the violation of a political, ethical or other rule of behaviour.[2] An example of violation of such a scenario is the violation of a rule of a sport as boxing.

3. PATTERN OF COMPLEX ARGUMENTATION IN EDITORIAL CARTOONS WITH A VISUAL METAPHOR BASED ON SYMPTOMATIC ARGUMENTATION

As I have explained, in an editorial cartoon the cartoonist takes the standpoint that the behaviour of a public official should be evaluated negatively. To make this standpoint acceptable, the cartoonist will have to defend it with arguments that are relevant in the activity type of editorial cartoons. In what follows I explain the argumentation underlying an editorial cartoon that is, as is explained in section 2, expressed in an indirect way. To establish what the argumentative obligations of a cartoonist are in light of the characteristics of the argumentative activity type, in 3.1 I describe the argumentative obligations of a cartoonist in terms of the complex argumentation he will have to put forward to defend his standpoint. On the basis of these obligations in 3.2 I explain how a reader can reconstruct the complex argumentation underlying an editorial cartoon, making explicit the arguments to which the cartoonist can be held committed.

3.1 The argumentative obligations of a cartoonist in an editorial cartoon with a visual metaphor based on symptomatic argumentation

To make his standpoint acceptable, a cartoonist will have to put forward certain arguments in order to convince his audience. To defend his standpoint that the behaviour of a public official (politician) or institution must be evaluated negatively, there are certain lines of argument that he can take. Like in cartoon 1, he can choose to show that the behaviour has certain characteristics that must be evaluated negatively because these characteristics violate or conflict with certain generally accepted values. This type of defence is based on an argumentation scheme of *symptomatic* argumentation.[3]

In *symptomatic* argumentation it is argued that the characteristics of a particular form of behaviour conflict with certain values. In the case of symptomatic argumentation the complex argumentation can be reconstructed as in Figure 1. The standpoint that the behaviour must be evaluated negatively is first supported by the argument 1.1a that this behaviour has certain characteristics. It is second supported by the argument 1.1b that these characteristics must be evaluated negatively. To be able to counter critique with regard to argument 1.1b, why the characteristics Y1, Y2 etc. must be evaluated negatively, the cartoonist will have to put

---

[2] For a further description of the concept of a scenario metaphor see Schilperoord and Maes (2009).

[3] Since I concentrate on editiorial cartoons with a visual metaphor, in this contribution I restrict myself to the discussion of an argumentative pattern based on symptomatic argumentation. In other types of cartoons, for example those that concern a comparison of the behaviour of a particular politician with another politician or a certain type of animal etcera, also other argumentative patterns such as patterns based on analogy argumentation can be reconstructed. See also Garssen (2009:136-138) for an analysis of a metaphor as symptomatic argumentation.

forward a supporting argument. In 1.1b.1 it is claimed that these characteristics conflict with certain values that are generally accepted in a particular culture.

1   The behaviour X of politician P in situation S must be evaluated negatively
       1.1a The behaviour of politician P in situation S has characteristics Y1, Y2 etc.
       1.1b The characteristics Y1, Y2 etc. of the behaviour X of politician P in situation S must be evaluated negatively
           1.1b.1   Characteristics Y1, Y2 etc. conflict with value W

Figure 1: Visual argumentation based on a symptomatic relation

This argumentative pattern of complex argumentation reflects the argumentative obligations in the activity type of an editorial cartoon for a cartoonist who bases his critical stance on a particular type of argument.

3.2 The reconstruction of the argumentation underlying an editorial cartoon

In an editorial cartoon in which the argumentation is expressed by means of a visual metaphor, the largest part of the complex argumentation described in the previous section remains implicit.[4] The cartoon contains certain visual and verbal information about politician P in situation S, as well as a characterization of the behaviour X with characteristics Y. The exact content of the standpoint and the complex argumentation must be reconstructed by the reader by translating the visual and verbal cues in terms of a standpoint and the different components of the argumentation as represented in figure 1.[5] Solving this 'puzzle' will reveal the argumentative message the cartoonist wants to convey.

The most important task for the reader is to reconstruct the *main argumentation*. In the case of symptomatic argumentation the reader must reconstruct argument 1.1a that the behaviour has certain characteristics Y and the argument 1.1b that these characteristics Y must be evaluated negatively. When the argumentation is expressed in an indirect way by means of a visual metaphor, large part of the propositional content of Y and the negative evaluation of Y must be reconstructed by the reader on the basis of an analysis of the visual metaphor, in combination with certain visual and verbal information provided in the cartoon. The reader must establish what the propositional content is of the metaphor that the cartoonist is committed to. When the reader has reconstructed the content of the visual metaphor it can be established to what propositional content of Y and to which negative evaluation of Y the cartoonist can be held committed.

To reconstruct the *subordinate* argumentation in support of argument 1.1b, the next step is to establish what the valuess W are that can be considered as the basis for the negative evaluation of Y. Often the cartoon does not contain information about these values because the audience and the cartoonist are supposed to share certain common values. Because these values are tacitly shared, the expression of the criteria for evaluating Y in a negative way can

---

[4] For the enthymematic nature of cartoons as argument see Medhurst and DeSousa (1981:204) who conceive cartoons as entymematic arguments in which the audience must fill in the missing premises such as the 'warrant' that makes a connection between the arguments and the conclusion.

[5] The description of the reconstruction that is performed by the audience/reader is a normative-analytic description of the reconstruction of the commitments of the cartoonist and not a description of the cognitive processes that take place in the mind of an actual audience/reader.

be considered as superfluous because they concern the tacit common values of a particular audience or culture.

4. THE ROLE OF VISUAL METAPHOR IN THE PRESENTATION OF ELEMENTS OF THE ARGUMENTATION

In this section I explain the way in which the complex argumentation described in the previous section is expressed and presented by means of a visual metaphor. I explain the way in which certain parts of the argumentation are expressed and I explain the possibilities a cartoonist has on the basis of the characteristics of the activity type to leave certain parts of the argumentation implicit so that they can be 'filled in' by the audience.

As indicated, the reader will have to reconstruct the characteristics of the behaviour that is criticized. In the editorial cartoon discussed here, the aspects of the behaviour that are criticized are conveyed by means of a visual metaphor. This implies that the reader will have to reconstruct the content of the visual metaphor in order to be able to reconstruct the underlying argumentation as described in the previous sections. Metaphors are rhetorical figures that make it possible to express a particular concept in terms of another concept with the aim of transferring certain characteristics of one concept (from a particular domain) to another concept (belonging to a different domain). In metaphor theory the first domain is called the 'source' domain or the 'phoros', and the second domain the 'target' or the 'theme'.[6]

The rhetorical advantage of the use of a metaphor is that this technique makes it possible to express certain abstract concepts, meanings or associations in such a way that they are made more concrete by presenting them in terms of an image that the reader is familiar with. In the case of cartoons, the metaphor also has the advantage that the critique that is conveyed is made less overt because it is 'wrapped up' in the form of a metaphor. The metaphor is often combined with certain visual techniques that form part of the genre to give the image a humorist or ironic aspect and contribute to the appreciation of the cartoon.

A type of metaphor that is often used in editorial cartoons is the so-called '*scenario metaphor*' in which the cartoonist uses the knowledge of the audience of a certain scenario. An example of such a scenario is the boxing game in example 1 in section 2 that is used as a source domain. A scenario, that Lakoff and Johnson (1980) call a conceptual schema, consists of a number of dimensions such as participants, roles, relations, objects, attributes, etcetera. Reference to a particular scenario makes it possible to leave certain information implicit because it is assumed that people in a particular culture are familiar with such scenario's or schemas and are capable of filling in the missing information. In the source domain of a particular scenario certain units are connected with each other by means of certain relations such as thematic, causal, spatial and temporal relations that the cartoonist can use as a basis for his implicit critique (Shen 1999:1633).

As has been indicated in the literature on metaphors, when interpreting a metaphor the reader has a certain space in establishing the interpretation. McQuarrie and Phillips (2005) explain that a visual metaphor that is used to express an indirect claim can be considered as what Sperber and Wilson (1986) call a 'weak implicature'. Such a weak implicature leaves open various alternative interpretations. This possibility of alternative interpretations created by the interpretation space of a visual metaphor can be used strategically by the cartoonist to leave the formulation of the critique to the reader.

---

[6] For the use of the terms 'source' and 'target', 'phoros' etcetera see Black (1979), Forceville (1996), Lakoff & Johnson (1980), Schilperoord & Maes (2009), Shen (1999).

Given the interpretation space for the reader, the cartoonist can use certain characteristics of the scenario to convey his critique in an indirect way. By changing certain elements in a particular scenario (such as the strangled boxer in the boxing game in example 1), that is in itself neutral, the cartoonist can steer the reader in the direction of recognizing the deviation of the standard scenario. On the basis of the identification of this deviation the reader will interpret that aspect of the scenario metaphor as the 'phoros' for the indirect critique that the cartoonist wants to convey. The problematic aspect of the interpretation of the critique is often that there are different possibilities for filling in the propositional content of the indirect critique that the cartoonist wants to transfer from the phoros to the theme of the metaphor, the behaviour of the politician. This enables the cartoonist to make strategic use of the possibilities of the metaphor to leave the interpretation of the critique to the audience so that the various readers can formulate the critique that best fits their preferences.

In the case of a political cartoon with a scenario metaphor, the reader will have to reconstruct the predicate Y and the negative evaluation of this predicate to which the cartoonist can be held committed. This predicate is a characteristic of the behaviour X of P in the case of symptomatic argumentation. The propositional content can be reconstructed on the basis of an analysis of the metaphor in terms of certain aspects of the 'source' domain that must be evaluated negatively and are transferred to the 'target' domain (the behaviour X of P that has characteristic Y). The function of the metaphor is to express in an indirect way that certain characteristics of the behaviour of the politician (the target domain) must be understood in terms of the source domain.

Apart from reconstructing Y the reader must also reconstruct the negative evaluation of Y. In the case of a scenario metaphor, like in cartoon 1, the negative evaluation is implied by the deviation of the standard scenario of a boxing game and can be reconstructed on the basis of the analysis of the visual metaphor of this scenario.[7]

5. EXEMPLARY ANALYSIS OF A CARTOON WITH A VISUAL METAPHOR

As an illustration of the reconstruction of the general argumentative pattern underlying the complex argumentation in an editorial cartoon, in what follows I give a possible analysis of the cartoon 'Elections Belarus' by Tom Janssen discussed in section 2. I give an exemplary analysis of the complex argumentation underlying a cartoon by showing how Tom Janssen makes use of the scenario metaphor of the boxing game.

The cartoon by Tom Janssen refers to the critique given by a.o. the Organization for Security and Co-operation in Europe (OSCE) on the presidential elections of March 19, 2006 in Belarus.[8] President Lukashenko presented himself for re-election as president, the opposition had presented Milinkevich as their candidate. Lukachenko threatened to wring the neck, 'as one might a duck', of anyone going to opposition protests. Lukashenko was re-elected and the international critique of this result was that the elections had not taken place in accordance with the international OSCE norms for fair and democratic elections to which the participating states of the United Nations have committed themselves. The critique was that Lukashenko, as president of Belarus, had misused the authority of the state in a way that impeded citizens to vote during free and fair elections and that during the election campaign a systematic use was made of intimidation and suppression of the opposition.

[7] See Medhurst & DeSousa (1981) for a discussion of visual cues for a negative evaluation of a situation or form of behaviour.
[8] See Kramer, David (21 March 2006). "Ballots on the Frontiers of Freedom: Elections in Belarus and Ukraine". United States Department of State. Archived from the original on 11 October 2007.

In his cartoon Tom Janssen uses the scenario metaphor of the boxing game to transfer certain characteristics of the source domain (a violation of a ruling of the boxing game) to the target domain (the violation of the rights of the opposition and the voters). The elements of the scenario are in this example the participants (Lukashenko and Milinkevich), the roles (the opponents in the boxing game), the relation (winner vs. loser of the game), and the attributes (boxing gloves and a rope that is used to tie Milinkevich). De deviation of the standard scenario of the boxing game is the way in which Milinkevich is tied, representing the violation of a rule of the boxing game. A possible reconstruction of the propositional content of the critique of Tom Janssen on the basis of a reconstruction of the argumentation can be found in figure 3.

1   The threat to wring the neck, 'as one might a duck', of anyone going to opposition protests (X) by president Lukashenko (P) during the election campaign of 2006 in Belarus (S) must be evaluated negatively

      1.1a The threat to wring the neck, 'as one might a duck', of anyone going to opposition protests (X) by president Lukashenko (P) during the election campaign of 2006 in Belarus (S) has as characteristics that it has impeded the opposition to conduct their campaign (Y1) and that he has 'permitted State authority to be used in a manner which did not allow citizens to freely and fairly express their will at the ballot box...a pattern of intimidation and the suppression of independent votes' (Y2).

      1.1b The characteristics of impeding the opposition to conduct their campaign (Y1) and permitting state authority to be used in a manner which did not allow citizens to freely and fairly express their will at the ballot box...a pattern of intimidation and the suppression of independent votes (Y2) must be evaluated negatively

            1.1b.1a   The characteristics of impeding the opposition to conduct their campaign (Y1) and permitting state authority to be used in a manner which did not allow citizens to freely and fairly express their will at the ballot box...a pattern of intimidation and the suppression of independent votes (Y2) conflict with the international norms for democratic free elections to which the participating states of the OSCE (Organization for Security and Co-operation in Europe) and the United Nations (UN) have committed themselves

Figure 3: Reconstruction of the argumentation in cartoon 1 by Tom Janssen

The reconstruction is based on an analysis of the source domain of the critique that is formed by the scenario metaphor and is translated in terms of characteristic Y of the behaviour of Lukashenko that is to be evaluated negatively. The reconstruction of the propositional content, the tying up of the opponent in a boxing game to be able to knock him out, is transferred to the behaviour of Lukashenko. The behaviour that is criticized concerns the fact that he has impeded the opposition to conduct a campaign so that they had no chance of winning the elections. The reconstruction of the characteristic Y forms the basis of the reconstruction of argument 1.1a and 1.1b. In this example the critique of tying up the opponent as a violation of a rule of the boxing game is a metaphor for the critique that he has impeded the opposition to conduct a campaign.

5.   CONCLUSION

In this contribution I have explained how political cartoons can be analysed as an attempt to convince an audience of the acceptability of a critical standpoint about the behaviour of a public official or politician. I have indicated how the attempt to convince can be analysed in terms of a standpoint that is defended with a complex argumentation and I have indicated what the argumentative commitments of a cartoonist are. I have demonstrated that a cartoon can be considered as a form of indirect argumentation and I have specified how a reader can reconstruct the complex argumentation underlying a cartoon, given the knowledge of the rules of the genre.

On the basis of an integration of insights from argumentation theory and metaphor theory, I have developed a conceptual framework for the analysis of the visual metaphor and the argumentative obligations of a cartoonist. I have described the argumentative obligations of a cartoonist who expresses his critique in terms of a complex argumentative message based on symptomatic argumentation aimed at convincing an audience of his critical stance. On the basis of an example of a cartoon with a scenario metaphor I have given an analysis of the argumentation. In future research, for other types of messages with visual metaphors that are based on other argumentation schemes, and other forms of visual rhetoric, different argumentative patterns have to be investigated that represent different argumentative obligations for cartoonists in light of the various forms of critique that are expressed.

Assessing connection adequacy for arguments with institutional warrants

JAMES B. FREEMAN

ABSTRACT: An institutional warrant is backed by rules. Appraising strength involves going from the rules to the warrant to strength assessment. The strength is resistance to rebutting by values of relevant variables. Sufficient strength for cogency depends on the backing institution, e.g. preponderance of evidence versus proof beyond a reasonable doubt. Strength involves characterizing counterexample resistance. Where the warrant resists counterexampling at each level below the threshold for counterexample indifference, the warrant is sufficient for cogency.

1. WARRANTS "BACKED FROM ABOVE" AND RULES

A warrant is "backed from below" when the backing consists of perceptually observed evidence. By contrast, a warrant is "backed from above" when the backing consists of a rule, typically a member of a body of rules which constitute an institution. The law is a paradigm case, but as Searle points out in (1969, p. 51), there are many other institutions, games being prime illustrations. Also, certain human relations such as marriage presuppose institutions to be entered into. In this paper, we shall develop our account with respect to warrants backed by laws, and then point out how our conclusions may be applied to warrants in general backed from above. We may distinguish two types of rules, both included in bodies of law. Cohen in (1970) considers legal hypotheses having the following form:

> For any persons *x* and *y*, if *x* has R to *y*, then *x* has good cause of action against
> *y* (i.e. if *x* sues *y* *x* ought to win).

(1970, p 157) This hypothesis and the law from which it is derived (more on this later) is regulative. It specifies that certain conditions where two persons are related in a particular way have legal consequences. The rule assumes that we can recognize when this relation holds. We do not need this rule for the condition to be defined or to exist.

By contrast, constitutive rules are necessary for certain conditions to obtain or for certain properties to be satisfied. A constitutive rule has the form "*X* counts as *Y* in context *C*" (Searle 1969, p. 52). For example, a piece of paper of a certain composition and bearing certain marks counts as a $10 bill, given the declaration of such an object, of such a composition, bearing such a pattern of marks being a $10 bill by a duly authorized government body. As Searle would emphasize, one cannot completely describe the object as a $10 bill without the constitutive currency rules.

How do rules of either type back warrants? We regard warrants as licences to move

from a set of premises to a conclusion. Consider Toulmin's paradigm example:

From:	x was born in Bermuda
To infer:	x is a British subject

Why, Toulmin invites us to ask, does the warrant have "authority and currency"? (1958, p. 103) Although warrants are inference rules, not statements, corresponding to the warrant in our paradigm example is a universally generalized statement, "All persons born in Bermuda are British subjects." Such statements are not accidental generalizations but law-like, presupposing the truth or at least truth-likeness of subjunctive conditionals. Our generalization requires not just that all those born in Bermuda are British subjects but that if someone *were* born in Bermuda, he or she *would* be a British subject.

Returning to our question of backing institutional warrants, in (2005), we pointed out that there are two ways in which one may come to know the rules upon which institutional subjunctive beliefs are formed. We may learn these rules either informally through practice or formally through encountering some official or authoritative formulation of the rule. Informal learning is the primary way one may come to learn rules. Coming to believe some generalization by consulting some certified source presupposes that one understands the language used to communicate the rule. But language is a system of syntactic, semantic, and pragmatic constitutive rules. One learns one's first language informally, by "picking up" its rules.

What we have said about institutional generalizations applies straightforwardly to institutional warrants. Learning constitutive rules involves learning to make certain projections (i.e. inferences). Upon observing that a soccer ball has taken a certain trajectory, one projects that one has scored a goal. If one has learned a system of rules constituting some practice through engaging in that practice or observing others engaging in that practice, the test of one's having learned the rule is projecting competently from one's practice or observation. If the fans erupt cheering, one needs no further confirmation of one's projection that one has scored a goal or of one's having learned correctly the rule behind it, at least for this application. A correctly learned rule backs a reliable warrant.

2. RELIABILITY FOR FORMALLY BACKED WARRANTS AND SPEECH ACTS

A formally backed warrant is reliable when it expresses a correctly drawn inferential moral from a statement of the rule or rules constituting its institutional backing. When is there a presumption that we have drawn the moral correctly? We approach this question through Searle's speech act theory. Suppose the formulation we consult is included in the official published record of the acts of some legislative body. We are dealing here with two speech acts in tandem. The formulation is an assertive that certain constitutive rules containing certain provisions have been enacted. These assertives report that another speech act has taken place, then, a declaration by a formal legislative body. Searle defines a declaration as an illocutionary act whose successful performance "brings about the correspondence between the propositional content and reality, successful performance guarantees that the propositional content corresponds to the world" (1979, pp. 16-17). Thus, if the official rule keepers of baseball have declared that balls hit with a certain trajectory are foul, balls hit with that trajectory *are* foul.

For one's formally acquiring a warrant to be presumptively reliable, four conditions are necessary: (1) One must understand the assertion that a successful declaration has been made. (2) That assertion must be true. (3) One must understand the propositional content of the declaration. (4) That content must give the warrant authority or currency. (Notice that if one heard the declaration of the constitutive rule from the declaring authority directly, as opposed to encountering some assertion of that declaration, to form a warrant properly one would still have to understand both that the authoritative body had made a declaration and what was the propositional content of that declaration. Again that content must authorize the warrant.) Under what circumstances will these four conditions be satisfied?

That an assertion is true is simply a matter of how the world is. The second condition, then, is totally straightforward. What is involved in the issue of understanding that an assertive has been made to the effect that a declaration with a certain propositional content has been made? Here again we may turn to Searle's speech act analysis. We may factor a sentence expressing a declarative into two parts, a declarative illocutionary force indicator D, such as "I declare" or "It is being declared that" and a sentence *P* expressing a proposition that *p*, the proposition declared. One understands a sentence of the form D*P* then when one knows the rules for the declarative operator and the rules for understanding *P*. In (2005), patterned on Searle's account of rules for the illocutionary promise operator, we presented four rules for using D:

Rule 1. D is to be uttered only in the context of a sentence *P* used to express *p*.
Rule 2. D is to be uttered only if that *p* does not occur in the normal course of events.
Rule 3. D is to be uttered only by a speaker in a position of legislative authority.
Rule 4. Uttering D in the context of *P* brings it about that *p*.

(2005, p. 198; compare Searle 1969, p. 63.) According to Searle, one understands a sentence *P* when one knows its meaning, which is determined by rules specifying both conditions of utterance of the sentence and what the utterance counts as (1969, p. 48).

Clearly, a sentence with the illocutionary force of an assertive that a declarative has been made is of the form AD*P*, where A is the assertive operator "I assert" or "It is asserted that." Understanding such a sentence, in addition to understanding D*P* is a matter of knowing the rules for using A. Hence, properly acquiring a warrant when confronted either with the declaration of a constitutive rule or an assertive to the effect that such a rule has been declared requires understanding both the propositional content of the constitutive rule, the rules for the proper use of the declarative operator and, in the case of assertives, for the assertive operator as well. According to Searle, "Understanding the speaker's utterance is closely connected with recognizing his intentions," more specifically "to get the hearer to know (recognize, be aware of) that certain states of affairs specified by certain of the rules [of the language common to speaker and hearer] obtain" (1969, p. 48). Hence, as long as the assertion that a constitutive rule has been declared is true and the declaring body has the legitimate authority to declare this rule (the declaration is successful), unless there is a problem with the meaning of the constitutive rule *P* or reason to doubt that the declaring body has the proper authority to declare that *P*, the warrants derived from *P* are reliable. We shall return to the problem of meaning with rules and institutional warrants shortly.

3. RELIABLE INSTITUTIONAL RULES, REBUTTALS, AND ARGUMENT COGENCY

Turning to connection adequacy considerations, should an institutional warrant be reliable, then where it licences a move from premises to conclusion, the premises are *ipso facto* relevant to the conclusion. What may we say about warrants and argument strength? Toulmin ties argument strength in general to warrants, the degree of strength being expressible through a modal qualifier or modality.

> Warrants...may confer different degrees of force on the conclusions they justify. Some warrants authorize us to accept a claim unequivocally..., others authorize us to make the step from data to conclusion either tentatively, or else subject to conditions, exceptions, or qualifications (1958, p. 100).

Although the modality expresses the strength, Toulmin does not make it clear–at least not here–how warrants confer their respective degrees of strength. But this is not hard to see. As we have indicated, corresponding to a warrant is a generalized conditional supporting a subjunctive. If that conditional is unrestrictly general

> For all x, if it were the case that φx, then it would be the case that ψx
> In a game of baseball, if a ball were hit with a trajectory taking it across the first base line, that ball would count as (would *be*) a foul

the corresponding warrant's force is "unequivocal" or conclusive.

> Given that $\quad\quad\quad$ x was hit with a trajectory across the first base line
> We may take it that $\quad$ x is a foul ball.

Whereas if the associated generalization is qualified by a *ceteris paribus* clause or a list of excepting conditions,

> For all x, *ceteris paribus* if it were the case that φx, then it would be the case that ψx

or

> For all x, if it were the case that φx, then it would be the case that ψx, unless $\chi_1 x$ or $\chi_2 x$ or...or $\chi_n x$

the warrant's force is only defeasible. But a *ceteris parbus* clause admits the possibility that all things might not be equal, i.e. that there are certain unspecified rebutting conditions. On this conception, warrant strength, at least the distinction between unequivocal and qualified warrant strength, is a function of the possibility of rebuttals.

Are institutional warrants then subject to rebuttals? At least some are, depending first on whether the rules backing them involve exceptions. Ordinarily, someone named in a will to receive a bequest of a certain amount of money will have the right to receive that amount upon the testator's demise and proper probate of the will. But one does not have this right invariably. If the person who made the will was mentally incompetent at the time or under duress, the will could be declared invalid. We may expect that in many cases, the exceptions would be built into the rules themselves.

To use Toulmin's example, we may expect that built into the British Nationality Acts, at least implicitly, would be the provisos that even if one were born in Bermuda or other crown

colony, should neither of one's parents be British subjects or should one have renounced one's British citizenship, one would not be a British subject. The corresponding warrant then would be subject to rebuttals, and the strength of the warrant a function of the plausibility of those rebutting conditions.

4. RECOGNIZING REBUTTALS

From an epistemological point of view, this raises at least two questions. First, in the general case, how does one determine the plausibility of these rebuttals? Secondly, how does one come to identify or recognize the rebuttals associated with a particular warrant? In the institutional case, this will in some cases simply be a matter of understanding the constitutive rule. The "C" in Searle's paradigm scheme for a constitutive rule "X counts as Y in context C" includes a list of rebuttals, as Toulmin's example concerning birth in Bermuda and British nationality suggests. Our recognizing the rebuttals, then, is a matter of our having properly learned the rule or of our having sufficiently learned the language in which the assertive reporting the declarative was uttered, and our being aware of presupposed rebutting conditions.

Recognizing rebuttals, however, may not always be a matter of simply acquiring or understanding rules. Some rules can be vague, others ambiguous. We might also expect that in certain systems of rules, there will be conflict of rules due perhaps to the vagueness or ambiguity of certain rules constituting the institution. Most importantly, as we have just noted, given a rule we may be aware of possible exceptions to it. How then can one determine what warrants are backed or authorized by these rules and what may be their associated rebuttals? This raises what one may call the he hermeneutical problem for institutional warrants. Taking the legal case as paradigm, resolving such hermeneutical problems involves the ongoing development of law. A judicial ruling may provide a precising definition adapting the law to current conditions. This court ruling then supplements the current system of constitutive rules, allowing recognizing more clearly which warrant is supported and its associated rebuttals upon understanding the original statute in light of the court ruling.

Will this always be the case? May not different courts give different precisings of a certain vague statute, raising the possibility of conflicting principles? Cohen in (1970) has suggested a way of dealing with such cases. Although his discussion is framed with respect to regulative rather then constitutive legal principles and with no reference to the categories of the Toulmin model, I believe adapting his account is straightforward. Consider the following example:

> x and y's declaring intent to take each other as spouse and exchanging vows before a duly authorized peace officer (civil servant or clergy member) count as x and y's having married each other.

Just what does declaring intent and exchanging vows entail? Must both persons be physically present? Can one act by proxy? Can both act by proxy? Some religious traditions have various orders of clergy. Are all such persons duly authorized to act as peace officers in instituting the state of matrimony? To diminish the vagueness of this rule, one might moot the following as a hypothesis:

> If x and y were to declare intent to take each other as spouse and exchange vows before a duly authorized peace officer, where at least one of x and y were physically present before the officer and the officer was either a duly licensed civil servant or any

duly ordained member of the clergy, then x and y would be married to each other.

As Cohen points out, such a hypothesis may be supported by appeal to legal precedents. Unlike backing an institutional warrant or its associated subjunctive "from above" through understanding the meaning or import of certain declarations, this support is "from below," through amassing data on judicial decisions. Following Cohen's suggestion (Compare 1970, p. 157), to establish such a proposition from legal precedent, one must show that in a variety of situations where x and y could be said to have declared intent and exchanged vows, they are judged married. "But what constitutes an appropriate variety of situations here (Cohen 1970, p. 157)?" Determining relevant variety involves identifying the branch of law to which this hypothesis belongs and the legal relevant variables which are proper to this branch (Cohen 1970, p. 157). In this example, identifying branch of law is straightforward. Marriage is a contract and so the laws governing contracts apply here. Relevant variables might include the ages of one or both partners to the contract, evidence of coercion, or mental incompetence. The relevance of these variables would be determined by referring to previous judicial decisions where there being a state of marriage was contested. If the marriage were declared invalid when at least one of the parties was below a certain age, but not when both were above that age in circumstances otherwise similar, age is a relevant variable.

Our knowledge of the class of contract laws presumably will include information on conditions invalidating contracts. Support for the hypothesis (backing of the corresponding warrant) would be generated by identifying analogous cases where there had been a declaration of intent and exchange of vows between two persons before a duly authorized peace officer where some further invalidating condition or combination of invalidating conditions held, i.e. cases satisfying different combinations of the values of the relevant variables identified for contracts. The evidence sought would be the last rulings of the highest court of appeals to hear the case. In an ideal situation, one would have access to the decisions of cases in which each combination of values of relevant variables were present. If in all such cases the highest court had ruled that the marriage contract was valid, none of the possible rebutting conditions would have served to rebut the warrant, the hypothesis would be fully supported.

5. REFINING WARRANTS

Suppose, however, that in not all cases do we have evidence that the court ruled that the marriage contract was valid and thus our hypothesis not fully supported. This can happen for at least two reasons. First, for some combinations of values of the relevant variables, the court would have ruled the marriage invalid. Secondly, we may lack evidence of court rulings for certain combinations of relevant variables. The appropriate appeals court may have made a ruling, but we have no record of the decision, or the court may not have made any ruling for that combination of relevant variables. In either case, we are faced with proceeding without this information. Such a case has never come before the court. To address this issue properly, we consider first how relevant variables may be qualified and secondly how they may be ordered. In (2018), we addressed both of these issues for the paradigm case of warrants backed from below by empirical investigation. What may we say for warrants backed by legal rules?

Return to our example of the marriage warrant. We have already noted that where a marriage has been legally contracted, the contract may be judicially invalidated should neither party to the contract have been present at the contracting or should the person officiating not

be duly authorized. Marriage, then, is a contract, a species within the genus of contracts, if you will. We all know that contracts in general and not just marriage contracts may be invalidated or declared invalid under certain conditions. Those conditions then are the relevant variables for contracts. We have information that for some types of contracts, if certain values of relevant variables or combinations of values of relevant variables are satisfied, the contract is invalidated. We may not know whether such conditions, if satisfied, also invalidate marriage contracts. We only know that they invalidate some types of contracts. We may then seek evidence for whether these conditions also suffice to invalidate marriage contracts, i.e. whether they serve ro rebut our warrant or to constitute a counterexample to its associated generalization. If we find that no ruling of a court of appropriate jurisdiction has sustained a decision of invalidity, for any value of a particular relevant variable, then this value of a relevant variable fails to be an invalidating or rebutting value.

Suppose, however, that the court has given a decision of invalidity for a given value of a relevant variable or combination of values. We have a disconfirming case. One way to handle the disconfirming cases is to refine the hypothesis, specifying in the antecedent that the values of the relevant variables in the disconfirming cases do not occur. This is to reduce the scope of the terms involved. The revised hypothesis will be less general but closer to being fully supported by the results of our investigation, since it has been narrowed to apply only to cases where the disconfirming values of the relevant variables do not hold. Where our warrant is of the form

From: φx
To infer: ψx

and 'χx' expresses that x satisfies a rebutting value of a relevant variable or a conjunction of rebutting values of various levels, we may modify the warrant by adding '$\sim\chi x$' to the premise, i.e.

From: φx & '$\sim\chi x$
To infer: ψx

Now we are attempting to argue that ψa from the fact that φa. If we know in addition that $\sim\chi a$, we have a licence to move to the conclusion that ψa which is not rebutted by the fact that χa occurs. Unless further rebutting values for our warrant emerge, our warrant is reliable.

But suppose a does not satisfy '$\sim\chi x$' but rather 'χx.' Then the warrant of our argument has been rebutted and the argument not cogent. By contrast, suppose our modified rule passes a given level i of our test. Up through i, we have now seen that the potential defeating values of the warrant do not hold through level i. But we have not, at this point, tested to see whether any of the values of variables i+1 - n are defeating. Must we test through level n before we may regard our warrant to adequately connect the premise or premises to the conclusion? Where rebutting values of a relevant variable may occur, must we add to the premise the condition that these rebutting values are not satisfied? Such an argument would have a conclusive warrant, given the relevant variables recognized from our current epistemic viewpoint. But suppose we do not have this information about values of relevant variables i+1 - n. Remember that we are concerned with defeasible arguments. Where we have no information concerning whether the rebutting values at these levels hold, does the warrant have sufficient strength to convey the acceptability of the premise to the conclusion?

6. REBUTTALS, WARRANT STRENGTH, AND PLAUSIBILITY

Sufficiency depends on the plausibility of values of the relevant variables at a given level. The motivating idea is that if encountering a rebutting value of a relevant variable at that level is implausible–perhaps because encountering any values of the relevant variable at some level i+1 - n is implausible–we need not take account of the relevant variables at those levels. That the warrant has level i reliability means it has sufficient strength to convey us from premise to conclusion, until or unless some evidence that a relevant variable at level j, i+1 ≤ j ≤ n, has some defeating value. Ordinarily those born within a certain jurisdiction are born to parents who are citizens of that jurisdiction. As both Rescher (1977, p. 37) and Perelman and Olbrechts-Tyteca (1969, p. 71) point out, there is a presumption for the ordinary, for the way things are. A rebutable institutional warrant, then, will be deemed reliable, at least presumptively reliable, when there is a presumption that the potential rebutting conditions of the warrant above a given level do not hold, even if there is no evidence of whether they do or do not hold. In light of such presumptions, the warrant is sufficiently strong to transfer the acceptability of its premises to its conclusion. Should any of these presumptions be lacking, the argument must be strengthened to counter them.

We have given a full discussion of how plausibility considerations may be used to order relevant variables when the warrant is backed from below, ultimately by the results of empirical observation, in (2018). But, as we have already indicated, when dealing with legal warrants, the rebutting conditions are legal decisions establishing legal precedents. But we learn of these decisions also "from below." The plausibility considerations are the same as with warrants backed from below. A law belongs to a "species," a subfield of a wider field of law, its "genus." Our knowledge of conditions under which laws within some species of the genus are overturned by judicial decision determines the set of variables against which we must test a legally backed warrant to identify which values of the relevant variables constitute rebuttals when satisfied. The issue of plausibility concerns how plausible a given condition may hold. Hence, our considerations on plausibility apply here also. What is significant for our purposes is that plausibility considerations allow us to identify a level above which a warrant is rebuttal tolerant. That conditions under which rebutting values above that level would be realized are too implausible to require their consideration.

The level of rebuttal tolerance may be set not simply by plausibility considerations but by the strength of an argument the context requires, witness the familiar legal distinction between proof beyond a reasonable doubt in criminal prosecutions and preponderance of evidence in civil cases. The level of rebuttal tolerance will be higher in criminal cases than in civil cases. What may be reasonable doubt in a criminal case need not indicate failure of preponderance of evidence.

7. APPLICATION TO INSTITUTIONAL WARRANTS IN GENERAL

So far, we have confined our discussion to the legal paradigm for warrants backed from above. Can this discussion be generalized for the entire class of such warrants? The answer is straightforward. Institutions consist of declared rules. The legal case includes both constitutive and regulative rules. We have already seen how legal constitutive rules can be analyzed as having the form 'DP,' where 'D' is the declarative operator and 'P' indicates some propositional content. Consider again Cohen's paradigm of an elementary regulative rule:

For any persons *x* and *y*, if R*xy*, then if *x* sues *y*, *x* ought to win.

(1970, p. 157) But clearly for "R*xy*" to be a sufficient condition for "if *x* sues *y*, *x* ought to win," "R*xy*" must be *declared* a sufficient condition by an agent with authority. Hence, the rule's being in force presupposes the truth of

D(For any persons *x* and *y*, if R*xy*, then if *x* sues *y*, *x* ought to win.).

But there is nothing specific to law which would make the propositional content of its rules the only propositional content substitutable for 'P' in the declarative action schema. We might conclude then that as long then as institutional rules are declared rules and thus open to the "DP" analysis, they may back warrants–institutional warrants.

A question still remains. Cohen's paradigm example is a generalized conditional. We may argue that some constitutive rules at least may be paraphrased in this form. Consider

Kicking the ball into the net counts as scoring a goal in soccer.

In the general form

X counts as *Y* in context *C*

(Searle 1969, p. 35), instances of '*X*' are instances of types of action or behavior. But we cannot have an action without an actor (and where the action is transitive, an object of that action). So taking '*A*' as a schematic letter for a subject-verb-object action, the form of a constitutive rule can be straightfowardly paraphrased as

if *Axy* & *Cxy*, then *Yxy*
if x kicks y into the goal and x is playing soccer with y, then x has scored a goal with y

Likewise,
if *x* has damaged some *y* which is owned by *z*, (i.e. the context of doing this damage is the institution of property) *x* has injured *z*

But can the propositional content of an institutional rule always be paraphrased as a universally generalized conditional? Cases not open to such a paraphrase, should there be any, pose no problem. Since corresponding to a warrant is a generalized conditional, if the propositional content of a rule could not be paraphrased as a universally generalized conditional, it would not back any warrant. One would not appeal to that rule to back any institutional warrant. So for warrants backed from above, institutional warrants, the 'DP' analysis suffices. If the declaration is successful, the warrant is reliable to some extent. That extent, likewise the strength of the warrant, depends on the falsifying conditions for the generalizations. That depends to what extent we know that the generalization is not falsified by a rebutting condition and how plausible are the remaining unexplored conditions. We rest our case. We have presented a method for assessing the strength of warrants backed from above and for judging whether arguments with such warrants are connection adequate.

Interrogative burden of proof in philosophical argumentation

JOAQUIN GALINDO CASTAÑEDA

Department of Philosophy
University of Valladolid
Spain
joaquin.galindo@alumnos.uva.es

ABSTRACT: My claim is that some argumentative moves are based on mechanisms of question generation that have the objective of allocating the burden of proof. Although these argumentative moves might occur in other domains, I shall argue that such argumentative moves are characteristically philosophical. The application to examples of argumentation in philosophy will show that questions have a role in the evaluation of the arguments and the allocating the burden of proof.

KEYWORDS: analytic dilemmas, burden of proof, counterargumentation, mechanisms of question generation, philosophical argumentation, pragmatic self-refutation

1. INTRODUCTION

In the process of argumentation we not only provide reasons but also ask questions. The questions we ask are used for several purposes. First of all, we use questions to express our doubts or disagreements ('Is that really so?', 'Do you really think so?') and to request reasons ('Why do you claim that?', 'On what basis do you say that?', 'What is your evidence?'). Then, we use them to ask for clarification, either of the claim or of the argument itself or of its warrant ('What do you mean?', 'What do the premises have to do with your claim?', 'How does that follow?'). All these are obvious uses, and nobody can deny that questions in one form or another play an important role in any argument (see van Eemeren, Houtlosser & Snoeck Henkemans, 2007). However, in this paper I shall explore some properly argumentative functions of asking questions which, being less obvious, have received less theoretical attention.

Briefly stated, my claim is that some argumentative moves are based on mechanisms of question generation that have the objective of allocating the burden of proof. Although these argumentative moves might occur in other domains, I shall argue that such argumentative moves are characteristically philosophical. But first, let me clarify what I understand by the key terms of "question-generating mechanisms" and "allocating the burden of proof".

It is a commonplace to distinguish between rhetorical and non-rhetorical questions. Rhetorical questions are ordinarily believed to be disguised claims, and so not really questions at all. Things are probably more complicated than that, but I shall leave that aside in this paper. As for non-rhetorical—or authentic questions—very often they are considered to be requests for information. There is much evidence (Graesser, 1992) that this is an incomplete description, and that we ought to distinguish at least four main question-generating mechanisms:

1.   Knowledge deficit questions: These appear when the one who asks the question detects a lack of information in their knowledge base and questions are formulated in order to obtain the missing information. This is the standard use of questions as requests for information. ('Who was present?')

2. Common ground questions: They are formulated to make sure that a piece of knowledge is shared between the participants of the dialogue. ('Would you agree that…?')

3. Social coordination questions: They focus on the participants' roles in the dialogue, such as often in student-teacher exchanges ('Can we take the recess now?').

4. Conversation control questions: These serve to direct the flow of the dialogue and/or the attention of the participants ('May I ask you a question?')

All these mechanisms play a role in argumentative exchanges, but I am interested in conversational control questions, particularly those that redirect the dialogue in counter-argumentation, in connection with knowledge deficit questions. The latter are usually raised when the questioner:

1. Finds an obstacle in a plan or problem.
2. Encounters a contradiction.
3. Perceives an unusual or abnormal event.
4. Perceives an obvious lack in the questioner's knowledge base.
5. Finds a need to evaluate and make a decision between a set of alternatives that are equally likely.

I will analyze and illustrate the second case, i.e. when the questioner finds a contradiction.

There are many studies of questions in formal semantics and logic that are relevant to discussions about knowledge deficit and conversational control questions (Which- and Why-questions, embedded and indirect questions, etc.). At the moment, the form of the questions is not of interest, but the central concept in all these, namely the presupposition of a question, is.

Belnap and Steel (1976, p. 5) define a question as presupposing a statement if and only if the truth of the statement is a logically necessary condition for there being a true answer to the question. If an answer cancels the presupposition, then it is usually called a "corrective answer". For example, the presupposition of the question: 'When did the Third World War end?', is: 'There was a Third World War.' If one answers that question by saying 'It never happened', or 'There has not yet been a Third World War', then one has given a corrective answer. As is well known, the many question fallacy is related to presuppositions ('Have you stopped beating your wife?', 'Did you hide the stolen goods in your house?'). The only answer to such questions is a corrective answer which denies the presupposition. Just remember its application in Walton's Profile dialogues.

In sum, the three auxiliary concepts for the part of my claim that regards mechanisms of question generation are: conversational control questions, knowledge deficit questions (related to inconsistencies of different types), and corrective answers.

Now let me explain what I mean by "the allocation of burden of proof". First of all, by "burden of proof" I mean the dialectic obligation often expressed in the norm: 'The person one who makes a claim has the burden of proof.'

I will follow Rescher's distinction (Rescher, 1977, p.27) between Initiating burden of proof (I-burden) and Evidential burden of proof (E-burden). The obligation to support an assertion with arguments in a dialectic situation has I-burden. On the other hand, counter-considerations and responses to counter-argumentation have E-burden.

We can distinguish, with Marraud (2017, pp. 54-55) three types of counterargumentation each having a different E-burden. Using Toulmin's well-known terminology, we have:

- Objection: It questions the truth of data, giving reasons.
- Rebuttal (Pollock's 'undercutting defeater'): It questions the warrant.
- Refutation: It directly questions the claim by providing an argument with an opposite (contrary or contradictory) conclusion.

The distribution of the burden of proof, both I-burden and E-burden, can be represented by the following tables (inspired by Lorenzen's dialogical logic):

Prop = Proponent
Opp = Opponent
W = Warrant
C = Claim
Rn =Reason
* = Burden of proof
! = Assertion
/ = Because
¬ = negation

Objection
Table 1

Prop	Opp
1. $*!C$	
2. C/R_1	
3.	$*\neg R_1$
4.	$\neg R_1/R_2$
5. $*!C$	

The proponent has the I-burden [1] and advances an argument [2]. If a counterargument challenges the reason given to hold the thesis, the E-burden is transferred to the opponent [3], who discharges it by providing an argument [4] with the result of returning to the initial state [5].

Rebuttal
Table 2

Prop	Opp
1. $*!C$	
2. $C/_w R_1$	
3.	$*\neg/_w$
4.	$*\neg/_w /R_2$
5. $*!C$	

The proponent again has the I-burden [1] and discharges it with an argument [2]. If the warrant is challenged by the opponent, the E-Burden again falls on him [3] and must in turn give a reason [4]. The result is that the proponent's argument is deleted and we return again to the initial state [5].

Refutation
Table 3

Prop	Opp
1. *!C	
2. C/R$_1$	
3.	*!¬C
4.	¬C/R$_2$

The proponent begins with the I-burden [1] and discharges it [2]. Now, the opponent denies the conclusion. The E-burden passes to the opponent [3], who discharges it with an argument [4], which is, precisely, the refutation of the proponent's claim. The result is that we have now two counter-oriented arguments. Deciding between them requires weighing reasons. These counter-argumentation moves can be reiterated.

This terminology is probably enough to explain the meaning of the phrase "allocation of the burden of proof".

And now we come to the point—the argumentative moves, especially those characteristics of philosophical argumentation. We find them in arguments, counter-arguments, and even in argumentative plans and strategies. For the moment, I will use it with the deliberate intention of not speaking about its exact nature, but towards the end I'll propose some hypotheses.

What matters now is that the argumentative moves I selected are paradigmatically philosophical, as found from Plato's Dialogues to the most recent papers. I was tempted to call them "philosophical tricks", not so much because they are, like tricks in general, everywhere, but because they take lay readers by surprise and strike them as strange, even awaking in them the suspicion of a sleight of hand. However, the word "trick" has negative connotations: it suggests a hoax. I don't mean that, so I use the more neutral term "argumentative moves".

I will analyze two argumentative moves:

- Analytic dilemmas
- Pragmatic self-refutation

Below, I will explain each one and illustrate them with examples.

But, before that, let us recall my original claim. The coarse-grained version was: Some argumentative movements are based on question-generating mechanisms that have the objective of allocating the burden of proof. They are characteristically philosophical.

A fine-grained version might be: Analytic dilemmas and pragmatic self-refutation charges are based on conversational control questions, knowledge deficit questions (related to inconsistencies), question presuppositions and corrective answers, all of which aim to allocate I-burden and E-burden.

I shall take them in turn:

2. ANALYTIC DILEMMAS

Philosophers are famous for making distinctions, finding ambiguities, carrying out semantic ascents, and analyzing the meanings of words. But what is much less well understood is that, in the case of philosophers, these activities are not merely lexicographical, but have an argumentative function.

The best way to see this is by means of an example. The argumentative move in question is characteristic of philosophy. It consists in questioning the meaning of a word or the interpretation of a proposition with the objective of confronting the proposer with the following claim:

"If you mean such-and-such, that is the truth but trivial; if such-and-such, it is then not trivial, but neither is it obviously true" (Passmore, 1961, p.14).

This is not an argumentation scheme, since there is no pattern of inference. Rather there is a main question (about the meaning of a word or the interpretation of a statement), a series of auxiliary questions whose function is to make the opponent, in a dialectic situation, answer affirmatively by directing him to the analytic dilemma.

There may be different versions depending on the second horn of the dilemma, for the first horn is always the same:

1.   First horn: 'What you say is trivial.' Second horn: 'What you say is not obvious' (we do not know if it is true or false).
2.   First horn: 'What you say is trivial.' Second horn: 'What you say is prima facie false.'
3.   First horn: 'What you say is trivial.' Second horn: 'What you say is patently false (or absurd).'

Each of these three combinations have consequences for the distribution of the burden of proof.

Now let's consider an example in detail, excerpted from Williamson's recent *Tetralogue* (2015). In spite of the fragmentary character of the text, it is a procedure, as I mentioned before, that we find repeatedly in the philosophical tradition.

Two people are in a train discussing science and witchcraft. One is a confessed relativist; the other uses a somewhat impertinent logic:

> Sarah: Let me try again. Can we express your relativism as 'Every point of view is just a point of view'?
> Zac: In a sense, Sarah. We can talk that way if you like.
> Sarah: If Bob says 'Witchcraft works' and I reply 'That's just your point of view', I'm refusing to endorse his statement. I'm accepting that it's his belief but by putting in the word 'just' I'm rejecting the idea that it's more than his belief, that witchcraft actually does work. In the same way, when Zac says something and then later says 'That's just my point of view', he sounds as if he's refusing to endorse his own earlier statement, disowning it. That's the retreat Bob and I complained about. But now Zac tells us he isn't disowning his earlier statements.
> Zac: Exactly, Sarah.
> Sarah: You're accepting that it's what you believe but you're not rejecting the idea that it's more than that. You are adding to what you previously put on the table, not replacing it. So we should delete the word 'just', because you don't really mean that it's just your point of view.
> Zac: Delete it if you like, Sarah. The wording was yours, not mine.

Sarah: I will. So instead of saying 'Every point of view is just a point of view', relativism says 'Every point of view is a point of view'.

Zac: So it is.

Sarah: Yes, but that makes relativism utterly trivial! Everyone, even the most hard-line absolutist, will agree that every point of view is a point of view (Williamson, 2015, pp.32-33).

Let's look at the burden of proof table:

* = Burden of proof
Knowledge deficit questions = ?KDQ
Conversation control questions =   ?CCQ
Corrective Answer = CA.

Table 4

Prop (Zac)	Opp				
1.	?CCQ Can we express your relativism as 'Every point of view is just a point of view'?				
2. *Yes			If Bob says 'Witchcraft works' and I reply 'That's just your point of view', I'm refusing to endorse his statement.		
		Warrant: If A says that *p* and B says that *p is* just your point of view, then (material inference) B does not endorse *p*.	Therefore		
			"just your point of view" implies disowning the embedded proposition	Zac asserts '"Every point of view is just a point of view'	
			Therefore		
			Zac says something and then later says 'That's just my point of view', he sounds as if he's refusing to endorse his own earlier statement, disowning it.		
3. CA (not disowning the embedded proposition)	?CCQ accepting that it's what you believe but you're *not* rejecting the idea that it's more than that. You are *adding* to what you previously put on the table, not *replacing* it. So we should delete the word 'just', because you don't really mean that it's *just* your point of view.				
4. Yes (you can delete "just")	One horn analytic Dilemma: Yes, but that makes relativism utterly trivial! Everyone, even the most hard-line absolutist, will agree that every point of view is a point of view.				
5.*I-burden					

3. PRAGMATIC SELF-REFUTATION

Another characteristically philosophical procedure (from Plato to Nagel) is frequently used in discussions against relativists and skeptics. It's about finding inconsistencies, but of a specific kind.

The point is not only to show that someone held that p and, say at another time, held that not p (like a philosopher in two different papers or books), for we might call that a mere inconsistency, and the proponent can reply by saying that they have changed their mind. Nor is it a reduction in the sense of extracting remote consequences involving the self-contradictory statement 'p and not p'. Rather, it looks like a pragmatic paradox, like saying "I can't talk," in the sense that something that is said is the best counterexample of what is stated. Of course, as we shall see, the procedure is more subtle.

Again, we find a set of auxiliary questions that lead the opponent step by step until the desired end is reached by showing that what is done is the best counterexample to the content of their thesis.

The only defensive movement/choice is to argue that it's not really a counterexample.

Consider another example from Williamson's book:

> Zac: Whoa there, everyone, not so fast! Surely once you start using the word 'true' you imply certainty. You can't call something true unless it's certain, beyond doubt. If you don't want to imply certainty, don't say 'true'.
> Sarah: Let me ask you a question. You'll see why in a minute. Is it true that there is life on other planets?
> Zac: I've no idea, Sarah. Nobody knows—at least, not from my point of view.
> Sarah: OK, but is it certain that there is life on other planets?
> Zac: No, Sarah, it isn't. As I just said, nobody knows.
> Sarah: There you are. Truth doesn't require certainty, even from your point of view.
> Zac: Sarah, what are you talking about? I get to tell you what my point of view is. You can tell me what your point of view is. You don't get to tell me what my point of view is.
> Roxana: Listen and learn. I will analyse the logic of Sarah's questions. If truth entails certainty, then uncertainty entails untruth. Yes?
> Zac: Yeah, OK, we can play those logic games if you insist, Roxana.
> Roxana: I insist. Sarah's first question was 'Is it true that there is life on other planets?'; call that the truth question.
> Her second question was 'Is it certain that there is life on other planets?'; call that the certainty question.
> Your response to the truth question was 'I don't know'. Your response to the certainty question was 'No'. Do you accept that those were your responses?
> Zac: Yeah, Roxana, they were, but where is all this heading?
> Roxana: You do not treat truth and certainty as the same. Your responses to the truth question and the certainty question were not equivalent. 'I don't know'
> is quite different from 'No'.
> Zac: They are both negative responses, Roxana. What's the big difference supposed to be?
> Sarah: When you next have to apply for a visa, try responding to the question 'Have you ever been involved in smuggling drugs?' with 'I don't know' instead of 'No'. You will soon find out the difference.
> Roxana: If you, Zac, inferred untruth from uncertainty, you would have answered 'No' to the truth question, since you answered 'No' to the certainty question. But you did not. Sarah's questions caught you out. They revealed that in practice even you do not take truth to require certainty (Williamson, 2015, pp.51-54).

Let's look at the burden of proof table:
TQ = The truth question: Is it true that p?
CQ = The certainty question: Is it certain that p?

Table 5

Suppose that X asserts that the word 'true' imply certainty.	If truth entails certainty, then uncertainty entails untruth.	If truth entails certainty, TQ and CQ have the same presupposition.

<div align="center">Therefore</div>

If X inferred untruth from uncertainty, X ought to answer 'No' to the truth question, since 'No' to the certainty question	'Is it true that there is life on other planets?' Zac's answer: 'I don't know' 'Is it certain that there is life on other planets?' Zac's answer: No

<div align="center">Therefore</div>

<div align="center">In practice Zac does not take truth to require certainty.</div>

Table 6

Prop (Zac)	Opp
1. the word 'true' imply certainty ¨*	?KDQ Is it true that there is life on other planets?
2. Answer: I've no idea, Sarah. Nobody knows— at least, not from my point of view.	?KDQ OK, but is it certain that there is life on other planets?
3. Answer: No, it isn't. As I just said, nobody knows.	PRAGMATIC SELF-REFUTATION: There you are. Truth doesn't require certainty, even from your point of view *

	Suppose that X asserts that the word 'true' imply certainty.	If truth entails certainty, then uncertainty entails untruth.	If truth entails certainty, TQ and CQ have the same presupposition.	
	Therefore			
	If X inferred untruth from uncertainty, X ought to answer 'No' to the truth question, since 'No' to the certainty question			'Is it true that there is life on other planets?' Zac answer: 'I don't know' 'Is it certain that there is life on other planets?' Zac answer: No
	Therefore			
	In practice Zac does not take truth to require certainty.			

4. CONCLUSION

The first thesis I am defending is that some argumentative movements are based on question-generating mechanisms that have the objective of allocating the burden of proof. They are characteristically philosophical. A fine-grained version is: analytic dilemmas and pragmatic self-refutation charges are based on conversational control questions, knowledge deficit questions (related to inconsistencies), question presuppositions and corrective answers, all of which aim to allocate I-burden and E-burden.

Two examples are analyzed, in both cases the analysis uses techniques from Rescher's formal dialectic (1977), Walton's profiles of dialogue (1998) and Marraud's diagrams of argumentation techniques (2013). I think the diagrams support my thesis. Although research is restricted to these examples of philosophical argumentation, the analysis techniques are easily extrapolated to other arguments.

ABSTRACT: In argumentative discourse fallacies occur regularly, but often they seem not to be noticed by the participants. In spite of the fact that people generally denounce this fallacy when confronted with clear case, this also goes for the fallacy known as the *argumentum ad consequentiam*. In explaining this paradox it is argued in this paper that certain types of *argumentum ad consequentiam* are modes of strategic manoeuvring which take on a reasonable appearance by mimicking legitimate pragmatic argumentation or *reductio ad absurdum* argumentation. In an experiment we tested the following hypothesis: fallacious *argumentum ad consequentiam* argumentation is regarded less unreasonable when it is presented in this way as reasonable pragmatic argumentation.

KEYWORDS: argumentum ad consequentiam, fallacy, hidden fallaciousness, Pragma-dialectics, pragmatic argumentation, strategic manoeuvring

1. INTRODUCTION

In a discussion with evolutionary biologist and fervent atheist Richard Dawkins, Wendy Wright, Chair of the conservative-Christian Concerned Women of America, defends creationism. She supports her standpoint that there is a loving "creator" as follows:

> What people believe about how human beings are created shapes what they believe about human beings. And if we believe that human beings were created out of love, by a loving creator that has given each one of us not only a material body but also a spirit and a soul, we are more likely to treat others with respect and dignity.

Put briefly: there is a loving creator, because if we believe that we will treat others with more respect and dignity. In this way Wright tries to prove that something exists by pointing at the favourable consequences of that existence.

Something similar happened after the American rapper Kanye West had stated on 2 May 2018 in an interview with the American entertainment channel TMZ that as far as he is concerned slavery is a matter of choice:

> When you hear that slavery lasted for 400 years. 400 years? That sounds like a choice.

Van Lathan of TMZ tackled him about these words:

> You may think as you like, but your statements have world-wide consequences. While you are making music and lead the luxury life of an artist, we – the remainder of society – are still being marginalized by the consequences of 400 years of slavery.

Next West just repeated that slavery is a choice.

Both Wendy Wright and Van Lathan point at the effects of what is claimed in an assertion about a certain state of affairs ('there is a loving "creator"' and 'slavery is a choice' respectively). Their argumentation is based on the positive or negative consequences of what is asserted in the standpoint that is defended.[1] For this reason in both cases the fallacy is committed that is known as the *argumentum ad consequentiam*. In an *argumentum ad consequentiam* a non-legitimate step is made from a normative premise to a descriptive standpoint. An assertion about the existence or non-existence of a certain state of affairs is then defended by pointing at the positive or negative consequences that this state of affairs would have.

The *argumentum ad consequentiam* is not a fallacy we encounter daily. In discussions about religion and discrimination however this unreasonable argumentative move appears to occur regularly. In particular in situations in which speakers take refuge to "wishful thinking" the *ad consequentiam* fallacy can often be heard. Anthony Beevor, the British World War II historian, describes in this way the desperate statements of German soldiers after their defeat at Stalingrad:

> Soviet intelligence officers, however, found their German prisoners still in a state of denial and confused logic at the possibility of defeat. "We have got to believe that Germany will win the war," said a Luftwaffe navigator from a JU 52 shot down on the Stalingrad run, "or what is the use of going on with it?" A soldier reflecting the same obstinacy: "If we lose the war we have nothing to hope for" (Beevor, 2012, p. 257).

In this kind of simple cases the unreasonable character of this argumentative move is clear immediately, even to laymen who have never heard of this fallacy. This has become clear in our empirical examination of reasonableness judgments of ordinary arguers (van Eemeren, Garssen & Meuffels, 2009). The results of this experimental research make clear that ordinary arguers judge the *argumentum ad consequentiam* as a very unreasonable fallacy (pp. 176-179). In our research we started from "clear cases". In the daily practice of argumentation however such fallacies will as a rule not manifest themselves so noticeably and revealing their unreasonable character will be more difficult. Therefore the question arises how it can be that in practice argumentation in which the argumentum *ad consequentiam* is committed is sometimes presented in such a way that it gets a more reasonable appearance. We will offer an explanation for this phenomenon and test this explanation subsequently in an experiment.

The research we are reporting about is part of a project named "Hidden Fallaciousness", in which we investigate how ordinary arguers manoeuvre strategically in order to give a less unreasonable appearance to the fallacies they commit. In earlier research conducted in this project we have examined how in practice the *argumentum ad hominem* and the *argumentum ad baculum* can be disguised or camouflaged (van Eemeren, Garssen and Meuffels, 2012, and van Eemeren, Garssen and Meuffels 2015, respectively). In our current contribution we shall first set forth the pragma-dialectical view of the *argumentum ad consequentiam*. After having paid attention to strategic manoeuvring with the *argumentum ad consequentiam* and discussing

---

[1] Van Lathan does not go into the factual correctness of West's assertion, but shifts the topic of discussion to the question of whether it is wise to make an assertion like that. In ordinary discussions such a shift occurs rather often.

two disguised manifestations of this fallacy we will report about an experiment that pertains to one of them.

2. TWO DISGUISED MANIFESTATIONS OF THE ARGUMENTUM AD CONSEQUENTIAM

In the pragma-dialectical theory of argumentation fallacies are viewed as violations of rules for conducting a critical discussion. The *argumentum ad consequentiam* is one of the violations of the Argument Scheme Rule (Rule 8):

> In case the defence does not take place by means of formally valid reasoning, standpoints may not be regarded as conclusively defended if the defence does not take
place by means of appropriate argument schemes that are applied correctly(van Eemeren & Grootendorst, 2004, p. 194).

The Argument Scheme Rule consists in fact of two parts: (1) the argument scheme must be suitable, and (2) the argument scheme must have been applied correctly.

An argument scheme, the central notion in this rule, characterizes the way in which the acceptability of the reason advanced is transferred to the standpoint defended. The suitability of the argument scheme is an intersubjective matter in the sense that in principle the protagonist and the antagonist agree (or are supposed to have agreed) in the opening stage of a critical discussion which argument schemes may be applied. Some argument schemes are by definition unsuitable or do not lend themselves for being used in certain contexts. The structural unsuitability of an argument scheme can, for instance, be due to an inadequate combination of the type of standpoint that is defended and the reason that is advanced in its support. This is the case when an *argumentum ad consequentiam* is used, because a normative reason is then supposed to justify a descriptive standpoint (van Eemeren & Grootendorst, 1992, p. 162).

Whether an argument scheme that is judged appropriate is also correctly applied is in the testing procedure determined by means of critical questions that are associated with the argument scheme concerned and the protagonist's responses to these questions. From the fact that no critical questions can be sensibly associated with the *argumentum ad consequentiam* it already clear that this is an argument scheme that is inherently inappropriate as a reasonable means of defence.

The *argumentum ad consequentiam* is an inappropriate argument scheme due to the combination of a descriptive standpoint and a normative reason, which makes it impossible to have a transfer of acceptability from the reason to the standpoint. The acceptability of a descriptive standpoint is in all cases independent of the value that is attributed to the consequences of having that standpoint. The question now is how it can be explained that a mode of argumentation that is clearly unreasonable can still be used with some success in the discussion. Why would participants in a discussion openly pose as unreasonable in this way? The answer to this question can be found in the extended pragma-dialectical theory, in which the strategic manoeuvring that takes place in argumentative discourse is taken into account (van Eemeren, 2010).

In their pursuit of effectiveness participants in a discussion will try to manoeuvre strategically in such a way that they can realize their dialectical goal by means of their contributions to the discussion by complying with the rules for critical discussion while they are trying at the same time to achieve their rhetorical aim of getting their standpoint accepted by the other party. In balancing between dialectical reasonableness on the one hand and rhetorical effectiveness on the other hand in order to realize these two (sometimes seemingly

incompatible) aims at the same time, the participants in a discussion make use of strategic manoeuvring (van Eemeren, 2010, p. 40).

In itself there is nothing wrong with the participants' zeal to win the discussion, but when achieving this aim gets the upper hand this can lead to an unrestrained pursuit of effectiveness which results in the abandonment of a party's commitment to a reasonable exchange and thus in a derailment of the strategic manoeuvring. Viewed in this perspective, fallacies are derailments of strategic manoeuvring which involve a violation of the rules for conducting a critical discussion. By violating the rules for critical discussion, such argumentative moves obstruct or frustrate the process of resolving a difference of opinion on the merits, so that these strategic manoeuvres must be characterized as fallacious.

Derailments of strategic manoeuvring can easily escape from being noticed by the participants in a discussion because in ordinary argumentative practice deviations from the rules for critical discussion may be hard to detect. None of the parties will be inclined to manifest itself openly ("on the record") as an unreasonable person – if only because this would make their contribution completely ineffective. Therefore: […] arguers will most likely try to stick to the established dialectical means for achieving rhetorical objectives which are possibly at odds with the dialectical rationale for a certain discussion rule, and "stretch" the use of these means so much that the fallacious maneuvering is also covered (van Eemeren, 2010, p. 140).

As a consequence of exploiting the dialectically appropriate means by "stretching" their applicability in order to achieve the arguer's rhetorical aims, derailments of strategic manoeuvring may in certain cases strongly resemble reasonable strategic manoeuvres. For this reason it will in everyday discussions not always be crystal clear where exactly the boundary between reasonable and fallacious needs to be drawn. Put differently: the distinction between reasonable strategic manoeuvring and fallacious strategic manoeuvring is often not simply a matter of black and white. The various modes of strategic manoeuvring that can be distinguished in ordinary argumentative practices often cover a continuum that goes from evidently fallacious to evidently reasonable variants (van Eemeren, Garssen & Meuffels, 2015). This also applies to the *argumentum ad consequentiam*.

Several variants of the *argumentum ad consequentiam* prove to be strikingly similar to modes of strategic manoeuvring in which a standpoint is defended in a reasonable way by pointing at its consequences. There is, for instance, a variant of the *argumentum ad consequentiam* which resembles in its appearance pragmatic argumentation and there is also a variant which has a great many points in common with the argument form known as *reductio ad absurdum* (Garssen, 2006).

This is an example of *ad consequentiam* argumentation that resembles pragmatic argumentation:

> This research concerning differences in intelligence between different races cannot be right because its results will lead to the discrimination of certain groups of people.

In the pragma-dialectical typology of argument schemes pragmatic argumentation, a sub-category of causal argumentation, is schematized as follows:

> 1 Standpoint: Action X should be carried out
> 1.1 Because: Action X leads to positive result Y
> (1.1') (And: If action X leads to a positive result such as Y, it must be carried out)
> (van Eemeren, 2017, 23)

The *argumentum ad consequentiam* resembles pragmatic argumentation because of two common features: the hypothetical causal claim and the negative or positive valuation that is

attached to the claimed consequence. In the *argumentum ad consequentiam* as well as in pragmatic argumentation the argument boils down to a prediction that what is mentioned in the standpoint will have a positive or negative effect.

As a matter of course, there are also differences. While in pragmatic argumentation a prescriptive (inciting) standpoint is defended, the standpoint is in the *argumentum ad consequentiam* always descriptive. It is the prescriptive nature of the standpoint that makes it possible for pragmatic argumentation to be sound whereas *ad consequentiam* argumentation is *qualitate qua* fallacious. When *ad consequentiam* argumentation manifests itself in a similar way as pragmatic argumentation, it can therefore be viewed as a derailment of the use of pragmatic argumentation: the arguer who commits this fallacy goes too far in the strategic manoeuvring of by changing the initially descriptive standpoint into a prescriptive standpoint.

The second disguised variant of *ad consequentiam* argumentation does not resemble pragmatic argumentation but is more like a specific application of the formal-logical argument form of *modus tollens* known as *reductio ad absurdum* or the *ad absurdum* argument. This is an invented example of such an *ad consequentiam* argumentation:

> Evolutionism cannot be right
> Because according to evolutionism we would be descendants of the apes
> And that would be a horrible idea.

The following is an example of a non-fallacious application of *ad absurdum* argumentation:

> Evolutionism cannot be right
> Because according to evolutionism we would be descendants of the apes
> And genetic research shows that this is certainly not the case.[2]

What is striking when we compare *ad consequentiam* argumentation and *ad absurdum* argumentation is that it is not the standpoint that differs – this is in both cases descriptive – but only the last premise. In the non-fallacious *ad absurdum* variant this premise is a descriptive statement, whereas in the case of the *ad consequentiam* it is evaluative.

Table 1 portrays the two variants of the *argumentum ad consequentiam* and their reasonable counterparts:

Pragmatic argumentation	*Ad consequentiam* **I**
Standpoint: X should be carried out *because* X leads to positive consequence Y (*and* If X leads to consequences of type Y, then X should be carried out)	Standpoint: X is true *because* X leads to positive consequence Y (*and* If X leads to consequence of type Y, then X is true)

Reductio ad absurdum	Ad consequentiam II
Standpoint: X is true *because* If X is not true, then Y is true *and* Y is not true	Standpoint: X is true *because* If X is not true, then Y is true *and* Y is not desirable

Table 1: Comparison of the pragmatic argument scheme and the pragmatic variant of the *argumentum ad consequentiam* (*ad consequentiam I*) and *reductio ad absurdum* and the *ad absurdum* variant of the *argumentum ad consequentiam* (*ad consequentiam II*)

These two variants of the *argumentum ad consequentiam* have both been examined in our extensive research of the conventional validity of the pragma-dialectical rules for critical discussion (van Eemeren, Garssen & Meuffels, 2009). The results showed that the two variants were both judged to be very unreasonable by ordinary arguers (pp. 176-179).

The fact that the *ad consequentiam* fallacy resembles certain reasonable counterparts in its appearance already offers a first explanation for the potential problems involved in identifying this fallacy in argumentative practice. The speaker who is guilty of an *ad consequentiam* can make the fallacy less easily identifiable by using specific presentational means that make it look the same as its reasonable counterpart (Garssen 2016, p. 251). What happens in fact is that a confusing ambiguity is created by leaving room for two possible interpretations: a reasonable one and an unreasonable one. In cases where there is no indication that this is not justified, ordinary arguers will start from the presumption of reasonableness and opt for the reasonable interpretation.

In the case of the pragmatic *ad consequentiam* variant it is pretended that the standpoint is not descriptive but prescriptive/inciting. In strategic manoeuvring with this variant directed at disguising this manipulation, it is a question of presenting the standpoint in such a way that it can be interpreted as a descriptive as well as a prescriptive statement. In the next example, J. Wiese, an "alternative" medical doctor adhering to the "Moerman method", phrases his standpoint in such a way that both interpretation are possible:

> It is a careless way of expressing oneself to say that cancer is mainly a matter of uncontrollable cell growth which can only be stopped by quasi-heroic interventions of doctors. To put it more strongly: this is even untruthful, because this unproven theory takes away the patient's confidence in his self-curing powers, which can destruct the cancer from the inside (van Eemeren & Snoeck Henkemans, 2011, p. 201).

Because of the phrasing "it is a careless way of expressing oneself" the standpoint can be interpreted in two ways: "cancer is not mainly a matter of uncontrollable cell growth" and "it is not a careful way of expressing oneself to say that …." When we interpret the standpoint in the first way, the argument that expressing this view leads to undesirable consequences results in an *ad consequentiam* fallacy. When the standpoint is interpreted in a prescriptive way, reasononable pragmatic argumentation agrees with it. However, because the speaker also uses the qualification "untruthful", the descriptive interpretation seems in fact to be the most likely one. These problems of interpretation are only caused by the ambiguous phrasing of the standpoint, which makes it difficult to detect the *ad consequentiam* fallacy immediately.

To make the pragmatic variant of the *ad consequentiam* harder to recognize, it is, as we have just shown, instrumental to phrase the standpoint in an ambiguous way. This can be achieved, for instance, by means of phrasings such as *x should (not) be seen as y* or *x should*

(not) be regarded as y. In the example we just discussed the phrasing could also have been: *cancer is not to be seen as a matter of uncontrollable cell growth* (ambiguous formulation) instead of *cancer is not a matter of uncontrollable cell growth* (non-ambiguous formulation).

It should be noticed that by using this variant in fact more fallacies are committed at the same time. By the unclear phrasing of the standpoint the speaker violates Rule 10 of the code of conduct for reasonable discussions: the Language Use (or Usage) Rule. If it was clear that the speaker has a descriptive standpoint and now he seems all of a sudden to defend a prescriptive standpoint, Rule 3, the Standpoint Rule, is also violated, because then the speaker readjusts the initial standpoint.[3]

Using the *ad absurdum* variant of the *ad consequentiam* fallacy does not involve a manipulation of the standpoint but a manipulation of the nature of the reason that is advanced in the argumentation. Whereas it is asserted in its reasonable counterpart that the consequence of what is said in the standpoint is untrue, in the *ad absurdum* variant of the *ad consequentiam* it is said that the consequence of what is said in the standpoint is undesirable. In the speaker's strategic manoeuvring phrasings can therefore be chosen that allow for both interpretations (untrue and undesirable). As we can illustrate by re-using an earlier example, this can, for instance, happen by making use of the word "absurd":

Evolutionism cannot be true
Because if that theory were true, we would be descendants of the apes
And that is absurd.

Here the use of "absurd" ensures the ambiguity that is aimed for because it can mean both "that idea is untrue" and "that idea is awful" (Garssen, 2016, p. 251)

In short, in the use of both variants an effort can be made to make the *ad consequentiam* fallacy less conspicuous by sowing doubt about what is the right interpretation.

3. THE EXPERIMENT

In our experiment we have concentrated on the pragmatic variant of the *argumentum ad consequentiam*; we will report later about the results of our research concerning the *ad absurdum* variant. We have tested the following hypothesis: *ad consequentiam* fallacies will be judged as less unreasonable when they are committed in argumentation in which the initial standpoint is presented as prescriptive. In total 35 discussion fragments were presented to the respondents; some of them contained fallacies, other fragments did not. For each fragment the respondents had to indicate on a 7 point Likert type scale how (un)reasonable they judged the last contribution to the discussion to be. The scale varied from 'very unreasonable' (= 1) to 'very reasonable' (= 7).

3.1 Material

In the 35 constructed discussion fragments 7 different types of fallacious and non-fallacious contributions were included, each of them represented by 5 items:

(1) moves that are openly *ad consequentiam*
(2) disguised *ad consequentiam* moves of the pragmatic type
(3) sound moves containing pragmatic argumentation

---

[3] Strictly speaking there not really a violation of the Standpoint Rule because the speaker leaves it a question which interpretation of his unclearly phrased standpoint we have to choose.

(4) sound moves containing other types of argumentation
(5) moves containing the circumstantial variant van the *ad hominem* fallacy
(6) moves containing the *tu quoque* variant of the *ad hominem* fallacy
(7) moves containing the *abusive* variant of the *ad hominem* fallacy.

All 35 discussion fragments were structured in the same way: they existed of three speaking turns in an exchange between 2 persons. Every fragment was preceded by a short description of the context. This description always made clear which standpoint occasioned the discussion. In the case of the *ad consequentiam* fallacies this standpoint is always descriptive.

Just like in our earlier empirical research concerning the (un)reasonableness of fallacies, charged subjects were avoided. In the first turn the protagonist advances a standpoint. In the items containing the disguised *ad consequentiams* the ambiguous phrasing also allows for a prescriptive interpretation of the standpoint. In the second turn the antagonist makes explicitly or implicitly clear that the standpoint is not accepted. In the third turn the protagonist provides a reason for accepting the standpoint.

An example of an item with a disguised *ad consequentiam* fallacy is the following:

Sanne and Alex are having a discussion about the question whether men are more rational than women.

Sanne: Rationality and analytic capability cannot be seen as male properties.
Alex: Why not?
Sanne: If we saw it like that, we would give men unintentionally and advantage in applications and getting promotion.

It is clear from the description of the context given in italics that a descriptive standpoint is discussed. Sanne's formulation of the standpoint in the first turn makes it ambiguous; it could also be interpreted as a prescriptive standpoint.

The following is an example of an openly expressed *ad consequentiam* fallacy:

Lisa and Yvon are discussing the future of life on earth.
Lisa: It is plausible that the sun will never stop functioning.
Yvon: Why?
Lisa: Otherwise life on earth would become impossible, wouldn't it?

In this item the standpoint is not ambiguous and cannot be interpreted as prescriptive. This makes the argumentation used in this type of item an openly expressed *ad consequentiam*.

The additional items of type (5), (6) and (7) have a double function. They serve in the first place as "fillers", which are meant to obscure the true nature of the experiment: it should not become clear to the respondents that we were only out to get their judgments on the *ad consequentiam* fallacies. In the second place, as we will explain in Section 3.3, these items serve as *gate-keepers* for the reliability of the experiment.

3.2 Respondents

31 adult volunteers took part in the research, which were selected by students Language and Communication of the University of Amsterdam. All respondents were 18 years old or older and they had not received any education about argumentation theory. The questionnaire was presented in writing. There was only a short written instruction; no further oral instruction was

offered. There were no indications that the respondents did not understand the explanations that were given to them. The test instructors did not know which hypothesis was tested.

3.3 Results

The results for the three fillers included in Table 2 agree as far as reasonableness is concerned with the results we found repeatedly in the project *Conceptions of Reasonableness.* Again, the *abusive* fallacy is seen as the most unreasonable argumentative move. Next comes the *circumstantial* attack and finally the *tu quoque* variant. Again, the latter two types of fallacies tend to score around the neutral middle of the 7 point scale. The reasonableness scores for the 3 types of fillers prove to be a good indication of the reliability of the experiment. In addition, the judgments concerning the unreasonableness of openly presented *ad consequentiam* fallacies and the judgments concerning the reasonableness of sound argumentation are completely in agreement with our findings is the *Conceptions of Reasonableness* project.

Type of fallacy	Reasonableness score
*Ad homin*em *abusive*	2.9 (0.8)
Ad hominem tu quoque	4.1 (1.2)
Ad hominem circumstantial	3.5 (0.7)

Table 2: Average reasonableness scores for the three filler items

Do our respondents – as predicted in our hypothesis – indeed regard the disguised *ad consequentiam* moves as less unreasonable than the openly expressed, 'clear-cut' cases of the *ad consequentiam* fallacy? The relevant data are recorded in Table 3.

Pragmatically reasonable	5.58 (0.9)
Reasonable	5.10 (0.6)
Ad consequentiam openly	2.10 (1.2)
Ad consequentiam disguised	3.13 (1.4)

Table 3: Average reasonableness scores for the experimental items

The average reasonableness scores for the four types of argumentative moves appear – as expected – to differ from each other in a statistically significant sense: F' (2,36) = 35.21, p < .01; η^2 = .48.[4] With the help of an orthogonal *post hoc* comparison we have contrasted the openly expressed *ad consequentiam* fallacy and the disguised *ad consequentiam* fallacy with each other (for our purposes the most important comparison). The disguised *ad consequentiam* fallacy was indeed considered less unreasonable than the openly expressed *ad consequentiam* fallacy: F' (1,36) = 17,31, p < .01. In absolute terms the respondents still consider the disguised *ad consequentiam* unreasonable, but 1 point more reasonable than the *clear cases*. This experiment therefore provides no grounds for rejecting our hypothesis.

---

[4] The data were analysed with the help of a multivariate analysis of variance ('mixed model' approach for repeated measurements), with 'respondent' and 'instantiation' as *random* factors and the variable 'type of fallacy' as a fixed factor. The *random* factor 'instantiation' is nested in the levels of the fixed factor 'type of fallacy', while the *random* factor 'respondent' is fully crossed with the *random* factor 'instantiation' and the fixed factor 'type of fallacy'. The statistical consequence of this design is that – instead of ordinary F-ratios – so-called *quasi* F-ratios must be calculated (noted as F'), while the accompanying degrees of freedom must be approximated (cf. Clark, 1973).

4. CONCLUSION

The mode of strategic manoeuvring we have examined in this experiment is complex. In order to camouflage the unreasonableness of the pragmatic variant of the *argumentum ad consequentiam* and to make it resemble reasonable pragmatic argumentation more closely, another fallacy needs to be committed: the fallacy of changing the initial standpoint. Doing so involves committing at the same time a third fallacy: the ambiguity fallacy. All the same our research concerning strategic manoeuvring with the *ad consequentiam* fallacy shows indeed certain effects. When it is disguised as pragmatic argumentation the *ad consequentiam* fallacy is judged less unreasonable, even though this disguised fallacy is still regarded unreasonable.

The *ad absurdum* variant of the *ad consequentiam* fallacy was not included in this experiment. The camouflaging by means of this variant will be examined in our next research in the "Hidden Fallaciousness" project.

Building argumentative adpositional trees: Towards a high-precision method for reconstructing arguments in natural language

ABSTRACT: There is a need for a tool for reconstructing arguments that describes their linguistic elements with high precision and at the same time identifies their type. In this paper, we prepare the ground for developing such a tool by introducing the notion of 'argumentative adpositional tree'. The notion is based on a combination of the linguistic representation framework of *Constructive Adpositional Grammars* (CxAdGrams) and the argument classification framework of the *Periodic Table of Arguments* (PTA).

1. INTRODUCTION

An argumentative analysis usually proceeds from the original text in natural language to a reconstructed version that highlights its argumentative aspects. In order to grasp, for example, what is at stake in Donald J. Trump's tweet pictured in Figure 1, an analyst may have to reconstruct the original text as *I am the world's greatest writer of 140 character sentences, because many people have said so*.[1]

Figure 1   The original text of a tweet by Donald J. Trump

During the reconstruction process, the analyst has to address a number of important issues. One of them concerns the selection of those parts of the original text that are relevant to include in the reconstruction. Whereas a minimal reconstruction includes only the statements that function as premise and conclusion, more sophisticated ones may also include statements expressing

---

[1] For a more detailed analysis of this example see Wagemans (2017, URL = www.periodic-table-of-arguments.org/periodic-table-of-arguments/delta-quadrant/argumentum-ad-populum)

doubt or criticism with regard to the acceptability of a certain point of view, statements expressing common starting points, and statements that relate to procedural aspects of an argumentative discussion such as the division of the burden of proof.[2]

A subsequent issue the analyst has to address is how to represent the selected parts of the original text in the reconstruction. The decisions regarding this issue are usually taken on the basis of the envisioned aim of the analysis. When that aim is, for instance, to obtain an overview of the all the premises that the arguer has put forward in support of the conclusion, it may suffice to provide a numbered list of literal representations of the statements that function as such. But if the aim is to provide an evaluation of the quality of the individual arguments, the analyst may want to represent the original statements in such a way that it becomes possible to determine the role the individual linguistic elements of each of the premises play in supporting the conclusion. This is a challenging task, even more since there is so far no analytical tool for reconstructing arguments that describes their linguistic elements in great detail and at the same time identifies their type.

In this paper we present a new method for reconstructing arguments in natural language that enables the analyst to perform this task. Our method centers around the notion of 'argumentative adpositional tree' (or 'argumentative adtree'). Like its linguistic counterpart, an argumentative adtree represents sentences on the morphosyntactic level. In addition, it contains pragmatic information regarding the argumentative function of their constituents and the type of argument they instantiate.

The notion of 'argumentative adtree' is the result of combining two theoretical frameworks. Its basic characteristics are derived from *Constructive Adpositional Grammars* (CxAdGrams), a linguistic representation framework developed by Gobbo and Benini (2011) that employs adtrees for the purpose of representing natural language. The addition of a layer of pragmatic information to these adtrees is carried out by using the *Periodic Table of Arguments* (PTA), an argument classification framework developed by Wagemans (2016) that is especially suitable for formal linguistic and computational approaches to argument.

We begin the paper with a general introduction to the two frameworks involved. In Section 2, we lay out the fundamentals of CxAdGrams. We explain the theoretical starting points of this approach as well as the central notion of 'adtree'. In Section 3, we discuss the way in which the PTA describes and classifies the types of argument. We describe the three partial characteristics of argument that constitute its theoretical framework and provide two concrete examples of so-called 'first-order arguments'. Then, in Section 4, we combine the two frameworks and introduce the notion of 'argumentative adtree'. We illustrate its use by generating and elucidating the argumentative adtrees of the two examples presented in the previous section. Finally, in Section 5, we briefly summarize and discuss our method of reconstructing arguments in natural language and indicate the main directions for further research.

2. CONSTRUCTIVE ADPOSITIONAL GRAMMARS

The theoretical framework of *Constructive Adpositional Grammars* (CxAdGrams) is the result of the application of constructive mathematics to the adpositional paradigm in linguistics. We first elucidate this framework by explaining the meaning of the key terms.

The adpositional paradigm in linguistics is the idea that each pair of linguistic elements can be conveniently described in terms of asymmetrical relations, that is, in such a way that their arrangement cannot be reversed. Thus, given a pair of morphemes, words or expressions,

---

[2] For an overview of analytically relevant contributions to an argumentative discussion, see van Eemeren and Grootendorst (2004, p. 68).

there is always one element that 'governs' the other, and consequently, the latter element 'depends' on the former. An example is the phrase *Children play*, which has the verb *play* as the governing element (*gov*) and the noun *children* as the dependent element (*dep*). The hierarchical relation between a pair of linguistic terms is conventionally called an 'adposition' and can be pictured in a so-called 'adpositional tree' (or 'adtree').

The set of rules for building adtrees that is admissible within a given natural language forms an 'adpositional grammar' (or 'adgram'). The term 'adgrams' denotes all the possible grammars of any human language. In CxAdGrams, more specifically, the formation of adgrams follows certain meta-rules that are described in terms of Grothendieck topoi – the most important instrument in topos theory, a branch of constructive mathematics. Since in constructive mathematics, unlike in classical logic, the use of the so-called 'law of excluded middle' is not allowed, the information content of any statement regarding the formulas of a theorem is strictly preserved – see Bridges and Richman (1987).

There is a tradition of using constructive mathematics to formally represent natural languages, starting from the work of Adjukiewicz (1935) and Church (1940). CxAdGrams, to the best of our knowledge, is the only framework that uses topos theory for this purpose. As a result, the adtrees it produces do not only represent natural language expressions in the form of recursive trees but can also be interpreted as formulas – which means that they are suitable for the purpose of natural language processing.[3]

We now turn to explaining the notion of 'adpositional tree' in more detail. A minimal adtree consists of a pair of linguistic elements and their relation, expressed in terms of their adposition. Figure 2 shows the abstract structure of such a minimal adtree – adapted from Gobbo and Benini (2011, p. 15).

Figure 2   The abstract structure of a minimal adtree

Within this adtree, the positions of the governing and the dependent elements are conventional: the governor (*gov*) is put on the right leaf at the bottom of the rightmost branch, while the dependents (*dep*) are put on the left leaves at the bottom of the branches on the left (in this case, there is only one). Their relation is represented by the adposition (*adp*), depicted as a hook under the bifurcation of the two branches. The variable *gc* under the hook and the leaves means 'grammar character'. Finally, the triangles on the leaves (△) indicate that adtrees can be applied recursively one under the other, if needed.

While each dependent can have one and only one governor, a governor can rule more than one dependent. The exact number of dependents, which ultimately determines the shape of the adtree, is defined by the Tesnerian concept of valency.[4] In order to illustrate this concept, we picture in Figure 3 the adtree of the phrase *Children play* that was mentioned above.

---

[3] The linguistic and formal rules of CxAdGrams are not discussed here for reasons of conciseness. For a comprehensive presentation of this approach to linguistic analysis, see Gobbo and Benini (2011). The formal model is presented in Appendix B of this work.

[4] The concept of valency was introduced by Tesnière (1959, 2015) within the framework of Structural Syntax. Gobbo and Benini (2013) clarify the relation between that framework and CxAdGrams.
Figure 3   The adtree of the phrase *children play*

The adposition (*adp*) is in this case instantiated by an epsilon (ϵ), indicating that there is a syntactic relation between the two words. The triangle ($\triangle$) indicates an adtree that represents morphological information regarding the word *children* and is hidden because it is irrelevant for our purposes. The grammar characters (*gc*) are in this case instantiated by O, I, and I. The theoretical framework of CxAdGrams uses five different grammar characters, which are represented by five vowels (A, E, I, O, U). Table 1 explains their meaning – adapted from Gobbo and Benini (2011, p. 41).

gc	*name*	*function*	*examples*
A	adjunctive	modifier of O	adjectives, articles, determiners
E	circumstantial	modifier of I	adverbs, adverbial expressions
I	verbant	valency ruler	verbs, interjections
O	stative	actants	nouns, pronouns, name-entities
U	underspecified	transferer	prepositions, derivational morphemes

Table 1   The meaning of grammar characters in adtrees

The shape of an adtree is mainly defined by verbants – typically, verbs (see Table 1). Their grammar characters (I) and those of the correlated nominal expressions (O) may show additional parameters. In the case of verbants, an apex indicates the verbal valency (*val*), i.e., the number of actants that are potentially involved in the activity described by the verb. The I^2 in our example indicates that the verb *play* is bivalent (*val* = 2), as semantically it implies a player (the first actant) as well as a game or a musical instrument (the second actant). In the case of the nominal expressions correlated with the verbant, a pedix indicates the number by which they are identified. In our example, *children* acts as the first actant (O_1), while the second actant has remained implicit. Finally, the information expressed in the complete adtree is summarized by the grammar character I_1^2 under the hook. Here, again, the apex indicates the valency value (*val*) of the verb, while the pedix indicates the number of actants (*act*) present in the sentence.[5] Since the former is bigger than the latter (*val* = 2 and *act* = 1), the verb is only partially saturated.

We now discussed most of the basic aspects of linguistic adtrees. The meaning of the arrows – for instance the left arrow ($\leftarrow$) above the epsilon in Figure 3 and the generic leftright arrow ($\leftrightarrow$) above *adp* in Figure 2 – is explained in Section 4.

3. PERIODIC TABLE OF ARGUMENTS

The *Periodic Table of Arguments* (PTA) is a classification of argument that integrates the traditional dialectical accounts of argument schemes and fallacies as well as the rhetorical accounts of logical, ethotic, and pathetic means of persuasion into a systematic and

---

[5] Please note that if the adposition of the second actant of *to play* is filled by the preposition *with*, the overall semantics slightly changes. Thus, in CxAdGrams, *to play* and *to play with* are considered different verbs.

comprehensive whole.[6] The theoretical framework of the table is based on three partial characterizations of argument, namely (1) as first-order or second-order arguments; (2) as predicate or subject arguments; and (3) as a specific combination of types of statements. The superposition of these three partial characterizations yields a factorial typology of argument that can be used in order to develop tools for analyzing, evaluating, and producing argumentative discourse.

The types of arguments described in the PTA are 'atomic' in the sense that they consist of exactly one premise and one conclusion, both of which are expressed by means of a statement that consists of a subject and a predicate. Closely following logical conventions, subjects are indicated with letters $a, b,$ etc., predicates with letters X, Y, etc. (predicate $\top$ having the fixed meaning 'true'), and complete propositions with letters p, q, etc.

The classification of the types of argument takes place by determining the 'argument form', a notion that comprises the first two partial characteristics mentioned above, and by subsequently determining the combination of types of statements instantiated by the argument, which yields the third partial characteristic. Without going too much into the details of the Argument Identification Procedure (Wagemans, 2018), we turn to mentioning the most important ingredients of the argument classification framework of the PTA.

From the above description it follows that the determination of the argument form involves an identification of the argument as either a first-order or a second-order argument and as either a predicate or a subject argument. These distinctions allow for four different possibilities: first-order predicate arguments, first-order subject arguments, second-order subject arguments, and second-order predicate arguments. For this reason, the visual representation of the PTA consists of a plane that is divided into four quadrants (Wagemans, 2017). The argument forms just mentioned correspond to the quadrants $\alpha, \beta, \gamma,$ and δ respectively. In Table 2, for each quadrant we list the corresponding argument form and provide a concrete example.

| quadrant	argument form	example
α	a is X, because a is Y	The subject (a) is driving fast (X), because he (a) left a long trace of rubber on the road (Y)
β	a is X, because b is X	Cycling on the grass (a) is forbidden (X), because walking on the grass (b) is forbidden (X)
γ	q is $\top$, because r is $\top$	He must have gone to the pub (q), because the interview was cancelled (r)
δ	q is $\top$, because q is Z	We only use 10% of our brain (q), because that (q) was said by Einstein (Z)

Table 2   Argument forms and examples in the four quadrants of the PTA

The argument types situated within each of the quadrants are further differentiated on the basis of a determination of the specific combination of types of statements they instantiate. For this purpose, the PTA makes use of a tripartite typology consisting of statements of fact (F), statements of value (V), and statements of policy (P). The conclusion and premise of the argument may thus instantiate one of the following nine combinations of types of statements: *PP*, *PV*, *PF*, *VP*, *VV*, *VF*, *FP*, *FV*, *FF*. An example is *The government should invest in jobs, because this will lead to economic growth*, which has a statement of policy (P) as its conclusion and a statement of fact (F) as its premise and therefore instantiates the combination '*PF*'.

---

[6] The present explanation of the theoretical framework of the *Periodic Table of Arguments* is based on Wagemans (2016, 2017, 2018).

When taken together, the three partial characterizations of argument constitute a theoretical framework that allows for 2 x 2 x 9 = 36 systematic types of arguments. Each of these systematic types hosts a number of 'isotopes', which are named in accordance with the existing dialectical and rhetorical classifications of argument classification. The traditional names usually originate in the linguistic formulation of the relation between the premise and the conclusion. The argument *The suspect was driving fast, because he left a long trace of rubber on the road*, for instance, can be identified as a first-order predicate argument that combines a statement of fact with another statement of fact. The systematic name of this argument is therefore '1 pre FF'. Given that the relation between the premise and the conclusion can be captured by saying that the predicate of the statement expressed in the premise, *leaving a long trace of rubber on the road*, is an 'effect' of the predicate of the conclusion, *driving fast*, the traditional name of this specific isotope of '1 pre FF' is 'argument from effect'.

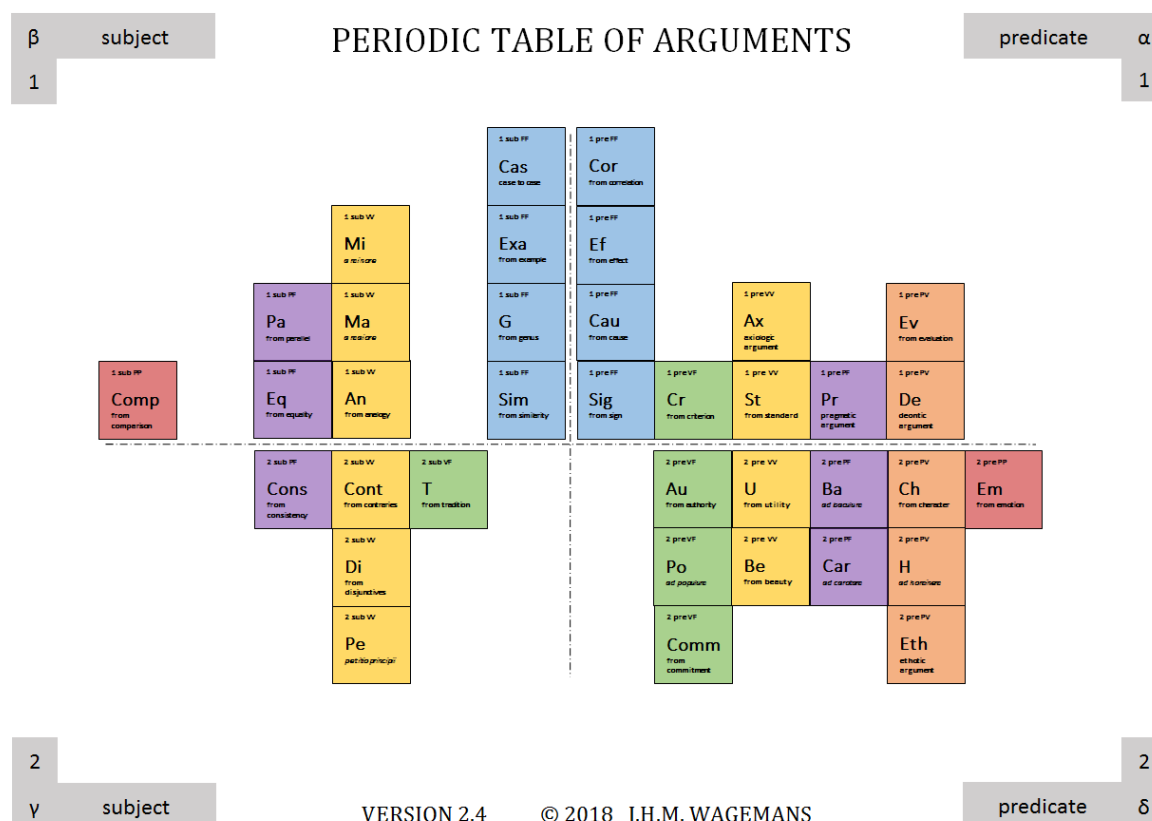
Within every quadrant, the systematic place of the type of argument is determined by the specific combination of types of statements it instantiates (*FF*, *VF*, *PF*, etc.), while the isotopes representing the traditional names are placed in a vertical line. In Figure 4, we picture the current version of the PTA – for updates and more detailed analyses of examples, see its official website www.periodic-table-of-arguments.org.


Figure 4   Version 2.4 of the *Periodic Table of Arguments*

In the next section we demonstrate how the theoretical framework of the PTA can be used for enriching the linguistic adtrees generated by CxAdGrams with pragmatic information regarding the type of argument. We do so by providing an analysis of two of the concrete examples of arguments that were mentioned in Table 2. The first example, *The suspect (a) was driving fast (X), because he (a) left a long trace of rubber on the road (Y)*, is a first-order predicate argument

that combines a statement of fact with another statement of fact ('1 pre FF') and is traditionally known as the 'argument from effect'. The second example, *Cycling on the grass (a) is forbidden (X), because walking on the grass (b) is forbidden (X)*, is a first-order subject argument that combines a statement of value with another statement of value ('1 sub VV') and is traditionally known as the 'argument from analogy'.

4. COMBINING CXADGRAMS AND PTA

Although CxAdGrams is built mainly for expressing morphology and syntax, the adtrees generated by its theoretical framework are also suitable for expressing pragmatics.[7] In this section we show how to insert pragmatic information about the type of argument into a linguistic adtree, thereby developing the notion of 'argumentative adtree'.[8]

As explained in the previous section, the PTA takes an argument to be formed by two statements, each of which consist of a subject (indicated by *a*, *b*, etc.) and a predicate (indicated by *X*, *Y*, etc.). In the corresponding adtrees of these individual statements, the predicate is represented by the leaf of the rightmost branch. While the position of the predicate does not change in transforming linguistic into argumentative adtrees, in the latter the subject is emphasized. In particular, the first actant (O_1), which corresponds to the subject, is put in evidence as the topmost left branch of the tree. The remaining linguistic material automatically becomes part of the predicate.

For the analyst, the identification of the subject and the predicate of the statements involved in the argument can be complicated by the fact that the arguer has left certain linguistic elements implicit. This is a well-known problem in argumentation analysis, for which our method provides an extra tool. In order to represent the elements that function in the argumentation in an adequate way, the analyst can consider the valency of the verb which rules the predicate and check whether or not the verb is saturated. If in the original text some actants are explicitly stated and some others have remained implicit, the implicit actants should be inferred and extracted from the semantic interpretation of the statement itself. This procedure of elicitation of the in-valent structure eventually deepens the analysis of the argument in terms of robustness. In fact, the overall goal of the reconstruction is to understand better how the argument works, and the analysis of the in-valent structure can play a major role in achieving this goal.

After having identified the subject and the structure of the predicate of the two statements, the analyst can determine their argumentative function and collocate the argument in the PTA. In the argumentative adtree, the conclusion is indicated by σ (sigma), standing for the Greek equivalent *συμπέρασμα* (sumpérasma), and the premise by π (pi), standing for *πρότασις* (prótasis). Regarding the order of presentation of these statements in the original text, van Eemeren and Snoeck Henkemans (2016, p. 33) distinguish between a progressive and a retrogressive mode. The former presents first the premise (π) and then the conclusion (σ), connecting them by means of the conjunction *so*, *therefore*, or another one with a similar function. Since there is a multitude of equivalent expressions, in argumentative adtrees of reconstructed arguments the progressive mode is represented only formally, by a left arrow ($\leftarrow$). The retrogressive mode starts from the conclusion (σ) and then arrives at the premise (π), connecting them with a conjunction such as *because*, *since*, etc. This mode is represented in argumentative adtrees by a right arrow ($\rightarrow$). For the sake of simplicity and conciseness, the

---

[7] Gobbo and Benini (2011, Ch. 6) have already provided pragmatic adtrees, representing the relation between illocutionary and locutionary acts as described in Searle (2010).

[8] The transformation from linguistic adtrees to argumentative adtrees is formally justified by the so-called conjugate construction in the formal model of *CxAdGrams* – see Gobbo and Benini (2011).

examples we have chosen for our analysis below are retrogressive in nature and use *because* as a conjunction. In the corresponding argumentative adtrees, this is represented with a right arrow (→).

Figure 5 shows the argumentative adtree of the two main types of first-order arguments distinguished in the PTA in an abstract way, i.e. showing their regressive normal form, regardless of the linguistic information. In each argumentative adtree, the adpositions representing the premise (π) and the conclusion (σ) appear once and once only. On the left we pictured the adtree of first-order predicate arguments, situated in the alpha quadrant (α) and having the form "*a is X, because a is Y*", and on the right the adtree of first-order subject arguments, situated in the beta quadrant (β) and having the form "*a is X, because b is X*".
Figure 5   The abstract argumentative adtrees of first-order arguments

In both adtrees, the relation between the premise (π) and the conclusion (σ) is represented by the adposition, which is the hook. The quadrant is indicated under the arrow. The letter *C* indicates generically the combination of the types of statements (*FF*, *VF*, *PF*, etc.) instantiated by the argument. The quadrant and combination indicators together enable the analyst to identify which of the 36 possible types of argument distinguished in the PTA describes the concrete argument under scrutiny.

We now turn to illustrating our method of reconstructing arguments by building the argumentative adtrees of the two concrete examples mentioned at the end of the previous section. Both are examples of first-order arguments, their variation lies in the other two partial characteristics that constitute the theoretical framework of the PTA. The first example is a predicate argument that supports a statement of fact with another statement of fact ('1 pre FF') and the second a subject argument that supports a statement of value with another statement of value ('1 sub VV').

Example 1
The first example we analyze is *The suspect was driving fast, because he left a long trace of rubber on the road*. Figures 6 and 7 picture the linguistic adtrees respectively of the premise and the conclusion of the example.[9] At first, a trivial parser will identify the two verbal forms that rule the two phrases: respectively, *was driving* (ruling the conclusion, which is the governor of the sentence and is therefore put at the rightmost subtree) and *left* (ruling the premise, which depends on the conclusion). At this point, the respective first actants (O_1) are identified, i.e. *the suspect* and *he*. In the conclusion, there is an adverb, *fast*, that specifies a quality of the verb (therefore, it has the grammar character E). In the premise, a similar role is played by the locative expression *on the road*. Its global adposition is E, and its internal structure contains a preposition (*U*), a noun (*O*) and a determiner (*A*). Unlike in the conclusion, in the premise there is a complex expression, *a long trace of rubber*, that saturates the second valency (O_2). Finally,

---

the triangles △ are used to hide linguistic details that are not immediately relevant for the present purpose – in this case, the morphological information regarding *was driving*.

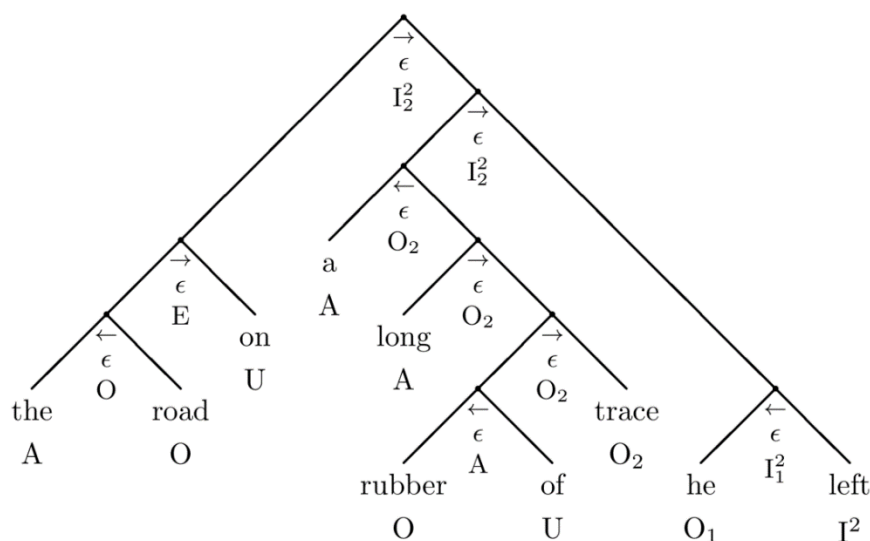

Figure 6   The fully expanded linguistic adtree of the premise of Example 1

Figure 7   The linguistic adtree of the conclusion of Example 1

At this point, we can transform the linguistic adtree into the argumentative one. We take the premise *he left a long trace of rubber on the road* as an example and show how the transformations mentioned above take place (see Figure 8). The argumentative function of this sentence, a premise, is reflected in the adposition π, which is placed under the topmost hook. Then, the analyst identifies the type of statement expressed in the premise as a statement of fact. In the argumentative adtree, this information is put as grammar character F under adposition π.
Figure 8   The transformation from linguistic to argumentative adtree

After having inserted this argumentative information in the adtree, the analyst proceeds with the extraction of the subject (a), which is put at the leftmost subtree, leaving the other elements of the sentence as parts of the predicate (Y). The extraction, which in this case results in a different position of the leaf *he*, highlights the subject-predicate structure of the sentence, which in turn enables the identification of the type of argument.

Then, after a similar procedure is carried out for the conclusion (σ), the analyst can put the two adtrees together (see Figure 9). This will create a new adtree with pragmatic information about the type of argument in the topmost hook. In this case, the premise and conclusion together form a first-order predicate argument (α) that combines a statement of fact with another statement of fact (FF).

Figure 9   The argumentative adtree of Example 1

The analyst is helped in her work by the linguistic analysis performed through CxAdGrams. In fact, the in-valent structure reveals that the verbal form ruling the conclusion, *was driving*, implies the possible presence of two actants: the driver (O_1) and the vehicle (O_2). In this example, the second actant (O_2) is not expressed, which is why that information is hidden. An adtree can show hidden information under the form of a barred leaf. Although at first sight, this hidden information does not seem to be that relevant, on closer inspection it could be crucial for the argumentation analysis, especially when the analyst is dealing not with a single argument but with a whole argumentative text. In fact, if the analyst forgets to represent hidden information, she risks to lose an important piece of information. Omissions can be very important to understand if the argument structure of the whole text is robust or not, and in

particular to detect the weak points in the reconstruction. In this example, the subject, *the suspect* (*a*), is metonymically identical with the driver (O_1) even if, strictly speaking, it is the vehicle (O_2) that *left the long trace on the road*, not the subject. This shows an important difference between linguistic adtrees and argumentative adtrees: what is peripheral from a linguistic point of view, can be central from an argumentative perspective. In particular, the circumstantial *fast* (E) of the premise (π) is linguistically merely a decoration of the ruling verbal form *was driving* (I^2). But it plays a central role in the persuasive force of the argument: if the suspect weren't driving *fast* (E), he could have never *left* (I^2) *a long trace on the road* (O_2). In other words, *long* is the key term and it is related to *fast*.

Example 2
The second example is *Cycling on the grass is forbidden, because walking on the grass is forbidden.* Like with the previous example, the analyst should start from the linguistic analysis of the two statements that form the argument. Figure 10 shows the linguistic adtree, whose main subtrees, representing respectively the main and the secondary phrase, are almost identical, as they share the same linguistic structure. It is worth noting that the preposition *on* is the adposition of the two identical expressions *on the grass* that modify the subjects (O_1) of both subtrees, and therefore takes the adjunctive grammar character (A).

Figure 10 The linguistic adtree of Example 2

The argumentative counterpart of the linguistic adtree is quite similar – compare Figures 10 and 11. As both statements share the same predicate, *is prohibited* (*X*), but have different subjects, *cycling on the grass* (*a*) and *walking on the grass* (*b*), they instantiate a first-order subject argument. This information is inserted by putting a *β*, standing for the corresponding quadrant of the *Periodic Table of Arguments*, under the topmost hook. Finally, since their verbal form is a cue for labelling both phrases as statements of value, the analyst adds *VV* as an indication of the combination of types statements involved.

  Our reconstruction reveals that the linguistically peripheral elements *on the grass* play a vital role in the argument and are therefore pragmatically central. In fact, if we cut them out, the resulting sentence of the argument *Cycling is prohibited because walking is prohibited*, loses all argumentative force.
Figure 11   The argumentative adtree of Example 2

As illustrated by reconstructing these two examples, argumentative adtrees are powerful analytical tools that enable the analyst to show where the pragmatic force is placed within the linguistic material.

5. CONCLUSION

In this paper we demonstrated a high precision tool for the purpose of reconstructing arguments in natural language that centers around the notion of 'argumentative adpositional tree'. The tool is the result of the combination of two theoretical frameworks, the linguistic representation framework of *Constructive Adpositional Grammars* (CxAdGrams) and the argument classification framework of the *Periodic Table of Arguments* (PTA).

Argumentative adpositional trees not only represent in great detail the linguistic features of premises and conclusions of the argument under scrutiny but they also contain pragmatic information about the type of argument. Moreover, the tool permits to express hidden information contained in the valency structure if this is necessary or desirable in light of the aim of the analysis.

We believe that our method of reconstructing arguments has some advantages compared to existing methods. In present-day argumentation theory, the analysis of the external organization of the argumentation – the so-called 'argumentation structure' – and the analysis of the internal organization of an argument – the so-called 'argument scheme' are often kept separated. Building argumentative adtrees enables the analyst to obtain an integrated picture of these two aspects of argumentative discourse. The method thus permits the analyst not only to operate on the level of the individual words, but also to freely choose the level of linguistic detail to be shown in the reconstruction in relation to the specific aim of the analysis.

A further direction of research is to apply the procedure for creating argumentative adtrees to the two main types of second-order arguments, which are situated in the gamma and delta quadrants of the PTA. Also, since arguments rarely appear in isolation, it is important to extend the procedure for generating argumentative adtrees so as to be able to represent complex concatenations of arguments and, ultimately, a complete argumentative text.

A simple theory of argument schemes

GEOFF C. GODDU

Department of Philosophy
University of Richmond
United States of America
ggoddu@richmond.edu

ABSTRACT: While there has been in depth discussion of many particular argumentation schemes, some lament that there is little to no theory underpinning the notion of an argumentation scheme. Here I shall present and defend a minimalist theory—a scheme is just a set of propositions and propositional functions—propositional structures with at least one variable. While simple, the theory contravenes several desiderata such as (i) aiding in the identification of enthymemes and (ii) keeping schemes constrained to a manageable taxonomy. So much the worse for the desiderata.

KEYWORDS: argumentative constant, argumentative force, argument taxonomy, critical questions, propositional functions, schemes

1. INTRODUCTION

Even though there has been often quite in depth discussion of many particular argumentation schemes (see, for example, Macagno and Walton, 2017, Walton, 2000, Walton, 1999, Walton, 1996), there has also been a lament that there is little to no theory underpinning the notion of an argumentation scheme (Dove & Nussbaum, 2018). Here I shall present and discuss the consequences of a very minimalist theory of argumentation schemes.

2. A THEORY OF ARGUMENT SCHEMES

According to Douglas Walton, Chris Reed, and Fabrizio Macagno, in their book, *Argumentation Schemes*: "Argumentation schemes are forms of argument (structures of inference) that represent structures of common types of arguments used in everyday discourse, as well as in special contexts like those of legal argumentation and scientific argumentation."(2008, p, 1) (See also Macagno, 2015, Macagno, 2018, Wyner, 2016). Though I am not sure what it means for a form of argument to represent a structure of a common type of argument, we can start with the notion that argument schemes are at the very least forms of argument. Indeed, their very next sentence is: "They include the deductive and inductive forms of argument that we are already so familiar with in logic …" (Walton, Reed, & Macagno, p. 1, p. 12). Though perhaps not wholly explicit, Christoph Lumer (2011), David Hitchcock, (2017), and Manfred Keinpointner, (2018), all, at least by the examples they give, endorse this last claim. Hence, whatever argument schemes are it is as least true that:

> (1) Logical forms are a type of argument scheme

Here, then, is a simple way to get a theory that accepts (1). Suppose an argument is a set of a set of propositions and another proposition. Argument schemes are the forms of arguments or schematic arguments. Hence, the simplest theory of argument schemes would be:

T1: An argument scheme is a set of a set of propositional functions and another propositional function.

What is a propositional function? According to Russell and Whitehead:

> By a 'propositional function' we mean something which contains a variable *x*, and expresses a proposition as soon as a value is assigned to *x*. That is to say, it differs from a proposition solely by the fact that it is ambiguous: it contains a variable of which the value is unassigned. (Russell & Whitehead, 1925, p. 38).

Assuming there is a difference between the things that express propositions (presumably some sort of sentence in some language) and propositions themselves, then it is hard to make both sentences of what Russell and Whitehead say compatible, since the first makes them the sort of thing that express propositions, while the second makes them a kind of ambiguous proposition or a proposition with an unassigned variable in it.

    I suspect one could go either way with a theory of propositional functions and so argument schemes—they could be (i) sets of expressions with at least one variable or (ii) sets of incomplete propositions. I am not going to argue for one choice over the other here. I am merely going to stipulate that I will take propositional functions to be propositions with at least one 'hole' in them in which the relevant sort of 'thing' could be placed to create a complete proposition. I represent these holes via variables within the sentences that once the appropriate type of term is substituted in for the variable then express propositions. Hence, the incomplete sentence, 'X is snub-nosed' represents or expresses a propositional function. Once a term is put in for the variable X, such as 'Socrates', the result is the sentence 'Socrates is snub-nosed', which expresses the proposition that Socrates is snub-nosed. Note that the 'hole' or variable could be the entire proposition, as in

    S1: X; Y; hence, X and Y

or

    S2: If X, then Y; X; hence, Y

else we could not make good on making claim (1) true, since some parts of logical forms range solely over propositions themselves and not just constituents of propositions.

    Suppose one takes seriously the claim that argument schemes are schematic arguments. Hence, every argument can be made into a scheme by schematizing at least one element of the argument. Consider, then, the slightly stilted argument:

    A1: Harry hates Billy. Hence, not possible that Harry impartially evaluates Billy's work.

Now consider some potential single variable schematizations of A1:

    S3: X hates Billy. Hence, not possible that X impartially evaluates Billy's work.
    S4: Harry hates X. Hence, not possible that Harry impartially evaluates X's work.
    S5: Harry Xs Billy. Hence, Harry cannot impartially evaluate Billy's work.
    S6: X. Hence, not possible that Harry impartially evaluates Billy's work.
    S7: Harry hates Billy. Hence, X possible that Harry impartially evaluates Billy's work.
    S8: Harry hates Billy. Hence, not X that Harry impartially evaluates Billy's work.
    S9: Harry hates Billy. Hence, not possible that Harry X evaluates Billy's work.

S10: Harry hates Billy. Hence, not possible that Harry impartially Xs Billy's work.
S11: Harry hates Billy. Hence, not possible that Harry impartially evaluates Billy's X.
S12: Harry hates Billy. Hence, not possible that X
S13: Harry hates Billy. Hence, not X.
S14: Harry hates Billy. Hence, X.

Depending on what can and cannot be properly replaced with a variable, a question I am not going to try to answer here, there may be even more single variable schematizations of A1, such as:

S15: Harry X. Hence, not possible that Harry impartially evaluates Billy's work,
S16: Harry hates Billy. Hence, not possible that Harry X Billy's work,
S17: Harry hates Billy. Hence, not possible that Harry X.

The maximal schematization is the eight variable:

S18: X Ys Z. Hence, A B (X C Ds Z's E).

There are lots of schematizations in between, such as the two variable:

S19: X. Hence, Y

or

S20: Harry hates Billy. Hence, not X that Harry impartially Ys Billy's work,

or the three variable:

S21: X Zs Y. Hence, not possible that X impartially evaluates Y's work,

etc.

All of these are schematic instances of Argument 1. But given Theory 1, not all of them are argument schemes, since T1 requires that every propositional element of a target argument be turned into a propositional function. But this is true of only 2 of the 15 given single variable schematizations, since only two elements are common to both premise and conclusion, viz Harry and Billy.

If all it takes to be an argumentation scheme is to be the schematization of some argument, then S5-S17 are schemes just as much as S3 and S4. Indeed, I suspect it is an interesting question what can and cannot be substituted in for X in Harry Xs Billy in S5, such that it is true that it is not possible for Harry to impartially evaluate Billy's work. Of course, one might argue that Harry and Billy are just placeholders here and the real scheme of interest is S21, which does satisfy T1. But consider:

S22: Mephistopheles Xs God. Hence, not possible for Mephistopheles to impartially consider God's judgments.

In this case, given how unique Mephistopheles and God are supposed to be, we may really be interested in what values of X would make the conclusion true for those two individuals. In other words, I am not sure we should rule out by definition that schemes cannot have complete propositions as parts.

In addition, I also suspect that our maximal schematization, S18, is unlikely to be of much interest, since it will have too many disparate and unrelated instances to make it of any value, and yet it also satisfies T1. So, T1 as it stands appears to exclude certain items by definitional fiat and merely appealing to some sort of 'suitably general' principle will not explain why the maximal schematization is of limited to no interest. Hence, to avoid the definitional exclusion of many of the possible schematizations of A1, I also offer the following even more liberal definition of argumentation schemes:

T2: An argument scheme is a set of a set of propositions or propositional functions and another proposition or propositional function, with at least one element being a propositional function.

Regardless of whether one adopts T2 (or accepts T1 and the concurrent challenge of explaining why S5-S14 and perhaps S22 should be excluded from the realm of schemes), either theory captures all existing cases of argumentation schemes. Any logical form such as:

S23: X or Y; not X; hence, Y.

or

S24: If X, then Y; If Y, then Z; Hence, if X, then Z,

can be captured as sets of a set of propositional functions and another propositional function, i.e. by T1, and anything that satisfies T1 also satisfies T2. Similarly, typical argumentation schemes such as:

S25: Source E is an expert in subject domain S containing proposition A; E asserts that proposition A is true (false); Hence, A is true (false.),

or

S26: Generally, case C1 is similar to Case C2; A is true (false) in case C1; Hence, A is true (false) in case C2,

satisfy both T1 and T2. In fact, all the schemes one can find in the literature satisfy both T1 and T2. Finally, recall we have the scheme:

S19: X, Hence Y,

which captures all possible single conclusion arguments given that X could be any proposition whatsoever (including an infinite conjunction) and Y could be any proposition whatsoever.

Hence, not only is the theory of schemes articulated by T1 or T2 quite simple, but the theory is also complete in the sense that it captures all the schemes currently on offer and provides at least one scheme for every possible single conclusion argument. And just as we could, if desired, define more complex arguments, i.e. arguments composed of more than one argument, in terms of simple (i.e. single conclusion) arguments and the relations amongst them, we could expand the notion of a scheme given in T1 or T2 to capture complex schemes by appealing to the simple schemes of T1 or T2 and the relations appealed to in defining complex arguments.

3. CRITICAL QUESTIONS?

One might, however, object that T1 and T2 do not capture all, or even any, given argumentation schemes. Schemes, especially defeasible schemes, are presented along with a series of critical questions and T1 and T2 include no mention of critical questions at all. Are critical questions part of schemes or not?

One standard answer is 'no'. Schemes have corresponding questions, but the questions are not part of the schemes themselves, but rather provide guidance for the proper evaluation of instances of the schemes. For example, Walton, Reed, and Macagno write: "The two elements together, the argumentation scheme and the matching critical questions, are used to evaluate a given argument in a particular case …" (2008, p. 11) David Hitchcock writes: "As an aid to evaluation of the inference in an argument fitting a certain scheme, the theorist will provide a list of so-called "critical questions" to be asked corresponding to the conditions under which arguments of the scheme in question have a good inference."(2017, p. 226). Ian Dove and E. Michael Nussbaum, (2018) citing the challenges of getting students to even recognize and utilize schemes, propose a strategy for argument assessment that generalizes the critical questions so as to be completely independent of any particular argument scheme.

Indeed, examination of the critical questions, should lead one to believe that they are not constitutive of the scheme since the critical questions are not setting out conditions for an instance of a particular scheme *being* an instance of the scheme. For example, consider the question, "Are there other events that would more reliably account for the sign?", in a typical argument from sign. The answer is either 'yes' or 'no'. But neither answer entails that the target argument is or is not an instance of an argument from sign. Rather those answers help an evaluator of a particular instance of an argument from sign judge whether the argument is a good one or not. In other words, the critical questions are not setting conditions for something to be an instance of the scheme in question, but rather setting conditions for something to be a *good* or *acceptable* instance of the scheme. We should keep identity conditions separate from goodness conditions, and so critical questions should not play a role in defining the scheme.

But despite the quotation given above, Walton, Reed, and Macagno also write: "The critical questions form a vital part of the definition of a scheme…" and "the complete set of linked premises employed in a scheme is thus the union of those given as premises and (the propositional content of) those listed as critical questions."(2008, p. 17) They provide an example in which critical question content gets added as explicit premises with the scheme 'appeal to expert opinion' in order to generate more and more refined and complex versions of the scheme.

Suppose we have some scheme S with associated critical questions, CQs. There is no doubt that we *can* incorporate the content of the CQs into S to create a new scheme S'. Does S' have its own associated critical questions or not? If not, then there are schemes with no associated critical questions and so critical questions are not necessary for the identity of schemes. Indeed, in such as case, S' satisfies both T1 and T2 as does S without the corresponding CQs. But the objection to T1 and T2 on offer was that it was failing to account for the CQs, so the only way for the objection to continue is to claim that S really is not a scheme after all, and only S' is, even though it has no CQs either and that seems arbitrary at best. We already know that we can take an argument 'X, so Y' and transform it into the argument 'X, if X, then Y, so Y' such that both arguments stand or fall together. All that changes is the evaluation—if the inference of the original argument fails, then the conditional premise of the second argument is false and vice-versa. If the inference from X to Y is good, then the conditional premise of the second argument is true and we are right back to determining whether or not X is in fact true or acceptable or whatever the premise adequacy standard is that is in play. But incorporating the CQs of S to generate S' is the exact same sort of

transformation—if we compare instances of S with S', what used to be questions about the premise adequacy or inference adequacy of S will now be questions about premise adequacy of S' for the newly added premises. But just as no one denies that both 'X, so Y' and 'X, if X, then Y, so Y' are both arguments, no one should deny that both S and S' are both schemes.

But suppose S' does have its own critical questions. Then the associated critical questions for S' can be incorporated as missing premises to create scheme S'' and we have our two options again for S''. If it does not have CQs, then S'' will satisfy T1 and T2 just as well as S and S' stripped of their CQs and saying S'' is the real scheme whereas S and S' are not will again be arbitrary. If S'' does have CQs, then once again we can raise the dilemma by creating S'''. Perhaps one might argue that eventually we will hit generic critical questions such as—are the premises adequate in the context, is the argument question begging in the context, do the premises sufficiently support (either by themselves or despite proximate potential counterexamples) the conclusion in the context? But since these questions can be asked of *any* argument, they are not doing any scheme individuating work—but that means the scheme is being individuated soley by its content independently of the generic critical questions, i.e. we are in the exact same situation we were in when we supposed we could have schemes without critical questions, i.e. we have a theory of schemes that satisfies T1 and T2. Hence, either we can have schemes without critical questions (which satisfy T1 and T2) or attempts to incorporate critical questions into schemes while also appealing to critical questions as part of the identity conditions of schemes generates an infinite regress.

4. THE PROPOSED DESIDERATA OF A THEORY OF SCHEMES

Both T1 and T2 are quite simple theories of argument schemes. I also suspect many theorists will not find them very satisfying since the resulting schemes will fulfill few if any of the roles traditionally attributed to schemes. For example, Macagno writes of schemes that "they allow classifying arguments in general categories. They bring to light the implicit rule of inference from the explicit premise(s) to the conclusion in an enthymeme, …they guide the evaluation of arguments through the set of critical questions. On the other hand, they can be used for producing arguments." (2018, p. 560). Hitchcock, citing Garssen (2001), also mentions inventing and evaluating arguments, but also adds "describing how a certain group of people reason and argue."(2017, p. 229). So the proposed roles are (1) Argument Taxonomy, (2) Enthymeme reconstruction, (3) Argument Evaluation, (4) Argument Invention, and (5) Describe sub-groups reasoning patterns.

In the longer version of this paper I go through each of these in turn, but for space reasons, I will go through the very short version of why T1 and T2 fail to fulfill these roles— there are too many schemes and single arguments satisfy too many of them (indeed recall all single conclusion arguments satisfy S19, X, so Y) for schemes to be what is doing the work in these desired roles.

For example, consider using argument schemes to generate an argument taxonomy. If schemes are types of arguments, then arguments that instantiate a particular scheme would be arguments of that type. But there are an infinite number of schemes (since there are an infinite number of logical forms and an infinite number of propositional functions), so this taxonomy will not be very helpful. Indeed, the hope expressed at the Panel session on argument taxonomy at the last ECA was for a theory of argument schemes is that we get a manageable set of schemes (see Hoppman, Keinpointner, Macagno, Wagemans, 2018; and also Macagno, 2015, p. 184 and Hitchcock, 2017, p. 236). But infinity is not manageable. In addition, arguments instantiate lots of different schemes. Just consider A1 and the very partial set of schemes I provided above.

So, what type of argument is A1 exactly according to schemes? Note also that A1, along with all single conclusion arguments instantiates S19, so all arguments are of the same type?

Consider also, using schemes to describe sub-groups reasoning patterns. However, since, as the A1 example above demonstrates, any arguing will instantiate many distinct schemes. But then merely appealing to schemes is not enough—too many distinct schemes describe any given reasoning pattern. Hence, no theoretical gain is achieved yet by saying that a particular piece of reasoning instantiates a particular scheme, since that reasoning will instantiate a whole host of other schemes as well.

But if schemes, according to T1 and T2, do not satisfy the primary roles desired of argument schemes, then, one might argue T1 and T2 are not adequate theories of argumentation schemes despite their simplicity. This, of course leaves the challenge of determining what argumentations schemes are and none of the existing takes on argument schemes are particularly good at justifying that they in fact satisfy these roles either. One could try a functional approach and say that argumentations schemes are just whatever satisfy the five roles given above. While I do not have the time or space to respond to this move in detail here, I can outline the general strategy—just as Dennett (1988) argued against the existence of qualia on the ground that nothing could satisfy the conditions of being qualia, i.e. ineffable, intrinsic, private, and immediately apprehensible in consciousness, I suspect there is no coherent class of things that satisfies the five roles. Again, this barest of sketches does not show that a functional approach to defining argument schemes in terms of the five roles will not succeed, but until a plausible candidate entity is put forward that does satisfy the roles, I will remain skeptical.

5. CONCLUSION

Lest one think that my only role in this discipline is to stomp through the edifices that others have created leaving only destruction in my path, let me conclude with a suggestion for refocusing the argumentation scheme literature. What are we getting when we schematize (and generalize) reasoning? Presumably we are trying to understand the 'argumentative force' of whatever is being left as the 'argumentative constant' in the scheme (and how various things left as constants will interact with each other). A simple example—leaving 'or' and 'not' as constants in 'P or Q', and 'not P', will, given true premises, entail Q. In other words, we gain information about how 'or' and 'not' argumentatively interact. Similarly, leaving 'is an expert in' and 'testifies that' as constants in 'X is an expert in Y' and 'X testifies that Z' we can explore what conditions need to hold in order for something plausible to be inferable from instances of 'X is an expert in Y' and 'X testifies that Z'. Of course, if we change either one of the 'constants', we can change the results. For example, consider replacing 'testifies that' with 'asserts that', or 'wonders whether', or 'supposes that', or 'hypothesizes that', or 'suggests that', etc.

Some combinations of various propositional functions may appear enough in our argumentation that they get special names and more attention—but to understand *why* those combinations may appear more than others we probably have to understand the argumentative force of the component propositional functions and how they interact with not just the other propositional functions in the combination under examination, but how they interact with other propositional functions that could have been used, but were not. Specific focus on particular schemes, then, is perhaps better construed as attempts to understand the argumentative force of very particular 'argumentative constants' such as 'is an expert in' or 'has very strong emotion Z towards', etc., through in-depth analyses of how those functions interact with other commonly used functions and the preconditions or scope of application of those functions for generating acceptable inferences. While I still doubt that refocusing on particular propositional functions

will aid in any attempts to provide a taxonomy of arguments or help with the so-called problem of enthymemes, I certainly do not deny that facility with the interactions amongst propositional functions, the conditions needed for acceptable instances of functions and the resulting inferential strengths and weaknesses can be useful in the evaluation of arguments and the invention of one's own (hopefully stronger) arguments.

Civic argumentation and political argumentation

JULDER ALEXANDER GOMEZ POSADA

School of Humanities
EAFIT University
Colombia
jgomezp5@eafit.edu.co

ABSTRACT: This presentation's theme is the relationship between civic and political argumentation. The problem relates to whether or not civic argumentation is political argumentation and, if that's so, in what sense. This question is important because its answer would be a contribution to the description and evaluation of a socially important kind of argumentation, especially for democratic communities. The question is problematic because we have reasons for an affirmative answer but also for a negative one.

KEYWORDS: civic argumentation, democratic communities, political argumentation

1. INTRODUCTION

I would like to suggest that civic argumentation is political and I would like to clarify in what sense it is so. To do this, I proceed in this way: First 1) I show some generic and common features between civic argumentation and political argumentation; Second 2) I emphasize some differences between those kinds of argumentation; and 3) I summarize trying to signal the sense in which civic argumentation is political, such as it is the argumentation of an individual having a political status function, and the sense in which it differs from the former.

1. Preliminary reasons for an affirmative answer

   1.1. *Argumentative discussions between citizens often trigger political action.*

   1.2. *Sometimes, civic argumentation reaches a consensus that transforms the standards of political argumentation.*

2. Preliminary reasons for denying that civic argumentation is political argumentation

   2.1. *The conclusions of a politician's argument are practical in the sense that they are decisions that transform the factual situations or the practical problems that motivate them* (Gómez, 2017)*, whereas, someone involved in civic argumentation does not have the power to make that kind of decision.*

   2.2. *Political argumentation is argumentation in an institutional context determined by constitutive rules (Fairclough & Fairclough, 2013)whereas civic argumentation is not. In the first case, the speaker, the discourse and the normativity of the discourse are determined by institutional rules, but in the second one they are not.*

3. Common features between civic argumentation and political argumentation

3.1.   They are argumentative discourses about what to do (Aristotle, 1358 b).

3.2.   In them, the most usual and important arguments deal with issues that can be resolved in several ways, issues that cannot be resolved by systematically applying a set of rules (Aristotle, 2006, p. 1357a).

3.3.   They are types of dialogues (Walton & Krabbe, 1995) or types of activities (van Eemeren & Houtlosser, 2005) in contexts of uncertainty, risk, and persistent disagreement (Fairclough & Fairclough, 2013).

From the point of view of those features, civic argumentation and political argumentation appears to be two kinds or species of dialogues or activities belonging to the genre of deliberation. Nonetheless, the problem rose because one essential characteristic of the deliberative discourses is that, by way of them, the speaker tries to make a decision which solves a practical problem (Gómez, 2017). This raises a theoretical problem because people involved in civic argumentation do not have the institutional power to make political decisions. So, we have to ask: if civic argumentation cannot solve practical problems, in which sense can it be regarded as deliberative argumentation? And, if civic argumentation does not have institutional power for solving political issues, how is it that it is political?

One obvious way of answering these questions is by saying that, *individually* considered, people involved in civic argumentation cannot solve political problems. However, *collectively* considered, they can make *joint* decisions in order to change a social and political order; and thus, civic argumentation is political and deliberative argumentation.

I assume this answer is right. But if we are to understand more precisely civic argumentation as a kind of political argumentation, we need to look more deeply into the differences between the argumentation performed by a group of citizens and the argumentation performed by an individual who hold an institutional function according to a constitutive rule. In fact, there are some interesting questions we should make: what is it for a group, who does not have a brain, to make a decision? What kind of agreement is necessary between the members of the group in order for the decision to be *their* decision? And, consequently, what kind of criticisms are appropriate to the arguments in this context? With the purpose of suggesting something about these questions, let us look at some differences between the kind of argumentation we have in, for example, the speech of a president and the kind of argumentation we have in, for example, a discussion between a group of citizens.

4. SOME DIFFERENCES

Taking note of some differences is convenient in order to reach my purpose:

4.1 Individual institutional argumentation is aimed at the performance of an action whereas civic argumentation is aimed at the influence over an action.

Political argumentation is a species of practical argumentation (Fairclough & Fairclough, 2013). Even though the conclusion of practical argumentation has been conceived as a practical judgment, as a judgment in which an action is represented as convenient for an agent (Audi, 2015; Walton, 2015), that proposal does not fit the difference between the theoretical character of the conclusions in the political science and the practical character of the very same conclusions in the political arena. In order to understand this difference, I suggest emphasizing that the conclusions of arguments in the political field are declarative, commissive or directive speech acts (Gómez, 2017). With those kinds of acts, the speaker modifies the social situation in such a way that the practical problem is solved or, at least, the speaker tries. Conversely, the conclusion of a citizen´s speech cannot do that. Citizen´s argumentation seeks to influence over the conclusion of the discussion between citizens. That's why civic argumentation is political in potency whereas individual institutional argumentation is political in act.

4.2 Individual institutional argumentation presupposes constitutive rules whereas civic argumentation presupposes declarative representations.

An institutional fact can be formal or informal (Hindriks, 2003; Searle, 1997, 2010). Political individual argumentation is argumentation in a formal institutional context. A formal institutional context is a context determined by a set of constitutive rules about who has the power to speak, in what place, how much time, and in accordance with what normative frame (Fairclough & Fairclough, 2013). Usually, those who can speak in a formal political institutional context speak in the name of a group of people or in the name of another institution. Conversely, civic argumentation is argumentation in an informal institutional context. Everybody can participate in a civic argumentation, this kind of communication can be performed wherever and whenever, and it does not have an identifiable normative frame. Nonetheless, some people have more influence than others because they are the object of a declarative representation which gives them more power. This kind of representation does not have to be explicit, they are not constitutive rules, they neither have to be coherent with the normative frame of the institutions, and they do not put their objects under the obligation to behave according to the normative frame of the institutions. That´s why civic argumentation is informal. Put it in other terms: Political individual argumentation is a disciplined field of argumentation whereas civic argumentation is an undisciplined one (Toulmin, 1977).

4.3 The legitimacy of politician's decisions depends on their arguments whereas the legitimacy of civic decisions depends on the decision making's procedure.

Literally speaking, groups are not things of such a nature that they can make decisions. On the other hand, individuals involved in civic argumentation cannot make decisions by themselves. In civic argumentation, individuals try to influence over a joint decision. They can have such an influence over the joint decision because they are recognized as having a status with that

purpose, in other words: they are objects of declarative representations. But, what is it for a group to make a decision? I propose that the expression "a group makes a decision" means that (1) the members of the group have a declarative representation of the decision as the product of a procedure designed for the election of an action, and (2) they have a declarative representation of that procedure as the validity's source of their decisions.

Now, civic argumentation is the way by which people try to influence the product of such a procedure. Unlike what occurs with decisions in the individual political argumentation, the legitimacy of civic decisions does not depend on the arguments but on the decision making's procedure. This is so because the civil society does not represent something else with which we should contrast its claims, as it happens in individual political argumentation. Unlike what occurs with decisions in the individual political argumentation, the legitimacy of civic decisions does not depend on any agreement about ends, means, circumstances and the other premises of a practical argument. Unlike what occurs with decisions in the individual political argumentation, a civic decision is legitimate, if and only if, there is an agreement about the decision making's procedure.

4.4 The appropriate critical reaction to an individual political argument's legitimacy is to demand an answer to a critical question while the appropriate critical reaction to a civic argument is to present a counterargument, an argument in favor of an opposite thesis.

For a politician's decision to be legitimate, a correspondence between their reasons and the cognitive background of the people in behave of which that decision is made is needed. Thus, in front of any practical argument in the political field, we should ask if there is such a correspondence between the ends, values, intensional descriptions of the circumstances and the cognitive background of the people who empower the politicians. However, with respect to a civic decision it is not so obvious what could any of those questions mean, for if a civic group makes a decision based on a set of values, ends and intentional descriptions, there is an apparently obvious sense in which we can say that set of reasons is theirs. Something different must be said about the means: in this aspect we can ask how do we know this mean is going to produce the desired end? But it is because this kind of premise does not pretend to represent a practical commitment of the civil society but an epistemic commitment of the public management.

5. CONCLUSION

I have tried to establish the relationship between civic argumentation and political argumentation. On one side, I have suggested that civic argumentation is political because is argumentation (1) about what to do; (2) supported in arguments dealing with issues that can be resolved in several ways, issues that cannot be resolved by systematically applying a set of rules; in (3) contexts of risk, uncertainty and persistent disagreement. On the other hand, I have argued that civic argumentation is different from individual political argumentation because (1) in it the speaker does not aim at making decisions but at influencing them; because (2) civic argumentation is informal institutional argumentation, while individual political argumentation is formal institutional argumentation; because (3) its legitimacy does not depend on the arguments but on the decision making's procedure; and, finally, (4) because the appropriate critical reaction with regard to civic argumentation is to counter-argue in favor of an opposite thesis, much more than asking critical questions.

Re-framing climate controversy: The strategies of *The Hartwell Paper*

JEAN GOODWIN

Department of Communication
North Carolina State University
United States of America
jegoodwi@ncsu.edu

ABSTRACT: In the public sphere, standpoints often seem to be locked into pro/con constellations. This essay documents the strategies of "pointing out," narrative and metaphor used in *The Hartwell Paper* to gain a hearing for a radically different approach to climate policy. These methods of evocation serve to create the conditions for a more complex polylogue, and more generally show the importance of non-argument in making argument possible.

KEYWORDS: argumentation, normative pragmatics, climate communication, environmental communication, ecomodernism, evocation

Given that there are innumerable issues of potential public concern at multiple scales, and various possible ways forward on each of them, we would expect that publicly defended standpoints would be as abundant as the stars in the sky. But that is not our ordinary experience of civic deliberations. Instead, the standpoints that appear in public space appear to be grouped into a relatively limited number of constellations. Take climate change as an example (Table 1). It is not surprising that we find some advocate arguing for, others against the Kyoto Protocol, the international regime under which nations committed to CO_2 emission reduction targets. Since the existence of anthropogenic global warming provides key support for the Kyoto Protocol, it's again not surprising that the advocates divide neatly on that issue as well. And the division of the advocates on the importance of environmental issues generally is also plausible. But things become a bit more mysterious when we consider nuclear power and fracking. Although these might be seen as approaches for meeting emission targets, we know that pro-Kyoto/AGW-believer advocates also tend to reject both. Indeed, the constellations extend to environmental issues like GMOs that have little to do with climate change, and even to issues like abortion that have little to do with the environment.

Table 1: Constellations of standpoints in climate controversies

Constellation L	Constellation R
The Kyoto Protocol is good!	The Kyoto Protocol is bad!
AGW is real and serious—scientists agree.	AGW is not real and/or not serious and/or scientists disagree.
Environmental issues should be a top priority.	Environmental issues should not be a top priority.
No nukes.	Nuclear power is not bad, and is maybe even good.
Fracking is bad.	Fracking is not bad, and is maybe even good.
Say no to GMOs.	GMOs are safe and effective.
Abortion should be legal (mostly).	Abortion should be illegal (mostly).

This focusing of the vast space of potential disagreements down to a limited number of mega-conflicts between constellations of standpoints (or party platforms, or ideologies, or cap-d hegemonic Discourses)[1] does have some positive impacts on the quality of public deliberations. It promotes the emergence and intensive development of robust standardized arguments (*topoi*, in one meaning of that term) through iterated pro/con dilogues on a determinate set of issues. It incentivizes advocates to become highly skilled at making those arguments. It allows ordinary folk to proceed efficiently, since a judgment on one standpoint permits them to inherit a large set of additional standpoints with no further cognitive labour. And it enables them to be equally efficient at social categorization, for if you're not with me, you're against me.

The negative impacts of limiting disagreements are equally apparent. Standpoint constellations lock in dilogues, suppressing potential argumentative polylogues (Aakhus & Lewinski, 2016; Lewinski & Aakhus, 2013) that might allow a broader range of arguments to get made and considered. Mainstream advocates participating in the set-piece dilogues may face few unexpected challenges and can get lazy. Advocates supporting standpoints between or beyond existing constellations are locked out of the process. And tribal polarization may not over the long term provide a stable social base for civic deliberations.

Arguers who want public discourse to shift from dilogue to polylogue thus face practical challenges in breaking through existing constellations. To continue the example above: consider the situation of advocates who want to demand action on climate change and environmental issues generally, while also arguing against the Kyoto Protocol and for nuclear power and fracking. They are likely to be seen as trojan horses by proponents of Constellation R, sneaking climate regulations through the opening provided by nuclear power; and as traitors by proponents of Constellation L, paying lip service to the environment while giving industry everything it wants. Neither L or R advocates may be willing to engage, and so a debate that goes beyond L v. R—a polylogue—may simply never get going.

In this paper, I propose to advance our understanding of the means non-constelled arguers have for gaining a hearing. This essay thus contributes to the growing body of research on the work it takes to get exchanges of arguments going, issuing especially from scholars adopting a normative pragmatic approach. An argumentative transactions is an achievement; arguers have to earn consideration of their views (Kauffeld, 1998; Innocenti Manolescu, 2007), make issues to be worth arguing (Goodwin, 2000), impose responsibilities to produce arguments (Kauffeld, 1998) and regulate the process as it goes along (Innocenti, 2011). Throughout the process, arguers must work is to overcome expectable and often legitimate sources of resistance. As Fabio Paglieri has been pointing out (2009, 2013, 2017; Paglieri & Castelfranchi, 2010) there are plenty of reasons *not* to start making arguments: it can confuse matters, escalate conflicts and damage reputations. It can waste time. It can prove you wrong. To this list, I now add inertia: the tendency of arguers to resist engaging arguments that jump out of well-worn tracks. What can arguers who want to press a novel perspective do to overcome this inertia?

I proceed through a case study of a presumably competent attempt to open a polylogue. The *Hartwell Paper* (Prins et al., 2010) was produced when two groups of experienced arguers joined to press (in the words of the subtitle) for "a new direction for climate policy after the crash of 2009" (Figure 1). In the US, activists Michael Shellenberger

---

[1] Note that I focus here on standpoints defended in the public sphere. A much broader range of political philosophies are elaborated in the technical sphere—for example, the environmental stances traced by Rodrigues, Lewiński and Uzelgun (2019). In addition, individual members of the public likely have more mixed up views; a Catholic steelworker might vote Democrat, hold pro-life views, and also support national health insurance. Recent polling, however, suggests that individuals are polarizing along the same lines as the constellations of standpoints I identify here (Pew Research Center, 2014).

and Ted Nordhaus had been advocating for a new way forward on environmental problems since their 2004 whitepaper, *The Death of Environmentalism: Global Warming Politics in a Post-Environmental World*. In the UK, science studies scholars Gwyn Prins and Steve Rayner had joined to warn against the unintended consequences of the Kyoto approach in their *The Wrong Trousers: Radically Rethinking Climate Policy* (2007). These leading figures were joined by ten additional academic co-authors, several of whom had published similar critiques of mainstream approaches to climate policy and science. As a group, they had a substantial track record in trying to articulate a new approach to the climate debate, and environmental issues generally (Nisbet, 2014). They met retreat in February, 2010 at the eponymous Hartwell House, an estate converted into a hotel; the *Paper* was issued a few months later.[2]

Figure 1: The front page of *The Hartwell Paper*

The immediate occasion for their meeting was the disaster of COP 15, the Copenhagen Summit, in December, 2009. The Summit had been supposed to produce a follow-up to the Kyoto Protocol, due to expire in 2012. Instead, beyond-last-minute, behind-the-scenes negotiations produced nothing more than a weak set of non-binding recommendations that were non-unanimously "taken note of." Contributing to the procedural and substantive disaster were: the refusal of a coalition of developing nations to discuss restrictions on their economic growth; demands from island states for immediate, deep emission cuts and recompense for climate injuries; and a new US president unable to live up to his campaign promises but (as always) willing to throw the country's weight around. The entire drama played out against the background of the "Climategate" emails, which two weeks before had revealed some unsavoury-looking sausage-making among leading climate scientists.

In its Parts II and III—approximately 85% of the text—the authors of the *Hartwell Paper* lay out the principles of and policy levers for a new approach to climate change. Put simply, they recommend dropping the Kyoto Protocol's emphasis on emission caps and instead pursuing broadly popular goals like energy efficiency, energy equity and research into clean technologies. These measures (say the authors) achieve modest gains in decarbonization while simultaneously building coalitions for further action. The authors in these two parts are clearly making a proposal: putting forth their standpoints for serious consideration while undertaking a burden of proof to answer reasonable doubts and objections against them.

---

[2] The joining of the transatlantic groups may have been brokered by noted North American "alternative" thinkers Roger Pielke, Jr, Dan Sarewitz and Christopher Green who were associated with Nordhaus & Shellenberger's Breakthrough Institute and also co-authors with Rayner, Prins and others from the EU of an intermediate whitepaper, *How to Get Climate Policy Back On Course* (2009).

Explicitly labelled arguments get made and refuted, and further exchanges are invited; the *Paper* closes by positioning itself "as a first, not as a last word" on its approach (p. 36).

All this is a customary argumentative activity, already well understood by argumentation theorists (especially Kauffeld, 1998). But as the authors openly acknowledge, not everything they are doing is so traditional. The *Paper* openly presents itself "radical"—a word used 16 times over 30 pages, including in the titles of both Parts II and III ("Radical Reframing," "Radical Departure") and in the final summary calling for "a radical rethinking and then a reordering of the climate policy agenda" (p. 36). The *Paper* similarly portrays itself as "invert[ing] the conventional wisdom" on the bearing of science to policy (p. 19) and on the focus on long-term over short-term goals (p. 10, 13). There can be, it proclaims, no "single, governing, coherent and enforceable thing called 'climate policy'" (p. 7); in a zen-like turn, the climate policy proposed by the *Hartwell Paper* is no climate policy at all.

The authors of the *Hartwell Paper* thus face a pressing challenge. How can they secure the minimum of engagement necessary for there to be an audience for their upside-down no-policy policy?—how can they get people even to read Parts II and III, much less to engage them argumentatively? Climate policy, including taxes, but with no mention of CO2 emissions? That set of standpoints is likely to be dismissed out of hand by proponents of standpoints in the familiar L/R, pro/con dilogue in Table 1. The authors' response to this challenge thus can give us indications about how advocates in general can force open constellations of standpoints, making room for argumentative polylogues.

Part I of the *Hartwell Paper* presumably provides the inducement for readers to go on to the remainder of the document, so I here examine the discursive work accomplished in that Part (plus the Executive Summary), and in particular in its first paragraph:

[1] One year ago, few would have guessed that by the spring of 2010 climate policy would be in such public disarray. [2] Two watersheds were crossed during the last months of 2009, one political and one scientific. [3] The narratives and assumptions upon which major Organization for Economic Cooperation and Development (OECD) governments had relied until that moment in shaping and pushing international climate policy towards becoming global climate policy have been undermined. [4] The course that climate policy has been pursuing for more than a decade is no longer sustainable – climate policy must find a new way forward. [5] And that presents us with an immense opportunity to set climate policy free to fly at last. [6] The principal motivation and purpose of this paper is to explain and to advance this opportunity (p. 6).

Let us go through this paragraph sentence by sentence, seeing how it makes room for the *Paper's* "inverted" proposals.

The paragraph opens with a declaration of a fact it takes to be "public"—obvious to all—namely that climate policy is in "disarray" [1]. The emphasis on the *apparentness* of the inadequacy of the Kyoto regime and its accompanying science reoccurs throughout Part I; the authors portray themselves as simply "observing" what "seems inescapable" (p. 8), "plain" (p. 5), and "discernable" (p. 10). What is euphemistically termed "disarray" in the opening sentence is elsewhere referred to more bluntly as a "crash," starting on the cover page in the Paper's subtitle. A crash is a conspicuous, attention-drawing event; hearing an explosive bang and seeing a mass of twisted steel, one doesn't need to weigh considerations about what just happened. One sees: the car has crashed.

At this point, with one policy-car crashed, the authors might be expected to reveal their new model and start arguing for its comparative advantages in carrying us forward. But instead of taking the *inferential* step from the evidence of a crash to a conclusion about the

vehicle's inadequacy, the *Paper* continues the *temporal* ordering started in the first sentence's opening reference to "one year ago" [1]. In the time since then, "two watersheds were crossed" [2]. The following paragraphs elaborate these watershed-crossings—the Copenhagen Summit and the Climategate affair— in brief narratives with no indicators that anyone would disagree. Indeed, the whole progression over the period has been from more to less disagreement: "we begin," the authors later explain, by "observing what was once controversial but which now seems inescapable: for progress to occur on climate policy, we must reframe the issue in a fundamental way: not simply in various procedural details" (p. 8).

The conspicuousness of the crash has thus dragged into the light what is ordinarily hidden: "the narratives and assumptions upon which major…governments had relied until that moment in shaping and pushing international climate policy" [3]. At issue are not the surface details of the policy—for example, the year to be selected as a baseline, the exact emission targets for each nation or the method of calculating them. Instead, "'problem is epistemological'" (p. 7); the "error…fundamental" (p.15). The general principles on which climate policy is built have been "undermined" [3]. What is needed then is not so much new policy, as a new "framing," to use the word the *Paper* deploys on average more than once per page.[3] For example: in the old framing, climate policy aimed to mitigate the CO2 emissions which drive climate change. Wrong. Writing with repetitions that emphasize the certainty of their statement, the authors state "there is no evidence that, despite vast investment of time, effort and money, the 'Kyoto' type approach has produced any discernable acceleration of decarbonisation whatsoever: not anywhere; not in any region" (p. 10). So "it is now plain that it is not possible to have a 'climate policy' that has emissions reductions as the all encompassing goal" (p. 5). Instead, the "object of emissions reduction [will be achieved indirectly] via other goals, riding with other constituencies and gathering other benefits" (p. 9). Or again: in the old framing, the certainty of climate science provides the basis for climate policy. No; that is a "flawed assumption"—a "mis-framing" (p. 17). Instead, it's clear that it is precisely the uncertainties of the science that provide the grounds for policies that will be robust against a large range of eventualities.

It is at this point that the authors of the *Hartwell Paper* offer their first argument— their first step from a premise to a conclusion. Because "the course that climate policy has been pursuing for more than a decade is no longer sustainable [therefore] climate policy must find a new way forward" [4]. The crash is less a dire emergency than an opening, a *kairos*: "an immense opportunity to set climate policy to fly free at last" [5]. And thus the purpose of the rest of the *Paper*: "to explain and to advance this opportunity" [6].

In summary: The opening section of the *Hartwell Paper* needs to earn its audience's attention to the upside-down proposal it offers in later section. The authors proceed by a strategy of "pointing out," drawing readers' attention to circumstances that are plain and undisputable. In other words, the authors proceed through non-argumentative discourse. Why is this strategy significant? Consider again the situation the authors face. The ultimate goal of all advocates on climate issues is to take any actions needed to save the planet (Figure 2). Since arguing about appropriate responses provides opportunities for justifying policies (normatively), improving them (epistemically), and building support for them (pragmatically), a policy debate is likely worth the time and effort involved. There is a room for argument before the room for action. The *Hartwell Paper* is now moving readers up another level, to examine the framing (assumptions, basic perspectives) underlying the debate, as a way to get

---

[3] This appears to be what Perelman termed a "reversal" of the ordinary appearance/reality dissociation (Perelman & Olbrechts-Tyteca, 1969, §89, 92). Instead of urging readers to abandon policies that seem on the surface attractive but are in a deeper way ineffective, the authors of the *Hartwell Paper* want readers to acknowledge the surface policy crash and abandon the deeper principles which brought it about. The real policy needs to align with what is apparent to all.

their novel proposals heard. The contours of the best framing, and the need for re-framing at all, could be debated—could be debated just as heatedly as the debate about climate policy. And why stop there? Arguers could go another level "meta-" and debate whether the *Hartwell Paper* has deployed the correct conception of "framing." But all that meta-debate would not seem to be getting us nearer to saving the planet. It would not significantly improve our situation, normatively, epistemically or pragmatically. At some point, there is no more room for meta-argument.

Figure 2: Rooms for action, for argument, and for non-argument

As Sally Jackson (2008) has noted, prudent management of probative responsibilities is key for both individual success and good collective outcomes in civic controversies (2008). Some kettles of fish are not worth opening. In particular, "meta-debate," like debate over the right way to frame the issue for debate, "does not, after all, really help to settle any of the individual controversies in which it emerges" (p. 228). Advocates therefore need strategies for establishing the conditions for argument that are not themselves argumentative—that don't invite dispute and further reasoning. The authors of the *Hartwell Paper* designed their text to make room for an argumentative polylogue over climate policy. But they designed it in way that *didn't* take on argumentative responsibilities for their re-framing. If challenged to defend the ruin of prior policies, they have left themselves room to refuse to respond.

In addition to "pointing-out," the first section of the *Hartwell Paper* contains several narratives, which I suggest function here in similar fashion—reminding readers of things they already accept. But instead of defending that claim I want to turn to examine one last strategy of non-argument. The opening of the *Paper* relies on strong *movement* metaphors, albeit somewhat mixed: after passing through "watersheds," climate policy has "crashed." It can no longer main its "course" and must "find a new way forward"—a new approach that will "set [it] free to fly at last." This metaphoric cluster is also hinted at in the subtitle of the paper, with its call for a "new direction for climate policy." In these uses, the metaphor suggests a sense of momentum, carrying the reader away from an orientation which has proved inadequate towards a more adequate perspective. But in the final paragraphs of Part I of the *Hartwell Paper*, the *movement* metaphor becomes instead a vehicle for imaginatively reconstructing the entire framework for climate policy. Here is the extended analogy:

> If one seeks long-lasting impact, the best line of approach may not be head-on. "Lose the object and draw nigh obliquely" is a dictum attributed to the famous eighteenth century English landscape gardener Lancelot "Capability" Brown. Brown's designs framed the stately home at the entrance, but only briefly. After allowing the visitor a

glimpse of his destination, the driveway would veer away to pass circuitously and delightfully through woodland vistas, through broad meadows with carefully staged apercus of waterfalls and temples, across imposing bridges spanning dammed streams and lakes, before delivering the visitor in a relaxed and amused frame of mind, unexpectedly, right in front of the house. That displays a subtle skill which has manifest political value: the capacity to deliver an ambitious objective harmoniously. "Capability" Brown might be a useful tutor for designers of climate policies. (p. 9)

Policy whitepapers are utilitarian documents, produced (and forgotten) quickly. So the grace and craftsmanship of this passage are even more striking. Consider the long quasi-periodic sentence in the middle of the paragraph. Like a garden by "Capability" Brown, it wanders through some elegant phrases before depositing the reader, in a relaxed and amused frame of mind, unexpectedly, at the main point. The sentence verbally enacts (Leff, 2003) the perspective of one approaching an English country house—the same perspective the authors invite readers to take on climate policy.

This linking of the design of climate policy to the design of English landscape gardens is referred to repeatedly in the rest of the *Hartwell Paper*. "Drawing nigh obliquely" becomes the motto for the inverted, re-framed approach to climate policy. Instead of proceeding headlong to the goal of decarbonization, the authors urge a more relaxed and enjoyable course that will eventually land us "right in front of" a world worth living in. In a subtle way, this "radical" perspective is implicit in the title of the *Paper* and its cover image (Figure 1): for the garden of the Hartwell House was designed by a follower of "Capability" Brown, and a map of the estate shows the remnants of an "oblique" approach (History, n.d.).[4]

I have catalogued three strategies for creating the conditions or argumentative polylogue, none of which involve arguing for such polylogue: "pointing out," narrative (barely touched here), and metaphor/analogy. At the oral presentation of this paper, Tony Blair remarked that these tools perhaps begin the study of a new aspect of argumentation—non-argument. I didn't respond adequately, astonished that the subject could be taken as new. Let me try to do better now.

"Argumentation [is] a self-regulating activity," Scott Jacobs (2000) declared; it is up to arguers to achieve the normative, epistemic and pragmatic preconditions for making arguments. This means that theorists of argumentation need to pay attention not only to arguments but to all the other discourse that makes arguments possible—what I have elsewhere termed "argument-plus" (Goodwin, 2000).

The three non-argument strategies catalogued can all be joined under the heading of *evocation*. Aristotle was probably not the first to notice that sometimes it isn't argument that is needed, but perception (*Top.* 1.11). If nothing else, arguments must start from points that are not themselves argued. "Even the most rationalistic of thinkers cannot argue demonstratively for everything, 'all the way down,'" Nicholas Rescher explained; "at some point a philosopher [or any arguer] must invite assent through an appeal to sympathetic acquiescence based on experience as such" (1998, p. 322). More broadly, in the view elaborated by Michael Leff in his OSSA and ISSA keynote addresses nearly twenty years ago, evocative discourse can actualize not only starting-points but all the conditions for argument in a complex, disagreement-filled world. Drawing on culturally resonant prototypes,

---

[4] Am I over-reading—was it just by chance that the image of the Hartwell House appeared on a paper referencing "Capability" Brown? The previous whitepaper *The Wrong Trousers* (Prins & Rayner, 2007), had attacked the Kyoto Protocol approach with a similar discussion of "draw nigh obliquely," linking it in that case to the zen-inspired design of a temple in—yes, Kyoto. And the cover image of *How to Get Climate Policy Back on Course* (Prins et al., 2009) was the famous Japanese woodprint of a giant wave seeming to swamp a small boat. These authors are not ones to leave allusions to chance.

evocation serves to "open situations to reasoned argument" (Leff, 2000, p. 252). Using terminology reminiscent of that in the *Hartwell Paper,* Leff explains that evocation "reframes or restructures perception of a situation" by summoning a new "recognition of the [it]…as an integral whole" through "the power of the language used in the persuasive effort" (Leff, 2003, p. 676).

While Leff, as was his wont, provided an account of evocation that emphasized its unifying and synthesizing aspects, Henry W. Johnstone, as was *his* wont (Goodwin, 2001), offered a more sober view. For communication of any kind to occur, discourse must first drive a "wedge between a person and the data of his immediate experience" (2007, p. 24). This wedge attacks "unconsciousness in all its forms: unawareness, naive acceptance, shortsightedness, complacency, blind confidence, unquestioning conformity to habits of thought and action" (p. 24). What is evoked for Johnstone is thus less a new world of shared meanings than a new consciousness alienated from what was formerly taken for granted. Constellated standpoints represent just such taken-for-granted material in civic controversies. To argue for a novel constellation requires first acknowledgement that it is arguable. And that requires driving a sharp wedge.

Leff, Rescher and Johnstone all place evocation within the province of rhetoric. I am less concerned with assigning disciplinary responsibilities. A key task in argumentation theory is to account for how arguments can get made. In this paper, I have considered the challenges faced by arguers in a world where standpoints have become locked into large-scale constellations, shutting down potential polylogues. How can polylogues get started?—what does it take to gain a hearing for a novel constellation? Arguing for the need to listen to arguments is, I have suggested, sometimes imprudent. Arguers thus have developed other strategies in order to wedge open minds and call forth new framings of a situation. The skilled authors of the *Hartwell Paper* have shown us some ways such evocation can be accomplished: by "pointing out" the manifest, inarguable failure of current perspectives, by synthesizing facts into a narrative, and by metaphors which invite imaginative reconstruction of the world. Two of these strategies—narrative and metaphor—have received attention from argumentation theorists who have considered what would happen if we treated them "as argument." The case study I have developed here shows the fruitfulness of an alternative approach. "Pointing out," narrative, and metaphor are worthwhile; worthwhile sometimes because they are not arguments.

Matching schemes of argument: Verbal, visual, multimodal

LEO GROARKE

Department of Philosophy
Trent University
Canada
leogroarke@trentu.ca

ABSTRACT: The emergence of argumentation schemes as a key tool for analysing argument has raised the question how they might best be organized. I support the development of taxonomies that systematize our understanding of schemes but argue that they must make room for visual and multimodal arguments and schemes. To illustrate this point, I develop a family of visual and multimodal schemes which are inspired by the 'argument from fit' – a visual scheme that Dove has identified.

KEYWORDS: argument schemes, argumentation schemes, visual argument, multimodal arguments, argument from fit, Dove, Wagemans, Hoppmann, Walton & Macagno

1. INTRODUCTION

In this short paper I fuse two trends in contemporary argumentation theory and respond to some questions that this raises. One is the study of visual and multimodal argument. Tseronis & Forceville, 2017 provide a good overview of current developments in this regard. The second trend is the study of argument schemes. Though their origins can be traced to ancient times, contemporary discussions are grounded on the catalogue of schemes one finds in Walton, Reed, & Macagno, 2008. Recent discussions are in many ways instructive, but I will (following Dove, 2016) argue that they must be expanded to account for visual and multimodal argument.

Multimodal arguments are arguments in which non-verbal elements (music, pictures, virtual reality, non-verbal sounds, etc.) play a key argumentative role – as a way to express a standpoint or provide evidence in support of one. I will focus most, though not all, of my attention on visual arguments – arguments in which photographs, videos, virtual reality or simple acts of seeing are key elements.

In my discussion of schemes I follow Dove, supporting his claim that there are visual instances of standard schemes, and at least one scheme – 'argument from fit' – which is inherently visual. I extend his account of the latter, arguing that it is best understood as one member of a family of 'matching' schemes that are used when we compare (and in some way match) different objects by visually inspecting them (or, in some cases, by listening to the sounds they make). Recognizing this family of schemes is a good step forward in the attempt to extend our accounts of schemes in ways that accommodate multimodal argument.

I end this paper with some exploratory comments on attempts to create a taxonomy of argument schemes. Recent moves in this direction include Wagemans' "Periodic Table of Arguments" (Wagemans, 2016, 2018); Hoppmann's alternative "chemical" analysis of arguments (Hoppmann, 2017); and Walton and Macagno, 2016. The attempt to create a typology of schemes is an important way to organize the hundreds of schemes that have been identified, but I argue that a fully comprehensive typology of schemes will have to include a clearer response to the issues raised by visual and multimodal schemes.

2. SCHEMES AND VISUAL ARGUMENT

An argument scheme can be understood as a pattern of argument. We can define a scheme by outlining its premises and conclusion in a generic way. Instances of the scheme can then be understood as different instantiations of this generic formula. In the case of slippery slope arguments we can, for example, outline the scheme as follows.

> Slippery Slope Argument
> *First Step Premise*: X is a proposal to undertake (or not undertake) some action.
> *Recursive Premise*: Bringing about X would cause (as far as we know) X_1, which would in turn cause X_2, and so forth, through the sequence $X_1, \ldots X_n$.
> *Bad Outcome Premise*: X_n is a bad (disastrous, unacceptable) outcome.
> *Conclusion*: X should be rejected.

Cases of slippery slope reasoning correspond to different interpretations of $X \ldots X_n$.

Following Walton, Reed, & Macagno (2008), the most common approach to schemes pairs individual schemes with a set of 'critical questions' which determine whether an instance of a scheme is a good/strong argument. This approach raises some important questions about critical questions which I will leave for elsewhere. In the case of the slippery slope scheme, we can define the critical questions as follows.

> Critical Questions
> *Q1*: Is there good evidence for the claimed causal links from X_1 to X_n?
> *Q2*: Is it true that X_n is a bad (disastrous, unacceptable) outcome?

As Dove, 2016 has shown, visual arguments can be instances of the slippery slope scheme. He gives illustrations of the "domino" theory of international politics that motivated the Vietnam war as an example. Consider a case in which someone answers the question "Shouldn't the United States stop fighting the Vietcong?" by pointing to the American government poster in Figure 1.

Figure 1: The Domino Theory

We can confirm that this is a case of the slippery slope scheme by defining the terms of the recursive premise as follows.

> X = The United States stops fighting the Vietcong
> X_1 = Vietnam will fall (to communism)
> X_2 = Laos will fall
> X_3 = Cambodia will fall;
> X_4 = Thailand will fall

X_5 = Burma will fall
X_6 = India will fall
X_7 = Bangladesh will fall

Of course, this is a case in which X_1 through X_7 are expressed visually, in details of the illustration – which represent a series of countries as domino ready to fall. In this case, the argument's Bad Outcome Premise is the implicit claim that the fall of these states would be a bad outcome (a disaster), something taken as obvious by Americans at the time. The conclusion of the argument is the claim that we should reject the proposal that the United States stop fighting the Vietcong (X).

Once we have recognized this instance of arguing as a case of slippery slope, we can assess it by posing the critical questions associated with the scheme. In this case, the first is the question whether there is good evidence that supports the causal claims that connect a U.S. decision to stop fighting to the fall of the seven states enumerated. The second is the question whether it would be a disaster if this happened (and they converted to communism). This is a case in which the critical questions successfully raise the core issues that need to be addressed when assessing the argument as weak or strong.

WHAT'S CZECHOSLOVAKIA TO ME, ANYWAY?

Figure 2: Low on British ambivalence at the start of the Second World War

In a discussion of argumentation schemes it is worth noting that everyday reasoning contains many visual instances of the slippery slope scheme. This is not surprising given that it is founded on an analogy which is easy to depict – comparing whatever progression is in question to what happens when someone or something slides down a slippery slope. Another good example is the 1938 David Low cartoon reproduced as Figure 2. It warns British citizens that they should not ignore the actions of Nazi Germany as it sets about annexing Czechoslovakia – because doing so is likely to precipitate a disastrous series of slides down a slippery slope that are depicted as a landslide that encompasses the fall of Poland and Romania, the French Alliances and ultimately Anglo-French security. Here again, a visual argument is an obvious instance of the slippery slope scheme.

3. DOVE AND THE ARGUMENT FROM (INTEGRATED) FIT

As Dove points out, it is not difficult to find other examples of visual argument which are instances of arguments by analogy, authority, sign, and other common schemes. Using schemes to assess such arguments is straightforward and can rely on standard accounts of schemes and critical questions. All that we need to add is an account of visual meaning which allows us to interpret visual arguments. In the present discussion, it will suffice to say that Groarke 2002 develops a pragma-dialectical account of meaning which provides a general framework that can guide the interpretation of visual arguments.

Dove takes the questions that visual arguments raise in the context of argument schemes further in his search for a scheme – not merely an instance of a scheme – which is inherently visual. The result is an account of a scheme he calls 'the argument from fit' – a pattern of reasoning used when one concludes (or is asked to conclude) that two separate objects were conjoined because one *sees* that they fit together. The scheme is a visual scheme because instances of it establish their conclusions based on *an act of looking* (rather than a set of sentences) that is inherently visual.

Figure 3: A Cross-mended plate

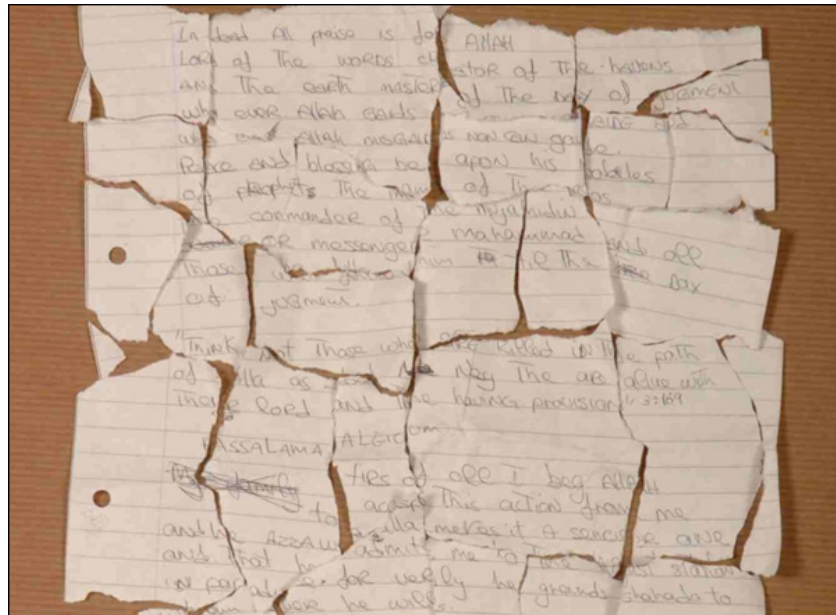
One important circumstance in which reasoning is characterized by the argument from fit occurs in the practice of archaeology. One common task for archaeologists is the piecing together of tens, hundreds or even thousands of pieces of broken artefacts recovered from archaeological sites. This process is called 'cross-mending'. The reconstructed plate with a floral design in Figure 3 has been cross-mended. The pieces are arranged in the way they are because they can be *seen* (and to some extent, felt) to fit together properly – because fitting the pieces together in this way can be seen to turn their shapes, colours and images into a coherent plate with a recognizable design.


Figure 4: Reconstructed note left by the suicide bomber Ramzi Mohammed

Figure 5: Drawing illustrating how the earth's continents fit together

Instances of the argument from fit play a role in arguing and reasoning in many other contexts. Forensic investigators use the scheme when they assemble the recovered pieces of a crashed airliner. Paleontologists use it when they connect dinosaur bones to create a conjoined skeleton. The photograph in Figure 4 shows how British police used it to piece together a torn note left by a suicide bomber. The drawing in Figure 5 presents the principal evidence for the theory of continental drift – which derives the conclusion that the earth's current continents were once connected parts of a super continent on the grounds that their contours fit together in a way that creates an integrated whole.

Having identified a pattern of inference that characterizes an argument from fit, Dove defines a corresponding scheme. The following definition is a slightly altered version of the one that he suggests.

(Visual) Argument to (Integrated) Fit
Matching Premise: [$X_1, \ldots X_n$ are seen to fit together in some integrated way.]
Conclusion: $X_1, \ldots X_n$ were once conjoined.

I have called this scheme an argument "to integrated fit" to distinguish the kind of fit it proposes from other kinds of fit (my foot fits into my shoe in a way that makes them an almost perfect match, but not in a way that would lead us to conclude that they were once conjoined). The proposed definition extends Dove's reliability premise so that it excludes cases where a fit does not suggest that objects were once conjoined and expands his matching premise to allow for cases in which a fit involves more than two objects.

The matching premise in the scheme has been placed in square brackets and phrased in a way that is designed to emphasize the point that the matching premise is an act of seeing (rather than a sentence). A fit may be observed directly, by looking at the objects which are claimed to fit together, or indirectly, by looking at some visual facsimile (a photograph, a drawing, or an image of some sort) that allows us to see whether their contours match. Instances of the scheme are instances of visual argument in which someone concludes that objects were conjoined because they *see* that the objects fit together. Dove highlights this possibility but defines the matching premise more broadly – so that it may consist of this act of seeing or the verbal statement that the objects in question fit together. I have limited my version of the scheme to the first of these possibilities. In part because my interest is visual arguments but, more importantly, because verbal claims that objects fit together must be ultimately founded on some observation that this is so, i.e. on some visual instance of the scheme.

Having defined the argument to integrated fit, we can complete our account of it by specifying critical questions that can be used to assess specific instances of the scheme. To ensure that all the issues this raises are included, I will define the critical questions in the following way (slightly adjusting Dove's account).

Critical Questions
Q1: Is our viewing of the fit in any way problematic?
Q2: Is the fit observed in a way that is sufficiently precise and clear?
Q3: Does the fit gloss over any anomalies that are not accounted for?
Q4: Could the fit be the result of coincidence or explained in some other way?

Answers to these questions, like answers to other critical questions, are designed to reveal potential problems with instances of the scheme. In answer to Q1 it may be said that the act of looking which is the basis of the argument is problematic. Because it was fleeting, the lighting was poor, we left our glasses at home, and so on. In answer to Q2 it may be said that we cannot judge the fit in a way that is precise and clear because we are observing it in an out of focus photograph. In answer to Q3 it may be said that there are specific points or places on the matched objects where the fit fails. In answer to Q4 it may be said that there are other ways to explain the fit in question (by claiming that it is contrived, attributing it to coincidence, and so on).

Combined with the proposed critical questions, the argument to integrated fit has the hallmarks of a useful scheme of argument. It identifies an important pattern of inference that frequently occurs in everyday reasoning and argument. It defines this pattern in a way that makes it easy to identify instances of the scheme. And it raises the key issues – in this case issues about what we *see* or have seen – that need to be considered in deciding whether an instance of the scheme should be characterized as a strong argument.

4. MATCHING SCHEMES OF ARGUMENT

The argument to integrated fit shows that argument schemes (not only instances of schemes) may be visual. I will call a scheme a 'matching' scheme when its conclusion is founded on our ability to match objects in some important way. In the visual cases I will consider, the matching in question is performed "with the eye" – making the key evidence in the reasoning an act of looking that occurs when we *see* a match. In this essay, I cannot provide an exhaustive list of such schemes or elaborate them in full detail (most notably I leave an attempt to provide critical questions for the schemes for elsewhere). My aim is more modest: to show that the argument to integrated fit is one of a family of visual schemes which can be identified and defined.

4.1 Arguments for and from a replica

A (visual) replica is an object designed to visually reproduce something. Paintings, models, photographs, sculptures, maps, etc. are replicas of a subject they reproduce (in whole or in part). In everyday reasoning, replicas often play a major role in arguing because they are more readily available than the subjects that they replicate. A photograph of a historical event may be the only record of it that we have; a map may show us the spatial arrangement of a network of roads in a way that it is impossible to see first hand; a wax figure may be claimed to be a perfect likeness of Queen Victoria, and so on. A successful replica matches what it replicates to some specified level of detail. A poor replica fails to do so.

In the study of everyday arguing, we can identify two common schemes of argument which depend on replicas. The most basic is the following scheme, which is used to justify the claim that something is a successful replica.

> Argument for a Replica
> *Matching Premise*: [X is seen to match (in whole or in part) Y.]
> *Conclusion*: X (in whole or in part) replicates Y.

This is a visual scheme of argument because the conclusion that some object is a good replica of something else is established visually – by looking at the replica and its subject and seeing whether they match.

An argument for a replica moves from a consideration of the properties of an object to the conclusion that something is its replica. An argument from a replica moves in the other direction, drawing a conclusion about the properties of an object on the basis of a claimed replica. It can be defined as follows.

> Argument from a Replica
> *Replica Premise*: X is a replica of Y.
> *Matching Premise*: [X is seen to be Z.]
> *Reliability Premise*: Z is the kind of property that X replicates.
> *Conclusion*: Y is Z.

In this case, the reliability premise recognizes that most replicas are not exact copies of the objects that they replicate. A good photograph of a barn will depict its colour shape, relative size etc. but it is not an exact copy of the barn – it is a two dimensional object, the barn is three dimensional; it lacks many of the fine details one could see if one was looking at the actual barn; and so on. The reliability premise allows us to infer that a replicated object has some property only when it is the kind of property the replica faithfully replicates.

Examples of arguments that invoke replicas are not difficult to find. Figure 5 below is a photograph of a see-through tourist map depicting the north face of the mountain Eiger (the photograph is a photograph of the map, making it a replica of a replica). The map in question depicts the mountain and the routes that different mountain climbers have taken "conquering the Eiger." When the map is viewed from the vantage point of the photograph we can see that it is not a successful replica – because the contour on the map does not

Figure 5: See-through map of the Eiger

match the right side of the mountain. When one steps further to the right one can find a vantage point which allows one to conclude that the map is a replica – because one sees that its contour exactly coincides with that of the mountain it purports to depict. In drawing this conclusion, one employs an instance of the scheme Argument to a Replica.

Once one is looking through the map from a vantage point that makes it a replica of the Eiger, this (and confidence in the accuracy of the lines drawn on the map) allow the viewer to conclude that the designated mountaineers climbed the mountain along the routes depicted (that the first ascent by Heckmair, Harrer, Kasparek and Vörg took the route indicated, and so on). Inferences of this sort are the basis of arguments from a replica – which base conclusions about the mountain on what we see on the map that depicts it.

Replication arguments play a key role in contexts in which visual depictions specify properties more precisely and more accurately than verbal descriptions. Replication arguments are, for example, prominent in reasoning about colour because verbal descriptions of colours are inherently vague and imprecise. The human eye can detect seven million colours. In contrast, English contains two hundred and fifty major colour names. In such circumstances, the best way to precisely specify a colour is not by using colour names, but by using replicas of colours – colour swatches and samples – that can more accurately depict specific colours.

Figure 6: Matching colour swatches with a couch

In a situation in which we want to buy a cushion to match a couch we own, the best way to do so is in two steps which (i) match the couch to a swatch (as in Figure 6), establishing the swatch as a replica; and (ii) match cushions in a store to the swatch selected. The first step of this process is an instance of the scheme for a replica (which picks the appropriate swatch). The second employs an argument from a replica (e.g. which picks a matching cushion). The latter argument can be seen to fit our scheme as follows.

Replica Premise: The swatch (X) is a replica of the colour of the couch (Y).
Matching Premise: [The colour of the cushion (Z) is seen to match the swatch (X).]
Conclusion: The colour of the cushion (Z) is the colour of the couch (Y).

Similar reasoning is used when a dentist decides the appropriate colour of a false tooth (that should match other teeth); the colour of a partial wig (that should match one's natural hair colour); and so on.

4.2 Arguments to and from an Exemplar

Replication schemes address questions about replicas and the ways in which they match their subjects. In other cases, visual matching is more generic, matching something, not with another object, but with some *kind* of object. An example is a birdwatcher who identifies a bird she sees by looking at it and matching it with a bird she sees in a photograph in the *Audubon Guide to Birds*. In this scenario, the photograph is not a replica of the particular bird she sees. It functions in a more general way, as a visual exemplar – as a representative member of a species. A good exemplar displays the most important traits of the species which is in question.

In reasoning with exemplars, a match with an exemplar implies a strong similarity rather than an exact match. The corresponding visual scheme 'Argument to an Exemplar' can be defined as follows.

Argument with an Exemplar
Exemplar Premise: Xs look like exemplar(s) X_1, X_2, X_3....
Matching Premise: [Y is seen to (strongly) resemble X_1, X_2, $X_{3...}$]
Conclusion: Y is an X.

This definition makes room for arguments to an exemplar which cite more than one exemplar, as a doctor does when they identify a skin condition by comparing it to a number of images that

depict different instances of the condition. In some cases, instances of the scheme argument to an exemplar can also be classed as visual instances of the scheme argument from sign. They occur when a sign one sees is matched with a visual exemplar. In a situation in which we see animal tracks in our garden we may, for example, conclude that a deer or moose or rabbit has been foraging in it because we see paw prints that strongly correspond to a reference photograph of their tracks.

A legal example of an argument to an exemplar played a key role in the Israeli trial of Ivan Demjanjuk, an American accused of being 'Ivan the Terrible' – a notorious guard at the Treblinka death camp. In his trial, the key piece of evidence for this conclusion

Figure 7: The Demjanjuk card and a staple hole exemplar

was a Treblinka identity card with a photograph of a younger Demjanjuk. His attorneys discredited this evidence by arguing that the card was a forgery created by the Russian KGB. One of their arguments highlighted two holes that can be seen in the photograph attached to the card (Figure 7), claiming that they were holes made by staples which had been removed when the photograph was illicitly borrowed from another document. They supported this conclusion by comparing them with staple holes that served as exemplars.

Arguments to an exemplar allow us to conclude that some particular is a member of a broader category. Arguments *from* an exemplar use exemplars as a basis for inferences about some instance of that category. We employ this scheme when we use a sewing pattern to design a dress or suit, the pattern serving as an exemplar which guides us as we decide the size of the pieces we cut, where and how we will sew them together, and so on.

The lower five-dollar bill one sees in Figure 8 was accidentally cut into pieces, then reassembled and taped together. Above one sees an intact five-dollar bill which was used to aid the reassembling. Reasoning from integrated fit played an important role fitting the pieces of the bottom bill together, but so did the attempt to match the reconstituted bill with

Figure 8: An intact and a reconstituted five-dollar bill

the intact bill that served as an exemplar (because it shows us what a five-dollar bill *should* look like). The latter matching supports, to take one example, the conclusion that the pieces of the cut bill which display the word "Canada" in white should be located in the top left section of the reassembled bill.

Reasoning from an exemplar can be generalized as the following matching scheme of argument.

Argument from an Exemplar
Exemplar Premise: X is a Y.
Matching Premise: [Arranging X (or the parts of X) in a certain way makes X
          (strongly) resemble exemplar(s) Y_1, Y_2, Y_3....]
Conclusion: This is the right way to arrange the parts of X.

4.3 Failure to Fit

Matching schemes of argument highlight the extent to which the seeing of a match of one sort or other plays a role in many instances of argument. The significance of such matches is also reflected in arguments that base conclusions on an observation that two objects do *not* match in some way (what I will call 'failure to fit'). Like argument schemes that rely

Figure 9: Poster critiquing fast food advertisements

on a match, schemes that rely on a failure to fit can be defined in a straightforward way. The two schemes Argument Against a Replica and Argument Contrasting with an Exemplar can, for example, be defined as follows.

Argument Against a Replica
Failure to Fit Premise: [X is observed to not match (in whole or in part) Y.]
Conclusion: X (in whole or in part) does not replicate Y.

Argument Contrasting with an Exemplar
Exemplar Premise: Xs look like exemplar(s) X_1, X_2, X_3....
Failure to Fit Premise: [Y is seen to not (strongly) resemble $X_1, X_2, X_{3...}$]
Conclusion: Y is not an X.

Like other matching schemes, these schemes could be elaborated further by combining them with critical questions. In the present context it is enough to note that the visual comparison of

objects may lead to an argument for or against a replica, or an argument with or contrasting with an exemplar.

The poster in Figure 9 circulates on hundreds of websites on the internet. It is a good example of an argument against a replica. It compares photographs of specific fast food items to the items as they appear when they are purchased at an outlet of the restaurant in question (for a detailed analysis of the argument, see Groarke 2017). In each case, the visual display shows that the photograph and the actual item do not match, leading to the conclusion that the photograph is not a faithful replica of the item it is claimed to replicate. The subconclusions about different fast food restaurants entail the broader conclusion that the advertising done by such restaurants is misleading.

Here it will suffice to say that arguments against a replica and contrasting with an exemplar are important instances of argument for the same reason that their positive counterparts are – because so much of our reasoning and arguing depends on visual comparison (and more and more all the time, as it becomes easier and easier to reproduce and transmit visual images in a world of digital communication).

4.4 Auditory Schemes

The examples of matching schemes I have noted are visual schemes which identify visual patterns of reasoning and argument. In a general discussion of schemes and matching schemes it is important to note that other matching schemes are auditory – i.e. based on inferences which are founded on an act of listening that allows us to hear whether two or more sounds match.

An auditory replica can be understood as the reproduction of a sound or set sounds (as in the recording of an orchestral performance), and an auditory exemplar as a representative example of some *kind* of sound (as in a recording of a blue jay call in the collection of recorded bird songs hosted by the Cornell ornithological laboratory). Understanding replicas and exemplars in this auditory way, we can define auditory versions of the replica and exemplar schemes I have already noted as follows.

Argument for an Auditory Replica
Matching Premise: [X is heard to match (in whole or in part) Y.]
Conclusion: X (in whole or in part) replicates Y.

Argument from an Auditory Replica
Replica Premise: X is an auditory replica of Y.
Matching Premise: [X is heard to be Z.]
Conclusion: Y is Z.

Argument with an Auditory Exemplar
Exemplar Premise: Xs sound like exemplar(s) X_1, X_2, X_3....
Matching Premise: [Y is heard to (strongly) resemble $X_1, X_2, X_{3...}$]
Conclusion: Y is an X.

Argument from an Auditory Exemplar
Exemplar Premise: X is a Y.
Matching Premise: [Arranging X (or the parts of X) in a certain way makes X (strongly) resemble exemplar(s) Y_1, Y_2, Y_3....]
Conclusion: This is the right way to arrange the parts of X.

Argument Against an Auditory Replica
Failure to Fit Premise: [X is heard to not match (in whole or in part) Y.]
Conclusion: X (in whole or in part) does not faithfully replicates Y.

Argument Contrasting with an Auditory Exemplar
Exemplar Premise: Xs sound like exemplar(s) X_1, X_2, X_3....
Failure to Fit Premise: [Y is heard to not (strongly) resemble $X_1, X_2, X_{3...}$]
Conclusion: Y is not an X.

There are many everyday contexts in which instances of these schemes are used. When musicians are charged with copyright infringement or musical plagiarism, arguments to auditory replica play a key role (for they occur when one composition is in some key way a replication of another). Arguments from an auditory replica are used when a careful listening to a recording of a speech is used as the basis for a conclusion that they speak in a particular way (with a particular accident or rhythm, e.g.). An argument with an auditory exemplar is used when a mechanic uses recorded engine sounds to identify a problem with an engine. An argument from an auditory exemplar is used when one sets about mixing music in way that aims to mimic the sound of a particular kind of music (say, a particular rock band's distinctive sound). Last but not least, failure of fit auditory schemes are used when someone demonstrates that the purported recording of a conversation does not match the conversation, or that a bird song does not match recorded calls of a Blue Jay.

5. CONCLUSION

Much more could be said about all the argument schemes I have noted. More matching schemes could be identified. Here it must suffice to say that the examples I have provided suggest that Dove's Argument from Fit is one of a multimodal family of matching schemes of argument in which a conclusion is founded on seeing (or hearing, or in some other non-verbal way detecting) that objects match or do not match. These are multimodal schemes because non-verbal acts of seeing, hearing, etc. are key components of such arguments. In other ways, these schemes are like verbal schemes of argument, identifying generic patterns of inference that play a prevalent role in everyday reasoning and arguing. The difference between them and the schemes in the received catalogue of schemes is that they are founded on non-verbal elements.

In this essay I have tried to show that there are visual and multimodal schemes of argument that need to be included in a fully comprehensive account of argument schemes. Many questions about such schemes need to be explored. What other schemes should be identified? What is the best way of representing them? What critical questions should accompany each scheme? Leaving these questions for elsewhere, I want to end this paper by noting some questions my examples raise about standard accounts of argument schemes.

In some ways, inferences that depend on what we see or hear are not difficult to accommodate in a comprehensive account of argument. It is easy to recognize inferences of this sort, and easy to identify instances in which the resulting arguments can be judged weak or strong, valid or invalid. As in the case of verbal premises, there are clear cases where visual, audio and multimodal input can be judged acceptable or not. Problems arise only when we assume that the latter need to be analyzed in a verbal way. In the case of schemes this raises the question how schemes can be understood in a way that does not assume that premises of an argument must be words and sentence.

One important attempt systematically organize the hundreds (potentially thousands) of schemes that have been identified is Wagemans Periodic Table of Arguments, "a proposal to

classify arguments on the basis of a formal analysis of the statements expressed in arguments and standpoints" (Wagemans 2016, p. 1). His "starting point" is the assumption "that the propositional content of standpoints and arguments can be expressed in the form of a categorical proposition. Such a proposition consists of two elements, namely that of which something is said – the 'subject' – and that what is said about the subject – the 'predicate'" (p. 4). Wagemans' project raises the intriguing question whether the acts of seeing and hearing that are key components of matching schemes can be understood in this way. I will begin that conversation by noting that we cannot adequately translate such acts into verbal statements of this sort. In real life arguing and reasoning, this is the very reason that we use maps and photographs and visual displays and audio recordings in arguments all the time – because they easily depict shapes, sizes, colours, contours, and sounds that are notoriously difficult to describe in words.

In the abstract to a paper explaining his chemical approach to schemes, Hoppmann has written that "there are three available argumentative paradigms: geometry, biology and chemistry, of which the latter will be championed. Of these the chemical approach proceeds in a downwards - analytic manner. Like the biological paradigm, it starts with real world instances of arguments, but it does not assume that these occurrences are representations of existing 'species', but instead that they can be broken up into a set of recurring smallest components (or argumentative 'atoms')." (2017, p. 1)

If we consider the constituent parts of arguments from Hoppmann's point of view, the examples I have given show that it is a mistake to proceed with the working assumption that the key elements of arguments and argument schemes we identify will be defined by sentences and words. We should instead expect to find that the key components of many arguments and many argument schemes are instances of seeing and hearing and other multimodal elements. They are difficult to categorize as veiled sentences or correlates of sentences. Does it not follow that they need to be distinctly recognized and discussed in our accounts of arguments and the schemes that they instantiate?

Argument from analogy in policy argumentation

KIRA GUDKOVA

Philological Department
St Petersburg State University
Russia
gudkovakira@bk.ru

ABSTRACT: The paper focuses on the argumentation scheme that represents argument from analogy and its use in policy argumentation. Policy propositions concern changes in behaviour; thus, policy argumentation contemplates a potential course of action. The argument from analogy is a commonly used kind of case-based reasoning where one case is held to be similar to another case in a particular respect. The paper argues that argument from analogy can be a very effective way of persuasion in policy argumentation.

KEYWORDS: argument from analogy, policy argumentation, case-based reasoning

1. INTRODUCTION

Argument from analogy is one of the fundamental forms of argumentation. It can be said that argument from analogy is the foundation of all case-based reasoning in which the argumentation turns on a comparison of one case to another. It "begins by using one case (usually agreed on and relatively easy to understand) to illuminate or clarify another (usually less clear") (Govier, 2013 p. 319). Such arguments are very popular and are widely used. For instance, argument from precedent in law is based on argument from analogy. The system of Anglo-American law is based on the principle that if a case has been decided by a court in a certain way, then a new case that is similar to it should be decided in the same way. Arguments from analogy are widely used in practical everyday reasoning.

There is no general agreement on the nature of analogy argumentation. There are many different approaches to the typologies of argument schemes but all argumentation theorists agree about the importance of analogy and all typologies include argument from analogy as a special type of reasoning.

2. ARGUMENT FROM ANALOGY: OVERVIEW

2.1 Logical approach

Let us have a brief overview of various approaches to this argument and the problems it represents.

Some scholars classify argument from analogy as a fallacious form of argumentation. They ground their reasoning on the fact that analogies can be used to illustrate, they can lead to a tentative hypothesis, but when they are used as reasons to support a claim they are not valid. Because a pair of cases may have many characteristics in common but there may be many other characteristics in which they are different. The key factor is not the number of common features that are the basis of the analogy, but the class under which the terms are categorized.

It is not clear whether argument from analogy is a deductive or inductive form of reasoning. D. Walton proposes a third alternative in "Argumentation Schemes". He argues that in some cases argument from analogy can assume deductive and inductive forms, but in the majority of cases of argument from analogy as used in legal reasoning, it has a defeasible form that is neither deductive nor inductive (Walton, 2008 p. 80).

D. Walton describes argumentation scheme for argument from analogy as the following:

Similarity premise: Case C_1 is similar to case C_2

Base premise: A is true (false) in case C_1

Conclusion: A is true (false) in case C_2 **(**Walton, 2006 p. 96).

T. Govier distinguishes comparison argumentation (inductive analogy) and the a priory analogy (logical analogy).

2.2 Pragma-dialectical approach

In the pragma-dialectical theory of argumentation comparison argumentation is considered a specific argument scheme along with causal and symptomatic argumentation. While arguing the speaker relies on a ready-made argumentation scheme that is a way of representing the relation between the argument and the standpoint. Each argumentation can be characterized by the argumentation scheme that is being employed. In comparison argumentation the speaker tries to convince the listener by pointing out that something is similar to something else. In this argumentation scheme the acceptability of the premises is transferred to the conclusion by pointing out that there is a relation of analogy between the argument and the standpoint (Eemeren, 1992 pp. 96-97). If the comparison is defective, the argument from analogy constitutes false analogy.

Garssen makes a distinction between (literal) comparison argumentation and figurative analogy. He discusses two types of comparison argumentation and puts the figurative analogy in a separate category. But he argues that seen from a pragma-dialectical perspective figurative analogy has probative force yet should be seen as a special presentation device that is used to put forward other types of argumentation (Garssen, 2009 p. 134).

The first type of comparison argumentation. In its first variant the comparison argumentation involves a prediction based on an extrapolation of shared properties, a comparison is made between the actual characteristics of one thing and the actual characteristics of another thing.

The testing system in St Petersburg University will prove to be effective, because this system proved to be effective in Moscow University.

Two things that belong to the same class (St Petersburg and Moscow University) are compared. This is the inductive argument from analogy and it is a weak one. Because St Petersburg and Moscow universities share many common characteristics but there are always many characteristics that are different. There should be a relevant similarity that acts as a premise for inductive arguments from analogy.

In the other type of comparison argumentation the main idea is the principle of consistency. People should act in a consistent way, if they acted in a certain way in one situation they should act accordingly in a situation that is similar (Garssen, 2009 p. 36).

We should introduce the testing system in St Petersburg University because it was introduced in Moscow University.

Garssen points out that this type of argumentation is similar to the type that Govier calls a priori reasoning. The only distinction is that the example that is used in the comparison in a priori reasoning can be fictitious (Garssen, 2009).

In both cases the principal critical question is whether what is mentioned in the standpoint is comparable to what is mentioned in the argument.

In figurative analogy the things that are compared belong to different classes. That is why they cannot be compared in a direct way. And the critical questions (are there similarities?) cannot be applied. Figurative analogy is not a normal comparison but a comparison of the abstract relations.

2.3 Cognitive approach

It is a fact about human cognition that we make a judgement that one case is similar to another in drawing conclusions about what to do in daily life. It is called pattern recognition; we recognize patterns in a scene and match such patterns, seeing one thing as similar to another. We all have our expectations about what we would normally encounter in a familiar situation.

When one encounters a new situation (or makes a substantial change in one's view of the present problem), one selects from memory a structure called a Frame. This is a remembered framework to be adapted to fit reality by changing details as necessary.

A frame is a data-structure for representing a stereotyped situation, like being in a certain kind of living room, or going to a child's birthday party. Attached to each frame are several kinds of information. Some of this information is about how to use the frame. Some is about what one can expect to happen next. Some is about what to do if these expectations are not confirmed.

We can think of a frame as a network of nodes and relations. The "top levels" of a frame are fixed, and represent things that are always true about the supposed situation. The lower levels have many terminals–"slots" that must be filled by specific instances or data. Each terminal can specify conditions its assignments must meet. Collections of related frames are linked together into frame-systems. The effects of important actions are mirrored by transformations between the frames of a system. These are used to make certain kinds of calculations economical, to represent changes of emphasis and attention, and to account for the effectiveness of "imagery" (Minsky, 1975).

Thus, in terms of frame-system we can view analogy from cognitive perspective and talk about cognitive analogy. We use cognitive analogy to compare two situations, but we do not compare the situations literally, we perform a familiar situation, 'put' people into this situation that is familiar for them and in which they behave in a certain way. They have their expectations about such familiar situations because these situations are filled with familiar slots. But then some slots of the situation are changed and this breaks the expectations about the situation. If any of the slots are changed it causes cognitive dissonance and it may lead to unexpected reactions, behaviour and emotions. We try to put a person in another person's shoes in order to make reasoning more effective.

3. PLEVAKO CASE

The argument from analogy can be quite reasonable in many cases. In legal argumentation we often encounter policy argumentation; the defended standpoint is expressed with the normative proposition. "This person should be acquitted".

I would like to give a very interesting example that can illustrate how argument from analogy was used very successfully in a court of law. But first I would like to introduce and say a couple of words about F. N. Plevako (1842 -1909). He was a very famous Russian defense lawyer who spoke in court. In the case I am going to present a man (hunchback) was found guilty with a murder of his long-term neighbor. The case was absolutely clear not only in general but in detail. All the evidence pointed to the accused, and he pleaded guilty. But

there was only one mitigating circumstance. The victim had been bullying the defendant for several years, by insulting him, calling him names etc. And once the defendant was not been able to tolerate bullying anymore and killed the bully. But a murder is a murder. Nobody expected the non-guilty verdict.

Plevako began his speech in a manner nobody expected. He addressed the people present by greeting the judge, the audience, the jury. "Dear ladies and gentlemen! Your Honour! Dear jury!" and so on. And he had greeted them like that for several minutes. After several rounds of greetings all the present started to giggle, to make a noise and all started to laugh nervously. But that did not stop Plevako. He continued his greetings, he addressed the audience using extremely polite words. The public roared with laughter. Then some people started to show their outrage and anger and started to make demands to shut up the speaker and to stop these disgraceful goings-on. But Plevako did not stop and continued to say the same greetings. Some people started to cry and demanded to claim Plevako mentally ill, some demanded to sue him for travesty of the rule of law. But Plevako continued to address the audience. And only when the outrage transformed into calls for actions and the angriest people from the audience rose and began to walk towards the lawyer threatening him bodily harm did he stop talking and asked the public: "What caused such an outrage, Your Honour and my dear ladies and gentlemen? You are almost ready to kill me. And I have only been addressing you for 15 minutes using only polite and reverential words. I have not insulted or have not verbally abused any of you. What would you say or do if you have been bullied, offended, insulted not for 10 minutes but for several years". They say that the accused had been acquitted.

This case illustrates the ideas about cognitive analogy presented in section 2.3. Cognitive analogy is similar to the second type of comparison argumentation described above in which the main principle is the principle of consistency. But this analogy is based on mental representations of familiar situations. Such situations are stored in human's cognition.

Cognitive analogy activates the frame system in such a way that people are put in a certain familiar situation. They have certain expectations about the behaviour of the participants of the situation. But then some slots of the situation are changed (the public expected only one greeting from the lawyer, they did not expect the greetings would be repeated for many times) and this change causes the outburst of negative emotions. Similarly, we have our expectations about our neighbours' behaviour. This information is stored in the frame system. If some slots are changed and the participants of the situation behave in a way that is not typical for this situation the outburst of negative emotions may occur.

Plevako played a typical familiar situation but changed some models of expected behaviour thus causing the negative reactions he had wanted to get. Only when the people present behaved in a certain way did they understand the analogy and were able to put themselves in the accused shoes. Such analogies appeal to emotions.

4. CONCLUSION

Argument from analogy represents a typical form of reasoning used in everyday conversations as well as in special context like legal reasoning. It turns out a very effective way of reasoning in policy argumentation. There are various approaches to argument from analogy. The described case represents analogy that can be called cognitive as it is connected with mental representations of familiar situations. The arguer performs the situation making some changes thus causing emotional appeal.

Analogy can be a very effective way of persuasion in policy argumentation, especially in the 'post-truth' era when objective facts are less influential in shaping public opinion than appeals to emotions and personal beliefs.

What place for values in argumentation studies?

JEAN-CLAUDE GUERRINI

Université de Lyon
France
Jean-Claude.Guerrini@orange.fr

ABSTRACT: The role of the values in argumentation deserves to be better known. Many reasons to be wary about their narrowly subjective or audience-dependent dimension have been pointed out. But if we want to broaden our intelligence of everyday argumentations, we must not dismiss their axiological aspect. Precisely, this paper presents the case of the still very heated controversy in France concerning the maintenance of bullfighting (bull racing with killing).

KEYWORDS: argumentation, axiological, bullfighting, Perelman, substance of arguments, valorization, value judgment, values

1. INTRODUCTION

This paper aims to draw attention to the role of values. Values are commonly mentioned in argumentation studies when it comes to characterizing audiences, but they rarely give rise to a methodical review of their importance.

Yet many who seek to obtain recognition of the legitimacy of this or that political, social or cultural struggle do so precisely in consideration of values: freedom, equality, non-discrimination, compassion, solidarity. To say it by using a verb that gives an assertion of legitimacy: "Values matter".

I will refer here, by way of example, to the case of a long-term controversy that may appear subaltern but that regularly agitates the south of France when summer comes around: should we or should we not abolish bullfighting? Bullfighting, in the form in question, almost always ends with the death of the animal.

This question may come as a surprise to an international audience which may consider that the abolition of this practice is self-evident. But I think that it brings us, at the same time, to the heart of the issues I want to address.

2. THEORETICAL REMARKS

2.1 Values and value judgment

First of all, I have to define what I mean by "values". The word "value" is a highly polysemic term that occurs in many disciplinary fields (economy, ethics, morals, aesthetics,linguistics,semiotics).

Contrary to popular belief, the word "value", in its abstract and countable meaning (we say "a value", "values") is of relatively recent use. In the second half of the nineteenth century, at the same time as the notion of value judgment appeared, it indicated the designation of substantive content justifying a positive assessment. The first testimonies of the plural "values" in an axiological sense are identified in the works of R.W. Emerson and in the American context. The definition provided by the Oxford English Dictionary is as follows:

orig. *U.S.* In *plural* (frequently collectively). The principles or moral standards held by a person or social group; the generally accepted or personally held judgement of what is valuable and important in life. Also occasionally in *singular*: any one of these principles or standards.

A "value judgment" is defined as:

"a judgement attributing merit or demerit to something according to certain standards or priorities. [Originally after German *Werturteil* (1823 or earlier as *Werthurtheil*; mid 19th cent. In specific theological use by Ritschl)]" (Ibid.).

According to the french Petit Robert dictionary (2013) a value is defined as "what is true, beautiful, good, according to a personal judgment more or less in agreement with that of the society of the time" (my translation). The judgment of value shows the evaluative activity of an individual or collective subject facing an object, a practice, a behavior, an opinion.

As opposed to quantified evaluation, the value judgment refers to a qualitative criterion or a model accepted in a community, whether to support it or to contradict it. "Values" can be considered as guarantors of judgment in a world deprived of the certainty of an absolute (God, History), which does not prevent some people from asserting the "objectivity" of values, demanding a return to "true values", confusing the legitimacy and permanence of certain values with their supposed "truth".

By attributing a major role to values in their *Treatise on Argumentation* (1958), Chaim Perelman and Lucie Olbrechts-Tyteca directed their New Rhetoric towards a rigorous taking into account of the plurality of value systems. By re-examining in terms of values and valorization (or depreciation) the normative tools long mobilized in arguments (the Aristotelian topoi, the goods, the virtues, the maxims), they opened the way to a methodical exploration of axiological operations.

2.2 Language and speech

The discursive manifestation of values is in fact extremely varied. It finds its most explicit expression in "value words" such as truth, tolerance, freedom, peace, and so on, or in substantive adjectives such as the good, the beautiful, the true, etc. which condense major options of judgment. It is often by invoking such terms ("in the name of freedom") that one ultimately justifies a decision, a measure, a choice. "Value words" can also be summoned, advocated, argued. Their semantic content can be supported by adjectives (free), adverbs (freely), verbs (to free). From the recipient's point of view, it is possible to proceed with the extraction of the value mobilized by the interlocutor by applying to the claim being proclaimed the question "In the name of what?" by resorting furthermore to control procedures (eg. "Can we really say that this word is used as a value in this community?").

The acceptability of values therefore depends on the cultural context. Nevertheless, "the True", " the Good", " the Beautiful" are usually considered as "universal values". We can name them more modestly "common instances of value judgment" and choose to group with this Platonic triad the criteria that it discarded: "the pleasant" and "the useful". Every positive term is opposed to its negative opposite (lying, evil, ugly, unpleasant and harmful). These semantic axes of valorization, which all come under the opposition "good/bad", supply a deep structure, in a very mundane way, to value-judgments.

In France, the expression of value judgments has been explored linguistically since 1980 by Catherine Kerbrat-Orecchioni through lexical analysis. But terms that have an apparently "neutral" descriptive content may be affected, in a particular context, by a positive or negative connotation. This is the case, for example, with the words "commercial", "strike", "war" whose contradictory polemical uses are easily imagined. The axiological meaning of terms can only

be identified by taking into account the context, i.e. who is speaking, to whom, in what situation. This is one of the major causes of disagreements. The axiological valence of the words that are mobilized is only very rarely stabilized: disputes will thus very often result from the different interpretations of which they are the object.

But it is virtually impossible to escape values. In situations of tension, it is with reference to such or such a value that we hold that we finally take sides. The value thus privileged fixes the course, the orientation of the argumentation. If one claims "not to judge", it is generally "in the name of tolerance", of "the respect due to everyone", of the "concern for objectivity or impartiality", that are so many values.

Values refer, as the case may be, to skills (moral, ethical, aesthetic, intellectual, practical, professional), to qualities valued in groups (political, trade union, mutual, sports, leisure) or belonging to certain affiliations (regional, national, class, ethnic, gender), visions of time (progressivism, conservatism, reactionary thinking), specific aspirations systematized or not in religious, philosophical or political doctrines.

They constitute classes of judgment whose combination is virtually infinite. Some sociologists seek to objectify them through opinion polls and quantitative or qualitative studies to identify groups sharing the same lifestyles or the same forms of consumption. But these studies, which feed foresight institutes, marketing agencies, advertisers and policy communication teams, are often open to methodological criticisms that hinder their full recognition in the academic world.

Values can, moreover, be classified according to their greater or lesser generality and their claim to universality or according to their particularity (values with general content, values with particular contents, values with universalist aims, values with particularist purpose).

3. THE CRITICISMS OF THE ARGUMENTATION BY THE VALUES

Argumentation with values raises many reproaches:
- Values do not allow us to differentiate "true /false" utterances which are more appropriate for the appraisal of validity, through rigorous procedures.
- When they appear explicitly, they are accused of introducing a dogmatic element into the exchange, the invocation or the summoning of values being suspected of being a form of argument of authority. Values are expressed through confused notions or by the use of words loaded with presuppositions that increase the share of the implicit and hinder the clarification of the positions being confronted. They provoke a form of distortion of speech and are accused of being a kind of petition of principle.
- Moreover, the consideration of values would be linked to a theory of persuasion based on cultural connivance rather than a rational norm independent of the peculiarities of an audience.

This is why it is often recommended, especially in the context of the pragma-dialectic, to limit the use of values as much as possible. Besides the New Rhetoric was explicitly presented, in a founding text of pragma-dialectic written in 1987 by Frans H. Eemeren (Argumentation's Five Estates), as taking up an anthropo-relativistic posture which it was right to guard against, one of the reasons for this critical distance being precisely the importance given to values.

Subsequently, this is well known, advocates of the pragma-dialectic have formulated theses tending to change the relationship between their discipline and rhetoric by introducing the concept of "strategic maneuvering". Taking up the history of relations between rhetoric and dialectic, they agreed to integrate the idea of a reference to shared values, particularly as regards the argumentative stage:

This explains why it is often attempted to elevate personal opinions and subjective impressions to the level of generally shared judgments. In the "argument stage", the argument can be strategically attuned to the audience by basing them on sources respected by the audience or by appealing to authorities recognized by the audience (Eemeren, 2009: 123).

The role played by values in decisions of law is also recognized. Feteris'work on legal argumentation points out how, for Perelman, values and loci serve to convince the different audiences of their merits: law practitioners (judges and magistrates), the academic community and all those concerned by court decisions. This role of values is also emphasized by other legal scholars who refer to Perelman, and who stress, aside from the validity and legality of arguments, their social acceptability, such as Alexy (1989 [1979]), Aarnio (1987) and Peczselnick (1983).

4. THE CONTROVERSY OVER BULLFIGHTING

4.1 Some contextual elements

Let's come to the case of the controversy over bullfighting in which value judgments play a major role.

This controversy is as old as the introduction in France in 1853 of Spanish bullfighting. Bullfighting called *corrida* is distinguished from other types of bullfighting by the fact that the integrity of the animal is compromised by the use of pikes and banderillas and that the show ends with its death given by the bullfighter with his sword. The bullfight takes place under the watchful eye of an informed public, of people who evaluate each sequence by their applause, their "*olé*!" or by their noisy manifestations of reprobation (called "*bronca*"). The president awards prizes (the ears and the tail, the triumphal exit of the arena). After the bullfight, the *aficionados* (bullfighting fans) discuss the quality of the show: the quality of the animals (*bravos*, brave or *mansos,* weak), the quality of the bullfighters, of the *tercios* (sequences of the fight). In dedicated clubs, during *tertulias* (discussions, debates), the different conceptions of bullfighting, articulated with distinct systems of representation and values, are confronted.

Outside, the *corrida* can be the subject of a favorable consensus at village or city level. But as soon as a wider context is involved, audiences become more composite, contestation becomes more probable: bullfighting divides and even constitutes in France a subject of privileged discord, which cannot be related to any of the usual sociological or political categories. It triggers highly passionate praise or blame, but also supportive actions or hostile demonstrations that mark a century and a half of national history.

A law protecting domestic animals voted in July 1850 (the Grammont law) had made it clear to the enemies of bullfighting that it would be quickly banned. But the resistance of the mayors of southern France was effective and, over the decades, made possible the gradual establishment of this form of bullfighting which was still criticized by a large part of the population.

It was this situation of endless discord that the 1951 Act (as amended in 1959) was supposed to remedy by introducing a derogation. The article of the penal code reiterated the text of the Grammont law, but introduced a geographical restriction to its application in cases where the bullfights constitute an "uninterrupted local tradition". Currently, bullfighting is illegal in most of French territory, but it is legal in some southern municipalities under certain conditions related to geography and local history.

The journalistic or literary praise of bullfighting and the campaigns of denunciation developed in parallel for decades. But since the creation of various anti-corrida movements in the late 1980s hostile manifestations have multiplied. Faced with the progress of the abolitionist

movement in Spain (which led in 2010 to a vote of the Catalan Parliament prohibiting bullfighting from 1 January 2012) and the development of anti-corrida campaigns in France, the many clubs of *aficionados* decided to federate within a National Observatory of Bullfighting (2008).

Proponents in favor of abolition and opponents defending this practice seek the approval of the general public, as both are well aware that the abolition or maintenance of bullfighting requires a solid line of legal defense, but also the adhesion of elected officials (at the municipal, departmental and regional levels) and of the public.

Action to influence opinion takes place in a variety of ways through a wide variety of media (press, specialized journals, feature books, militant pamphlets).

For a long time, opponents have remained closed to opposing arguments, contempt, insult or indifference being the rule between them. It is only recently that courteous exchanges, at least in part, have appeared, for reasons of rhetorical efficiency.

The anti-corrida continue to demand the application of the Grammont law without exception. They consider that the incompatibility between the law and the freedom to practice this type of bullfight, which is prohibited elsewhere in the country, is a contradiction : the law must be the same for all. They appeal to the spirit of the law against the letter of the derogation. They criticize the notion of "tradition" and the interpretation adopted by case law since 1951.

Aficionados consider, for their part, that the legality of bullfighting is an asset and call for the maintenance of existing legislation.

In this case, we find the situation analyzed by the authors of the New rhetoric when they analyze the conflict between two rules or values and conclude that they need to be hierarchized or to resort to an argumentative technique aimed at a "division in time" or at "a division as regards the object":

> Incompatibilities oblige one to make a choice, which is always difficult. One of the two rules, one of the two values, must be sacrificed — unless both of them are given up, which often involves further incompatibilitiés — or else one must resort to various techniques for removing the incompatibility. These we call compromises, in the broadest sense of the term, but they also involve a sacrifice (Perelman and Olbrechts-Tyteca,1969, p. 197).

This is one of those "techniques" that seems to be applied here since the law tries to lift the incompatibility between the rule of the law fixed in article 6 of the Declaration of the Rights of Man and the Citizen and another rule which allows a practice to which the local population manifests its attachment:

> Rule 1: (the law) "is the same for all, whether it protects or punishes" (Declaration of the Rights of Man and the Citizen)
> Rule 2: Do not question "certain traditional practices"

The lovers of bullfighting, who rely on the strength of the precedent, consider that the legality of bullfighting is an asset and call for the maintenance of the existing legislation. One of their spokesmen, S. Casas declares as follows: "The law is well made [...] It is respectful of all the citizens and endorses the local culture, this tradition of the South of France" (Casas, 2012, my translation).

On the contrary, the "anti-" consider that this is very incoherent. That is why they decided to turn to the European Court of Human Rights. They are also seeking to gain the support of the population as they know that the fight to get MPs to change the law will be long and difficult.

4.2 Supporting a stand-point by value-words

Both among the supporters and opponents of bullfighting, the role played by values is essential:
- in an explicit form, because of the use of the word "value" itself and the more or less ostensible mobilization of axiological terms.
- in an implicit form through the qualification of the actors (human and non-human) and the acts involved in this practice.
Whatever the mode of insertion of values, each camp relies on basic values:
- on the pro-corrida side, the values of "liberty" and "tolerance" are first and foremost mobilized, the primary objective is to proclaim the right to indulge in one's passion and, above all, to keep things as they are.
- for the "anti-", the values used are centered on the animal and suppose a change of attitude based on emotions: "compassion", "animal protection", "animal welfare". The rise of this last value stems in particular from the fact that the word "welfare" is well known in social history.

To this must be added "truth" and "respect". These values are constantly mobilized on both sides.

But the value-words, far from constituting only "objects of agreement", provoke fierce debates. The "anti-" unsurprisingly reject the argument of tradition. Despite the difficulties that it raises, perfectly identified by some *aficionados*, it remains in their own arguments, because this notion is an integral part of the speech intended to gain public support for *ferias* and economic activities that are related to this type of festivities.

4.3 *The axes of valorization*

The main axes of the valorization (ethical, aesthetic, epistemic, hedonic, pragmatic) constitute the first framework of constraint imposed on the discourses. They can be thematized (when the aesthetic or ethical axes, for example, are named) or exert their influence through all the verbal material. The fact that some axes are better identified and valued as such (aesthetic, moral-ethical) facilitates their recognition and their mobilization. It is by identifying their presence that the interlocutor or the analyst can identify the action of the axes, their convergence or their opposition (especially through the prototypical terms: pleasant, pleasure, useful, harmful, effects, useless, true, truth, veracity, false, lying, etc.). Since the mid-2000s there is a strong and explicit presence in the *aficionados*' discourse of the two ethical and aesthetic axes, the pragmatic axis of interests (economic and touristic) being more rarely summoned. It is a strong framework, which sometimes gives rise to meta-ethical considerations and which comes to relay, or complete, the metaphorical framework favored by the *aficionados* since the 1930s (love, sexuality and sacrifice) which had been promoted mainly by writers and artists (Picasso in particular). The *aficionados* consider that in bullfighting the two ethical and aesthetic axes can't be separated. They claim the "epic heroism" present in the arena, and they are the bearers of a body of truly humanistic values against the mediocrity conveyed by humanitarianism and what they call "Anglo-Saxon animalism" (Wolff, 2007 p.150).

This axiological characterization is absolutely rejected and denounced by the "anti-" as a maneuver of justification that radically breaks from common morality. They denounce a show based on cowardice, perversion, voyeurism and mediocrity (FLAC Faa, 2018).

As we have pointed out, for many *aficionados*, the spectacle of bullfighting has an essential aesthetic dimension: bullfighting is beautiful by itself and it inspires aesthetic creations (in painting, in literature, notably, Wolff, 2007 p. 13)

Opponents of corrida may adopt different attitudes towards this aesthetic claim. For some, there is a real antinomy between bullfighting and art (FLAC Faa). Others, while

conceding the reality of the links that bullfighting has with art refuse to conclude with a justification. They dissociate clearly the aesthetic and ethical axes.

The epistemic axis (that of the truth) plays a major role in the controversy: the establishment of the scientific truth gradually acquires an increasing place in the diagnosis focused on the suffering of the bull. There is thus a "controversy in the controversy", a quarrel of experts on the reality of this suffering that leads to questions of methodology and validation of knowledge through academic tests.

The study by C. Illera del Portal, Professor of Cell Physiology published in 2009 dissociates pain and suffering and presents as irrelevant the compassion of animal defenders. It reinforces *aficionados* in their defense of the exceptional character of the bull, both genetically and physiologically. But it is precisely the lack of conformity of Illera del Portal's work to academic standards that destroys, in the eyes of the "anti-corrida", the assertions of the Madrid professor. They quote the statements of Professor G. Chapouthier (Laborde, 2009, p. 17) who deplores the lack of scientific publication confirming the thesis of Illera del Portal. Many also consider that we are dealing with a simple denial of reality and that showing images of bloody bulls is a sufficient proof of their suffering and they recall the tiny percentage of matadors killed or wounded in proportion to the animals killed in the bullring.

4.4 The rise in generality

The weakening of the argument of tradition in public opinion explains that in parallel with the requirement of respect of the precedent in the legal battle (and thus of the maintenance of the use of the word "tradition" by the text of the law), the supporters of bullfighting have adopted a strategy based on other values: "culture", the transmission of "intangible cultural heritage", "cultural diversity". What they are looking for is the recognition by the state of the "cultural dimension" because they are aiming for a further step: the recognition of the corrida as part of the Intangible Cultural Heritage of Humanity.

In fact, since 2001, the Universal Declaration on Cultural Diversity, drafted after 9/11, has made "cultural diversity" a "common heritage of humanity". At the same time, the Inventory of the Intangible Heritage of Humanity, launched by the UNESCO 2003 Convention, intends to take into account "the subjective importance given to this or that practice by the community that keeps it alive". This is why an application for the registration of the *corrida* was filed on August 31, 2011. Precisely adjusted to the texts of UNESCO, the information sheet provided by the pro-corrida lobby underlines the threats to this practice and calls for "respect for the diversity of cultural expressions".

The *aficionados* try to obtain, thanks to this value-word, the bond of a third-party of international rank able to block the challenges that appear at the level of the European Union and thus guarantee the survival of the *corrida*.

A large number of "anti-*corrida*", who do not overlook this international dimension of their fight, think they have a guarantor of the same scale by invoking the Universal Declaration of the Rights of the Animal solemnly proclaimed on October 15, 1978 at the UNESCO Headquarters. But as Emmanuelle Danblon (2010) has clearly shown, the conditions of enunciation of this declaration and its very text (in particular the use of the notion of "animal species" with an undefined contour) prevents it from benefiting from the same legitimacy.

On the other hand, there can be no denying the development of a new sensibility to animal life, which is reflected in many countries by the development of legislation incompatible with the treatment inflicted on bulls in the arena. This metamorphosis of sensitivity and values cannot fail to influence the political or judicial institutions in the long term when they are led to establishing new standards with greater acceptability.

We are thus typically in the field not of the validity of a procedure or argument, but of a social acceptability of certain acts or behaviors. In this respect, we should note the role played in various social movements by the notion of "intolerable" which indicates the way in which certain legal norms are criticized because of their blatant discrepancy with the axiological expectations of contemporaries (Fassin, 2005).

The notion of acceptability brings about the complexification of Perelman's distinction between a particular audience and a universal audience. It is clear that the arguments addressed to the supporters and opponents of bullfighting are addressed to specific concrete different audiences whose features cannot be correlated to precise sociological parameters or rational competencies. On both sides, discourses refer to ideal private audiences constructed according to different hierarchies of values. These "life forms" are mutually exclusive on the precise point of a controversial practice, here the practice of bullfighting, even if they also share "family resemblances" that make their cohabitation possible in the same political society. The conquest of a Third party, of an arbitrator appears, however, essential to resolve the ongoing dispute: the rise in generality is reflected in the call for compliance with international legal bodies such as the UN or UNESCO that are concrete substitutes for a universal audience. On 16 March, a draft bill was tabled by a French deputy at the French National Assembly demanding the prohibition of the presence of children under 14 years of age at bullfighting events by citing the recommendation of the Commission for the Rights of the Child, the United Nations body responsible for verifying the implementation of the International Convention on the Rights of the Child, to ban such performances for minors.

5. CONCLUSION

My goal was not limited here to the study of an isolated and picturesque case. I wanted to highlight a capital aspect of the argumentative activity. In this case-study it is not just about a conflict of preferences between particular audiences, but about their attempt to gain recognition and legitimacy from audiences of recognized quality, according to their own ideal audiences: international bodies which serve as guarantors for the decisions of national bodies or regions.

So the question here is the role of the substance of the arguments which depends on historical evolutions and choices, at various levels of relevance: for instance, the major roles of the values of freedom, of equality, of non-discrimination, of dignity of the human person, of respect for cultural diversity, of protection of the animal condition do not stem from universal and timeless certainties derived from a rational logic, but from human experience, from the evaluation of practices and the legitimacy that this gives in international organisations to values that would, according to them, put limitations on arbitrariness, domination, barbarism, chaos or the standardization of cultures.

So, it is important, in my opinion, without diminishing the various approaches that emphasize the logical and pragma-dialectical forms of argumentation, to pay more attention to the manifestations and forms of the substantial content of the arguments, such as values.

Authority and auxiliary experts

HANS V. HANSEN

Department of Philosophy
University of Windsor
Windsor, ON
Canada N9B 3P4

ABSTRACT: Arguments from authority are sometimes modeled as requiring that auxiliary experts should corroborate the expert's pronouncements. There are at least two problems with this approach: it marginalizes the role of the main expert and it casts doubt on the integrity of the authority scheme. An alternative role for auxiliary experts is to convey their assessment of the main-source's epistemic character. The reliance on trust, it is argued, overcomes the difficulties incurred with corroboration.

KEYWORDS: argument schemes, authority arguments, auxiliary experts, corroboration, epistemic character, John Hardwig, principle of testimony, trust

1. INTRODUCTION

One of the methods of informal logic is the method of argument schemes and one of the most studied of the schemes is the one for Argument from Authority, also called Appeal to Expertise. The kind of authority in question is knowledge or cognitive or intellectual authority, not command or political authority.

Schemes (patterns) for AA-arguments can be expressed in different ways but the basic idea is that they should at least identify the basic necessary conditions for being a good instance of the argument kind. The following is one proposal for what would make for a good AA-argument:

Sc1. P1. *S* states that *p*.
P2. S has credentials which are relevant to determining whether *p*.
P3. *S's* advocacy of *p* is not biassed.
P4. *F* is a subject area in which knowledge is possible.
P5. *p* belongs to *F*.
P6. *There is wide agreement among relevant experts in* F *that* p *is the case.*
C. *p* should be accepted. (Adapted from Groarke and Tindale, 2013, p. 317)

According to Scheme 1, AA-arguments are to be reconstructed as six-premise arguments with each of the premises stating a necessary condition for good arguments of this kind. The conditions are also jointly sufficient for a good AA-argument, given the proviso that this is a defeasible kind of argument.

2. TROUBLES WITH CORROBORATION

What I want to focus on is P6. I will call it the Auxiliary Condition or the Auxiliary Premise. Many other informal logic and critical thinking textbooks include a very similar requirement in their models of good AA-arguments. What the auxiliary condition requires is that there should be wide agreement among what we may call the *auxiliary experts* in *F*. Their agreement is about, *p*, the conclusion of the AA-argument.   Here is how some others have stated this requirement:

- *p* is *consistent* with what other experts assert? (Walton 2006, p. 88).
- There is *consensus* among the relevant experts supporting the claim (Bailin and Battersby, 2016, p. 137).
- The experts in *F agree* about *p* (Govier, 1997, p. 140).
- There should be a limited amount of *disagreement* over the proposition among experts in the field. The greater the degree of controversy among more-or-less equally qualified experts, the less reliable the judgment of any particular expert (Churchill, 1990, p. 471).

Two things that all these propositions have in common are that (i) they require that all (or nearly all) of the auxiliary experts agree that *p* is the case, and (ii) that this agreement is taken to be additional evidence for, *p*, over and above what the main source, *S*, affords.   (*S*, the main source, is not among the auxiliary experts.) This turns the auxiliary premise into the requirement that the auxiliary experts should corroborate what *S* has asserted.   So, the auxiliary premise is to be understood as a *corroboration condition* (Corr-Con). We can state it explicitly as follows,

> (*Corr-con.*) The role of the auxiliary experts in AA-arguments is to corroborate what S, the main source, has claimed.

Notice that the evidence provided by the auxiliary experts gives *direct support* for the conclusion of an AA-argument in addition to, and independently of, the evidence given by S, him or herself.

There are problems with the Corr-con interpretation, however, which are brought out by the following dilemma. Let *Γ* be any AA-argument patterned on Scheme 1, *S* the authority relied upon, and Corr-con the interpretation given to the auxiliary premise, then we have:

D1. 1. Either the auxiliary experts in *Γ* corroborate what S says, or they do not corroborate it.

2. If the auxiliary experts in *Γ do not* corroborate what S says, then *Γ* is not a strong argument.

3. If the auxiliary experts in *Γ do* corroborate what S says, then S's testimony is of negligible value.

4. Therefore, either *Γ* is not a strong argument or the testimony of authority *S* in *Γ* is of negligible value.

If, on the Corr-con interpretation, an auxiliary premise is not acceptable, then the AA-argument in which it occurs will not be a strong one and so we can have little faith in its conclusion. But if, on this interpretation, the premise is acceptable, that is equivalent to

saying that the proposition that *there is wide agreement among all (or most of) the relevant auxiliary experts that p is the case*, is acceptable. However, if that proposition is acceptable then we have little need of what the source, *S*, might have to say because now we have an even better argument for the conclusion, *p* – an *argument from consensus*. "In arguments of this type," writes Wesley Salmon, "a large group of people, instead of a single individual, is taken as an authority. Sometimes it is the whole of humanity, sometimes a more restricted group" (1973, p. 93). If we consider the auxiliary experts as a "restricted group" whom we are consulting, then we see that Scheme 1 arguments contain all the ingredients needed for an argument from consensus.

Sc2.   P6. There is wide agreement among relevant [auxiliary] experts in *F* that *p* is the case.
        P4. *F* is a subject area in which knowledge is possible.
        P5. *p* belongs to *F*.
        C.   *p* should be accepted.

The premises are all taken from Scheme 1. But now, in light of the Corr-Con interpretation of the auxiliary premise, AA-arguments turn out to be either weak arguments or they are transformed into arguments from consensus. Why do I think this is so? Because of what we may call the comparative weight argument. It goes like this: In normal times (not scientific revolutions), should the community of experts (the auxiliary experts) disagree with an authority, our epistemic loyalties should be with the auxiliary experts because the comparative weight of their collective voice counts for more than the weight of *S*'s solitary voice. Hence, when there is agreement between the authority and the experts, then the view of the auxiliary experts should also carry more weight. This argument greatly diminishes – if it doesn't eliminate – the role of *S* in good AA-arguments.

There is another reason why the Corr-Con interpretation of the auxiliary premise is problematic. It raises a difficulty for Scheme 1 as a good model of AA-arguments. Argument schemes are schemes of individual kinds of arguments. The premises of individual kinds of arguments are linked together and schemes must be drawn to include this fact. If a scheme does not show an argument kind as having linked premise then the scheme would be of two or more argument kinds, perhaps convergently related (or the scheme could include an idle premise). Thus, any argument scheme of a unique kind of argument must be such that any instantiation of that scheme will result in an argument with linked premises. If a premise set, *L*, is linked, then any proper subset of *L* does not support the argument's conclusion nearly as well as does the complete set of premises in *L*. Yet we have seen that consensus arguments, being instantiations of a proper subset of the premises of Scheme 1, supports the conclusion as well or nearly as well, as AA-arguments that instantiate all the premises in Scheme 1. This is evidence that Scheme 1 is not a scheme for a linked argument; i.e. that Scheme 1 does not capture the essence of a unique kind of argument, to wit, AA-arguments. In fact, we should view Scheme 1 as not being an argument scheme at all but really a conglomeration of two sets of premises forming a convergent argument. On the left we have this scheme:

Sc3.   P1.   *S* states that *p*.
        P2.   S has credentials which are relevant to determining whether *p*.
        P3.   *S's* advocacy of *p* is not biassed.
        P4.   *F* is a subject area in which knowledge is possible.
        P5.   *p* belongs to *F*.
        C.   *p* should be accepted.

And beside it, on the right, we can place the scheme of an argument from consensus (Scheme 2). Thus, Scheme 1 breaks into two independent arguments schemes horizontally related (beside each other), Scheme 3 and Scheme 2.

There are then two problems we have encountered with regard to Scheme1. The one is that it puts the role of *S*, the main source, in question, thereby defeating the very purpose of an appeal to a single authority or expert. The other problem is that it makes us wonder whether Scheme 1 is a genuine normative argument scheme. Is it possible that both these difficulties can be traced to the Corr-Con interpretation of auxiliary premises?

3. TRUST

Perhaps we have been barking up the wrong tree. The problem for lay-people is to put themselves in an epistemic situation wherein they can trust the testimony of experts. Jean Goodwin, following up on observations by Doug Walton, advises lay-people assessing an expert for credibility

> to examine such things as his employment, his degrees, the testimony of his peers, and his publications. Note that in each of these the layperson is relying on *third parties,* those who are likely to share the relevant expertise themselves and thus are capable of assessing the purported expert's real knowledge. These *third parties* act as gatekeepers, presumably only hiring, publishing, granting degrees or good reputations to those who are truly qualified. (Goodwin, 2010, p. 140; my ital.)

I have highlighted Goodwin's point that there is an essential role for third parties: they are to assist lay persons in deciding on the credibility of experts. These third parties we can identify as auxiliary experts.

In more detail than Goodwin, John Hardwig has argued that scientific knowledge depends on trust. There are two basic reasons for this: (1) gathering and analysing data takes too long to be done by only one person, and (2) no one knows enough to be able to do all the needed experiments by herself, so research must be done by teams in which every member must trust the testimonial evidence of other team members. Although Hardwig's main concern is to show that scientists must trust each other in order to advance their research he does allow that "the principle of testimony" may suffice to connect lay persons with scientific knowledge: "If *A* [a lay person] has good reasons to believe that *B* [an expert] has good reasons to believe *p*, then *A* has good reasons to believe *p*" (Hardwig, 1991, p. 697). Here *A*'s reasons for believing *p* are at least partly what we may call "testimony reasons."

However, testimony reasons to believe a proposition depend on the trustworthiness of the one trusted. When we rely on what someone conveys to us (their testimony) it is because we trust their character. Hardwig considers character to have both a moral and an epistemic aspect: the moral aspect relates to truthfulness, and the epistemic aspect relates to the testifier's reliability as an expert, to their competence, conscientiousness and epistemic self-assessment (Hardwig, 1991, p. 700). But how can we trust someone's character if we don't know them? Not only are we lay people far removed from experts in terms of knowledge and understanding, we are also, usually, not personally acquainted with them; hence, we are not able to place our trust in an authority or expert directly. Hardwig sees two possible solutions to this practical impediment to trust. The one is to pursue corroboration: if other scientist have come to the same conclusion, that will increases our confidence (trust) in the main

source's pronouncement. But we have already examined and found the corroboration route problematic for AA-arguments. The preferred solution, according to Hardwig is to turn to intermediate sources – Goodwin's third parties – who, although they may not have corroborated *S*'s findings can assess *S*'s trustworthiness based on their knowledge of his or her moral and epistemic character. Although Hardwig's principle of testimony was first stated as an immediate relationship between two parties, a giver and a receiver of testimony, he further suggests that the principle can be extended to include third parties (Hardwig, 1991, p. 701) and we can adapt it to our purposes as follows:

> If *A* (a lay person) has good reasons for believing *C, D, E*, ... (the auxiliary experts), and *C, D, E*, ... have good reasons for believing *S* (the source expert) has good reasons for believing *p*, then *A* has good reasons for believing *p*.

Here we have *C, D, E*, ... in an intermediate role between *A*, a lay person and *S*, a main source. *S*'s reasons are presumable not testimony reasons but direct evidence reasons based on her research. *C, D, E*, ...'s reasons are, however, testimony reasons based on the character of *S*. (We may add that *A*'s reasons are testimony reasons based on what *A* takes to be the trustworthiness of *C, D, E*, ...)

If auxiliary experts have good reason to believe that a source expert has a good reason to believe *p*, then auxiliary experts have a good reason to believe *p*. This leads us to an alternative to the Cor-con interpretation for auxiliary premises. We now focus on having evidence for the credibility of *S*, the main source. We will call it the Credibility Condition (Cred-con) interpretation of the auxiliary premise. More precisely,

> (**Cred-con.**) The role of the auxiliary experts in AA-arguments is to confirm that *S*, the main source, is trustworthy with regard to the issue in question.

What the auxiliary experts say may *indirectly support* the conclusion of an AA-argument by bolstering the credibility of *S*, the main source. Cred-con does not imply that the auxiliary experts know and/or understand *S's* reasons for *p*, the conclusion in question; yet they may still have confidence in *S*'s judgment based on their trust in him. Hence, the role of auxiliary experts on the Cred-con interpretation is quite different than it is on the Corr-con interpretation because it shifts the focus away from looking for further support for the conclusion, *p*, to looking for support for the trustworthiness of *S*. I think that this modification ameliorates the problems to which we were led by Corr-con. Let us restate the dilemma, D1, under the Cred-con interpretation.

D2.   1. Either the auxiliary experts in *Γ* find S trustworthy or they do not find S trustworthy;
         2. If the auxiliary experts in *Γ do not* find S trustworthy, then *Γ* is not a strong argument;
         3. If the auxiliary experts in *Γ do* find S trustworthy, then S's testimony in *Γ* is credible (other conditions being satisfied);
         4. Therefore, either *Γ* is not a strong argument or *S's* testimony in *Γ* is credible (other conditions being satisfied).

The outcome of this second dilemma based on the Cred-con interpretation is more favourable to the role of *S*, the main source in AA-arguments, than was the outcome based on the Corr-con interpretation. True, it is still the case that, if the auxiliary experts in an AA-

argument do not find *S* credible, then the argument will be a weak one. However, should the auxiliaries find *S* trustworthy this will give *S's* testimony a boost of support and make the AA-argument stronger. Thus, on the Cred-con reading the auxiliary experts bolster *S's* testimony rather than marginalize its value, as they did on the Corr-con interpretation.

But now we are faced with a new problem, if we want to retain the other insights of Scheme 1. The second premise of Scheme 1 already requires that *S* has credentials (education and training) which are relevant to determining whether *p* is the case. And, having credentials – degrees, titles, awards – is a mark of recognition by one's peers. So, it seems like this condition could be included under Cred-con, something the auxiliary experts could testify to. This makes for an unnecessary overlap of requirements expressed in Premise 2 and the Cred-con reading of the auxiliary premise. In fact it leads us to conclude that, on the Cred-con interpretation, if the auxiliary premise is acceptable, then Premise 2 is superfluous. Is there a way around this?

It seems advisable to distinguish the different factors that contribute to credibility and to divide-up the labour as much as possible. The reasons are that we should be aware that credibility results from a number of different factors, and also that lay people, although they need the help of auxiliary experts, should shoulder as much responsibility as they can for evaluating AA-arguments themselves. One source of our confidence in *S,* as mentioned, will be that she has the accreditation to practice in her field. This is evidenced by degrees, diplomas, and memberships, in professional organizations as we just observed. Laypersons can, in many cases, explore and decide for themselves self whether *S* satisfies the accreditation condition; e.g., I can easily find out where from Noam Chomsky earned his degrees. It is less obvious, but often not beyond the reach of laypersons, to find out whether *S* has any biases or interests that might affect her research and pronouncements (a concern brought forward by Premise 3 in Scheme 1). But some kinds of bias affecting a researcher is more likely to be known to professional colleagues, the auxiliary experts. A third source of credibility has to do with what Hardwig called "epistemic character". Here we are thinking of what contributes to *S's* reputation among her peers. This is where we consider questions such as: Has *S* successfully published her research in peer-recognized journals and with respected publishers? Are her conclusions, in general, thought to be reliable? Has she in the past responded appropriately to criticisms? Does she fulfill her professional commitments? In short, what is *S's* track record as a member of the research community? Considerations such as these are the measure of a researcher's epistemic character, and it is this factor in evaluation for trust that laypersons will have considerable difficulty in answering without the assistance of auxiliary experts.

We may then take ourselves to have identified a third factor in a source's credibility: her professional reputation based on her epistemic character as recognized by auxiliary experts. This is a source of credibility distinct from accreditation and the question of bias. Thus, our auxiliary premise in Scheme 1 may now be revised and stated as follows: *There is wide agreement among relevant [auxiliary]experts in F that S has good epistemic character.*

We have identified three distinct factors that contribute to the credibility of a source's pronouncements: accreditation, lack of biases, and epistemic character. The factors may be seen as logically independent of each other, any one of them could fail to obtain while the other two still obtain. It follows that the more of them do obtain, the greater should be our confidence in the sources's credibility. For clarity's sake, however, it is desirable to group these together as source-related reasons in AA-arguments.(Trust comes in degrees.) This gives us a three-premise scheme for a convergent argument:

Sc4.   1. *S* has credentials which are relevant to determining whether *p*;
2. *S's* advocacy of *p* is not biassed;
3. *There is wide agreement among relevant [auxiliary] experts in F that S has a good epistemic character.*
C. *S's* pronouncements about propositions in *F* are trustworthy.

The conclusion of this argument scheme will introduce a new proposition into AA-schemes; to wit, that *S's pronouncements about propositions in F are trustworthy.* My suggestion is that we now restructure Scheme 1 such that it consist of four linked premises as in Scheme 5:

 Sc5.   1. *S* says that *p*.
2. *F* is a subject area in which knowledge is possible.
3. *p* belongs to *F*.
4. *S's* pronouncements about propositions in *F* are trustworthy.
C. *p* should be accepted.

These premises are linked together because no proper subset of them will support the conclusion nearly as well as the full set of premises. But now, what has happened to the auxiliary experts? How do we bring their role to light? They are relegated to providing support for premise 4 in Scheme 5. Notice that Schemes 4 and 5 are not convergently related (as were Schemes 2 and 3) but they are related as sub-argument to main argument. Altogether we have:

Sc6.   1. *S* says that *p*.
2. *F* is a subject area in which knowledge is possible.
3. *p* belongs to *F*.
        4a. *S* has relevant qualifications for *F*.
        4b. *S* is not biassed.
        4c. *There is wide agreement among relevant [auxiliary] experts in F that S has*
            a good epistemic character.
4. So, *S's* pronouncements about propositions in *F* are trustworthy. (4a - 4c)
C. *p* is acceptable. (1, 2, 3, 4)

In this pattern of argumentation, (4a) - (4c) convergently support (4), and (1) - (4) give linked support with respect to the conclusion of the AA-argument.

4. CONCLUSION

The advantages of seeing the role of the auxiliary experts as testifying to a source's epistemic character rather than being corroborators of the conclusion has a number of payoffs. First, it avoids the result that an AA-argument's main source is marginalized by a consensus argument. Second, it avoids the result that AA-arguments, as modelled on Scheme 1, turn out to be patterns of convergent arguments rather than a single kind of argument. Finally, it gives the auxiliary experts a role as intermediates between laypersons and experts where they will report on trustworthiness of a source rather than the details of research. Thus, their assistance to laypersons may be more readily available and more easily understood, and more practically valuable, than it would be on the corroboration model.

A taxonomy for the comparative study of argument across cultures

MICHAEL DAVID HAZEN

Department of Communication
Wake Forest University
Winston-Salem, North Carolina
United States of America 27101
hazen@wfu.edu

ABSTRACT: The idea that argument may interact with cultures first entered the literature in the 1980s, however, it has resulted in little systematic comparative work. Using a minimalistic definition of argument, this paper will propose a taxonomy for comparing argument across cultures. The basis for the development of this taxonomy will be provided by a review of previous attempts to organize the elements of the argument process and studies about argument in various cultures.

KEYWORDS: argument, comparative, culture, structures, taxonomy, validity

1. INTRODUCTION

In recent years, the argumentation field has increasingly acknowledged the role of culture in the argument process. Most research on argumentation has continued using traditional concepts such as the classical thinking of the Greeks and Romans or contemporary theories such as those of Toulmin, Pragma-Dialectics, informal logic, the rhetorical study of argument and interpersonal theories of argument. The studies that have paid attention to culture and its relationship to argument have mostly been studies of argument within one culture (e.g. Avtgis, Rancer, Kanjeva & Chory 2008; Hazen & Shi, 2009) or occasionally, comparisons of argument within two cultures (e.g. Warnick & Manusov, 2000).

This paper will explore ways of comparing argument processes across cultures. As such, it will use a minimalist definition of argument that can be applied to any culture and will subsequently form the basis for a taxonomy of argumentative dimensions that will provide a general outline for exploring how argument works in any culture. In addition, we will discuss how to best assess these dimensions in any culture without privileging any pre-existing approach. It should be emphasized that this taxonomy is exploratory in nature and is a starting point for comparing similarities and differences in argument processes across cultures.

2. THE NEED FOR AN APPROACH TO ARGUMENT THAT CAN FIT ANY CULTURE

It is our goal to develop an approach to argument that can be used to compare cultures across time, space and historical/cultural backgrounds. To make such comparisons it is necessary to use a conception of argument that is not contingent upon Western theories of argument or any other particular culture's conceptions. Such a conception should provide a baseline view of the nature of argument by outlining the minimal characteristic necessary for the presence of argument in any culture.

If we are to be able to compare argument in and between any cultures, we must be able to explore both differences and similarities between cultures. As such, a conception of argument and a subsequent taxonomy of argumentative processes should be able to be applied to cultures of any kind including those that:

1. Are democratic or non-democratic societies
2. Have different historical/cultural backgrounds
3. Are both ancient and modern societies

The first three criteria define elements of cultures across time and space. While a majority of contemporary societies have some form of democratic political structure, throughout most of human history, societies have been primarily nondemocratic. The ability to conceive of argument within all political structures is important, particularly since most Western conceptions of argument come from Athenian society, which was a quasi-democratic form unique to that particular time. It should also be recognized that societies come with a variety of cultural and historical backgrounds. It is important that a minimal conception of argument can take into account such a multitude of historical and cultural aspects. Finally, a conception of argument should be able to fit any society in both ancient and modern times.

In addition, this taxonomy should be able to detect the presence of argument in messages involving any of the following characteristics of the communication process.

4. Those that are verbal and nonverbal
5. Those that are explicit and implicit

The last two criteria deal with aspects of the communicative process, which have sometimes been used to define the nature of argument. First, for a long time, argument was seen as functioning primarily through verbal codes, however, in recent years there has been a growing acceptance of the idea that argument can function in other forms, such as nonverbal code systems. For example, the debate over the last twenty years about the use of visual codes as argument illustrates the growing acceptance of code systems beyond verbal codes (Groarke, Palczewski & Godden, 2016). Second, the explicit statement of elements of an argument has been privileged even though the use of implicit elements of an argument been accepted since Aristotle developed his conceptions of the enthymeme and the example.

3. A MINIMALIST DEFINITION OF ARGUMENT

In line with the need for a conceptualization of argument that can be applied to any culture, Hazen has developed a definition of argument that emphasizes what is the minimal or most basic concept required for argument to be present in any situation. The initial impetus for this project came from a situation in 1980 when he was asked to define logic to an audience of Japanese students and professors. While some of the audience may have been aware of the Western traditions of argument growing out of the Greco-Roman thought, a large percentage of the audience would not be knowledgeable about such a point of view. In fact, they were more likely to be aware of the Japanese and East Asian traditions about argument. Rather than use traditional Western concepts to define the types of arguments and explain what makes them valid or invalid, instead, he asked the question: what is the underlying core of argument that can be applied to another society such as Japan where the culture and historic background differ from that of the West. At that point, in time, he discussed the concept of consistency as the underlying idea of Western forms of argument and asked whether such a concept could be applied to Japan or other non-Western cultures. Upon later consideration, Hazen concluded that consistency was probably a better definition of the concept of validity, not argument as a whole. Therefore, he started to explore the idea of linkage between concepts as the fundamental minimal requirement for argument (Hazen, 1995).

Hazen proposed the idea of linkage as the underlying concept of argument in several papers (Hazen, 2006; Hazen, 2015), but the idea was not fully developed as a theoretical perspective until its presentation as a keynote address at the 2016 Tokyo Argumentation Conference. At that time, the idea was defined in terms of five propositions and four implications. The propositions defined the elements of a minimal definition of argument that could be applied to any culture.

Proposition 1: The minimum requirement for the presence of argument is the linkage of any two or more concepts in a message.
Proposition 2: The units linked in an argument can be anything that can be expressed.
Proposition 3: The linkage between particular elements in an argument can occur in terms of any types of association posited by humans.
Proposition 4: Arguments may involve explicit or implicit units and linkages may exist between any possible combinations of unit types.
Proposition 5: Arguments perform the function of linking ideas so that they support each other, i.e. the argumentative function.

The propositions define the fundamental concept underlying argument and lay out the parameters of what constitutes the nature of linkage and the kinds of units that can be linked. The final proposition posits the fundamental function performed by argument.

The implications of the definition are meant to define the relationship of argument with other elements of the communication process.

Implication #1: Arguments are a dimension of communication that is always present in a message.
Implication #2: Arguments as linkages are contextual and interact with elements of the situation
Implication #3: The cross-cultural examination of arguments as linkages should be initially treated in a descriptive fashion.
Implication #4: The cross-cultural study of argument in a minimalistic sense as the linking of units may require the reconstruction of arguments.

The implications posit that arguments are present in messages as a part of the communication process, and are contextually related to situations. The roles of description and reconstruction are meant to be the initial processes in the exploration of argument in any culture, but do not preclude subsequent discussions of validity and its standards in a culture.

Since the focus of this paper is on the development of a taxonomy for the description of argument in any culture, we will not provide a full discussion of the propositions and implications of the definition of argument. The point here is that this taxonomy is built on the idea of a minimalist definition of argument, i. e. the idea of argument as linkage. The ideas presented in this paper are a means of making the idea of linkage clearer.

4. WHY A TAXONOMY IS NEEDED FOR EXPLORING ARGUMENT ACROSS CULTURES

Considering the previously discussed minimal definition of argument for the study of cultures, what are its implications for defining the dimensions of the argument process in any cultures? Before we proceed to answer this question, we need to look for any existing taxonomies that might provide some basis for comparing elements of argument in different cultures.

No taxonomy exists that seeks to provide a list of the essential dimensions of argument in any culture; however, two partial taxonomies exist. In 1987, Kienpointner published an article that examined argumentative types or schemes. While most of the article deals with the traditional idea of validity in argumentative schemes, at the end of the article, he does suggest aspects of argument that he thinks might be part of a typology. His discussion

of validity does recognize the need to broaden it to include "soundness" and he suggests that a distinction needs to be made between context dependent and context independent argument schemes. Finally, he argues that "typology attempts should consider various sources of data to provide distinctions within the typology with a solid empirical base" (Kienpointner, 1987, p. 286).

While Kleinpointner's scheme is limited to argumentative types and is closely tied to Western conceptions of argument, he still provides some interesting starting points for the consideration of a typology of argument. He suggests that argument types are an important part of any taxonomy, he recognizes the importance of context in such a taxonomy, he stresses the need to develop a taxonomy based on a corpus of argumentation texts to provide an empirical basis for a taxonomy and he suggests the need for cross-cultural data as a part of the taxonomy.

In 2011, Koch created a taxonomy of claims in an effort to insure that what could be said about argument in one type of claim might be distinguished from what could be said about argument in other types of claims. In the end, Koch concludes that what he creates might be closer to a spectrum, which includes the following types of claims: factual claims, claims about social facts, claims about values, evaluations, claims about choices of interpretative claims, stipulative claims, and practical claims. Koch's work represents one possible dimensions of a typology of argument in different cultures.

In 2005, Hazen presented a paper that sought to create a comparative framework for the analysis of communication across cultures. In that analysis, he suggested the following questions for defining the nature of communication as practiced in different cultures:

1. What is the phenomenon that is to be compared across cultures and what is its nature?
2. What are the goals of people engaged in the phenomena of what are the resulting functions?
3. How does a phenomenon relate to the idea of the situation and its various manifestations?
4. What are the primary structural elements of the phenomenon?
5. What is the unifying focus of the phenomenon?
6. How are differences and similarities understood in the phenomenon?
7. What is the relationship between the descriptive and the normative in the analysis of the phenomenon?

While Hazen's typology primarily focuses on the broader concept of communication, of which argument is a part, the framework does suggest some relevant points that can be applied to a taxonomy for the study of argument across cultures. First, the idea of focusing on the phenomenon is more fruitful in that it looks at practices rather than linguistic labels. Second, the idea of looking at goals and functions can be useful in identifying the phenomenon, especially considering that in the minimal definition of argument, there is something called the argumentative function that is defined as the linking of one idea to support another idea in an argument. Closely related to the idea of functions is that of goals, which are more conscious and purposive desires on the part of the arguer. Similar ideas can be found in Hample and Irions (2015) who explored the idea of argument serving as fulfilling the goal of displaying identity and in Cionea, Hoelscher & Ileş (2017) who developed an instrument for measuring ten goals of arguers: mutual understanding, problem solving, conflict resolution, persuasion, dominance, personal expression, emotional release, standing up for oneself, enjoyment, and intellectual growth.

In 2007, Cionea presented a paper that reviewed the literature on argument and culture and sought to organize it by dividing the studies into five clusters. The following are her list of clusters:

Cluster I: Studies identifying factors that influence argumentation
Cluster II: Studies focusing on types of arguments
Cluster III: Studies analyzing differences in reasoning
Cluster IV: Studies analyzing responses to arguments
Cluster V: Studies focusing on argumentativeness

While Cionea did not attempt to develop a taxonomy in her paper, her clusters can be considered a starting point for examining many aspects of argument in different cultures. The second and third clusters focus on types of argument and differences in reasoning processes, which define structural elements of an argument. The first cluster, factors that influence argument, and the fifth cluster, personality traits like argumentativeness, both provide important context elements of the argument process

5. ELEMENTS OF ARGUMENT IDENTIFIED IN CROSS-CULTURAL COMPARATIVE STUDIES

To explore further possible elements of an argument taxonomy, a review was conducted of a number of comparative studies to see what aspects of argument had been previously examined. To be considered a study needed to provide data on at least two cultures in terms of some aspect of argument. There are not many studies that meet these criteria; however, we were able to find enough to group them into five categories that suggest aspects of argument for an exploratory taxonomy.

First, several studies looked at the nature of argument, or the way argument was conceived in different cultures. For example, Cionea, Hopârtean, Hoelscher, Ileş & Straub (2015) compared several aspects of argument in Romania and the United States. They examined how argument was conceptualized in each culture (as a quarrel, debate or discussion), the topics where argument was seen as occurring, whether argumentation partners differently depending on how argument was conceptualized, and the perceived role of arguing in the society. Hample and Anagondahalli (2015) compared argument in India and the United States, looking at whether argument was considered a part of civil discourse.

The second category of studies looked at the structure of argument at four different levels. At the macroscopic level, Arsyad (2000), following the procedures of the contrastive rhetoric studies, examined the characteristics of written argument structures as used by Indonesian speakers and English speakers in terms of elements such at the introduction, justification and conclusion and subsections such as induction and reputation. The second level was explored by Warnick and Manusov (2000) who examined traditional types of argument such as deduction, induction, abductive, and narrative patterns as used in the conversations of African Americans, Asian Americans, Asians and European Americans. At the third level, Suzuki (2010) examined the use of stylistic features such as indirectness and succinctness in written forms of argument among Japanese and Americans. And at the fourth level, Hornikx and Hoeken (2007) examined the degree to which anecdotal evidence, statistical evidence, causal evidence and expert evidence were used by French and Dutch participants. In a later study, Hornikx and Haar (2013) examined the persuasiveness of similar forms of evidence among Dutch and German participants. Finally, there is a highly contested set of studies on reasoning by Nisbett and his associates (e. g. Peng & Nisbett, 1999) that

examine whether people in East Asia resolve seeming contradictions using a dialectical or compromise model, while Westerners are more likely to use a differentiation model. While some would consider reasoning different from argument, however, in these studies, reasoning is assessed in terms of expression, i. e. argument.

The third category of studies focuses on aspects of arguers that affect the way that they approach the argument process. For example, several studies examine the goals that arguers pursue. Cionea et al. (2015) in a study involving Romania and the United States looked at the goals that people pursue when arguing. In a series of studies by Hample and his students, the argument frames (what arguers think they are doing, primary goals for arguing, and positive interactional possibilities) were examined in several sets of cultures; US and India (Hample and Anagondahalli, 2015), United Arab Emirates, US, and India (Rapanta & Hample, 2015), China and US (Xie, Hample, & Wang, 2015). In addition, these studies looked at the personalization of conflict, i.e. whether the conflict is experienced as person centered or issue centered. Finally, several studies have explored personality characteristics of arguers, particularly argumentativeness in different cultures: Finland and the US (Croucher, Galy-Badenas, Jäntti, Carlson & Cheng, 2016), India and US (Croucher, Braziunaite, Homsey, Pillai, Saxena, Saldanha, Joshi, Jafri, Choudhary, Bose, & Agarwal, 2009), and the above mentioned Hample studies. Finally, in a study by Chen, Nadamitsu, and Kaman (2001) of Japanese, Hong Kong Chinese, and mainland Chinese, argumentative approach and avoidance tendencies were examined among the different groups.

The fourth category deals with situational/contextual components of the argumentation process. Elements of situations such as argument spheres (Goodnight, 2012), argument fields (Rowland, 1983), and argument contexts have played prominent roles in the study of Western argument, however, there has been little consideration of the topics in cross-cultural comparisons. Cionea et al. (2015) looked at the contextual appropriateness of arguing for different types of situations and the question of what topics were used when arguing occurred. And Croucher et al (2009) looked at aspects of argument in organizations in India and the United States.

One interesting set of studies that demonstrates the importance of context are those conducted by Scribner (1977) and by Cole (1977), in which they examined the argumentative reasoning of people in underdeveloped societies versus those in developed societies using judgments of validity in classic logic problems and whether the participants were able to assess the validity of such problems. One of the key findings of this study was that groups of people in rural and underdeveloped societies often failed to provide the accepted answers to the logical problems. However, when questioned about the reasons for their answers, it was discovered that the contextual information used as premises and assumptions in answering the problems was different from that used in developed societies. When such contextual information was taken into account, the conclusions drawn by the participants were appropriate and demonstrated a form of rationality.

The fifth category deals with the processes involved in evaluating argument. For example, Mercier, Deguchi, Henst, & Yama (2016) examined Japanese ability to solve standard logical problems and concluded that they performed significantly better when they engaged in discussions of the problems amongst groups and then made final estimates individually. In addition, there is a long debate among those who study deductive reasoning about whether people are able to make correct determinations of an argument's validity (Johnson-Laird, 1999; Evans, 2002; Khemlani & Johnson-Laird, 2012).

6. A TAXONOMY FOR THE COMPARISON OF ARGUMENTATION PROCESSES IN DIFFERENT CULTURES

This taxonomy is based on discussions in previous sections of this paper. The taxonomy starts from the assumption that in examining argument in any unknown culture, one should initially look at the phenomenon or behaviors that seem to be treated as argument according to the minimal definition of argument used earlier in this paper. The goal is to look for the ways that people interact with each other by linking concepts to support and convince each other. One should not primarily focus on particular labels or descriptions that come from other cultures, but what is found in a particular culture.

6.1 What is the nature of the phenomenon that can be described as argument in a culture?

The key to this element of the taxonomy is to know what behaviors or phenomena in a culture are treated in a way related to the argument process. The problem when we address behavior in other cultures is to not rely on a common set of definitions of what constitute argument coming out of the Western traditions built on Greco-Roman foundations. To look for particular things that have been described as argument from the perspective of such definitions in other cultures is to possibly prioritize elements of argument as seen from the Western perspective and potentially exclude elements of the process as practiced in other cultures.

Thus, the fundamental question involved in comparative research is how to define and understand what argument is in another culture across time and place. We will consider three approaches to this question. The first approach, which has been used in a number of studies discussed in this paper, is to start from the point of view of looking for specific forms of argument in terms of the linguistic labels used in Western traditions. Therefore, as done in one study, a researcher might look for forms of argument that are equivalent to English words such as 'quarrel,' 'argue,' or 'discuss'. A second approach is to take what we know about aspects of argument, e.g. argument types, and look for examples of those behaviors in other cultures. This approach has been used in studies about argumentation in ancient societies such as India and China (Kennedy, 1998; Garrett, 1993).

Finally, the third approach is based on the minimal definition of argument where one should look for argument as constituted by linking behavior on the part of participants in another culture. Once one has found different forms of linking behavior in another culture, they can then ask people in that culture to describe how they understood such behaviors. This allows for the identification of a set of activities that could be defined as argument within that particular culture. Such forms of linking behavior may or may not correspond to behaviors in Western societies, but more importantly, they will be defined by people within a particular culture in ways that to correspond to some element of the argument process that makes sense to them.

6.2 What are the goals/functions of people when they engage in the phenomenon known as argument?

This element of our taxonomy deals with the things that people seek from engaging in argumentation. In the studies by Hample and his students, and by Cionea et al. (2017), we can see the range of possible goals suggested in the various countries studied, however, the framework used is limited in that it was developed from work in the United States.

In addition to goals, one can also look at the idea of functions, which is something that results from a particular activity such as arguing and its associated goals (Merton, 1949). In

our discussion of the minimal definition of argument, the idea of the argumentative function was proposed where one concept provides support for another concept when an argument is made.

Thus, if we were to look at the linking behaviors of people in another culture, then, in the process of asking them to define how they view such activities, we could find out what kinds of goals and functions are present in that society.

6.3 What are the primary structural elements of the phenomenon known as argument?

In Western thinking about argument, the structure or form of arguments has traditionally played an important part in the process, as it does in the research literature comparing cultures. In our earlier review of studies, we found the structure of the argument was examined in terms of: a) the macroscopic organization of parts of a message, b) the use of traditional types of argument such as deduction, induction, abduction and narrative, c) the presentation of arguments in terms of the degree of indirectness and succinctness, d) and the types of evidence used such as anecdotal, statistical, causal, and expert.

What is important here is that the way that argument is structured in a particular society is usually described in terms of the classic types of Western argument structures. The presence of such forms in other cultures is useful information but it may overlook different argument structures that are also present in those cultures. Thus, it is important to examine the particular linking processes used in other cultures to see what is important and to explore how people in the other culture understand such structures.

6.4 What are the codes and media used for arguing in a society?

Questions related to the codes and media used in argumentation have been explored to some degree in the general literature but have been rarely mentioned in the comparative cross-cultural literature. For example, the debate about visual argumentation has taken 20 years to go from skepticism to acceptance in the general literature (Groarke et al., 2016), but in the research on argument in other cultures, it is only beginning to be seen (e. g. Winkler, El-Damanhoury & Lemieux, 2018).

To consider codes and media in other cultures in terms of the minimal definition of argument will require adaptation of research methods. Guidelines from research in Western cultures are just starting to be developed and the use of such codes and media in other cultures may not always be obvious. We will need to be particularly sensitive to the argumentative behaviors in other cultures and ready to engage in a high degree of interaction with participants in other cultures about how they work.

6.5 How does the phenomenon known as argument relate to the idea of a situation and its various manifestations?

The relationship of argument to situations or contexts has been acknowledged in many ways in the literature: a) argument fields (Toulmin, 1958; Toulmin, Rieke & Janik 1979), b) argument spheres (Habermas 1989; Goodnight, 2012), and c) contexts (Johnson, 2000). Unfortunately, very little of this has shown up in the comparative literature dealing with different cultures.

As reviewed earlier, Cionea et al. (2015) looked at the contextual appropriateness of different kinds of argument and the topics that were considered as part of argumentation. Croucher et al. (2009) looked at the organizational field in India and the U.S. and Scribner (1977) and Cole (1977) illustrated the importance of context in the operation of deductive

forms of argument and their validity. In addition, there have been studies about the appropriateness of the public spheres in countries such as China, which do not have a fully democratic political system (Bolsover, 2017).

It should be noted that the methodology used in the studies by Scribner and by Cole, illustrates the importance of looking at the way arguments are constructed in a society and seeking explanations from the members of the culture. The importance of context or situation is clearly suggested by the research discussed above, and therefore, it is important to study its role in other cultures.

6.6 What are the Characteristics of Arguers?

Several of the studies examined in this paper explore characteristics of arguers in different cultural settings. A number of the studies looked at personality characteristics such as argumentativeness, verbal aggressiveness, and whether the arguer experiences conflict as person centered or issue centered. In addition, some of the studies look at socio-demographic characteristics such as gender.

These studies suggest that in looking at argumentation in different cultures, personality characteristics and social demographic characteristics of arguers should be examined to see their relationships to different aspects of argument behavior. The two personality characteristics used in most comparative studies were argumentativeness and verbal aggression, which are characteristics that have a direct connection to argument and reflect behaviors more indicative of Western cultures. Personality characteristics associated with argument in other cultures may be more difficult to assess at first glance and socio-demographic variables may be more easily assessed.

6.7 What are the ways that arguments are evaluated in a society?

The evaluation of argument has been a principal concern of Western theorists for centuries. Aristotle and others in the Greek and Roman tradition examined the idea of validity, i. e. whether a particular argument meets the conditions of truthfulness or rationality. The criteria for the evaluation of validity have varied over time, however, within Western traditions, the criteria has been firmly established when related to deduction, formal validity or symbolic logic.

Other ways of evaluating arguments have become an important part of the literature in recent years. Toulmin resuscitated Aristotle idea that the validity of an argument could be dependent on the nature of the subject. Simon and others have developed the concept of bounded rationality, i.e. "rational choice that takes into account the cognitive limitations" of a person (1997, p. 291). Others have used phenomenological criteria such "soundness" or "making sense".

In looking at other cultures, the question is what criteria are used to make judgments about good arguments in that culture? Using the idea of a minimal definition of argument, we would expect that those arguments that appear regularly within a culture would be evaluated positively. The question then becomes how to explore the meaning of such processes for people within the culture and to understand when particular criteria are used within that society.

7. CONCLUSION

In considering the preceding taxonomy, it should be emphasized that this is an initial effort to outline the general characteristics of argument across cultures, and therefore is exploratory and subject to change.

ABSTRACT: We assess the degree of direct and indirect face threats in the September 17, 2015 Canadian prime minister election, the last 2016 U.S. presidential debate, and the last French prime minister debate held May 3, 2017. The findings reveal debates in the U.S. and in France reflected aggressive strategies threatening norms of political debate for democracies while the Canadian debate did not. The paper considers the implications of these recent argument strategies for liberal democracies.

KEYWORDS: authoritarianism, presidential debates, prime minister debates politeness, political debate, international communication

1. INTRODUCTION

In the wake of the 2008 recession, populist and authoritarian appeals have gained currency (Brown, Rohac, & Kenney, 10 May 2018). While already existing authoritarian governments remain firmly entrenched (Fuller, 2015; Quimpo, 2009; Schenkkan, 2017), populist movements with authoritarian impulses are making advances in traditionally democratic countries such as Hungary, Poland, and the Philippines (Asian Century Institute, 2016; Karolewski, 2017). This is true around the world, with Freedom House reporting in 2017 that 18 of 29 countries surveyed witnessed a decline in their democracy scores marking the second biggest fall in the survey's history, second only to the drop following the 2008 financial crisis; today, there are now more consolidated authoritarian regimes than consolidated democracies (Schenkkan, 2017). The rise of global authoritarian politics is startling, and clearly evident.

Diamond, Plattner, and Walker (2016) explain a key role in the spread of global authoritarianism is authoritarian parties adopting techniques of authoritarian rule from one another. Recent survey data from MacWilliams (2016) demonstrates an attitudinal link of

authoritarianism between European nationalist parties and Alt-Right Trumpism in the U.S. This linkage is marked by intolerance and aversion to diversity that seeks to maintain social order and norms, acceptance of authority and a move towards conformity while targeting outsiders labeled as "the other." Survey data from Great Britain, France, Sweden, Germany, and the United States show increased intolerance and aversion to diversity and targeting of outsiders viewed as the "other" (MacWilliams, 2016). The "preliminary conclusion from these surveys is inescapable: the electoral rise of Trumpism and the Alt-Right to the United States and populist national parties in Europe appear to share one common, measurable trait-- a predisposition among supporters toward authoritarianism" (MacWilliams, 2016, p. 2). Our goal in this paper is to examine the degree to which such practices have made their way into leader debates in three recent national campaigns.

2. POLITENESS IN LEADER DEBATES

At the core of beliefs about deliberative democracies is the belief that communication is at the center of politics requiring effective justification of positions, reciprocal understanding across differing ideologies, values of inclusion and reflection, and suspicion of coercive and deceptive communication strategies (Ercan & Dryzek, 2015; Gutmann & Thompson, 2004; Gastil, 2005). Deliberation requires citizens and their representatives to justify their decisions, providing reasons for their actions, and responding to reasons citizens give in return.

Gutmann and Thompson (2004) lists four characteristics of deliberative democracy. First, and most importantly, citizens and their representatives must justify their decisions, providing reasons for their actions, and responding to reasons citizens give in return. Gastil (2000) goes further in stating that political actors need to not only provide reasoned arguments for their own views, but also "consider alternative views" (p. 24). Second, these reasons provided should be accessible to all citizens they are addressed to, that is not overly technical but understandable, and occur in public settings. Third, the deliberative process aims to produce a binding decision for a period of time. However, these decisions are provisional, in that the fourth characteristic recognizes that the process is dynamic (Gutmann & Thompson, 2004).

Political debates provide a forum where competing ideas can be tested in civil ways. Presidential and prime minister candidates represent their parties' interests without the aid of advisers, must stand on a stage while moderators question them, are sometimes subject to questions from citizens in town hall formats, while citizens watch and deliberate on the characters and leadership potential of the candidates (Hinck, 1993; Jamieson & Birdsell, 1988). As of 2000, Hart had found that presidential debates were important forums for testing ideas, at least in the U.S.: "presidential debates are comparatively sober, comparatively focused, comparatively plainspoken, comparatively self-risking encounters with some potential to create genuine dialogue" (p. 126). However, after the 2016 presidential campaign in the U.S., these views were called into question by McDonough (2018) who found Trump's performance in the 2016 general campaign debates reached the standard of demagoguery.

From a politeness perspective (Brown & Levinson, 1987) concern about the degree of face saving and face threatening messages used in debates, as well as a focus on policy issues, might reveal how well the deliberative process is served by leader debates (Dailey, Hinck, & Hinck, 2008). Candidates are concerned about political face in the debates because they constitute a high stakes political event (Schroeder, 2008); gaffes or poor performances can undermine a candidate's appeal as was the case in the 1976 debate between Ford and Carter when Ford declared that Poland was not under the domination of the Soviet Union. Candidates and their staffs spend substantial time negotiating the details of debates (at least in

the U.S.) to ensure that the conditions of participating advance their political image (Self, 2016; Seltz & Yoakum, 1962). Ideally, a candidate should be able to give reasons and provide evidence to support claims about policy proposals. Failure to do so reveals the lack of substantive support for policies and presumably, would diminish political support for policies that cannot be defended. Candidates prepare in earnest to inform the public and defend their political image in debates (Jamieson & Birdsell, 1988).

Debates place positive face at risk in debates, the degree to which a candidate wants to be approved and supported by audience members (Brown & Levinson, 1987). Candidates advance positions and reasons in support of those positions in the hope of reinforcing support for their candidacy and of persuading undecided voters to support them. Debates call forth attacks on those positions by inviting disagreement in a forum designed to show how well candidates advance and defend reasons for their positions. Discourse strategies can reflect direct attacks on the face of opponents, indirect attacks, or supportive strategies that convey agreement or good will toward opponents. Supportive strategies are rare given the adversarial nature of the context but not are unknown. (A recent example of a supportive strategy could be found in the primary debate where Bernie Sanders exclaimed that he did not "give a damn" about Clinton's emails thus terminating that as an issue between them as candidates for the Democratic nomination.)

Politeness strategies offer an assessment of the tone of debates in regard to civility, or respect toward one's political opponent. Candidates can use language strategies that demonstrate respect for one's opposing views or can choose language strategies that convey a lack of respect. In previous work we have examined the intensity of face threats along five content dimensions: leadership/character, policy/plan, consequences of the plan, use of data, differences and/or disagreement between the candidates, campaign tactics, and ridicule (Dailey, Hinck, & Hinck, 2008; Dailey, Hinck, Hinck, & Hinck, 2017). Debates featuring indirect attacks or instances of supportive messages on character, proposals, use of data, ways of disagreeing, and campaign tactics would suggest candidates are observing democratic norms of civil disagreement; debates featuring greater instances of direct attack on character and use of ridicule would suggest candidates are deviating from democratic norms of civil disagreement. To explore the state of political discourse in leader debates in the context of reported shifts toward populist and authoritarian appeals, we examined three debates from three campaigns in three different countries from 2015-2017.

3. CAMPAIGN CONTEXTS

3.1 The 2015 Canadian Prime Minister election

The Canadian campaign took place over eleven weeks between August 2 and October 19, 2015. Five candidates participated in one or more debates. Stephen Harper ran for re-election representing the incumbent Conservative Party. Justin Trudeau, son of former Prime Minister Pierre Trudeau, led the Liberal Party. Tom Mulcair was the candidate of the New Democratic Party. Gilles Duceppe led Bloc Quebecois and Elizabeth May represented the Green Party. Five nationally televised debates were held during the campaign; all were multiparty debates. Harper, Mulcair, and Trudeau participated in the second debate on September 17, 2015 which focused on the economy and was used for this study

Major concerns facing Canadian voters included child care, climate change, coalitions, crime, defense spending, democratic reform, health care, jobs, marijuana, pensions, refugees, taxes, terrorism, Trans-Pacific Partnership, truth and reconciliation, use of a niquab in citizenship ceremonies, and vanishing data in census surveys (Peyton, 6 October 2015).

Although the Canadian political landscape differed from that of the U.S., there were concerns about populist appeals moving from the U.S. to Canada and beyond (Ibbitson, 17 August 2015; Patriquin, 16 October 2015). Stephen Harper's campaign defended a controversial *Anti-Terrorism Act* (which Justin Trudeau and his colleagues of the Liberal party supported) and advocated the banning of niquab's for federal public servants and at citizenship swearing-in ceremonies (Peyton, 6 October 2015). Despite the complexities of Canadian politics past, "both Quebec separatism and western-specific grievance politics have vanished as forces in Canadian politics, giving way to a more straightforward left-right ideological conflict" (Yglesias, 2 August 2015).

3.2 The 2016 United States Presidential election

The U.S. presidential campaign pitted Hillary Rodham Clinton, former U.S. Senator from New York, and former Secretary of State in the Obama administration against Donald Trump, a wealthy business person turned celebrity, known for developing reality television shows, The Apprentice and Celebrity Apprentice. Over the course of her campaign, Clinton developed policy papers on 41 issues (Clinton, 2017). Comparatively, Trump's campaign offered commentary on a little more than half the number as Clinton and his positions evolved during the campaign. Jane Timm of NBC News reported that "President-Elect Donald Trump took 141 distinct stances on 23 major issues during his bid for the White House" concluding that "After more than a year and a half of stadium rallies, around-the-clock interviews, sweeping primary wins, and one stunning general election victory, the Republican president-elect has the most contradictory and confusing platform in recent history" (Timm, 28 November 2016). However, Trump sought to make character the focus of the campaign. Trump argued that Clinton's use of unsecured servers for her email while serving as Secretary of State was a threat to national security. Despite being cleared by several congressional committees of any wrongdoing, the Trump campaign called for her arrest in the slogan, "lock her up." Additionally, despite being recorded on an Access Hollywood tape that he could assault women with impunity, and accusations by other women claiming Trump harassed them, he argued that Clinton had been much worse on women's rights in defending her husband against claims of sexual harassment.

Clinton prevailed in all three debates by wide margins in the polls--62 percent versus 27 percent in the first debate (Agiesta, 27 September 2016), 42 versus 28 in the second debate (Palmer & Sherman, 11 October 2016), and 52 percent versus 39 percent in the third debate (Agiesta, 20 October 2016). Clinton won the popular vote but lost the electoral college vote.

3.3 The 2017 French Presidential election

Eleven candidates competed in the first round of voting April 11, 2017. Marine Le Pen (Front National [National Front]), Emmanuel Macron (former member of the Socialist Party during the tenure of Francois Hollande who formed his own party En Marche [On the Move]), Francois Fillion (center right Republicains party), Jean-Luc Melenchon (former member of the Socialist party who started his own party--La France Insoumise [France Unbowed]), Benoit Hamon (former education secretary in Hollande's Socialist Party cabinet), Philippe Poutou (New Anti-Capitalist Party), Francois Asselineau (Popular Republic Union party), Nathalie Arthaud (Workers' Struggle party), Jean Lassale (Resistons!), Jacques Cheminade (Solidarity and Progress]), Nicolas Dupont-Aignan (Debout la France [Stand Up France]). Emmanuel Macron and Marine Le Pen advanced to the second round, Macron with 24% of the vote and Le Pen with 21.3% of the vote (John, 25 April 2017).

The May 3, 2017 debate between Macron and Le Pen was viewed by 16.5 million French citizens (*Le Figaro*, 4 May 2017). The moderators were Christophe Jakubysyn of TF1 and Nathalie Saint-Circq of France 2. Four major issues drove the discussion over policy differences: 1) France faced 10% unemployment--more than neighbouring UK and Germany; 2) France was struggling with sluggish economic growth; 3) French citizens were concerned with security after terrorist attacks took the lives of more than 350 people in 2015; and 4) large Muslim minorities reside in France making immigration a salient issue for many French citizens (John, 25 April 2017). Two scandals were also part of the conversation: Le Pen was facing an investigation over allegations of false employment of her assistants and use of violent images in responding to critics on Twitter; Macron apologized to conservatives for calling France's history in Algeria a "crime against humanity" despite the fact that around 1.5 million Algerians lost their lives in a battle for independence from France (John, 25 April, 2017).

The 2017 French presidential debate it occurred after Britain's decision to exit the European Union and Trump's improbable victory in the 2016 U.S. presidential election. Both outcomes were attributed, partially, to growing anti-immigrant sentiment. The French presidential debate could be viewed as a test of whether U.S. conservative messages were attracting support in other nations and whether they could shift the election from a 40% to 60% showing in the polls favoring Macron to a much closer contest through debates.

4. RESEARCH QUESTIONS

Our first interest was to find out what politeness strategies were used by the candidates in the three debates. Also, coding the debates gave us a sense of frequency of use of these strategies and might allow us to consider when and where face threats were adapted strategically to issues raised in the debates. Thus, our first research question:

RQ 1: Do the candidates exhibit differences in their use of face threats in the debates?

We were also interested in whether the general level of aggression differed among the campaigns and cultural contexts in which the campaigns occurred. While the U.S. and Canada share a continent, the two nations' political system and cultures are distinct (as examples, consider the significant differences in approaches to policy regarding health care and gun control). Additionally, France represents a European system with a political culture distinct from the west. Comparing the level of face threats across the debates can help determine if there are differences in how these political cultures engage in leader debates. Previous work discovered some differences in debates due to culture (Hinck, Hinck, Dailey, Hinck, & Ghanem, 2015). Research question two asks:

RQ 2: Are the face threats of the three debates different in their levels of intensity?

Prior work has led us to believe that prior to 2016, aggressive tones had been rising but for some debates and some candidates, indirect strategies of face threat were still being used. However, after 2016, at least in the U.S., a significant increase in aggressive tone was noted in presidential debates (Dailey, Hinck, Hinck, & Hinck, 2017). To see if leader debates in campaigns in other countries after 2012 were featuring more aggressive tones of discourse, we asked:

RQ 3: Do the face threats of the debates vary in levels that are different from campaigns prior to 2015?

The rise of populist and authoritarian appeals raises the question of what kind of discourse is promoted in the political process. Critics of populist and authoritarian rhetoric claim, at least "within the digital space, polarization, fragmentation, tribalism, and a virulent

form of populism that rejects reason and fact are now the hallmarks of contemporary politics" (Browne, Rohac, & Kenney, 2018, p. 13). Finding such strategies in leader debates would suggest that democratic institutions are under increasing strain since leader debates constitute a unique forum where the ideals of democracy are enacted before a public audience (Hinck, 1993). A healthy political system, normatively speaking, would have candidates arguing about the campaign issues, plans and policies, and evidence and reasoning advanced in support of claims about those issues (Jamieson & Birdsell, 1988; Jamieson, 1992). Therefore, we asked:

RQ 4: Do the most recent leaders debates from the 2015, 2016, and 2017 campaigns in Canada, the U.S., and France feature more strategies of ridicule compared to strategies testing argument and reasons?

5. METHOD

5.1 Selection of debates and the acquisition of primary texts

We chose the second Canadian debate held on September 17, 2015 because it featured the three major candidates arguing about economic issues, Trudeau, Harper, and Mulcair. Additionally, it was one of two debates in English and thus a transcript was convenient for coding. We choose the third U.S. debate held on October 19, 2016 in Las Vegas, NV. The first and third U.S. debates featured similar formats while the second was a townhall style debate. There was only one debate between the top candidates in France occurring on May 3, 2017. The content of the last debates of the French and U.S. elections and the second Canadian debate gave us a basis for exploring the role of intensity in face threats across the three political systems. All three debates focused on global economic issues, immigration, and refugees--subject matters related to concerns about how populist and authoritarian appeals are tested in political leader debates in democracies undergoing economic stress.

The September 17, 2015 Canadian Prime Minister debates included Justin Trudeau (Liberal Party candidate), Steven Harper (current Canadian President/Conservative Party), and Thomas Mulcair (National Democratic Party). The English language debate was 90 minutes in length and addressed five topics related to the economy: jobs, energy and the environment, infrastructure, housing, and taxation. The October 20, 2016 U.S. Presidential debate lasted 90 minutes featuring the Republican candidate Donald Trump and Democratic candidate Hillary Rodham Clinton. The debate was divided into six topics that included debt and entitlements, immigration, economy, Supreme Court, foreign affairs, and presidential temperament. The May 3, 2017 debate for the French President lasted 140 minutes and included Marine LePen (National Front) and Emanuel Macron (En Marche). The key topics for the debate addressed immigration, terrorism, unemployment, and the role of France in the European Union.

The transcripts for the Canadian and the French debate were found on c-span.org and the transcript for the U.S. debate was found on the Commission for Presidential Debates website.

5.2 Unitizing and Coding the Debates

Two individuals served as primary coders of the transcripts. The coding process involved three decisions regarding the discourse of the candidates. First, the coders divided the transcripts into thought units. A thought unit is defined as "the minimum meaningful utterance having a beginning and end, typically operationalized as a simple sentence"

(Hatfield & Weider-Hatfield (1978, p. 46). Since viewers of televised debates are interested in how candidates construct their messages, unitizing the transcripts into statements of complete thoughts seemed most appropriate for the study.

Second, thought units were coded according to Dailey, Hinck, and Hinck's (2008) coding schema, an extension of Kline's (1984) social face coding system. Kline's schema notes that positive politeness and autonomy granting/negative politeness are two separate dimensions of face support. Positive politeness is defined as the desire to be included and the want that one's abilities will be respected. Positive face is supported by expressions of understanding solidarity, and/or positive evaluation; it is threatened by expressions of contradiction, noncooperation, disagreement, or disapproval. Negative politeness is defined as the want to be unimpeded by others. Our coding schema focused on positive face of the candidates since political debates are primarily concerned with a candidate's ability to demonstrate his/her ability to lead, to offer policies and plans for the country, and invite disagreement--all of which threaten positive face.

The coding schema is composed of three major levels. Statements at the first major level of the system are those that threaten the positive face of the candidates. Statements at this level of the system are further differentiated concerning the directness of the positive face attack (levels 1 and 2). Statements at the next major level of the system balance both threatening and supportive evaluative implications for the other's face (level 3). Finally, statements at the final major level explicitly support the positive face of the candidates. Statements at this level of the coding system are further differentiated in terms of the directness of the positive support exhibited by the candidates (levels 4 and 5). Examples of statements reflecting the different levels of the coding schema can be found in Dailey, Hinck, and Hinck (2008).

The second decision made by the coders focused on the topic of the action identified in the coded thought unit. Topics such as leadership/character, policy/plan, consequences of the plan, use of data, differences and/or disagreement between the candidates, campaign tactics, and ridicule were identified.

Because the Canadian debate included three candidates, we also coded for the direction of the attack: which candidate(s) or candidate's party the attack was intended.

6. RESULTS

The first research question asks: Do the candidates exhibit differences in their use of face threats in the debates? The answer is a clear "yes." While most of the candidates did follow the current trend of personal and direct face threat and criticism toward other candidates, the Canadians showed a wide diversity in their use of direct versus indirect threat thought units (See Table 1). Across candidates, comparing direct threat thought units, indirect threat thought units, and thought units not coded as any sort of threat, a significant difference ($x^2 = 67.1$, df = 12, p<.001) was found. Looking at direct threats to face, the Americans and the French used about the same percentage of thought units directly threatening the face of their opponents. Clearly the Canadians showed the diversity of the results with Harper using far fewer direct threat thought units and his opponents using far more. Looking at indirect threat to face, we see Canadian Harper using an extraordinary amount of indirect threat to face, and Canadian Mulcair with an elevated use of indirect threat compared to the rest of the candidates. Harper's behavior stands out as so different from the others that the analysis without his results does not produce a significant outcome.

If we consider what we see as the most face-threatening behavior, direct threat to character and leadership competence, we see, again, a significant variance considering threat

thoughts units used for this particular form threat units in any other threat category ($x^2 = 52.2$, df = 6, p<.001). Compared to the first analysis, however, the variance is more shared across the candidates with 44% as the median value.

Table 1								
Face Threat Behavior Among Canadian, French, and American Candidates								
	Canada - 2015			U.S. - 2016		France – 2017		Historical Mean Pre 2015
	Harper	Trudeau	Mulcair	H Clinton	Trump	Macron	Le Pen	
Direct Threat	17%	48%	43%	35%	36%	38%	37%	25%
Indirect Threat	29%	9%	14%	9%	8%	6%	7%	10%
Direct Threat to Character/ Leadership	12%	46%	47%	54%	37%	44%	41%	13%

Research question 2 asks: Are the face threats of the three debates different in their levels of intensity? The answer to the question in both forms of analysis is yes (See Table 2). If we consider the proportions of indirect threat: $x^2 = 28.1$, df = 4, p<.001 due to the high level of indirect face threat in the Canadian debate. As Table 1 shows, the Canadian numbers were largely a result of Harper's behavior.

In terms of direct threat to character and leadership competence, there is modest variation across the debates ($x^2 = 6.64$, df = 2, p<.05). The Canadian debates show a smaller level of this particular face threat, albeit the variation across the Canadian candidates is extreme (See Table 1).

Table 2				
Face Threat Behavior in Canadian, French, and American Debates				
	Canada – 2015	U.S. - 2016	France - 2017	Historical Mean Pre 2015
Direct Threat	37%	35%	38%	26%
Indirect Threat	17%	9%	6%	10%
Direct Threat to Character/ Leadership	37%	45%	43%	15%

Research question 3 asks: Do the face threats of the debates vary in levels that are different from campaigns prior to 2015? The answer, again, is yes there is a difference (See Tables 1 and 2). Considering the use of indirect and direct face threats, it seems clear that the three debates in question had higher levels of direct face threat, and similar levels of indirect threat, save the levels in the Canadian debate ($x^2 = 76.7$. df = 6, p<.001). In terms of the threat to character and leadership competence, the debates in question show remarkable high levels of this threat compared to U.S. campaigns before 2015 ($x^2 = 2342.6$. df = 3, p<.001).

The trend of these threat types can be seen in Figures 1, 2, and 3. The graphs place Canadian and French debates in their chronological order among U.S. campaigns. The level of direct face threat shows quite a variation, but trends upwards as is the case of the Canadian and French debates along with the 2016 American campaign debates. In terms of indirect threat to face, heretofore, we would have seen a clear decline in the use of indirect threats, but clearly, the Canadian debate stands out in contrast. Finally, in terms of the percentage of threat thought units used to directly criticize the character and leadership competence, the Canadian and French debates follow this trend in sequence with the history of the U.S. campaigns.

Figure 1

Percentage Direct Face Threat Over Time

Figure 2
Percentage Indirect Face Threat Over Time

Figure 3

Percentage of Threat Thought Units Spent Directly Attacking Character and
Leadership Competence

Research question 4 asks: Do the most recent leaders debates from the 2015, 2016, and 2017 campaigns in Canada, the U.S., and France feature more strategies of ridicule compared to strategies testing argument and reasons? Two content categories in our schema tend to correlate and comprise what we see as the best of debate and reason behaviors. These are the category we call threat towards the opponents' policies and plans and they category we label as threats to the opponents' use of data. These are what we call here "testing arguments and reasons." The rest of the coded units we put in the category of ridicule; these include threats to character and leadership, blame for problem, bad campaigning, general disagreements, and overt ridicule. The use of these two broad groups has changed over the years, and it easy to demonstrate that the Canadian, 2016 American, and the French debates represent a clear departure from what was happening when debates started (See Table 3). While the 2004, 2008, and 2012 debates had started to change the relative use of these groups of thought unit types, the three debates we analyze in this present study demonstrate a whole scale change in what happens in the debate ($x^2 = 137.0$, df = 2, p<.001).

Table 3			
Proportion of Thought Units Used for Policy Debate Versus Other Threats			
	Through 2000	2004, 2008, & 2012	Canada, 2016, & France
Plans, Policies, & Data	17%	15%	12%
Criticism, Blame, Campaigning & Attack	18%	20%	33%

	Canada - 2015			U.S. - 2016		France – 2017		Historical Mean Pre 2015
	Harper	Trudeau	Mulcair	Clinton	Trump	Macron	LePen	
1A	5%	26%	26%	24%	16%	19%	18%	5%
1B	10%	4%	4%	4%	4%	4%	3%	7%
1C	-	-	1%	-	3%	-	2%	2%
1D	-	4%	3%	2%	9%	5%	4%	6%
1E	2%	9%	6%	4%	1%	6%	5%	4%
1F	-	3%	1%	-	1%	-		1%

Table 4

Specific Face Threat Types Among Canadian, French, and American Candidates

7. DISCUSSION

The results of this study confirm, generally, a trend toward more aggressive debates. While the results for RQ 1 showed different face threat strategies being used by the candidates, this trend seems to be more evident in the U.S. and French debates. Harper and Mulcair stand out as candidates relying more on indirect face threats, what we would regard as a more civil and substantive set of discourse strategies for the debates. RQ 2 showed a difference in intensity between the Canadian candidates and the U.S. and French candidates. Part of this effect might be due to the similarity between the 2016 U.S. campaign issue of immigrants and the 2017 French rise of LePen's candidacy. French voters had the advantage of viewing the effects of Trump's rhetoric and we would argue this caused more moderate elements of the French electorate to take the appeals of LePen seriously. After deliberating on the tone of discourse presented in the French debate, it might be the case that French voters desired a more cosmopolitan, less xenophobic view of the world and chose a more moderate candidate to lead their nation.

Considering the Canadian candidates, we do not know if these strategies of indirect attack are characteristic of Canadian politics. Arguably, Canada's concern about divisive ethnic and cultural differences might have receded after the Quebecois movement of the 1980's when citizens claiming a French heritage advocated for independence from Canada. Unlike the U.S., which was concerned with race and immigration in 2016, Canadian voters were not arguing over equally divisive issues in 2015. Whether this sense of civility extends to previous Canadian debates is not known. Future research might include at least the two debates in the 2011 Canadian prime minister election to see if such patterns of civil and substantive debate extend back to Harper's victory in 2011. Even so, the future for Canadian debates might not be so clear. Extremist views have been salient in recent campaigns concerning immigration. It will be interesting to see how candidates and voters respond in the

next prime minister campaign. At the very least, in 2015, Canadian candidates for prime minister demonstrated that it is still possible to argue about issues in civil ways.

The results for RQ's 3 and 4 suggest significant changes in the quality of debate discourse, an increased aggressiveness since the 2012 U.S. presidential election cycle. The results for the U.S. and French debates confirm claims by observers that our political discourse is becoming more polarized. Specifically, the results regarding the use of ridicule as a strategy in 2015, 2016, and 2017 represent a growing lack of respect for political differences and a growing strain on our political systems. While such strategies were evident in the U.S. and in France, they were not present in the Canadian debate and were not effective in France's debate.

8. CONCLUSION

What do we make of the state of debate discourse going into future leader debates? Levitsky and Ziblatt (2018) argue that for democracies to function successfully, two norms are required: 1) mutual toleration, "the idea that as long as our rivals play by constitutional rules, we accept that they have an equal right to exist, compete for power, and govern" (p. 102); and 2) institutional forbearance, "avoiding actions that, while respecting the letter of the law, obviously violate its spirit" (p. 106). These norms should be evident in leader debates where the values of reason giving and respect are expected as signs that rational discourse continues to test competing ideas. However, results from this study show that norms of debate discourse were violated in the U.S. and French debates reflecting populist and authoritarian appeals.

Our findings suggest a continuing trend toward a more aggressive, less respectful, less substantive quality of leader debates. If debates do not serve deliberative ends of facilitating arguments over policy differences and do not serve epideictic ends of displaying reasoned discourse for the community, debates do not serve democratic values. These findings should be of concern to political communication and argumentation scholars.

On fallacy and language

MARTIN HINTON

Institute of English Studies
University of Łódź
Poland
Martin.hinton@uni.lodz.pl

ABSTRACT: To be complete, any theory of fallacy, or indeed of argumentation, must take proper account of the role of language in the giving of arguments. This paper suggests that since the work of Aristotle, proper account has not been taken, and that, given both the subtlety and potential importance of linguistic fallacies, a new framework, involving an informal argument semantics, needs to be constructed to allow a complete analysis of arguments to be carried out.

KEYWORDS: ambiguity, Aristotle, equivocation, fallacies of language, fallacy theory, informal argument semantics

1. INTRODUCTION

The wider project of which the thoughts contained in this paper are a part is motivated by the premise that, while it has certainly not been completely ignored, the role of language in the practice, the assessment and the study of arguments has not been fully acknowledged, and that this shortfall in attention has prevented a better understanding of certain elements of the process of argumentation being reached.

The aim of this short essay is to discuss language in the context of fallacy theory, to show that without a proper understanding of its importance, such theory cannot be considered complete, and to suggest, in outline only, a new form of assessment of argument which I shall refer to as informal argument semantics. The paper is divided into four parts. The first gives a very brief review of how the role of language in fallacious thinking has been characterised in the literature. This is followed by a section in which a number of claims are made as to the nature of language, the nature of argumentation, and the way in which the first influences the second. These claims form the foundation upon which the conclusions of section five, and indeed, the work of the broader project, are based. Before those conclusions are expounded, however, section four provides further explanation of the necessity of the informal argument semantics approach in the form of examples of arguments which require a proper semantic analysis to expose their weaknesses.

2. FALLACIES OF LANGUAGE

In order to describe fallacies of language, one ought, perhaps, to begin with a description of what being fallacious is taken to mean by the author. In the context of this essay, however, that would be to jump the gun rather. It might also be considered a good idea to describe what other scholars have taken the concept of fallacy to mean. That will be touched upon, but, in truth, there have been a good many such reviews written (see Tindale, 2007, ch.1), and there is no space here to produce another complete history of the fallacious argument. Instead, I shall begin with Aristotle, and mention others who have contributed comment on aspects of

the dangers of the linguistic pitfall in reasoning, and lament the lack of a theory of argument which brings them together.

In the opening section of 'On Sophistical Refutations', Aristotle singles out the ambiguity of names as a major reason why some arguments appear to be good, but are in fact not, and then notes: "There are two methods of refutations; one has to do with the language used, the other is unconnected with the language" (Aristotle, 1955, p.13). This fundamental division, an "inviolable distinction between the linguistic and the extralinguistic sources of error" (Schreiber, 2003, p.3) is followed by two lists of ways in which one may be fooled by poor arguments. Aristotle's list of linguistic fallacies: Homonymy, Amphiboly, Form of the Expression, Accent, Composition, and Division, and the distinction itself, have been criticised on a number of fronts, but come from the basic assumption that "false reasoning is persuasive only if the victim holds a particular false presupposition about either language or the world. It is the nature of that presupposition that determines where the example of false reasoning is situated in Aristotle's typology" (Schreiber, 2003, p.4). It is Aristotle's concentration on the victim of the Sophist which leads him to organise things the way he does: more modern theorists are apt to treat all sides in an argument generously as seekers of truth and consider poor arguments as obstacles in their path rather than attempts to play on the weaknesses of the audience.

It is not my intention here to examine Aristotle's taxonomy in detail, nor to defend it. The first three items on the list are all forms of multiple meaning and the second three largely apply to the nature of the ancient Greek language; which facts might appear to allow the modern author to reduce the distinction to one between forms of ambiguity and other fallacies. There is, however, a far more important point to be noted: Aristotle makes it clear that an audience can be deceived by the structure of reasoning or by the way in which it is expressed.

The concerns of Berkeley, which are echoed by Wittgenstein, are of an even more fundamental nature: both see language itself as a great source of erroneous reasoning, rather than just a fallible tool for its expression. Berkeley blames language for the very existence of abstract ideas: "had there been no such thing as speech or universal signs, there never had been any thought of abstraction" and believes that a great deal of confusion is caused by the misapprehension that the meanings of words are "precise and settled" (Berkeley, 1988, p.47). In the same vein, Wittgenstein highlights the error of the belief that if there is a word, there must be a thing which corresponds to it, an error which happens "again and again in philosophy" (Wittgenstein, 1958, p.6) making it "one of the great sources of philosophical bewilderment" (1958, p.1).

To discuss the ways in which the misunderstanding of the nature of language creates erroneous thinking is beyond the capacity of this paper, and would, indeed, require an entire volume of its own. The intention here is simply to point out that there is a long and well-known tradition of both recognising that forms of expression may be fallacious and recognising that language itself may trick even the finest minds into making foolish arguments. To these observations should be added the work of Ducrot and Anscombre on the inherent argumentative content of natural language utterances (Anscombre & Ducrot, 1989) and the related influence of Grice's theory of implicature on argumentation (Macagno & Walton, 2014).

In spite of all this, and a host of other work which looks at linguistic factors, there is no comprehensive theory of language and argumentation and no theory of fallacy which takes these elements fully into account. In Tindale's book length discussion of fallacies (2007), there is one chapter on "Problems with Language" which provides a good description of the usually cited examples, equivocation and vagueness, as well as considering other fallacies which might be based on errors in language. Tindale even provides "Critical Questions" to

ask in order to establish whether a fallacy of language has been committed; but this is still a long way from a full theory of the complex relationship between language and argument. In order to begin to move towards the construction of such a theory, some basic notions about what argument is and how it may go wrong must be established.

3. LANGUAGE AND ARGUMENT

In this section I advance several claims about the nature of language and of argument. The claims are, of course, supported; but they are not advanced as *the* way to understand argumentation, rather as *a* way to do so, and one which will offer certain advantages in the study of argument. I begin with a definition.

The definition of argumentation which I shall offer is designed to be useful to the theorist of fallacy. It is not a definition which will be accepted universally – as if such a thing were possible – but one which draws out the three elements of arguing which can, and often do, go wrong. Aristotle distinguishes between the reasoning and its expression, but it has always been clear, as Hansen's review (2002) showed, that the trouble with reasoning wasn't restricted to cases of logical invalidity: other commonly recognised fallacies are categorised as being fallacies of relevance. Relevance is a slippery concept, of course. If an argument is irrelevant, it must be irrelevant to something; and that something is not necessarily another argument advanced by another speaker, since not every argument must be a direct reply to what has just been said. Rather, I would characterise relevance in this context as relevance to the process of argumentation currently ongoing. What is relevant in one type of process, a court of law, for example, might not be so at another time in another place. It is this element of process, then, which forms the third aspect of my definition of argumentation.

Thus: Argumentation is a process involving the expression of reasoning in language. Any particular example of an argument, then, can fail to be a proper part of the process, can fail due to its expression in language, or can fail as a result of its faulty reasoning. Reasoning, here, is understood as a pre-linguistic system of inferring employed in the mind of the arguer. Naturally, such inferences need not be restricted to the deductive; and naturally too, I do not submit this as a universal definition of what the word reasoning does, or indeed should, mean to others in other places. I might also add that if other non-linguistic forms of argument are advanced, they are still, if meaningful, coded expressions of reasoning, and that system of coding and decoding faces the same vulnerabilities as linguistic processing.

From the point of view of fallacy theory, then, this leads to an apparently clear division into fallacies of process, fallacies of language, and fallacies of inference. I have included the word 'apparently' because I am aware that, as is usually the way with clear theoretical distinctions, in practice there are cases which do not obviously sit in one category to the exclusion of the others. This is not an important flaw, however, since the main role of the division is to show the three ways in which arguments can be fallacious, accepting that some may be so in one more than one, rather than to draw up lists of fallacies in three neat columns for students to learn.

There are two other points of interest to which the separation of these three strands leads. The first is that rather than existing in parallel to one another, there is a sense in which they occupy a hierarchy; certainly in theory, and, I suspect, largely in practice as well. At the most basic level comes the question of process. A certain agreement between parties on the conventions of the process is necessary – a point brought out strongly in the pragma-dialectical description of the critical discussion, to which I return below. Any argument which violates those conventions is simply not considered, regardless of the strength of its logic. Whether it be a shift of burden of proof, a refusal to doubt the sacrosanct, or a circular

argument, an argument which does not comply with the process and move it forward is at once rejected. Second comes the inferential structure. It is for the audience to the argument to judge if the conclusion put forward does, in fact, follow from the premises given for it. Errors of inference may be obvious, or they may be subtle; they may be demonstrable or they may be subjective. What is clear, however, is that an argument may be a relevant part of the process, it may be sound: having true premises and an acceptably strong inference for the situation, and yet it may still fail at the third level by committing a fallacy of language.

This ordering seems natural when one considers the alternatives: it would be odd to look at the niceties of the language of an utterance, then examine its inference, and finally reject it because it was on a topic unconnected with the current discussion. Similarly, it would be odd practice to closely examine the language of an argument and then conclude that it doesn't matter anyway since the inference is utterly illogical. Again, as I have said above, I do not claim that all arguments *must* be examined in this order, only that it seems a good way to go about it. Obviously, some examination of the language of an argument is necessary to form an opinion on its relevance and its soundness, that cannot be helped if we are to interact at all; but our common use and understanding of the languages we speak is not the same thing as the type of analysis I shall describe and recommend in section 5 below.

This hierarchy, as I suggested above, may also be reflected in the levels of sophistication in real-world debate. Errors of process, as the most fundamental, are also the coarsest. Utterances put forward that are not arguments at all, mere insults and insinuations, refusal to doubt and debate: these are all examples of the lowest level of practical argumentation. They are common in the harsh and unforgiving arena of the internet debate, in the non-sequiturs of the political interview, and the evangelising of the true believer. It is not the case that those making such errors must themselves be coarse, though they may well be, rather that this type of poor argumentation is exemplified in a level of debate which can barely be called argument at all; a level of debate in which the pursuit of truth is not only not paramount, but is often actively disrupted.

On the other hand, when an argument has passed the first hurdle and is found to be an appropriate contribution to the process at hand, it deserves to be treated a little more seriously, as does its protagonist, and have its structure examined. Often such errors are made in speech, but they are also frequently found in earnest attempts at written persuasion. Anyone who has read a large number of student essays will be able to attest that errors of inference proliferate in such texts. These errors are made sincerely; relevant arguments are advanced in accordance with the accepted process in a genuine attempt to establish a true conclusion. Other forms of more considered writing show the same tendency: the non-polemical newspaper opinion piece, for example. Such mistakes can be made by people of intelligence, and are often not noticed by others of intelligence. It is easy to train students to spot breaches of the process, but far harder to instil in them a critical attitude to unwarranted leaps of inference, and harder still to get them to remove such leaps from their own writing.

Finally, errors of linguistic expression are to be found at the highest level of debate: amongst philosophers and other serious thinkers, who would be unlikely to seriously put forward arguments which ignored the relevant process, and ought not to be making mistakes in the structure of their reasoning. Textbook examples of ambiguity may involve foolish savers burying their money in the sides of rivers, but in reality such arguments involving completely different meanings of words are neither common nor problematic. However, philosophy, I would argue, is plagued by instances of equivocation, of vagueness, of obfuscation, and of the type of general misunderstanding of the nature of language, and the words of which it is made, referred to in the section preceding.

All three varieties of error, of course, can be found at all levels of sophistication. Philosophers do make basic errors, internet trolls do misuse language. There is a

correspondence, however, between the subtlety of the error and its importance, and thus between the difficulty in finding it out and the necessity of doing so.

All three types of error are also addressed by all schools in the study of argumentation. However, the second point of interest I wished to draw out was that the principles of the process of argument receive particular attention within the pragma-dialectical tradition, where the clear emphasis is on what arguers should and shouldn't do in order to reach the desired conclusion; while the informal logicians are more inclined to concentrate on the way in which inferences are made. While discussing the rationale behind Rule 15 of the extended rules for critical discussion, van Eemeren and Grootendorst note that: "If a discussant is unclear in formulating his standpoint or in calling a standpoint into question, or if the discussant misinterprets the formulations, there is a high probability that they will speak at cross-purposes" and that, therefore, "discussants must formulate optimally" (2004, p.156). This discussion acknowledges the importance of making arguments clear, but does so from the point of view of the process – a process which cannot take place if one discussant does not understand the other. Given the focus that it places on the interaction between discussants and the normative nature of its rules, the pragma-dialectical approach is ideal for the assessment of fallacies of process, but while other fallacies can be identified as breaches of the rules, those rules themselves are not especially helpful in identifying when those fallacies occur.

It is, I suppose, not controversial to claim that informal logicians take great interest in the structure of arguments and, in particular, in the process of inference. Where the rules of pragma-dialectics tell us that inferences must be made by acceptable argument schemes, informal logic sets out and analyses argument schemes. In order to reach the actual structure employed in the inference, a great deal of reconstruction, along with a degree of interpretational generosity, is often required, taking the focus away from the utterance itself, and making the argument as speech act less important than the argument as inference structure. Informal logic, after all, is still logic. This approach, therefore, is of particular importance in the detection of errors of reasoning: fallacies of inference.

Just as pragma-dialectics demands clarity of expression, so informal logic also recognises that ambiguous language can lead to false inferences; but the feeling remains that the form of the expression of the argument is something to be cut away in order to reach its underlying structure. Argument is an activity of language: and while the pragmatics of argument has been elaborated and discussed at length, the semantics of argument still awaits a full theoretical treatment.

On the nature of language, here, just one observation. Theorists of argument have generally latched onto ambiguity as the root of linguistic fallacies. It should be noted, though, that, to borrow a phrase from the writers of computer software: ambiguity is not a bug, it's a feature. All language is inherently ambiguous: concrete nouns refer to many concrete objects; abstract nouns, adjectives, verbs and adverbs refer to many instances,
and their meaning is never precisely the same. It is not enough, then, to say that an argument has gone wrong because it contains ambiguity – a full account needs to explain why the ambiguity, in this case, is unacceptable.

4. SEMANTICALLY PROBLEMATIC ARGUMENTS

To illustrate some of what has been said above and to emphasise the need for a specifically linguistic analysis of some arguments, this section sets out some examples of arguments which are shown to be linguistically fallacious. There are three varieties of such arguments which I wish to highlight: equivocations, imprecisions, and what I shall call cases of semantic incompatibility – a category which I have not seen discussed elsewhere. The first two are well

known and often cited as fallacies of language, although I suspect their ubiquity is rarely recognised: all of them are particularly 'dangerous' to the audience for different reasons. Equivocations may go unnoticed, even by careful listeners, if the variation of meaning is of a subtle nature, especially if the audience is unaware of the possibility of such variation – for instance that a word has a certain technical meaning in a particular field as well as a more generally applied one. Vague, imprecise language, descending sometimes into total meaninglessness can allow poor arguments to pass in two ways: firstly, it encourages the audience to understand what they want to understand in an utterance, allowing differing interpretations and making refutation difficult. Secondly, obtuse, pretentious, unclear language can be daunting, and an arguer lacking in confidence, or unsure of his language abilities, whether in his native or a foreign tongue, may fear to address the lack of clear sense for fear of looking foolish and being accused of simply not understanding. The long word, the twisted sentence, the new meaning bestowed upon a familiar sign; these are the cloak, the beard and the dark glasses behind which the charlatan hides the poverty of his ideas. Finally, semantic incompatibility occurs when, perhaps in the premises, but more especially, in the conclusion of an argument there are words which may fit together perfectly in terms of syntax, but cannot function together semantically: that is to say, that while the sentence may appear well-formed, the meanings of the words within it clash, creating an impossibility. As this category has not received attention, it will be best explained with the use of an example, as below.

In the manifesto of the Labour party published before the 2017 UK general election, under the heading "Brexit", the following promise was made: "Labour recognises that leaving the EU with 'no deal' is the worst possible deal for Britain and that it would do damage to our economy and trade. We will reject 'no deal' as a viable option" (Labour Party, 2017, p.24). There are a number of things wrong with this argument, assuming that the second sentence is an inference from the first. Firstly, "no deal" is described as "the worst possible deal" when, by definition, it is not a deal, and cannot, therefore, be the worst one. Secondly, without wishing to take sides politically, the statement is obviously false: one can easily imagine a trade deal with huge tariffs and other restrictions in one direction only, which would be much worse than having no deal at all. There is, however, a far more interesting error which, as is often the case, only becomes apparent when the argument is fully reconstructed, as below:

P1. Reaching no deal with the EU on trade would be against the interests of the UK.
P2. We must defend the interests of the UK.
Therefore: We reject 'no deal' as an option.

Such an argument appears to be sound. All sides of the debate agree that a deal would be better than no deal (although other political parties would stress that a bad deal would also be against the interests of the UK), political parties ought to defend the interests of the countries they seek to govern (but see the example below), and the inference looks to be valid. The conclusion, however, is an example of semantic incompatibility. The absence of an agreement is simply not the sort of thing which one *can* reject. Neither party to a negotiation has the right to demand a deal and reject the possibility of not reaching one. One might quibble that the phrase "a viable option" means that they are not rejecting the possibility of not reaching a deal, but only of its being "viable". That only leads to a further questioning of what "viable option" actually means. If it means a good option, then the argument is reduced to 'having no deal would be a bad thing, therefore, no deal is not a good thing'. It could be that they meant to say that the Labour party rejected the pursuit of a 'no deal' exit from the European Union as a policy option, accepting that 'no deal' was still in reality a possibility. That, however, is to stretch the implication well beyond what was actually said.

However the argument was meant, the way it is set out above serves as an example of how an apparently sound argument can still deliver an unacceptable conclusion due to the semantic relationships between the words used to express it: some verbs cannot work with some nouns and nonsense is the only result of putting them together. Perhaps more important than a political manifesto, by the same token, the entire school of Utilitarian philosophy might be dismissed on the not unreasonable grounds that human utility, whatever it is, is not the kind of thing which can be summed. Any argument which concludes that it should be has, therefore, gone astray somewhere.

There is, perhaps, no need to provide examples of arguments made in imprecise language. For the category of imprecision based on a simple lack of clarity as to what is actually being said, one might pick up any book by the great figures of Continental Philosophy, who employ a style Barry Smith has characterised as "the utilization of various tricks" designed to "distance themselves from the responsibility of making assertions which might be judged as true or false" (Smith, 2006, p.21). Smith cites in evidence a passage from Jacques Derrida, which begins: "The feminine distance abstracts truth from itself in a suspension of the relation with castration. This relation is suspended much as one might tauten or stretch a canvas, or a relation, which nevertheless remains –
suspended – in indecision" (Derrida, 1978, p.59). This is, in fairness, a translation; it is also completely without meaning, and, therefore, impossible to argue with. Derrida may have had a clear idea in his mind of what he wanted to express, if so, the expression is a failure. One might claim to understand what those two sentences mean, but one would have to accept that the words themselves do not carry that meaning in any usually accepted way.

Such examples, along with such propositions as Theresa May's famous "Brexit means Brexit", might well be considered fallacies of process first and foremost, since any argument process will require that statements made within it actually say something. Vagueness does not have to mean meaninglessness though; it is often a case of under-determination. In March of this year, The Washington Post published a story with the title "Trump doesn't have America's best interests at heart" (Sargent, 2018); then, one month later, the Financial Times published an article "Donald Trump is standing up for American interests" (Navarro, 2018). The titles may be understood as standpoints being defended. That they contradict one another is neither surprising nor wrong; both articles set out at length the actions they think support their conclusion, but neither stops to consider whether America actually has, or even could have, interests. This might be a case of semantic incompatibility or the author might have a conception of 'America' in mind which would allow it to have interests, the reader cannot know. Both authors take it as obvious that an American interest exists and can be defined and recognised, but for both the concept remains vague.

Imprecision is a close cousin of ambiguity. Vague words are often words which could mean various things, even if there aren't actually conflicting distinct senses: consider phrases such as 'help for the homeless', which could describe a very wide range of policies offering very different types of 'help'. Help is not exactly ambiguous, but it refers to many possibilities. Equivocation is what takes place not when completely different uses of a word are taken to be the same, but when the precise designation of the word is different in two or more places within one argument. This may often be the result of quite legitimate analogical thinking. For example, one may say that a difficult or traumatic period in one's life teaches one a lot; and one may say that time spent at university teaches one a lot. The result of this analogy is the phrase 'the university of life'. However, if one then argues that one doesn't need a university education because one already has an education from the university of life, one commits a fallacy. The two uses of 'university education' are not the same: having knowledge of how the world really works is not a substitute for having knowledge of how chemical processes work, for instance.

Such observations, of course, are nothing new. My point is to show how far-reaching and varied are the ways in which language can disrupt the process of argumentation. The examples discussed in this section relate to the expression of reasoning and have not touched upon the ways in which linguistic notions can affect that reasoning itself, on which there is much more to be said.

5. CONCLUSION

This paper serves as the introduction to a larger project. It has attempted to illustrate the need for a more systematic theoretical approach to the impact of language on argumentation, in order to facilitate better analysis of arguments and understanding of where they have gone wrong. In terms of pragmatics, argumentation theory has been well-served by the Pragma-dialectical approach; there is, however, certainly room for a theory of the semantics of argument, informed by the philosophy of language, and understood as a compliment to, rather than a replacement of, the existing approaches. This semantics I intend to develop and present in forthcoming publications. For the sake of avoiding confusion with formal semantics, with which my approach has little in common, I propose to refer to this theory as informal argument semantics.

Informal argument semantics aims to provide a comprehensive account of how the meaning of words affects the arguments in which they are employed. This includes considering how arguments are understood, how they are expressed, and how language interacts with the reasoning process. It must bring together a treatment of ambiguity, of implicature and argumentativity, and, crucially it must provide a practical means of assessment by which the faults of arguments can be shown, just as they can be shown to breach the rules of pragma-dialectics or to fail in the answering of the critical questions relevant to an identified argument scheme.

Reflective consensus building as a goal of argumentation

MICHAEL H. G. HOFFMANN

Philosophy Program, School of Public Policy
Georgia Institute of Technology
United States of America
m.hoffmann@gatech.edu.

ABSTRACT: The literature on argumentation discusses many purposes of argumentation. Building on Gilbert's "coalescent argumentation" which aims at reaching ''agreement based on maximally fulfilling the goals and needs of the arguers involved,'' I develop the notion of reflective consensus building as a goal of argumentation and show how it is implemented—in the form of user guidance—on the Reflect! platform.

KEYWORDS: coalescent argumentation, computer-supported collaborative learning, conflicts, consensus, CSCL, disagreement, Michael Gilbert, reflection, scripts, scripted user guidance, wicked problems

1. INTRODUCTION

The literature on argumentation discusses many functions or purposes of arguments and argumentations (Hoffmann 2016, supplemental online materials):

- Persuasion / changing people's beliefs, attitudes, or confidence in positions
- Justifying claims / giving reasons for claims / making reasons manifest
- Resolving or managing differences of opinion / finding agreement on the acceptability of descriptive, normative, or evaluative claims
- Learning scientific reasoning
- Understanding other people: Seeing reasons allows us to appreciate the legitimacy of positions
- Critical testing of opinions
- Inducing attitudes like fear, hope, hatred, or admiration in other people
- Stimulating reflection
- Relationship between the arguers ("face goals")

Whereas these functions of arguments are either well-known or, at least, discussed frequently in the literature, it is surprising that an additional purpose that Michael Gilbert discussed extensively already in 1997 did hardly find any discernible resonance, as far as I can tell:[1] the objective of reaching ''agreement based on maximally fulfilling the goals and needs of the arguers involved'' (1997, p. 74). In a book with the same title, Gilbert introduced the notion of "coalescent argumentation" as a method of arguing that aims at such agreement (Gilbert 1997).

This contribution continues the discussion that Gilbert started. After summarizing the arguments that he provided more than twenty years ago for developing the practice of coalescent argumentation, I will introduce the notion of "reflective consensus building" as a

---

[1] Besides the project described in this contribution, an exception is Jan Albert van Laar's "Middle Ground" web app that he is currently developing at the University of Groningen, NL. As he writes in its August 2018 user guide: "This app assists groups of 2 to 5 students in performing a reasonable discussion on some predetermined scenario-based issue, with the goal of crafting a compromise agreement despite the participants' having diverging opinions on the topic."

goal of argumentation. "Building" consensus does not refer to finding agreement on a given claim, but to the *creative* process of collaboratively developing a new claim, position, or proposal to solve a problem that can be accepted by all involved. Instead of "winning" an argument about a given proposition, the goal is to build consensus through a particular reflective process. This process is realized—in the form of scripted user guidance—in the Reflect! platform, an online learning system that is designed to train reflective consensus building on wicked problems in teams of about four students. The paper will explain this process of reflective consensus building by way of presenting the platform, and it will show at which points arguments in the sense of justification are crucial for this process.

2. GILBERT'S COALESCENT ARGUMENTATION

Gilbert takes aim at the still widely shared assumption that the main purpose of arguments is bringing "an opposer around to the point of view the proponent is defending" or "winning" an argument: One point of view is abandoned by both parties, the other accepted. However, as he points out, "winning does not occur frequently. More often, outcomes include a negotiated agreement, a compromise, or a realization that further dispute is futile." Even if one arguer gives up, "there is a strong sense" that the agreement is not "very well entrenched"; the opponent might well go back to the previously defeated claim.

Often an arguer simply runs out of reasons. "In this case the argument may terminate but not with a satisfactory solution." Gilbert reminds his readers that according to Quine's holism, "beliefs are connected in a web-like way, such that altering one belief has considerable impact on surrounding beliefs and potentially on the entire belief set." This means, some beliefs are much harder to change than others.

For all these reasons, Gilbert argues that we should focus instead on "the joining together of two disparate claims through recognition and exploration of opposing positions"; that is, on "coalescent argumentation" (Gilbert 1997, p. 103).

How can such a merging of positions be achieved in coalescent argumentation? Gilbert's general strategy is based on an understanding of argument as "any exchange of information centered on an avowed disagreement." It is well known that, for Gilbert, such an exchange goes beyond providing Claim-Reason Complexes. While he counts giving reasons for claims as the "critical logical" strategy, important are also an "emotional," "visceral (physical)," and "kisceral (intuitive)" strategy (p. 76; "kisceral" is formed from the Japanese term *ki* which means "energy"). Through the application of these strategies, he thinks coalescent argumentation should be possible:

> By uncovering the crucial connection between a claim and the attitudes, beliefs, feelings, values, and needs to which it is connected, dispute partners are able to identify points of agreement and disagreement. These points can then be utilized to effect coalescence: a joining or merging of divergent positions by forming the basis for a mutual investigation of non-conflictual options that might otherwise have remained unconsidered. (Gilbert 1997, pp. 102-103)

3. REFLECTIVE CONSENSUS BUILDING

In addition to Gilbert's arguments that argumentation theory should explore possibilities of reaching ''agreement based on maximally fulfilling the goals and needs of the arguers involved,'' it should be noted that many disagreements are not at all about claims but about the question: What exactly is the problem? In research on conflict resolution it is well known that a crucial barrier is often the fact that stakeholders have a radically different understanding

of what a conflict is about, its history, what exactly is involved, what the decisive questions are, and how it could be resolved (Dewulf et al. 2009; Donohue, Rogan, & Kaufman 2011; Gray 2005; Lewicki, Gray, & Elliott 2003).

In this literature the concept of *framing* has been developed to capture the observation that problems and conflicts are often perceived and conceptualized differently. I use the concept of framing to define what Horst Rittel and Melvin Webber introduced 45 years ago as "wicked problems" (Rittel & Webber 1973). According to this definition, wicked problems are problems whose complexity results from the fact that they are framed in a number of different ways, depending on who is looking at them. Differences in framing can refer to the question of what the problem exactly is, where to draw the line between problem and context, on which level it should be addressed, and when it can be considered solved. Generally, framing is realized in two different processes:

1. Determining the boundary around the problem in a specific way
2. Describing the problem by specific concepts, images, metaphors, theories, descriptive, or explanatory models (Hoffmann 2011).

Wicked problems cannot be described "as such," their perception, formulation, or indication always depends on a particular way to frame the problem. It depends on people's background knowledge or knowledge that is specific for a certain scientific discipline; or on conflicting interests, world-views, cultural contexts, values, ideologies; or on other cognitive limitations. As long as people have different interests, value different goals, and have different tools at their disposal to conceptualize reality, framing is a fact of life that we cannot simply wish away.

Wicked problems are a crucial challenge in many areas of life. Every time a problem can only be addressed by collaborating with people who contribute specialized expertise or different values or ideologies, chances are that we are facing a wicked problem.

When it comes to wicked problems, I would claim, the goal can only be to build consensus among those who deliberate on the problem, not to solve the problem once and for all. The reason is the following. Since any solution depends on how the problem is framed, there can be no solution that is independent from any particular framing. But we also cannot expect that all stakeholders immediately come up with the same solution. Even though it might be possible—although unlikely—that every relevant stakeholder proposes the same solution, in spite of framing the problem differently, this possibility cannot be taken for granted. But if there is no objective, frame-independent solution and no expectation that all stakeholders agree right away on a solution, then the only remaining option is an ongoing process of trying to build consensus among the relevant stakeholders (Hoffmann forthcoming; Hoffmann submitted).

4. CONSENSUS BUILDING ON THE REFLECT! PLATFORM

The cognitive limitations that come with framing wicked problems from a particular point of view lead to three important consequences:

1. Decisions on wicked problems can harm people—people who are affected by the consequences of the decision but were overlooked in the process of making the decision.
2. For this reason, and to overcome the cognitive limitations on which such unethical decisions might be based, wicked problems should only be approached in collaboration with others. We need different points of view and we need to learn from others.

3. Collaborating with others whose perception of the problem differs from our own often leads to confusion and conflicts. Frequently people do not understand that others look at the same problem from a completely different point of view.

Even though wicked problems are everywhere in modern life, there are hardly any attempts in education to prepare future generations to deal with them. One of the reasons is certainly that it is difficult to provide opportunities to experience wicked problems in educational settings (Hoffmann submitted). Work on wicked problems—especially in teams—is unpredictable and does not fit easily into a curriculum. Moreover, it is a question of ethical responsibility whether we should even confront students with situations in which they might experience conflicts and overwhelming confusion.

The Reflect! platform has been designed as an answer to this pedagogical challenge. It tries to achieve a balance between self-directed learning in small teams—which is crucial to experience the challenges of wicked problems—and guidance that is required for three reasons: to manage collaboration on a wicked problem within a given time frame; to reduce the impact of confusion; and to reduce chances of conflicts. The platform is an online tool (http://reflect.gatech.edu/). Instructors can set up classes with teams who might work on different wicked problems.[2] Each class works along the same "work plan" so that the activities of all teams are synchronized.

The main innovation of the Reflect! platform is the implementation of a particular strategy to approach wicked problems in the form of user guidance that the software provides (Hoffmann 2018, submitted). There is not only guidance for the work of individual students and teams, but also for the instructor. Reflect! realizes what Pierre Dillenbourg called an "orchestration of sequences of learning activities" (Dillenbourg 2015). Modelled on Dillenbourg's "orchestration graphs," we developed what, as he points out, "does not exist" (at least at the point of his writing): a platform that allows "the management of pedagogical scenarios" in which activities that learners perform individually, in teams, and with the whole class are orchestrated by "scripts." In psychology, a "script" is a cognitive schema that refers to a sequence of behavioural steps with which people in a certain culture are familiar and which they experience as "normal," such as dining at a restaurant (Schank & Abelson 1977). The term interaction script has been used in research on computer-supported collaborative learning (CSCL) to model sequences of activities according to which students are supposed to interact with each other, with tools, and with the teacher in a way that fosters collaborative learning and triggers "engagement in social and cognitive activities that would otherwise occur rarely or not at all" (Kobbe et al. 2007, p. 212).

The orchestration of a project will be achieved by combining two types of scripts, which we call scripted user guidance and action scripts. We define *scripted user guidance* as a sequence of individual activities that is pre-determined and needs to be completed one-by-one by the user. Scripted user guidance might offer choices, but each choice leads again to pre-determined steps so that the user's freedom is heavily constrained. We define an *action script*, by contrast, as a set of instructions that prescribe a "chunk" of activities—be it individual or group activities. These instructions are designed to support students to achieve a certain subgoal within a project. This chunk of activities is not determined in detail. Students are free to determine and perform activities within such a chunk as they see fit.

In Reflect! the orchestration of activities is achieved by "Work plans." There are currently five available, each for a specific type of project:
- A comprehensive "Work plan for Reflective Consensus Building on Wicked Problems in Education" that is designed for project work that covers roughly half of the class

---

[2] Currently, classes can only be established manually by contacting the author of this paper.

time of a 3-hour-per-week class over the course of a college semester. Part of this currently most extensive work plan are trust building measures and exercises that guide reflection on team dynamics and problems within teams.

- An "Instructor version" of this work plan that determines, for example, at which point feedback to the teams' work is required. It also provides criteria to assess student work and highlights commonly observed problems. Additionally, it provides instructions and materials for the exercises on team dynamics.

- A work plan for a "3-hour workshop on reflective consensus building." I offer these workshops to familiarize potential instructors with the Reflect! approach. In three hours, though, participants get just a taste of how it feels to work in a team on a wicked problem, supported by the platform. This work plan can be used for smaller projects in class, but since this has not yet been done, there are no experiences to communicate.

- A work plan for deliberation among stakeholders. This work plan will be used this fall for a consensus building process on the controversial issue of Confederate Memorials that can be found all over the South of the United States. Under the heading of "Controversial figures and events of the past: How to deal with them if eradicating them from history is not an option?," this work plan engages representatives of civic organizations in Atlanta, Georgia, that promote conflicting stances on a particular memorial in the city.

- A "Support team work plan" for teams that facilitate such a deliberation project.

In the future we plan to transform the platform into a modular system that allows users to define their own "project types" (each with a generic work plan), develop "modules" for work plans, or to select such a generic work plan and tailor it by selecting specific modules from it. Such a selection will then create a class-specific "work plan instantiation."

The strategy of Reflexive Consensus Building (RCB) that is implemented in the user guidance of all currently existing work plans focuses in particular on the following main challenges:

1. *Problem formulation*. Students and users need to learn how difficult it is to develop a problem description for a wicked problem: On which scale should the problem be addressed? How to determine its boundaries?

2. *Stakeholder analysis*. This requires, first, to identify all those who have or should have a particular interest in the outcome of a decision *and* who either affect, or are affected by, a decision. And, secondly, it requires to understand the legitimacy of their positions. On the Reflect! Platform, this is achieved by guiding users to develop statements that describe what each stakeholder would propose to solve the problem; to provide reasons for these proposals; and then to abstract from these reasons specific values and interests that motivate each stakeholder.

3. Creating a *"symphysis proposal."* In Greek, *symphysein* means "growing together." Whereas "synthesis" refers to "something that is put together," "symphysis" is intended to signify an ongoing process of growing together, that is, the evolution of a proposal that is always better—i.e., more broadly acceptable—than its predecessor or predecessors. A symphysis proposal is created based on a reflection on all the proposals put forward by stakeholders. It attempts to cover as many of the motives underlying stakeholder proposals as possible, taking the broadest possible variety of stakeholder interests, goals, and values into account, and trying to find creative solutions and possible win-win solutions. The goal of creating a symphysis proposal is achieved when all stakeholders might be able to accept it as a (preliminary) solution of the problem.

In addition to project phases that address these main challenges, the comprehensive "Work plan for Reflective Consensus Building on Wicked Problems in Education" includes a project phase in which individual students and teams develop justifications for each component of their symphysis proposal. Since this proposal has to satisfy all stakeholder interests, it is usually rather complex. The justification of all its components is important for two reasons:

1. It is an easy way to document all the reasoning that went into the formulation of the symphysis proposal in a well-structured manner. Moreover, it allows to communicate project results to others. The justification of the symphysis proposal represents and summarizes all the arguments for the main outcome of the project.

2. Sometimes an attempt to justify a claim shows that the claim is badly formulated or just wrong. Students are instructed to use argument assessment skills (http://reflect.gatech.edu/how-to-assess-the-quality-of-an-argument/) to evaluate their justifications, and to use the results for either improving the justifications or reformulating those components that cannot be justified.

To create these justifications, the work plan refers teams to the argument mapping tools AGORA and MindMup.[3]

5. CONCLUSION

About twenty years ago Michael Gilbert argued that argumentation theory should engage not only with ways to "winning an argument" on a claim that is given from the beginning, but also on processes such as "coalescent argumentation" which aim at reaching ''agreement based on maximally fulfilling the goals and needs of the arguers involved.'' The present contribution is one of only very few answers to this challenge. By developing the notion of "reflective consensus building," I hope to initiate a broader discussion in the field that continues Gilbert's work.

Is it reasonable to be funny?

MICHAEL J. HOPPMANN

Department of Communication Studies
Northeastern University
Boston, United States of America
m.hoppmann@neu.edu

ABSTRACT: This essay addresses the relationship between norms of reasoning and norms of humour: To what extend can one be funny and reasonable at the same time? For this purpose, a normative system of reasoning (i.e. the model of the pragma-dialectical critical discussion) is contrasted with three approaches to humour: ancient rhetorical humour, and the modern Script-based Semantic Theory of Humour (SSTH) and the Benign Violation Theory (BVT) respectively.

KEYWORDS: benign violation theory, communication norms, critical discussion, fallacies, humour, joking, reasonableness

1. INTRODUCTION

Being reasonable is great. In light of the outlet and the audience of this essay, treating reasonableness as a communicative virtue should encounter very little resistance. Reasonable argumentation can serve as a universal language to bridge disagreements, and being able to solve differences of opinion on the merits might well be judged to be one of the decisive personal skills in a diverse society.

It is easy to jump from this very common starting point to the assumption that a virtuous communicator should maximize his or her reasonableness in discourse wherever possible. As a matter of fact, it seems that Frans van Eemeren supports this view when he describes fallacies (i.e. violations of the rules of reasonable *argumentation*) as a faux pas of *communication*.

> In our view, the fallacies could be better understood if they were treated as faux pas of communication – as argumentative moves whose wrongness consists in the fact that they are a hindrance or impediment to the resolution of a difference of opinion on the merits. (van Eemeren 2010, p. 193)

For most practical purposes the underlying assumption that a faux pas in argumentation implies a faux pas in communication is entirely unproblematic. As soon as one looks at the fascinating – and arguably still understudied – areas of conflict between different sets of communicative norms, however, the difference is essential.

Being reasonable is great. But reasonableness is far from the only communicative virtue. Communicators legitimately strive to be reasonable, but – depending on the specific occasion, setting and communicative goal – they also strive to be funny, polite, law abiding, moral, flirtatious, persuasive and so on. The topic of this essay is a brief exploration of some of the conflicts that can arise for communicators that try to pursue the first two of these goals simultaneously in a given situation, and are thus confronted with the questions: 'Is it reasonable to be funny?' and 'Is it funny to be reasonable?'

Visiting the borderlands of reasonableness and humour or, to be more precise, questioning under what conditions the communicative norms of reasonableness and of humour conflict, requires a great deal of preliminaries, definitions and disclaimers. Luckily, this essay is not the first visit to one of these areas of potential conflict between sets of communicative

norms, and accordingly most of the required clarifications can be taken from a previous essay that analysed the intersection of reasonableness and politeness (Hoppmann, 2017).

To avoid undue repetition with the methodological considerations presented there and in the interest of due brevity, a reminder of some of the key assumptions should suffice here: a. conflicts between two or more communicative norms can arise when a communicator tries to pursue multiple communicative virtues at the same time; b. these conflicts arise in individual speech occasions and are dependent on personal priorities – communicative activity types (CATs) or dialogue types / dialogue orientation genres (DOGs) influence these speech occasions but do not align with them; c. only norms that are directly or indirectly prescriptive can collide with each other, 'normal' behaviour does not lead to the kind of theoretical conflicts that are of interest here; d. the words 'norms' and 'rules' are (in agreement with large parts of argumentation literature) used mostly synonymously here, but it is of course acknowledged that in other fields these words invoke different concepts; e. only norms that prohibit or demand can conflict with each other, but not with norms that permit; in other words if being funny requires speech act x and being reasonable permits speech act non-x, there is no conflict. (Hoppmann, 2017, pp. 220-231)

With these general considerations acknowledged, the main preliminary remaining for this essay is the selection and definition of the communicative norms to be contrasted: what does it mean to be reasonable and what does it mean to be funny?

The first of these questions can be answered with relative ease and confidence for the purposes of this analysis: while modern argumentation theory has created a large number of sophisticated and useful models of reasonableness, an easy case can be made that none has been worked out in quite as much detail and influenced recent scholarship anywhere near as much as the pragma-dialectical model of a critical discussion developed by Frans van Eemeren and Rob Grootendorst and further enhanced and refined by countless others. Accordingly, 'being reasonable' as a communicator will here be understood as abiding by the pragma-dialectical rules, and 'being unreasonable' as breaking one or more of the "ten commandments for reasonable discussants" (van Eemeren and Grootendorst, 2004, p. 190).[1]

The situation is nowhere near as easy in the case of humour. What rules does one have to follow if one wants to be funny? Or humorous? Or witty? Or ridiculous? Firstly, the distinctions between 'humour', 'wit', 'ridicule' and many other related terms that have entertained generations of rhetoricians[2] will be mostly without consequence for the present purpose. However, the underlying differences between the definitions of humour in, say, classical rhetoric and modern linguistics are of key interest. In other words: Whether one can be reasonable while being funny depends strongly on the definition of humour that is being used. In the following sections, three exemplary definitions of humour will be contrasted with the pragma-dialectical rules: 1. humour and ridicule in classical rhetoric, 2. joking in modern linguistics (SSTH and GTVH) and 3. the benign-violation-theory. General overviews of the history of humour in general, and rhetorical humour in particular (Phillips-Anderson, 2007, pp. 3-48) tend to emphasize the three dominant strands of humour as an expression of superiority, humour as caused by incongruities, and humour as an expression of relief. While the correspondence is not exact, the three models discussed below can be seen as representatives of those three strands, with classical rhetorical humour showing clear signs of superiority, the

---

[1] The difference between the 15 rules and the ten commandments of the critical discussion is of no consequence for the purposes of this essay, given that the substance they cover is functionally equivalent. For simplicity's sake and because the theoretical centre of the analysis is the practical communicator, most references will be to the ten commandments.

[2] By any likelihood no rhetorician is more representative of this keen interest in rhetorical humour and obsession with terminological preciseness in this field than George Campbell who dedicates the opening chapters of his *Philosophy of Rhetoric* to these phenomena and launches a fierce attack on the "spurious bantling called *fun*" (Campbell, 1963, I, 2, 3)

linguistic model being built on the incongruity between two different scripts, and the benign violation theory and its predecessor stressing the relief of non-threatening normality in humour.

2. IS ANCIENT HUMOUR REASONABLE?

Fine details aside, humour, laughter and the risible are principally treated as a bullying technique in classical rhetoric. Like most of the Greek writings about humour it is relatively clear representative of superiority theory (Attardo, 1994, pp. 14-34). Cicero offers a representative example of this approach in his masterpiece De Oratore, when he defines the limits of the legitimate use of laughter by the speaker:

> But the limits within which things laughable are to be handled by the orator, that fourth question we put to ourselves, is one calling for most careful consideration. For neither outstanding wickedness, such as involves crime, nor, on the other hand, outstanding wretchedness is assailed by ridicule, for the public would have the villainous hurt by a weapon rather more formidable than ridicule; while they dislike mockery of the wretched, except perhaps if these bear themselves arrogantly. And you must by especially tender of popular esteem, so that you do not inconsiderately speak ill of the well-beloved. (De Orat. II, 237)

Cicero continues his explanation by providing a large set of examples of fierce personal attacks and ridicules that he seems to endorse and enjoy (De Orat. II, 239-254). Note that in Cicero's rhetoric, laughter is clearly an aggressive technique or weapon, one that should be used against the opponents, unless they are too vicious (because then they deserve more open hatred) or too esteemed (because then the audience will not tolerate attacks with ridicule). Wilkins comments on Cicero's description of humour as a tool that "shatters or obstructs or makes light of an opponent" (De Orat. II, 236):

> Wit 'breaks' the force of an opponent's attack by turning his serious charges into ridicule, 'hampers him' by preventing him from pressing on in the same line, 'disparages him' by turning him into a laughing-stock and thus robbing him of his *auctoritas,* 'deters him' by showing the superior acuteness of his antagonist, 'refutes him' by laughing away his accusations. (Wilkins, 2002, p. 346)

Quintilian expresses a similar sentiment when he distinguishes between three methods of arousing laughter "(1) from the physical appearance of our opponent, or (2) from his mental attitude, which is inferred from his actions and words, or (3) from external circumstances" (Inst. Orat. 6, 3, 37) and continues on to classify ridicule as a form of invective (ibid.).[3]

If humour in classical rhetoric is thus an aggressive tool of personal invective, can one be funny (in this sense) and reasonable at the same time? Or do the two communicative norm sets collide? Two pragma-dialectical commandments stand out as potentially in conflict with humour of this kind.

The first commandments, the 'freedom rule' demands that "Discussants may not prevent each other from advancing standpoints or from calling standpoints into question." (Van Eemeren & Grootendorst, 2004, 190).[4] Among the communicative behaviours prohibited by this rule are the varieties of the *argumentum ad hominem* or attempts to limit the ability of a communicative party to effectively participate in the discourse (van Eemeren et al., 2014, p. 550; van Eemeren & Snoek Henkemans, 2017, p. 164). In as much as humour and ridicule in classical rhetoric are used as personal attacks on opponents and attempts to undercut their credibility, they are certainly violations of the first commandment.

---

[3] Don Waisanen provides a less antagonistic interpretation of the function of humour in Cicero's and Quintilian's rhetoric. (Waisanen, 2015)

[4] The wording is slightly different in Van Eemeren & Snoek Henkemans, 2017, 163.

The other pragma-dialectical rule that stands in potential tension with classical rhetorical humour is the fourth commandment. The 'relevance rule' requires that "Standpoints may not be defended by non-argumentation or argumentation that is not relevant to the standpoint." (Van Eemeren & Grootendorst, 2004, 192)[5] It seems rather evident from the practical examples of successful ridicule that Cicero and Quintilian provide, as well as from their theoretical observations, that humour in classical rhetoric is indeed often intended as a way to avoid engaging in the argumentation of the opponent or as a strategy to deter the opponents from producing relevant counterarguments (see Wilkin's commentary above). In both cases being funny in this sense does indeed mean that one cannot be fully reasonable at the same time.

3. IS LINGUISTIC JOKING REASONABLE?

If being funny in the ancient rhetorical sense might thus well stand in stark contrast to the norms of reasonableness, then how about its relationship to modern linguistic theories? Introducing these theories, requires a shift away from a rhetorical perspective with its concentration of humour and ridicule as a persuasive tool towards a concentration of the evocation of laughter in jokes. One of the most influential modern linguistic attempts to explain these phenomena is the Script-based Semantic Theory of Humor (SSTH) by Victor Raskin (1985) and its extension and modification with the General Theory of Verbal Humor (GTVH) by Salvatore Attardo (1994). The SSTH' main hypothesis claims that:

> A text can be characterized as a single-joke-carrying-text if both of the conditions are satisfied:
> i) The text is compatible, fully or in part, with two different scripts
> ii) The two different scripts with which the text is compatible are opposite […] (Raskin, 1985, p. 99)

Raskin and Attardo illustrate this model with the help of a number of well-known jokes, such as the following: "George Bush has a short one. Gorbashev has a long one. The Pope has it, but doesn't use it, Madonna doesn't have it. What is it? A last name." (Attardo & Raskin, 1991, pp. 305-306; Attardo, 1994, p. 392). This relatively typical joke works with two scripts that stand in opposition to each other.[6] The first and dominant script for the interpretation of the statements invokes male genitalia. The second and victorious script invokes names. An additional bonus that is not demanded by the SSTH, but which is nevertheless a frequent feature of many of their jokes, is the fact that one of the scripts touches an awkward or taboo topic for polite conversation (in this case sexuality).

The SSTH is clearly catering to the analysis of prepared and repeated jokes, but it is not hard to see its application to some more general forms of conversational humour that depend on ambiguities and surprising turns. Whenever a speaker or writer creates a false expectation by setting up two possible scripts that are compatible with an ambiguous narrative and then surprisingly switches from one to the other to create a humorous effect (a strategy that is quite

---

[5] Van Eemeren & Snoek Henkemans 2017, 163 change the phrasing to "A party may not defend his or her standpoint by advancing non-argumentation or argumentation not *related* to the standpoint." (italics mine). At first glance it seems as if this change significantly softens the content of the fourth commandment, since a joke or personal attack might well be *related* to a standpoint (e.g. non-smoking advocates being mocked for their inability to quit smoking themselves) without being *relevant* to it. Given that the explanations and related fallacies remain similar, it seems that no significant shift is intended however.

[6] Attardo and Raskin do not clarify their use of the term 'opposition', their examples make it clear however that they do not envision a full contrary opposition but seem to rather think of some kind of contradictory opposition. A somewhat clearer formulations of the second condition of the SSTH might thus be that the scripts need to be incompatible with each other.

frequent in many witticisms, puns and other forms of playful use of language), then the results can be capably explained by the SSTH. Reversely, if one attempts to inject humorous effects into discourse, the SSTH gives a rather clear recipe for its creation.[7] Does following this recipe violate any of the pragma-dialectical rules?

The tenth commandment, the 'Language use rule' states that "Discussants may not use any formulations that are insufficiently clear or confusingly ambiguous, and they may not deliberately misinterpret the other party's formulations." (Van Eemeren & Grootendorst, 2004, 195; similarly, Van Eemeren & Snoek Henkemans, 2017, 164). At face value there is a clear contradiction between the SSTH humour recipe and the tenth commandment, with the former requiring the intentional creation of ambiguity and the latter prohibiting it. Realistically this contradiction will be resolved in most cases as soon as the joke is completed, and the ambiguity resolved. A realistic conflict between the two sets of norms might however arise in cases with a continuous humorous undertone or extensive double entendre. In those situations, being funny (as understood by the SSTH) will indeed be an obstacle in the attempt to solve a difference of opinion on the merits.

4. ARE BENIGN VIOLATIONS REASONABLE?

The final model to be considered here is McGraw and Warren's Benign Violation Theory (McGraw & Warren, 2010; McGraw & Warner, 2014; McGraw & Warren, 2014; Warren & McGraw, 2016). The Benign Violation Theory (BVT) closely resembles Tom Veatch's earlier humour model (Veatch, 1998), but introduces some important adjustments to its definitions and standards. The BVT suggests that "humor occurs when (1) a circumstance is appraised as a violation, (2) the circumstance is appraised as benign, and (3) both appraisals occur simultaneously." (McGraw & Warren, 2014, p. 75) McGraw and Warren explain that within the framework of the BVT a wide variety of human norms can be violated to produce humour, assuming only that the violation is benign. Among the examples that the authors explicitly include are social norms, cultural norms, linguistic norms, logical norms and moral norms (McGraw & Warren, 2014, 76; Warren & McGraw, 2016, 410).

At first glance there is no intrinsic reason, why humour, understood in the terms of the BVT, should conflict with the rules of the critical discussion. One can certainly violate a variety or social, cultural or even moral norms without being unreasonable, especially if those violations are benign and perceived as such. When it comes to the violation of logical and linguistic norms, some of the considerations mentioned in the context of the SSTH might come into play again and thus create a tension with the tenth commandment.

More interesting than the potential tension with any specific pragma-dialectical rules however, is the larger question, if the norms of reasonableness themselves (in our case the ten commandments of the critical discussion) could be the object of humour creation in the sense of BVT. In other words: Do argumentations theorists have access to their own set of norms that can be violated in a funny way. Field-specific academic humour (i.e. humour that can only be appreciated with a certain amount of academic knowledge) in general is well spread. A beautiful illustration of this kind of humour is the charming Banach-Tarski joke that depends on basic knowledge of set theory (Question: What is a good anagram for Banach-Tarski? Answer: Banach-Tarski Banach-Tarski). For argumentation theory based humour to be possible, the

---

[7] As in the case of any aspect of humour theory, knowing the recipe is of course not a sufficient condition for becoming a skilful cook. Yet, while the discrepancy between understanding humour theory and being funny in practice is a frequent object of discussion (the frequently cited dissected dead frog gives a testament to this), the same can of course also be said for similar tensions between theoretical knowledge versus practical competence in persuasion, irony, politeness and flirting – to name just a few.

field would need to have created a well-known set of norms that can be immediately identified by the listener and which can be violated in a benign manner. Reasonableness based humour of this type would thus by definition be unreasonable – but as in the case of the SSTH the potential violations might well be too insignificant to matter. The author of this essay so far has not observed any fully developed reasonableness humour in the wild – but witnessed at least a feeble start at the ISSA 2018 conference. Speaker 1: "I am not quite certain where Andrew is from, but I think he might be British." Speaker 2: "Why? Was he born in Bermuda?"

5. CONCLUSION

This essay is an attempt to continue the exploration of the borderlands of reasonable communication. What are the limits of reasonableness and when does one need to decide if one wants to be reasonable or primarily pursue a different communicative virtue. Exploring these fields by no means suggests an intrinsic superiority of one field over the other. On the contrary, the best a cursory examination of the tensions between reasonableness and its neighbouring norm sets can do, is point out where conflicts can arise. The solutions of these conflicts cannot be offered by any of the fields in question but requires priority choices of the individual communicator. If one decided to prioritize humour over reasonableness, does one act fallaciously? Maybe, but one does not necessarily commit a faux pas of communication. The main aim of this essay is not to offer or even discuss possible priority rules between communicative norm sets, but solely to point to some areas where making a priority decision might be necessary. In other words, this cursory exploration has aimed to identify reasonable reasons for being unreasonable.

Musing on the meta-theoretical principle of externalization

PAUL VAN DEN HOVEN

Utrecht Institute of Linguistics
Utrecht University
The Netherlands
p.vandenhoven@uu.nl

ABSTRACT: Although the pragma-dialectical meta-principle of externalization can be interpreted many ways, in practicing argumentation analysis it turns out to justify a separation between the actual formulations in the discourse and formulations in reconstructions that are the starting point of further dialectical analysis. This practice assumes highly articulated and transparent cognitive positions and semiotic systems. Cognitive semiotic insights explain that such view is untenable. Four interconnected implications are discussed.

KEYWORDS: externalization, semiotics, reconstruction

1. INTRODUCTION

The pragma-dialectic meta-theoretical principle of externalization is defined as:

> Externalization of commitments is in pragma-dialectics achieved by investigating exactly which obligations are created by (explicitly or implicitly) performing certain speech acts in a specific context of an argumentative discourse or text (Van Eemeren & Grootendorst 2004, 54).

Reflecting on this formulation, two questions come up. Firstly, what is meant by "investigating exactly which obligations are created"? Does such investigation has to result in a formulation of obligations that is exact (= can have one and only one interpretation) and undisputable (or at least undisputed), replacing the original discourse as a starting point for further (dialectical) analysis and assessment? If so, what if we are not able to live up to this achievement, does that mean that we should not consider the discourse argumentative, or is the communicative act to be assessed as defective? Secondly, who is investigating? Is the investigator some 'meta-semiotic' external judge, an analyst with the skills or authority to exactly determine obligations, or is the investigator a participant in the critical discussion (the testing of a standpoint against reasonable doubt)? In practices that on institutional grounds qualify as argumentative practices (for example courtroom discussions) one can observe that participants frequently paraphrase each other's contributions, discuss what obligations should result from performing certain communicative acts, refute some interpretations, qualify others, often mutually developing emergent meaning. Are they acting in what has to be considered some (preliminary) discussion, not part of the critical discussion in which standpoints are tested against reasonable doubt? Or is what these participants are doing dialectically irrelevant, are they 'strategically maneuvering' to pursue a complementary rhetorical goal? Or, on the contrary, should we model such 'externalization-process' as an integrated part of what the critical testing of a standpoint implies?

Because of its vagueness – a common feature of carefully designed but abstract and complex verbal utterances – this meta-principle has been interpreted in different ways. I will focus on two. The first reading is *pragmatic*; the principle is understood as an instruction that

(pragma-dialectical) argumentation analysts should start with determining the obligations of participants in argumentative discourse, replacing the original speech acts by an exact formulation of these obligations. Many argumentation analysts seem to adopt this reading when undertaking a dialectical analysis of actual argumentative discourse. In order to capture the dialectically relevant appeal to reason from often somewhat fuzzy, incomplete, indirect, redundant discourses, these scholars start to reconstruct (Van Eemeren and Grootendorst 2004; Van Eemeren and Houtlosser 2009), or standardize (Govier 2010), or dress (Woods 1995; Groarke and Tindale 2013) the discourse into what are considered the (dialectically) relevant arguments. With minor variations between different approaches this roughly means that the original discourse has to be replaced by sets of verbal expressions with a well-delineated propositional content, ordered in a specific, (informal) logical structure. Propositional content in a reconstruction need to be 'well-delineated' to assure that taking responsibility for such proposition can count as an exact obligation. In a terminology that is closer to informal logic: it has to be exactly clear what the premises are and what the conclusion is that some participant takes responsibility for.

It is remarkable that often no detailed account of this reconstruction, standardization, dressing is provided by the analyzing scholar; it seems to be supposed that the transformation is rather straightforward and basically evident and indisputable. If a reconstruction of a communicative act is considered problematic by the analyst, the participant's contribution is usually considered to some extent defective. If the discourse is reconstructed and participants disagree about some obligation, then either the participant who denies an obligation commits the fallacy of hedging (if the reconstruction attributes the obligation to him or her), or the other participant creates a straw man (if the reconstruction does not attribute the obligation to him or her). In sum, this first pragmatic reading of the meta-theoretical principle as an instruction states that a reconstruction can and should replace the argumentative appeal conveyed by the original discourse by a set of exact obligations; this set is object of further dialectical analysis. The original discourse is processed this way and plays no further role in the dialectical analysis, but may play a role in the rhetorical analysis (as a discussant's strategy to maximize effectiveness in convincing the prospective audience).

The other reading is *abstract and paradigmatic*; the principle is understood as a meta-theoretical declaration that the obligations of participants in a critical discussion are actually the object of dialectical analysis and that therefore dialectical analysis should always investigate to what extent such obligations can be determined. I think that Van Eemeren & Grootendorst (2004) intended this latter reading. The pragma-dialectical conception of dialectical reasonableness is modeled as a set of normative rules for critically testing a standpoint. Therefore communicative acts performed in an argumentative context should be interpreted in terms of these rules, which is similar to determining exactly what obligations they bring about. It may be assumed that in an idealized situation these obligations are fully determinable, but nothing is said a priori about the outcome of such investigation for specific discourses in practice. It is indeed a *meta*-theoretical principle that follows from the philosophical position that testing a standpoint is a rule based activity in which values as clarity and consistency are important requirements. Contributions of participants to a critical discussion are considered reasonable then and only then when they follow the set of normative rules. Therefore the game starts with investigating which obligations the rules assign to the communicative acts of the participants. Whether this results in clear set of obligations, and whether such investigations are in principle to be performed by discussants themselves as part of the critical discussion, is not specified in the meta-principle.

I intend to reflect on both readings. I will argue that the first reading is untenable because it violates basic features of the semiotic systems applied. In particular the requirement of with a well-delineated propositional content is the Achilles' heel. Moves in

discourses that we obviously consider argumentative are usually if not always underspecified in terms of exact obligations they bring about. Nevertheless they are taken up and considered practicable and meaningful by discussants testing a standpoint against reasonable doubt. In other words, exploring (instead of 'applying') the meta-principle of externalization is an argumentative process in itself, essentially part of the critical testing of a standpoint and therefore inseparable part of the critical discussion. Because investigating and often negotiating the exact obligations is a (dialectical) process within a critical discussion, largely owned and performed by the discussants, an exact set of undisputable obligations cannot be a constitutive criterion to speak of argumentative discourse (section 2).

Because determining the obligations is an argumentative process in itself, one cannot maintain that any disagreement among participants about each other's obligations has to be assessed as either committing the fallacy of hedging by the one party, or committing the fallacy of creating a straw man by the other party; we should theoretically model such disagreement as a legitimate and necessary and productive part of the critical discussion as such, although participants can of course derail, committing one of these fallacies (section 3).

The outcomes of section 2 and 3 imply that the first reading of the meta-principle as an instruction to the analyzing scholar to replace the discourse by a reconstruction of exact obligations is untenable. The outcomes however are fully compatible with the latter, abstract and paradigmatic reading. So, rejecting the first, pragmatic reading causes no problem for the original pragma-dialectical theory. Indeed, one can model discussants' behavior as reasonable if they fulfil obligations that follow from a set of normative rules, which implies a meta-principle that formulates the need to investigate these obligations. However, I will argue that rejecting the first reading has consequences for the *extended* pragma-dialectical theory. This theory distinguished between dialectical goals and rhetorical goals, analyzing the specific wording as presentational choices that are related to pursuing rhetorical goals. I will argue that such distinction between these two goals is grounded on the untenable first reading of the meta-principle of externalization. Determining whether two different formulations create the same set of dialectical obligations is an interpretative act instead of a reference to a reconstruction (section 4).

2. CONVEYING 'EXACT OBLIGATIONS'?

My discussion of the pragmatic reading of the meta-theoretical principle of externalization is related to a challenge that David Hitchcock has posted in 2006 on the list server of Association for Informal Logic & Critical Thinking. It is a challenge to people who believe that there are purely visual arguments. Hitchcock challenges them "to come up with examples which interpreters of visual artifacts with appropriate background knowledge will agree […] independently of each other on exactly what the premises are and what the conclusion is". An exact and undisputed consensus of what premises and what conclusion are conveyed by some discursive artifact seems equivalent to determining exactly which obligations are created by performing certain speech acts in a specific context. So Hitchcock's challenge mirrors the meta-principle of externalization; he seems to considers meeting his criterion a constitutive requirement to qualify a discursive artifact as conveying argumentation.

Hitchcock does not expect anyone to be able to come up with examples of visual artefacts that meet the criterion, and therefore does not expect that it is possible to convey discursive appeals to reason in a critical discussion by means of visual artifacts. It is indeed this realm of thought that underlies the first reading; if argumentation is a set of exactly and irrefutably determinable, then argumentative discourses that have formats other than a straightforward presentation of these premises and conclusions have to be replaced by a

reconstruction in the standardized format that scholars agree about; if that is not possible, the discourse is not argumentative.

My task is to show that many discourses that we obviously tend to consider argumentative do not meet the Hitchcock criterion. If I can, a pleasant side effect is that this supposed lack of determination of visual discourses is no reason anymore to deny that they are potentially argumentative. So, if I can come up with obviously argumentative discourses about which there is no consensus among experts about what exactly the conclusion and premises are, my point is made. As a consequence we cannot replace the original discourse by some reconstruction, neglecting the exact formulations as far as the dialectical aspects are concerned.

There are many ways to argue what is so obvious from a cognitive semiotic point of view. In the context of this brief paper it is impossible to develop decent empirical arguments that show that actual reconstructions of scholars are dubious or far from unassailable (but compare Van den Hoven 2012, 2015, 2017). It is also impossible to empirically support my claim that when observing actual argumentative discussions, for example in courtrooms, one sees that large parts of the disputes deal with what the other actually said, or meant to say, or is committed to, or should have said, or denies to have said, and so on; that opponents do not always replace metaphorical utterances by utterance that convey the 'literal' meaning of such metaphor (if that is possible anyhow) but take up the metaphor, extend of narrow it; that participants frequently allow and take up other party's formulations, even when they are obviously not specific enough to determine an exact set of obligations. In sum, that participants do not reject discourse that fails to meet the criterion as argumentatively irrelevant or at least defective.

My point can be made here in a brief and more playful way. David Hitchcock considers his challenge as a move in a critical discussion (about the possibility of visual argumentation). Let me try to reconstruct his argument. What is the conclusion and what are the premises to derive from his speech act? This is my proposal:

> Premise 1: If visual argumentation is possible, someone should be able to come up with examples which interpreters of visual artifacts with appropriate background knowledge will agree […] independently of each other on exactly what the premises are and what the conclusion is.
> Premise 2: Nobody comes up so far with such examples.
> Conclusion: (For the time being) There is no reason to accept the possibility of visual argumentation.

If you disagree with my reconstruction, my point is made because I seriously think that Hitchcock intends to convey this argument, so we have no agreement about a serious attempt to reconstruct. If you agree with this structure, then I have to continue. I need to show that in this reconstruction it is not clear at all what exactly the premises are and therefore there is no clear set of obligations.

In Van den Hoven & Schilperoord 2017 we present an analysis of some cartoons, showing that many aspects of their meaning are underspecified, but also showing that certainly not everything goes; some cartoons do convey argumentation, some do not and there are structural elements that explain this difference, and the audience is clearly guided to the one or the other interpretation; the author of the cartoon is obliged to take responsibility for this. Now, will David Hitchcock accept that we meet his challenge when he shares our argumentative interpretation of some of the cartoons (as we predict he will)? Does he think that the content of premises and conclusion is exact enough to be object of exact agreement? We do not need the actual answers on these questions; it suffices to see that posing these questions already fires back on Hitchcock's argument. These questions come up because it is

not clear what in premise 1 is meant by "agreeing exactly" and therefore it is not clear which obligations we can assign to Hitchcock. It is also not clear enough what in premise 2 counts as "coming up with an example" to tell me whether we actually did come up with several. So, the reconstruction obviously does not determine his exact obligations. Admitted, the vagueness is less spectacular than in "Our experiences with 9/11 teach us that we need to accept a certain surveillance of our private sphere by the government", the example discussed in Van den Hoven 2017, but still Hitchcock's argument in it given formulation is better understood as a first challenging move in a discussion about the possibility of argumentation conveyed by visual discourse, an invitation to be explored further in the critical discussion itself than as verbal discourse that meets his own criterium.

Developing the meaning of his utterances in a dialogue is actually what we did in an oral conversation during the ISSA 2018 conference. David Hitchcock immediately and wholeheartedly admitted that many verbal discourses that he considers argumentative do not meet his challenge. (This of course does not imply that he agrees with my rejection of the pragmatic reading of the meta-principle of externalization or any of the consequences of such rejection.) Although we did not work this out in the brief coffee break conversation, a next move of Hitchcock can be to articulate his challenge, because I guess that he still suspects a difference in exactness between genuine verbal argumentative discourse and visual discourse. This is in my view a regular and productive step in what I consider our dialectical investigations.

3. HEDGING OR STRAW MEN?

Often, if not always, argumentative communicative acts are severely underspecified. Therefore, determination of obligations is a dynamic process that is best considered element of the critical discussion, as I tried to show in the Hitchcock example. Meanings emerge. Participants can try to convey delineated obligations, but it can be just as 'reasonable' and most of the time inevitable to contribute to a discussion with invitations to emerge meaning, verbally or in multimodal codes. This is incompatible with the first , pragmatic reading of the meta-principle of externalization, but fully compatible with the second, abstract and paradigmatic reading.

Challenging the semiotically naïve ideas that underlie this first reading has a gratifying consequence; we can repair a naïve conceptualization of two interesting fallacies: hedging and creating a straw man. If one departs from a method for analysis in which an unambiguous dialectical reconstruction is assumed, then it is easy to define the fallacies of hedging and creating a straw man; if the reconstruction assigns an obligation to a participant and that participant denies that obligation, this is hedging; if a participant assigns an obligation to an opponent and the reconstruction does not, this participant commits the fallacy of creating a straw man. That is it.

However, insights from cognitive semiotics and cognitive linguistics make clear that argument theorists better adopt a much more advanced and plausible theory of sign systems, even though the consequence is a much more complicated, but also more interesting and productive theory about these fascinating interpretation fallacies.

It is remarkable how little attention argument theorists give to cognitive semiotics and cognitive linguistics because their insights deeply affect conceptualizations of rationality. Dennett (2018: 366) concludes after lengthy analyses: "The manifest image that has been cobbled together by genetic evolutionary processes over billions of years, and by evolutionary processes over thousands of years, is an extremely sophisticated system of helpful metaphorical renderings of the underlying reality […]. It is a user-illusion that […]we take it

to be unvarnished reality." This users-illusion is encoded in the semiotic systems, making their relation to a reality highly complicated. Especially in contexts of critical discussion we employ an often highly metaphorical language system, evolved to accommodate social-cultural needs, with a desire to reach high levels of exact, mutual understanding. One can predict the necessity to incrementally attempt to reach such high levels of mutual understanding. If we consider sign structures as cultural evolutionary phenomena that maintain a complicated relation to what they claim to represent (Dennett 2018), that strongly rely on prototype, analogy, metaphor (Hofstadter 2015), that employ processes of emergent meaning (Fauconnier & Turner 2012), then obviously one can predict that in (argumentative) exchanges there is a continuous need to cooperatively explore whether a sufficient level of precision can be reached that participants in the specific context accept as mutually shared meaning.

In this process obviously a participant can reject obligations that another participants attributes to him or her without committing the fallacy of hedging, usually by clarifying or developing the 'intended' meaning and if necessary explaining why the original, specific formulation was chosen and thought to be adequate. Vice versa, a participant can 'externalize' a reading (as I did with David Hitchcock's speech act) which is not shared by everybody and perhaps even rejected or modified by the original speaker, without such interpretation creating a straw man. These fallacies should be reserved for situations in which a communicative act is intentionally deceptive or intentionally misinterpreted. To qualify a move in a critical discussion now becomes an interpretative act, with a fuzzy border between committing the fallacy and proposing an interpretation of the speech act that is not fully accepted by other participants. Such model is adequate to describe what we can see happen in serious debates, balancing between cooperative searches for the intended meaning, negotiating meaning on the one hand, and accusations about intentional misinterpreting communicative acts on the other hand. Such 'process of externalization' is an integrated part of the dialectical aspect of the critical discussion and is in principle performed and owned by the participants. A scholar can analyze this process and can even develop normative assessments, but should not replace the process by some reconstruction, claiming that that reconstruction covers what is dialectically relevant.

4. STRATEGIC MANEUVERING

Externalizations can end up in a set of not fully determined obligations which are not irrefutable and beyond discussion. This is compatible with the meta-principle of externalization in the latter reading. This abstract and paradigmatic reading fits much better in the original pragma-dialectical theory (Van Eemeren & Grootendorst 2004) than the somewhat naïve pragmatic reading. Although the original theory departs in its idealizations from a modernist, Cartesian conception of rationality and therefore aligns very well with the (fundamentally untenable) ideal of a fully specific, unambiguous sign system, still this theory allows that argumentative discourse in practice is far away from this ideal and therefore resists perfect externalization.

However, nowadays we have to deal with the so called *extended* pragma-dialectical theory, developing the concept of strategic maneuvering. This theory (Van Eemeren and Houtlosser 2006, 2009; Van Eemeren 2010) assumes that a discussant attempts to reconcile both dialectical goals (resolving a difference of opinion in a reasonable way) and rhetorical goals (maximizing effectiveness) by choosing and performing dialectically relevant moves in a way that may convince the prospective audience best. This is called *maneuvering*

strategically. The concept of maneuvering strategically presupposes that we can distinguish the dialectical aspect from the rhetorical aspect.

Van Eemeren (2010) distinguishes three aspects of strategic maneuvering: choices made from the topical potential, adaptation to the audience, and presentational choices (2010: 93–127). The third aspect, presentational choices, is at the heart of the problem discussed in this paper. The theory states that presentational choices merely affect the rhetorical aspect, the effectiveness of the argumentation. This only makes sense if we assume that presentational choices are variations of what is dialectically the same argument. It seems inconsistent to model presentational choices as the presentation of different arguments, because different arguments imply potentially different dialectical commitments.

Van Eemeren writes: "[R]ecognizing the unbreakable connection between expression and content observed already in antiquity […] my starting point is that whenever something is at one time expressed differently than it was expressed at another time it is pragmatically no longer 'the same thing'" (2010: 119). This utterance is a beautiful example of a carefully formulated sentence that nevertheless needs elaboration to get clear what obligations it may bring about. If Van Eemeren would refer with "pragmatically" to the dialectical as well as the rhetorical aspect, it is unclear what the referent of "something" is; it seems that 'something' refers to an argument as represented in a dialectical reconstruction, something that 'exists' irrespective of its expressions.

When we look at the practice of strategic maneuvering analyses within the new pragma-dialectical framework, we observe that analysts actually make dialectical reconstructions first, apart from the presentational choices. Presentational choices are thus considered independent of these commitments (with one major exception: when the presentation renders a reconstruction problematic, this is considered a (dialectical) derailment (Van Eemeren 2010: 187–209).

So, perhaps without being fully aware of this, the extended theory seems to adopt the first, pragmatic reading of the principle of externalization, the reading I qualified as untenable. However, this is not necessary. One can accept that indeed there are different discourses that convey the same set of dialectical obligations. For example, when we have two rather well delineated propositions A and B, then it seems to me that usually (perhaps we can construct exceptions) "A therefore B" expresses the same set of dialectical obligations as "B because of A". But that is a possible outcome of an interpretation process. To determine whether "My starting point is that whenever something is at one time expressed differently than it was expressed at another time it is pragmatically no longer 'the same thing'" creates the same set of dialectical obligations as for example "Whenever an appeal to reason is at one time expressed differently than it was expressed at another time it has a different rhetorical meaning", requires a process of externalization that is best modeled as part of a critical discussion in which these expression play a role.

What does this imply? It implies that the actual formulations are in principle object of pragma-dialectical analysis, not some reconstructed sets of obligations. Because it is inevitable to assess which interpretations are possible and productive and therefore to be considered 'reasonable' and which interpretations derail to some extent (if such distinction is possible and in many situations it is), one needs semiotic theories about the sign systems applied. Argument theorists do not need to be semioticians, but need to reflect on the semiotic resources applied in argumentative discourses.

5. CONCLUSION

Although the meta-principle of externalization can be interpreted many ways ☺, in practicing argumentation analysis it turns out to justify a separation between on the one hand the actual formulations in the discourse and on the other hand formulations in reconstructions that are the starting point of further analysis and assessment. The challenge of Hitchcock symbolizes the world of thought that underlies this reading of the meta-principle, namely that argumentative verbal discourse is, or at least should be and to a large extent can be such that exact and undisputable determination of relevant obligations is tenable. Maybe such optimism is inspired by the logical tradition with its emphasis on formal sentence structures and highly simplified relations between sentences, neglecting discourse phenomena and neglecting the complexities that need to be exchanged in real live critical discussions. In other words, it assumes a world of highly articulated and transparent cognitive positions and semiotic systems that reflect such articulation and transparency. Cognitive semiotic insights explain that such view is untenable (Fauconnier & Turner 2002, Hofstadter 2007, Dennett 2018), in verbal discourses as well as for multimodal discourses. This has four interconnected implications.

Firstly, because exploring the meta-principle of externalization is inevitably an argumentative process in itself, it cannot be a constitutive criterion to consider discourse argumentative, excluding all discourses that do not meet the criterion. The pleasant consequence is that now a lack of consensus about what exactly are the premises and conclusion is no reason anymore for Hitchcock to hold the standpoint that argumentative discourse is necessarily verbal. On the contrary, content of a visually conveyed, anchored communicative act in the context of a critical discussion is often more determined than its verbal counterpart.

Secondly, because meeting the meta-principle of externalization is an argumentative process in itself, one cannot maintain that in a specific context of an argumentative discourse or text every sub-discussion about "exactly which obligations are created by (explicitly or implicitly) performed speech acts of one of its participants" (the meta-principle) has to end in either the finding that the participant denying a commitment committed the fallacy of hedging, or the participant accrediting a commitment committed the fallacy of creating a straw man. We need to develop a theory that allows for an appeal to reason to be (initially) underspecified or otherwise vague, but is taken up and considered practicable and productive (which is not the same as acceptable) by the discussants. I considered David Hitchcock's challenge a meaningful and productive move in a critical discussion about the possibility of visual argumentation, even though as we saw it is severely underspecified. My attempt to clarify should not be considered creating a straw man when Hitchcock turns out to be unhappy with my interpretation, nor should he right away be accused of hedging if he refuses to take responsibility for that interpretation.

Thirdly, because there is no possibility to replace the discourse by a reconstruction that catches the 'real' (?), the 'relevant'(?) , the 'intended' (?) argumentation, the 'dialectical part of the' argumentation, one cannot maintain a simple model of strategic maneuvering, that is to develop on the one hand the dialectical aspect by analyzing the argumentation as reconstructed (applying the tool kit of the non-extended version of pragma-dialectical theory and its refinements in for example the theory of argument schemes) and to develop the rhetorical line by analyzing the choices made in what content to include (topical potential) and the presentational choices that one identifies by imagining the numerous ways that the argument as it appears in the certified reconstruction can be presented.

Of course I do accept strategic maneuvering as an important category to analyze and access discourses that for some valid reason one considers part of a critical discussion. I

consider using very explicit conventional formats to indicate argumentative structures in a discourse a rhetorical strategy to suggest that one is oriented on a specific set of ideological (modernist) values (compare Van den Hoven 2011). But obviously one cannot separate a dialectical from a rhetorical aspect in the naïve way the simple model suggests.

Finally, my musing on the principle of externalization implies that interpretation is a significant element of the critical discussion as such, therefore that cooperative searching for (but necessarily also negotiating) and developing (but necessarily also assuming) common ground is element of discussions in which participants try to solve a conflict of opinions. This seriously complicates a theory that tries to grasp these social practices, because it acknowledges the complexities that these cultural practices bring about as they performed in the semiotic realm and therefore enclose the evolutionary, cultural, cognitive complexity of this realm. This does, however, not imply that anything goes. Obviously participants in these critical encounters are constrained. But constraints are often dynamic, emerging, appealing to creative processes. Therefore, to model important phenomena such as hedging and creating a straw man, argument theory needs to take into account cognitive semiotic theories concerning the semiotic resources employed, even if argument theory is developed as a normative and even idealized theory; it does not make sense to depart from ideals and to work with normative systems that violate fundamental principles of how human cognition works.

Warrant-establishing arguments: Defending a new kind of inference

SALLY JACKSON

University of Illinois at Urbana-Champaign
United States of America
sallyj@illinois.edu

ABSTRACT: Wolfram's *A New Kind of Science* proposed a new kind of inference built on computational modeling. Analyzing the book as an instance of warrant-establishing argument allows improvement on Toulmin's account of that process. Toulmin's insights about "logical innovations" are affirmed, but his speculative description of how this might occur is not. The empirically-grounded characterization of warrant-establishing argument offered here illuminates the central role of intuition in establishing inference rules.

KEYWORDS: computational modeling, Toulmin, warrants, warrant-establishing argument

1. INTRODUCTION

In many scientific fields, practice lags behind theory. In argumentation, theory is lagging behind practice. The natural practice of argumentation—most notably, how we actually draw and defend conclusions—is advancing far faster than our explanatory concepts and analytic methods. Communities of arguers are inventing new inference rules with some regularity, but our legacy concepts and theories often make it hard to see these inventions as within the scope of argumentation theory.

For any observer of contemporary argumentation practice, though, it is getting harder and harder to *not* notice the great wave of inventions and innovations that are occurring in how people draw and defend conclusions. Toulmin (1958, p. 257) drew attention to this phenomenon at a time when it was far less noticeable, when he spoke of "logical innovations" occurring periodically within specialized fields. What can be added 60 years later is that the pace of this kind of innovation has accelerated dramatically. I have argued elsewhere that this wave of inventiveness is partly a consequence of the rise of design thinking in society (Jackson, 2015; Jackson & Aakhus, 2014) and partly due to revolutionary changes in communication technology (Jackson, forthcoming). I have also suggested that argumentation theory should expand its research agenda to include certain designed objects: those that incorporate new inference rules that extend human capacity for reasoning and arguing, and those that incorporate new procedures for managing disagreement.

I assume, as did Toulmin, that new inference rules may be proposed within any field (not just logic), and that they should be understood not in relation to analytic argument (nor even in relation to known schemes) but in relation to their own purposeful contexts. A new inference rule is meant as a way of generating conclusions and arguments that support these conclusions; however, as Toulmin realized, any such rule may first need to be established through argument that builds confidence in the rule itself. The study reported here attempts to show how that establishment process may occur.

2. TOULMIN'S NOTION OF WARRANT-ESTABLISHING ARGUMENT

Toulmin (1958) urged greater attention to what he called "practical argument," meaning argumentation as practiced within any of its ordinary human contexts, and he introduced the still-controversial notion that standards for argument evaluation might be field-dependent. Every argument, he theorized, has some sort of warrant, or inference license, to permit the drawing of a conclusion from some sort of grounds. Early interpretations of the concept of a warrant likened it to the major premise of a syllogism, but Toulmin clearly had in mind that only in the very special case of "analytic" arguments was the warrant a statement or paraphrase of the syllogism's major premise. In non-analytic arguments, the warrant is clearly distinguishable from anything looking like data. In terms that have grown familiar in the intervening decades (Searle, 1976), a warrant might better be expressed as a directive-type speech act than as an assertive-type speech act: not a bit of information, but an instruction for how to work with information. In evaluating anyone's conclusions, the decision about how the conclusion was reached can be challenged, and that challenge *may* involve backing that often looks like additional information, but the warrant itself is more instruction than information.

Toulmin clearly had in mind that expert fields could devise completely new inference rules, that any such rule would likely require an argument aimed at defending its rationality, and that this defense could not be limited to formal demonstration. He distinguished "warrant-establishing arguments" from "warrant-using arguments," and said (1958, p. 120) that:

> Warrant-establishing arguments will be . . . such arguments as one might find in a scientific paper, in which the acceptability of a novel warrant is made clear by applying it successively in a number of cases in which both 'data' and 'conclusion' have been independently verified. In this type of argument, the warrant, not the conclusion, is novel, and so on trial.

Later, in his *Human Understanding* (1972, p. 487), he drew a very similar distinction (which he credited to Ryle) between "making a formal inference" and "justifying that form of inference," and he emphasized that justifying a new form of inference generally involved going outside established formal procedures to try to forecast the future success of the newly proposed procedure. He spoke often of innovation in reasoning, and was comfortable with the idea that these innovations belonged to all rational enterprises, and not just to logic. As he said (1958, p. 257):

> To think up new and better methods of arguing in any field is to make a major advance, not just in logic, but in the substantive field itself; great logical innovations are part and parcel of great scientific, moral, political, or legal innovations.

Unfortunately, we still know too little about how argumentation itself is involved in the emergence and spread of these innovations in argument. Toulmin's own speculative description of warrant-establishing argument (quoted above) is highly implausible, even for the limited context of establishing the major premise of a syllogism. It implies that the path to establishment of a new inference rule is to "apply" the warrant in several separate arguments, and that the warrant-establishing argument is somehow a generalization of the success of the warrant in these cases. But how, then, does the unestablished warrant succeed in any one of the cases? Although there is some merit in the idea that warrants might get established by compiling a track record of successful inference, this certainly is not always the case. An additional vulnerability in this account is that it assumes that success of a wholly novel warrant will be *intuitively* recognizable, a point to which I return later.

A very important correction of Toulmin's account that a warrant-establishing argument must have the warrant that is to be established as its conclusion, and there must be some

grounds offered in support of the conclusion; there must also be a warrant that generates this conclusion from the grounds. In an early review of *The Uses of Argument*, Castaneda (1960, pp. 283-284) noted this as a deficiency in Toulmin's sketch of warrant-establishing argument. Hitchcock (2006, pp. 214-215) made this point directly:

> In fact, there seems no reason to postulate a sharp difference in kind between warrant-using reasoning and warrant-establishing reasoning. If one is reasoning to a conclusion that will later serve as a warrant for further reasoning, the conclusion is one's claim and the 'backing' for that claim constitutes one's grounds; the inference from grounds to claim will have its own warrant.

Also useful in the insight offered by Freeman (2011, p. 88), that Toulmin's warrants are not actually part of an argument in the same way that data and conclusion are part of the argument:

> [A]rguments instance inference rules rather than include them as elements. It is no more appropriate to count an inference rule as a part of an argument than it is to count an attribute as a part of a substance.

Freeman objects to the practice of turning warrants into the kind of expression that can be treated as part of the argument's content, an objection I have taken very seriously in my own efforts to examine warrant-establishing argument.

Beyond these useful clarifications, not much progress has been made in improving on Toulmin's ideas about how new warrants get established. But as new inference rules are proposed with increasing frequency and with increasingly high stakes for society, we need to understand their emergence and adoption.

3. EMPIRICAL STUDY OF WARRANT-ESTABLISHING ARGUMENTS

I and my colleagues have long argued for direct empirical inquiry as a basis for building argumentation theory (Jacobs & Jackson, 1982, 1989; Jackson, 2018). Especially in theorizing new objects in the environment such as novel inference rules, we should not expect legacy concepts and theories to have anticipated the truly new. As my recent studies with Jodi Schneider (Jackson & Schneider, 2018; Schneider & Jackson, 2018) have already shown, when we look at naturally occurring instances of warrant-establishing argument, what we find is different even from what Toulmin expected. New inference rules *do* get explicit defense, and these rules are not always (if they are ever) empirical generalizations that can be arrived at by induction. New warrants are often proposed and defended without anything we might call a track record of success. And the defense of a new inference rule often requires knocking down intuitive *resistance* to the rule rather than reliance on intuitive recognition of its success.

So we really need to almost start over from *The Uses of Argument*. We can save Toulmin's insights that these kinds of inventions occur, and that when they occur they are very consequential. But we need to carefully examine what they actually look like and how their inventors defend them as reasonable ways to arrive at conclusions. We need to find cases in which the warrant to be established is itself the conclusion of the argument that seeks to establish it.

Toulmin's early conjectures about warrant-establishing argument can be greatly improved by comparing them with what can be seen by examining defenses of new inference rules as these occur in real argumentation. Such arguments appear openly in the discourse of scientific fields (and no doubt elsewhere as well). Although they always have something to do with the field's specific subject matter, they are not assertions *about* the subject matter but instructions for how to work *with* the subject matter. Locating cases of warrant-establishing

argument requires looking for contributions to a discipline's literature that propose new ways of generating conclusions that can be applied, without explicit defense, in many independent arguments. Such proposals can sometimes be found in ordinary research reports, but they also appear in standalone methodological papers.

In this study, I examine one extraordinarily clear case of warrant-establishing argument, contained in Stephen Wolfram's *A New Kind of Science* (henceforth, *NKS*). The book runs to well over 1200 pages, so it required a great deal of processing. The procedures I used are a form of analytic induction, a method often employed in qualitative discourse analysis (Jackson, 1986). In analytic induction, the analyst begins with only a very loose idea of what is interesting about the phenomenon and makes observations without defining in advance what will count as data. Analysis becomes more purposeful as the analyst begins to form conjectures about what is going on. Taking *NKS* as data, the method of analytic induction involves reading, extracting passages that seem interesting, forming conjectures about important groupings of these passages, building hypotheses that can be held accountable to the data (that is, to the text itself), and testing these hypotheses by purposeful search for data that might contradict any one of the hypotheses. In my project, analytic induction was used to arrive at and test a special kind of hypothesis, a reconstruction of the book as an argument, with a conclusion supported by data and reasoning.

Despite the length and complexity of *NKS*, the book's argument is in many ways easier to reconstruct than arguments unfolding in dialogue, since Wolfram took pains to make clear what he was claiming and on what basis. However, even a very thoughtfully presented argument will require interpretation by each reader. Here, Wolfram's practice of commenting on his own presentational choices was often very helpful. His extensive notes provide clues as to the intentions behind particular rhetorical choices, such as the choice to treat visualizations themselves, and not mathematical descriptions of the visualizations, as evidence for his claims. But as with any other work of similar length, inevitably some content will be ambiguous, some will seem superfluous, and so on. Deciding whether content that resists a particular candidate reconstruction is or is not evidence against the reconstruction often comes down to the analyst's own intuitive judgment.

I approached the task of reconstructing *NKS* by keeping a file of interesting passages, simply recording them verbatim at first. When appropriate, I added analytic notes commenting on my initial impressions of a passage, or annotating passages with information checked against other sources. As with any qualitative study, this process involved starting with the most obviously interesting passages, but returning for multiple readings of passages whose significance was less obvious. As themes emerged, the digitized version of the book (available online at https://www.wolframscience.com/) was used to conduct systematic search for all mentions of certain concepts. For example, intuition was discussed in Chapter 2, but its centrality to Wolfram's overall argument did not become really clear until much later. At this point, a systematic search produced 75 mentions of intuition, each of which was examined separately and in comparison with the others.

The first chapter of the book provided a preview of the rest of the book, so very early I created several conjectures about the overall structure of the argument, including alternative conjectures about what to consider as the main claim of the book. A first question was whether to treat the book's main claim as some form of assertion (e.g., "Computational modeling will transform/has transformed science") or as some form of proposal (e.g., "Try modeling nature as computational"). The first chapter allowed both readings, each in several more specific variations, so each was retained as a conjecture to be tested against the rest of the book. But to survive as a credible reconstruction of Wolfram's top-level claim, a conjecture needed to be able to "roll up" as much as possible of the book's content.

The conjectural reconstructions guided reading of the remaining chapters, as I attempted to see whole sections and even specific passages as sub-arguments that could roll up to a case in support of one or more of the candidate claims. This quickly eliminated any possibility of reconstructing the top-level claim as an assertion about the future of science; too much material went too far beyond this. But these future-oriented claims did find a place as supporting arguments about what will happen *if* scientists come to see nature itself as computational, that is, as reasons for adopting Wolfram's suggested course of action.

4. WOLFRAM'S PROPOSAL FOR A NEW KIND OF INFERENCE

The book opens (p. 1) with this ambitious statement:

> Three centuries ago science was transformed by the dramatic new idea that rules based on mathematical equations could be used to describe the natural world. My purpose in this book is to initiate another such transformation, and to introduce a new kind of science that is based on the much more general types of rules that can be embodied in simple computer programs.

What is important here is that from the first line of the work Wolfram likens the unexplored potential in computational rules to the now-proven value of mathematical equations. In warrant-establishing argument, an advocate is generally trying to compare some newly devised inference rule with some prior way of working, often an established form of inference that enjoys a presumptive advantage based on its past successes. Overcoming this presumptive advantage might involve showing that what seemed like successes were in fact failures, but in this particular case, Wolfram acknowledges the successes and sets out to show that his new kind of inference is an improvement over what scientists have been able to accomplish with legacy forms of reasoning.

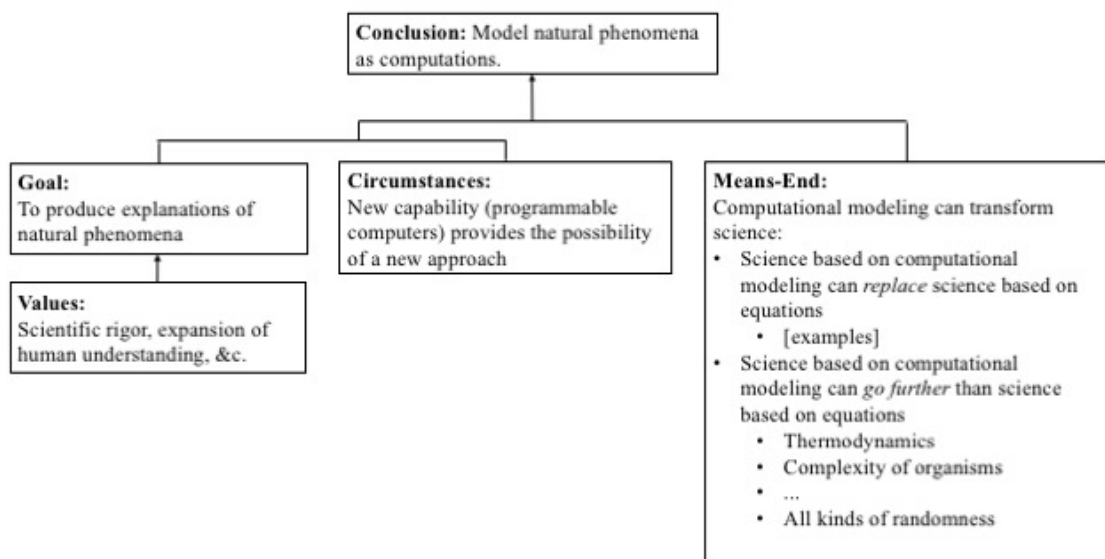
I suggested earlier that warrant-establishing arguments might involve practical reasoning. This works well for Wolfram's case. He establishes a goal (extending scientific understanding of the natural world), points to a new circumstance affecting this goal (the invention of programmable computers), and argues at great length that modeling nature computationally will in fact advance the goal. Figure 1 shows my reconstruction of Wolfram's top-level argument, using a practical argument scheme adapted from Fairclough and Fairclough (2012). The entire top level argument is previewed in the first chapter, though it is intermingled with enough other content to make the identification of the main claim uncertain.


Fig. 1. Wolfram's top-level argument reconstructed as practical reasoning.

Macagno and Walton (2018) have argued that practical argument will normally require a modular analysis in which each component in the practical reasoning scheme may invoke entirely different kinds of schemes to support whatever rolls up to this kind of overview. *NKS* invites this kind of modular analysis, and although I cannot attempt that here, it is worth noting that the modules can be far more heterogeneous than is suggested by Macagno and Walton. For example, drilling down from the circumstance premise, we would find several arguments from analogy, based on conceptual change associated with prior technology changes.

The means-end premise is the most controversial part of Wolfram's argument, and he spends most of the book developing it. I plan to drill down on two sub-arguments to the means-end claim that science based on computational modeling can go further than science based on equations; Wolfram says that his new kind of science can generate accounts for phenomena that have long resisted explanation.

4.1 Randomness

Keep in mind that the argument to be developed about randomness needs to roll up to the means-end premise, so it needs to show *how* we can explain the occurrence of randomness in nature. Randomness has been a noticed phenomenon for at least several centuries, and it has generally been assumed to be what is unexplainable after we have explained all that we can. If something is random, it cannot be predicted by any sort of equation. At least in the social sciences, the random component of anything is treated as an irreducible source of error in our understanding of the world—what's left over when we've done the best job we can of fitting equations to actual observations. But Wolfram sets out to establish that randomness can be generated by even the simplest sort of rules, and that if we think of natural phenomena as the output of these simple rules, randomness and patterning both have the same kind of generative mechanism.

For his demonstration, Wolfram chooses to work with cellular automata, very simple programs that update cells in an array using rules that apply one step at a time. Wolfram has developed a standard form of visual representation in which the history of the array is preserved vertically, with each row showing the state of the cells in the array at one step in the

history. At step 1, the array is a row of white cells with one black cell. The history shows us what Wolfram calls the behavior of the rule.

Figure 2 shows two "rule icons" for cellular automata, one for Rule 254 and the other for Rule 30. Each rule tells how to update each cell in the array by referring to the state of the cell, and the states of its two neighbors, on the just preceding step.

Fig. 2. Icons for Rule 254 (upper) and Rule 30 (lower), adapted from Wolfram (2002, p. 24 and p. 53).

Figure 3 shows the behavior of each of the two rules: the left panel of Figure 3 shows the behavior of Rule 254 through ten steps, or iterations, and it is obvious what must happen with further iterations: a symmetrical growing pattern in which a cell, once black, never returns to white. A simple rule producing simple behavior is no surprise, and it does not provide any evidence that simple programs can generate randomness. But Rule 30, which is simple in exactly the same way that Rule 254 is simple, produces behavior that is far more complex. The right panel of Figure 3 shows the behavior of Rule 30 through hundreds of iterations, and Wolfram expects us to see, just by looking, that there is no discernible pattern, no possibility of predicting the state of any arbitrary cell at any arbitrary step.

Fig. 3. The behavior of two rules (adapted or reproduced from Wolfram, 2002, p. 24 and p. 53). Copyright © 2002 by Stephen Wolfram LLC.

Suppose you looked just at the center column in the right-hand panel of Figure 3, and tried to predict what color the cell would be at any step. No equation can do so. The color of the center cell alternates randomly between black and white, and the only way to know what color it will be at any step is to actually perform the iterations required to get to that step. This is an important property known as computational irreducibility. Rule 30 produces random behavior and can be used for any practical task that requires random binary values. It is an important piece of Wolfram's demonstration that a simple program can produce complex behavior.

Wolfram's characteristic method is to define a rule type (like cellular automata) and exhaustively study the behavior of individual rules of that type. There are exactly 256 rules of this type, and Wolfram has studied the behavior of all of them. Only a few generate randomness. Most generate repetitive or nested patterns. But Rule 30, and several other rules, provide Wolfram's main evidence for the means-end premise that complex phenomena can be

successfully modeled with simple programs. All of these rules are simple in the same way, but they behave very differently. Both simple and complex behavior can result from rules of equal simplicity.

4.2 Complex natural organisms

Not all rule types examined by Wolfram can be studied exhaustively. Some types have so many individual rules that they must be sampled. But Wolfram still uses the characteristic method of starting by studying properties of the rule *type* by looking comparatively at many individual rules within the type.

Having identified a rule type that produces growth in a spiral pattern, Wolfram experimented with many rules within the type, producing behavior that is different in particulars but recognizably similar in appearance. Figure 4's left panel shows the result of changing two of several parameters that define any one rule for generating spirals.

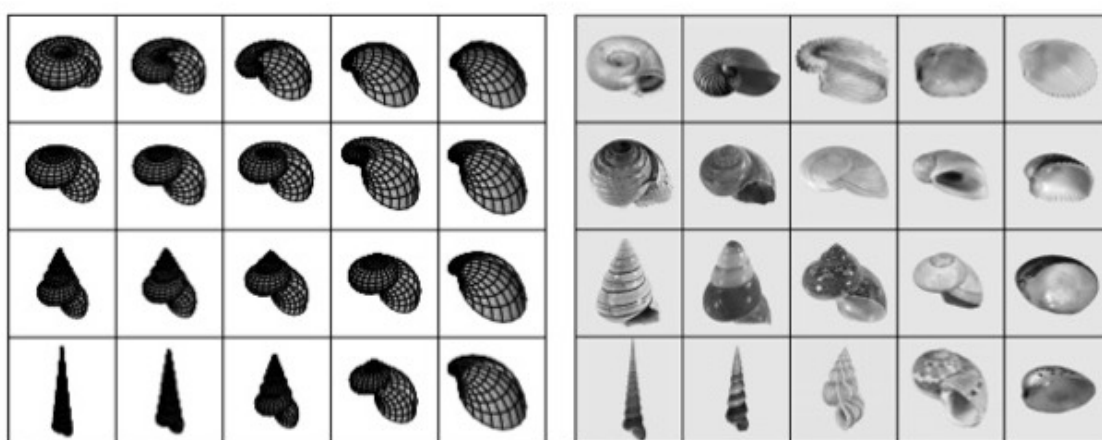

Figure 4. Spiral shapes generated by computational rules (left) and similar shapes found in nature (right). Reproduced from Wolfram (2002, p. 416). Copyright © 2002 by Stephen Wolfram LLC.

Wolfram asks a very interesting question about his computed shapes: "out of all the possible forms, which ones actually occur in real molluscs?" And he answers himself: "The remarkable fact is that essentially all of them are found in some kind of mollusc or another." (p. 415). The right panel of Figure 4 contains photos of shapes found in nature. The pairing of model and nature makes clear the special sense in which Wolfram thinks programs explain real-world phenomena: They show how the phenomena might have come about. The reliance on visualization captures well the style of Wolfram's argument, and the method of beginning with program behavior and searching for natural phenomena to explain is perhaps more radical than any other aspect of his method, suggesting as it does that if something can be generated by a simple rule, somewhere in a computational universe we should expect to find that it has been generated.

Each of Wolfram's means-end sub-arguments either shows how computational explanations can replace an earlier form of explanation (not reviewed here, but located in Fig. 1 as support for the first of two means-end premises), or shows how a computational explanation can handle phenomena that have resisted any other form of explanation. Some sub-arguments are far more speculative than the two reviewed here, but rolled up, even the weaker lines of support help to build the case for great potential in inference based on identifying simple programs that produce behavior seen in nature.

5. THE ROLE OF INTUITION

Although Wolfram's top-level argument fits well with a practical argument scheme, one issue discussed throughout the book does not fit, or at least not neatly. As is well known, practical argumentation may be countered by showing reasons, not considered by the advocate, why the proposal should not be accepted. In warrant-establishing argument, even a strong case for the proposal may have to overcome resistance that is not based on reasons but on strong intuitions—the sort of intuition so deeply entrenched that it dismisses the warrant-establishing argument out-of-hand. Reasoning rules that run counter to people's intuitions cannot fulfill their justificatory function for those people, so a defense of a new reasoning rule may require *making* the rule intuitive. Wolfram expects intuitive resistance to his ideas, and he responds with some of his most creative argumentation.

Wolfram mentions intuition many dozens of times, inviting analysis in terms of Gilbert's (1994) concept of the kisceral. The kisceral is a mode of arguing where a speaker's own intuition is the basis for a belief or decision, and some of Wolfram's mentions of intuition do appear to fall within this modality. But in a more basic sense, Wolfram's case illustrates that what we take as a good argument *in any modality including the logical* must satisfy a certain kind of intuition that is innate but shaped by experience. Wolfram knows that his argument will be counter-intuitive for his target audience, as it was for him at first. So he spends a lot of time trying to re-shape his readers' intuitions. He says (p. 47):

> [O]ne might hope that it would be possible to call on some existing kind of intuition to understand such a fundamental phenomenon [as randomness]. But in fact there seems to be no branch of everyday experience that provides what is needed. And so we have no choice but to try to develop a whole new kind of intuition.

Wolfram asserts that anyone performing experiments with simple programs will quickly develop the new kind of intuition required to see their potential. In effect, he suggests that the only reason a person resists this new way of thinking is that they *lack* a certain kind of experience—the kind of experience that he himself had in working with practical computers. By running experiments on simple programs "one is in the end able to develop an intuition that makes the basic phenomena that I have discovered seem somehow almost obvious and inevitable" (p. 41).

Recently I argued that all arguments, no matter how highly disciplined, must ultimately pass a deeply intuitive test of reasonableness (Jackson, 2018). But warrant-establishing argument often needs to do more: to change the intuitions against which arguments are tested. Changing people's intuitions is not easy, but neither is it impossibly difficult. Wolfram is a convincing example of this. He advances several quite different lines of argument but relies centrally on the testable assertion that people can change their own intuitions by having new experiences.

6. CONCLUSION

Updating Toulmin, warrant-establishing arguments will be such arguments as one might find in scientific discourse *proposing* a new way of reaching and defending claims about the field's phenomena. Some of what is learned from Wolfram's case confirms what is seen in other cases of warrant-establishing argument (Jackson & Schneider, 2018; Schneider & Jackson, 2018). But each case of warrant-establishing argument is likely to have particular features that were not present or not prominent in other cases. So each new case adds to a general understanding of warrant-establishing argument.

A first conclusion from this study, consistent with Hitchcock (2006), is that warrant-establishing arguments are not distinguished by a special form but only by their purpose. They are attempts to defend new ways of drawing and defending conclusions. They enter a space that may already be occupied by other ways of reasoning, some of which may be very well entrenched. In many ways, the defense of these new inventions is similar to advocacy for any new form of technology. The inventor has to explain what the invention is supposed to accomplish, demonstrate that it can deliver what it promises, and often, actually get people to want some new thing for which they have felt no prior need. The fact that the invention being defended is an inference rule is interesting, but not as much of a puzzle as Toulmin seems to have expected.

No doubt there are multiple paths to establishing new warrants, but in cases Jodi Schneider and I have examined so far the top-level defense has taken the familiar form of practical reasoning. Wolfram proposes his new kind of inference and defends it by attempting to show that it can meet scientific goals that are not met by traditional methods. Without examining cases in nonscientific fields (especially law), it is too soon to conclude that warrant-establishing arguments generally instantiate practical reasoning schemes, but it is already clear that they are not (at least not usually) simple induction of the kind that might justify a major premise in a syllogism.

Most unusual in Wolfram's case is the prominence of intuition. Deep in the substructure of his case, he often relies on his own intuition as the grounds for a conclusion, in effect asking the reader to defer to his experience in working with materials of the kind he presents. But the more important role of intuition in this case is the recognition, by the case-maker himself, that no defense of an inference rule will be successful without making it intuitive for the prospective user. To review once more Toulmin's early conjectures about warrant-establishing argument, even if it were possible for a rule to arrive on the scene with a track record of success, it would still need some account of why it succeeds in generating good conclusions in order to reach this level of intuitive acceptance.

An unabashed liberal's defense of Richard Nixon's "Checkers" speech: Why argumentation critics need an audience-centered principle of rhetorical charity

SCOTT JACOBS

csjacobs@illinois.edu

ABSTRACT: Richard Nixon's "Checkers" speech is widely regarded as one of the most persuasively successful speeches in the history of American political rhetoric. It is also widely regarded as a poster child for the kind of demagogic emotional appeals to which the unwitting public must be kept alert. The critics are wrong. Their judgments illustrate the dangers of "cookie-cutter criticism" and a failure to take seriously the interpretive demands of when analysing real-life argumentative messages.

KEYWORDS: charity, cookie-cutter criticism, ethos, Nixon, rhetorical dilemmas

1. INTRODUCTION

On Sept. 23, 1952, Senator Richard Nixon delivered an historic one-half hour television speech (see Aitken, 1993; Parmet, 1990; Wicker, 1991; Wills, 1970). It was wildly successful, by far, the most persuasively effective speech in American political history. It is also among the most infamous: Nixon's speech is said to have only proven the public's gullibility and lack of critical thinking. Dubbed dismissively as "Checkers," the speech is used to this day as a textbook exercise in fallacy identification. But the dramatic disagreement between critics and the actual audience is an anomaly in need of attention: Is it possible that the critics, confident as they are in their judgments, may have missed something important? If our theories and methods cannot account for the success of this speech, we must not forget that criticism tests arguments, but also the concepts being deployed in the criticism. Our conceptual systems work well enough for straightforward, plain acts of justification, but not so well when we work with messages of real functional complexity, interpretive density, or genuine nuance.

I propose two maxims of Rhetorical Charity that, if followed, force the analyst to test their own judgments and theoretical presuppositions against the judgments and interpretations that other people find plausible.

> Maxim 1: To the degree that an audience finds a message convincing, presume there is an interpretation and functional design that would redeem that judgment and look for it.

> Maxim 2: Where a message (or message aspect) is judged fallacious, be sure that judgment is justified in response to how it might be defended as a constructive move that promotes reasonable argumentation and decision-making.

These maxims can be thought of as analytic injunctions to take seriously arguers and their audiences, to presume that arguers try to persuade their audiences through reasonable

means and that when audiences are persuaded by argumentation it is because they found the argumentative tactics to be reasonable (Jacobs, 2009, p. 68). Of course, arguers may care less about being reasonable than about having their way with an audience, and audiences can be careless in their assessments, and either can be simply wrong about argument quality. But for a critic to show that some case of argumentation is fallacious or otherwise defective, they should not simply presume the authority of their theoretical expertise or the adequacy of their critical method. Critics should accept their burden of proof. They should engage with the ways in which a message might be defended as *non*fallacious, not just as strategically fitting for some persuasive end, but as actually enabling, even improving critical discussion (Jacobs, 2002, p. 125). Critics should imaginatively project themselves into the viewpoints of the participants, the circumstances of occurrence, and the interpretations audiences give to the message (Jacobs, 2006, p. 431, 437). In effect, these maxims establish presumptions that turn the justification of the claim of fallacies into a refutational act, and not just an act of pointing and labelling. Critics must rebut defense of the presupposition of acceptability. And this rebuttal can be expected to account for contextualized interpretations.

2. BACKGROUND OF THE SPEECH

Nixon was the vice-presidential nominee on the Republican ticket with General Dwight D. Eisenhower. They were running against the Democratic ticket of Illinois Governor Adlai Stevenson and his vice-presidential partner, Senator John Sparkman of Mississippi. Nixon's speech was delivered in answer to a scandal that broke out just six weeks before Election Day.

On September 18, 1952, the New York *Post* ran a front-page banner headline: SECRET NIXON FUND! The story on page 3 was headlined, SECRET RICHMEN'S TRUST FUND KEEPS NIXON IN STYLE FAR BEYOND HIS SALARY. The story revealed that Nixon had a $16,000 fund (actually $18,000) donated by 76 prominent Californians to assist Nixon in his office and travel expenses after his election to the Senate in 1950. There was no question of the legality of the fund per se. Rather, the newspaper questioned the ethics of accepting money from special interest groups. The story was written so as to insinuate that the fund was not for campaign expenses, but for Nixon's personal use and that the contributions were given in exchange for political favors. As the boldface lead-in line put it: "The existence of a 'millionaire's club' devoted exclusively to the financial comfort of Sen. Nixon was revealed today."

The next day, Democratic Party National Chairman Stephen Mitchell called on Eisenhower to "cast away" his running mate. Nixon lashed back in speeches on his west coast whistle stop tour, saying he was being "smeared" by "crooks" and "communists". Nixon also had the administrator of the fund, Dana Smith, release a full list of the donors and their contributions as well as all the expenses paid for by the fund. Smith also explained to reporters that all contributors were prior and open contributors to Nixon's congressional and senate races, and that all contributions were limited to $500 per year so that no one would think Nixon owed them any special favors. But Nixon's explanations and Smith's disclosures were largely ignored by the press, shunted to the back pages in favor of stories reporting Eisenhower's lukewarm backing of Nixon and speculating on the reasons for lack of a full-throated defense of his running mate.

A movement began to have Nixon dropped from the ticket. On September 20, the *Boston Globe*, an Eisenhower endorser, led the front page with the headline: "OUSTING OF NIXON DEMANDED BY SOME OF IKE'S ADVISERS." Worse yet, the *Herald Tribune*--owned by one of Eisenhower's closest friends--ran an editorial calling on Nixon to resign from the ticket. These were not so subtle signals, leaked and endorsed by Eisenhower advisers

(and perhaps by Ike?), designed to get Nixon to step down without Eisenhower having to demand it. By September 21, the *New York Times* published a full page of editorial reactions and reported that disapproval of Nixon ran two to one against him--an astonishing result given that the vast majority of American newspapers at the time were under Republican ownership.

The problem was that corruption during the Truman administration was a central issue in Ike's Crusade to Save America, and Nixon had spoiled it all. Eisenhower faced a dilemma. If he unequivocally backed Nixon, Eisenhower would look like the very politicians he was denouncing--and like a hypocrite to boot. If he demanded that Nixon resign, Eisenhower would be admitting that for his first major political decision--the choice of the man to stand one heartbeat away from the Presidency--he had chosen a crook. The General would look like a political amateur. Thus, Eisenhower took a "wait and see" stance that only further stoked speculation among reporters covering the Eisenhower campaign tour and emboldened those campaign advisors who wanted Nixon dropped from the ticket.

That Sunday (September 22), newspapers reported that Republican leaders had met in St. Louis and arranged a one-half hour national TV and radio spot for Nixon to give an accounting. So, Nixon stopped his campaign tour and flew back to Los Angeles to prepare his speech. After spending Monday and all day Tuesday getting ready, at 6:30 p.m. California time (9:30 on the east coast), Nixon delivered his historic address.

3. THE SPEECH ACHIEVED OVERWHELMING SUCCESS

From Sunday through Tuesday Nixon had made no comments to the press, deliberately building the suspense as to whether or not he would resign. In a country of 162 million people, with only nine million television sets, almost 30 million Americans interrupted their nightly routines to watch the speech and another 30 million listened beside their radios. They thought it that important. They were paying attention. And their judgment--reached independently in each living room beside each radio and television set across the country-- was as decisive as anything America has ever seen.

Right after the speech, Nixon had thought he had blown it. He had asked the audience to write and wire to let the Republican National Committee know whether he should stay on the ticket or resign. But Nixon had missed the countdown cues and was cut off before giving the address of the RNC. He expected that, if people sent anything at all without an address, they would send their letters, calls, and telegrams every which way--to local campaign offices, to their congressmen, to newspapers or radio and television stations, to Eisenhower campaign headquarters (who wanted Nixon ousted), and not just to the Republican National Committee. The response would surely be dispersed, suppressed, lacking any focused force.

The public response was dispersed, and perhaps also suppressed. But the magnitude of response was so great that it had the force of a tsunami overwhelming everything everywhere. America had never seen anything like it before, and will probably never see anything like it again. Herbert Parmet (1990: 249) described the scene:

> Not knowing where to turn, listeners reached out to whatever seemed plausible. Calls and telegrams inundated Republican offices everywhere; in desperation, respondents also turned to local television and radio stations. The overloaded San Francisco telephone system became almost inoperative. In Whittier, [hometown native Gerald] Kepple recalled, the telephone lines "were so blocked there was more use of Western Union . . . than for anything that happened in the United States in a hundred years."

550

Telephone lines across the United States jammed and broke down. Newspaper offices were overwhelmed with calls, so much so that some posted the address of the Republican National Committee on their front pages. Newspaper headlines described the public response with terms like "avalanche," "swamp," "deluge," "inundate" and "flood." Calls and telegrams were "pouring in" so as to "tax lines" in cities around the country. And the public outpouring continued for days.

In one week, over two million letters, calls, and telegrams managed to make it to the RNC headquarters alone. Western Union stopped counting the telegrams and simply weighed them by the bagful. The first 4,000 were read; all but 21 supported Nixon. Parmet (1990) reports messages favored Nixon 350 to 1.

No surprise, Eisenhower kept Nixon on the ticket. When Nixon flew to meet him in Wheeling, West Virginia, Ike ran onto the plane, put his arm around him, called him "My boy," and announced that Nixon had been "completely vindicated." The Republican National Committee never even needed to meet after phone calls that night showed the members wanting to keep Nixon on the ticket by a margin of 112-0. And all those newspapers whose editorials had been denouncing Nixon--now there was widespread praise.

But the effects were even more pronounced than that. Nixon did more than save his political career—he launched it. For the first time in American history, a vice-presidential candidate became a nationwide political asset. Campaign crowds to see Nixon were reported to be as large as those for the presidential candidates. Nixon was given control over his own campaigning and a few weeks later was given another one-half hour TV program. Eisenhower never went on television.

Moreover, Nixon had not only convincingly defended himself and his fund. He put the Democrats on the defensive more than ever. In his speech, Nixon had called on Stevenson to explain a donors' fund that the governor had used to supplement the salaries of state officials-- a fund that was much larger and much more loosely administered. Stevenson squirmed for days as newspaper headlines called on him to explain himself. After some initial resistance, Stevenson finally published a full accounting of the money, who donated how much, and who received how much. Also in response to Nixon's speech, the millionaire had to reveal his income tax returns. Likewise, Sparkman had to explain why his wife, unlike Nixon's, was given a salary as office staff. And Sparkman too had to reveal his tax returns. Eventually even Eisenhower made his tax returns public, something that must have given secret satisfaction to Nixon.

Then, after Stevenson's and Sparkman's release and Eisenhower's announcement of a release, Democratic National Chairman Stephen Mitchell said that Nixon too should release his tax returns (something Nixon had not done during the speech or later). What did Nixon do? Nixon said no. I'm not going to. Nixon had so strongly inoculated the public and the press against further charges that newspapers simply accepted his refusal. Even more than this, Nixon's speech had so decisively shifted the presumption in favor of his innocence and good character that he inoculated the press and public against any further accusations. Newspapers simply dismissed such stories as more unfounded smears or did not even bother the publish them.

And, of course, the Republicans won the 1952 election by a landslide. For the first time since Herbert Hoover and the start of the Great Depression, Republicans won control of the House of Representatives, the Senate, and the White House. Tellingly, beneath the headline announcing the "landslide" victory, the *New York Times* featured not only a photograph of president-elect Eisenhower, but beside it a photograph of vice-president-elect Nixon.

4. THE SPEECH OVERCAME IMPOSSIBLE DIFFICULTIES

But it is not just the magnitude of the audience response and the force, depth, and extent of the political consequences that mark Nixon's Checkers speech as such a success. The difficulty of the situation was such that no one (other than Nixon maybe) imagined that *ANY* kind of political success was possible. Consider the difficulties that Nixon faced. He had only one and one-half days to prepare his speech of self-defense. There was no real prospect of collecting documentation beyond what Dana Smith had already made public. (Nixon had expected full reports from a law firm and an accounting firm assigned by the Republican National Committee to investigate the fund. He received only summary letters of vindication.) He had to assemble a defense from a pastiche of one-liners and brief answers delivered to whistle stop audiences during the first few days of the scandal. He was given only one-half hour to make his case--hardly the time one would prefer in making a defense against corruption charges. Moreover, his speech was the very first one of its kind. Nixon had to use a new and unfamiliar medium whose presentational properties were barely understood, with presentational techniques woefully untested and underdeveloped.

Moreover, anyone would have thought the demands placed on Nixon by the Eisenhower campaign were completely unrealistic. Nixon could not ignore those demands--orders, really--without seeming to abrogate the duties of his role as the junior running mate to the presidential candidate. On a phone call in the days leading up to the speech, Eisenhower had told Nixon he needed make a "full disclosure" of all his financial information "from the beginning." The general had also told reporters that Nixon had to be "clean as a hound's tooth." And when Eisenhower's chief advisor, Thomas Dewey, called Nixon to discuss giving a speech, he told Nixon to have the public response sent to Eisenhower's campaign, and that Ike would "consider" keeping him on the ticket if the public showed "90% approval"! Not even apple pie or baseball could get that strong an endorsement. Then, just to make sure that Nixon understood that he was expected to bow out gracefully, Dewey called Nixon one half-hour before the speech and told him that it was the opinion of Ike and his campaign staff that Nixon should close his speech by announcing his resignation. With the demand to offer his resignation and leave his fate in the hands of a man who had set seemingly unattainable standards of success--and who would demand team loyalty and deference to his authority as a condition of membership on that team, Nixon faced a double-bind whose only solution seemed to be that he step down in a way that allowed Eisenhower to avoid making the decision he did not want to make. No wonder Garry Wills (1970) concluded that Nixon had been set up to fail. Still, Nixon found a way to avoid resigning and to even force Eisenhower to embrace him.

But the reason for the set up itself ultimately flowed from a deeper rhetorical problem for Nixon. It was a rhetorical problem that was no doubt led Eisenhower and other Republican politicians to the conclusion that Nixon's situation was hopeless. Nixon's core rhetorical problem flowed from a kind of Gestalt image that by 1952 was already taking hold in the public imagination. Since his first campaign in 1946 for Congress against the incumbent Jerry Voorhis, and later on as a member of the House Un-American Activities Committee exposing communists like Alger Hiss, then in his Senate campaign against Representative Helen Cahagan Douglas, Nixon projected a kind of double image: To his supporters, Nixon appeared to be a young, earnest moral crusader. They found in Nixon the character of a fighter with the courage to stand up against corruption and communism, willing to endure all the suffering that such a stand would draw in furious response. To his critics, Nixon seemed to be an unprincipled, cynical political opportunist who would turn to the worst sort of smears, demagoguery, and dirty tricks to advance his political career. He would ruin anyone and say anything to win.

Nixon's Gestalt-switching quality came from the way that the very same performances evoked both images--even to the extent that each image reinforced the other. For those who believed Nixon to be an American champion, the accusations of his opponents merely magnified his virtue because he would not back down in the face of unjust persecution. To his supporters, the critics only exposed the depths of the menace that Nixon was warning against. For those who saw in Nixon a dark and devious danger, his popular image was dismissed as a phony front and only provided further proof of just how threatening to the Republic Nixon really was.

But the charge of political corruption against the Crusader Against Corruption destabilized Nixon's image dynamic. The charge triggered a decisive flip in point of view, a seemingly irretrievable collapse of the hero image into that of the villain. Nixon now simply appeared to be the unprincipled hypocrite that his critics had been claiming all along.

And here, from a rhetorical and argumentative point of view was the deep dilemma for Nixon. Without the presumption of personal character, once the spiral of suspicion had taken hold, once the Gestalt image had flipped, Nixon had no apparent way to defend himself. An appeal to personal character was the only viable resource for self-defense against the kind of charges at the heart of the scandal. How else do you prove a negative when the presumption has shifted so decisively against you that proof of innocence must be provided? How do you prove the absence of hidden funds, of off-the-books bank accounts, of under the table payments? The representative of the new American middle-class family dream could hardly be expected to be living a lifestyle that rejected those aspirations. And how do you prove the absence of vote selling? After all, the contributors to the fund no doubt made those contributions because Nixon stood for the kind of political principles that those contributors supported. And if Nixon really was the principled advocate of free enterprise that he portrayed, he could hardly be expected to show votes against those principles. In the end, Nixon would have to convince his audience that he simply wasn't the kind of guy who would do the kind of thing he accused of. But how could he do that when the presumption of honesty and integrity had flipped so completely against him?

5. BUT WAS THE SPEECH REASONABLE?

Space does not allow for a detailed analysis of how Nixon pulled off such an amazing outcome against such seemingly impossible odds. Suffice it to say that among the many things Nixon did he demonstrated his innocence to the American public by the way that he performed his arguments of self-defense. His arguments were a demonstration of authenticity not just in the sense that arguments demonstrate a conclusion, but in the sense that his acts of argument realistically showed, displayed, embodied the requisite character. The whole point of his performance was to show through what he argued and the way he argued that he just wasn't the kind of guy who would do the kind of things he was accused of. Nixon argued the way a guy who would not do that kind of thing would argue. Nixon framed the charges the way a guy who would not do that kind of thing would frame such charges. He showed the kind of emotions that a guy who would not do that kind of thing would show. Nixon offered the kind of reasons and the kind of motives that a guy who would not do that kind of thing would offer. Nixon talked, and stumbled, and used language the way a guy who would not do that sort of thing would talk, and stumble, and use language.

And in doing all this, he reclaimed a persona that the American public could believe and approve. In making his case, Richard Nixon embodied all the cultural symbolism of a Frank Capra character (Think Jimmy Stewart in *Mr. Smith Goes to Washington*.). And Nixon did so authentically, vividly, and convincingly such that any reasonable person who shared

and believed in those cultural values and symbols would properly conclude that Nixon had been unjustly smeared.

The more important point to consider for the purposes of this paper, however, is why that public judgment, as overwhelming as it was and as convincing as it felt, was not also shared by so many professional pundits and academic critics. And how to this day could they draw such a contrasting judgment?

A good part of the answer lies in the way that pundits and academic critics have interpreted the speech. They have taken it literally, but not seriously. Or, at least, they have relied on relatively superficial, face-value interpretations of Nixon's arguments and rhetorical strategies. That's why they found the speech transparently "corny," "trite," "maudlin," "mawkish," "phony," "an illusion of proof," and wondered how so many people could be taken in by such "nauseating" baloney.

Those interpretations align well with the political, cultural, and aesthetic sensibilities and values that the broader communities of professional pundits and academic critics take for granted, and so it is not really surprising that those interpretations would generally go unchallenged. All of this would be further reinforced by the sense of sophistication and professional expertise that allows pundits and academic analysts not to worry that disjunctures between professional and public judgment might indicate that *they* may be the ones to have gotten something wrong.

It should no longer come as news that the majority of professionals in the news media and the academy do not share the sensibilities or have faith in the values that ordinary people found embodied by Nixon in his speech. What needs to be news is that alienation from those sensibilities and scepticism toward those values needs to be noticed and resisted, especially among a self-reinforcing community of like-minded critics. Without it, there is little or no demand to reconstruct the perspective and situation of the audience that was in place in America in 1952--at least, not in a way that is sympathetic or anthropologically serious. We should never feel safe dismissing such a manifest public judgment without asking whether people might be seeing something in Nixon's speech that would not make them out to be gullible, naive fools and rubes.

For academic critics, the problem is in many ways even more pronounced. Academic critics in particular must constantly struggle with the way in which their models of argument and their lists of fallacy categories encourage a kind of literal-mindedness in their interpretations of argument, a "cookie-cutter" approach to fallacy identification, a mechanical method of reconstruction, and post-hoc rationalization of personal judgments and cultural expectations disguised as the product of methical analytic procedure.

6. AN ICONIC MOMENT RECONSIDERED

Consider the iconic moment in Nixon's speech. It is one that continues to be widely mocked and repeatedly trotted out in argumentation textbooks as a "real-life" example of fallacy.

> Well, that's about it. That's what we have. And that's what we owe. It isn't very much. But Pat and I have the satisfaction that every dime that we've got is honestly ours.
>
> I should say this, that Pat doesn't have a mink coat. But she does have a respectable Republican cloth coat. And I always tell her that she'd look good in anything.
>
> One other thing I probably should tell you, because if I don't they'll probably be saying this about me, too. We did get something, a gift, after the election. A man

down in Texas heard Pat on the radio mention the fact that our two youngsters would like to have a dog. And believe it or not, the day before we left on this campaign trip we got a message from the Union Station in Baltimore, saying they had a package for us. We went down to get it. You know what it was? It was a little cocker spaniel dog, in a crate that he'd sent all the way from Texas, black and white, spotted. And our little girl Tricia, the six-year-old, named it Checkers. And, you know, the kids like all kids, love the dog. And I just want to say this, right now, that regardless of what they say about it, we're going to keep it.

      It isn't easy to come before a nationwide audience and bare your life as I've done. But I want to say some things before I conclude, that I think most of you will agree on. [Transcribed from the video. Nixon, 1952, Sept. 23.]

Both Nixon's mention of Pat's "respectable Republican cloth coat" and his insistence that "regardless of what they say about [Checkers], we're going to keep it" have been held up as transparently obvious fallacies (red herring for the coat; strawman for Checkers; both for ad misericordiam appeal). I think those uses ought to be held up as examples of the danger of falling into uncharitable, literal-minded, cookie-cutter criticism. Those judgments of fallacy reflect a superficial reading of the passages, ripped from the context of the speech as a whole, rendered without consideration for the functional design in which these passages play a role, and accepting a shallow, dismissive picture of the interpretive capacities of the audience.

      What's really going on here is that Nixon has been posing then answering a series of questions about his political fund. The questions are increasingly pressing, pointed, and sceptical. The impression created is that of a man being pushed into providing progressively more desperate proofs, giving ever more deeply embarrassing explanations and humiliating disclosures, of someone (as Nixon puts it later) having to "bare his soul." In answer to whether maybe he has been able "to fake this thing," Nixon has just ended an "unprecedented" full accounting of "everything I've earned, everything I've spent, everything I own." It is a deeply dramatic disclosure. "It isn't easy to come before a nationwide audience and bare your life as I have done" is profound understatement. No American politician had ever before made such a disclosure. It was a dramatic, and deeply embarrassing, moment in the speech, given American attitudes in 1952 toward the privacy of personal finances. The genuine sense of humiliation has only been amplified by Nixon's prior, almost frantic efforts to explain why he needed the fund and practically grasping presentation of legal and financial opinions declaring that he had done nothing wrong.

      In this context, Nixon's admission that Pat "doesn't have a mink coat" but only "a respectable Republican cloth coat" isn't a red herring. It is further evidence, a capping proof of his denial that "you may have feathered your own nest." And it is a reminder that Democrats in Washington have been accepting gifts of mink coats for their wives. But Nixon just isn't the kind of guy who would do that kind of thing. And if it is a disclosure that evokes an emotional response, it evokes that response in a way that is relevant to the audience empathically identifying with Nixon's situation, to understanding how he thinks and how he feels, to recognizing the character displayed in those thoughts and feelings, and to seeing how unfair it is that Nixon is the one who has to answer accusations of corruption.

      Nor is the Checkers story a straw man. It is not meant to be taken literally. It comes right after his detailed disclosure of how modestly his family lives, exemplified in the final humiliating admission that Pat can only afford to wear a cloth coat. The Checkers story is meant to show that Nixon has drawn the line. He has been pushed far enough. Nixon is fighting back. He then smoothly pivots into an angry attack on his (Democrat) accusers and a spirited call to join Eisenhower's Crusade.

The emotional force of the story does not come from thinking that Nixon is defying a call to give back his kids' dog. The story is hyperbole, and meant to be seen as such, as nonliteral exaggeration that captures the emotional sense of the moment. It is how Nixon expresses a sense of closure to the self-defense section of the speech and sets up and motivates the appropriately righteous indignation that frames Nixon's upcoming attacks.

7. CONCLUSION

His audience was moved by this and other emotionally charged moments in the speech because they took Nixon seriously but not literally, and because they found a functional sense and interpretive depth to his speech that has been woefully lacking in too many of the analyses of professional pundits and academic critics.

Argumentation as an ethics of action and in action

HENRIQUE CARLOS JALES RIBEIRO

Department of Philosophy, Communication and Information
University of Coimbra
Coimbra, Portugal 3004-530
jalesribeiro@gmail.com

ABSTRACT: The primary objective of this paper is to show how and why rhetoric and argumentation arose as a revolutionary ethics of human action, with Perelman and Toulmin, in the second half of the 20th century. The thesis developed is that (1) philosophy overall can be reduced to the theory of rhetoric and argumentation; (2) that the divorce between knowledge and action established by philosophy since the modern era no longer makes sense to that theory.

KEYWORDS: action, argumentation, ethics, interdisciplinarity, knowledge, Perelman, philosophy, rhetoric, Toulmin

1. INTRODUCTION

Let me start by explaining, bearing in mind the subject of this presentation, how I see the current relationship between philosophy, on the one hand, and rhetoric, on the other. For me personally, the latter field is the field of philosophy itself as a whole, systematically understood, rather than simply an interdisciplinary subject-matter for research, among others, to which philosophers offer the contribution of their own research (as is the case of linguistics or of sociology). Thus, for me, after more than two decades of teaching and researching in both philosophy, in the broad sense of the concept, and rhetoric and argumentation, philosophy is essentially rhetoric and argumentation; or, if you prefer, rhetoric and argumentation are fundamentally philosophy. The faculty where I teach, or the faculty where I have the honor of presenting this paper now could therefore be called not simply faculties of "arts" or of "humanities" (noble titles, at that, in which rhetoric may, in principle, be included) but rather "faculties of rhetoric"; and I do see myself, as well as all philosophers, from ontology to aesthetics or to political philosophy, again not as people who simply teach philosophy, but rather as people who essentially or fundamentally teach rhetoric, irrespective of the field of research concerned.

It should be emphasized that this status of rhetoric and argumentation is not recent or original ─ it goes back to ancient Greece. Even today, the specificity of rhetoric derives from the fact that it has to do with the teaching of all that can be taught ─ hence its decisive importance and its essentially interdisciplinary nature. In this respect, we are at present still on the same footing as Plato and Aristotle among the Greeks. Since everything ─ absolutely everything ─ is susceptible of being taught, a philosopher is essentially a *rhetor*. The main aspects that differentiate us from Plato and Aristotle are our better perception of the fact that philosophy (rather than any other discipline or knowledge) should constitute the unifying framework of the said interdisciplinarity, and the idea that this is only possible if philosophy is identified with rhetoric itself ─ an idea which was indeed not foreign to Plato's thought when he wrote *Phaedrus* (cf. Meyer (ed.) (1989, p. 318). From this fundamental perspective, philosophy and rhetoric are therefore essentially on the same thing, although seen from different angles (see Ribeiro 2016, pp. 21-51). Obviously, when I mention this identification I am ruling out, from the start and without hesitation, the common meaning of rhetoric: that it

has to do merely with the form of our speech, rather than with its substance, being a sort of tool for presenting it. As I said, this is not Plato's conception in his above-mentioned dialogue; nor does it seem to be Aristotle's conception in his treaty on *Rhetoric*, although he may suggest it here and there. However, this was how rhetoric was conceived of since antiquity: something that deals with the way (the *form*) how we should persuade a specific audience, rather than necessarily the subject-matter or the substance of our own speech.

Elsewhere (books, articles, lectures), in the last few years, I have tried to explain this crucial paradigm shift, which is academically and publicly known as the "rhetorical turn". Up to the mid-1960s (notably, to Toulmin and Perelman), rhetoric was identified as a type of research which concerns itself primarily with the way we speak or argue, rather than (as I said before) with the substance of our own speech. Since it concerned form, not affecting the matter or substance, rhetoric could not help but be a secondary type of research, however important it might be deemed to be. On the other hand, the rhetoric I am talking about was not necessarily a philosophical or characteristically philosophical endeavor, but rather something of an interdisciplinary nature, or something shared by researchers coming from different areas. From this perspective, and virtually since ancient Greece, its status has remained ambiguous and indefinite, with the role of philosophy sometimes emerging, depending on the authors and their times, in open conflict with that of other interdisciplinary contributions (see again Ribeiro 2016, pp. 21-51). No! Again, what I am saying when I speak of the relationship between philosophy and rhetoric or argumentation is that the latter, irrespective of the origin of those contributions (theory of literature, linguistics, political philosophy, etc.), can be subsumed to, or entirely assimilated into the former, in the sense that the matter or the substance of the speech involved is, *par excellence*, a matter or a substance of philosophy itself, as systematically conceived. Philosophy, as I conceive of it, can and must play that fundamental role after the "end of philosophy" that was proclaimed, as early as the 1950s and 60s, by a number of major authors such as Wittgenstein and, most particularly, Quine (Wittgenstein 1953; Quine 1969). Using an analogy that I have often resorted to in the past, I see philosophy, as rhetoric or theory of argumentation, playing the role of the trunk in the tree of human knowledge at large, a role which, in his *Principles of Philosophy*, Descartes ascribes to metaphysics as "first philosophy" (Descartes 1993). It is from rhetoric and argumentation, as philosophically understood, that the different branches or areas of knowledge in general, whatever they may be, stem (see Ribeiro 2013). You may now understand a little better the institutional toponomy of rhetoric which I began by introducing ("the rhetoric of the arts and humanities", "the rhetoric of sciences", "the rhetoric of law", etc.). This conception can only become feasible if, as I suggested, against the heavy and pernicious tradition in this field since Aristotle, rhetoric and argumentation are not considered to be theories that have to do simply with the form of our speech, but rather, and fundamentally, as something that concerns its very subject matter; they are not simply "means" or "tools" to achieve or to arrive at whatever it may be ─ in this case, persuading or convincing a potential audience. However, if this is the case, it becomes clear that there are no reasons to distinguish between rhetoric and philosophy, as if they had two different, separate "essences".

2. THE RHETORICAL TURN

Before I continue to analyze the relationship between philosophy and rhetoric, let me just say the following: were it not for the novelty, the originality, and the radicalness of these conceptions, and, especially, the above-mentioned chaotic interdisciplinary status of the teaching of rhetoric in western universities, particularly in European and North-American universities, from the 1950s onwards, philosophers could and should have claimed for

themselves, institutionally and academically speaking, this absolutely crucial role of rhetoric, which follows from Perelman's and Toulmin's conceptions (Perelman & Olbrechts-Tyteca 1969; Toulmin 1958, 1976). When Wittgenstein, Quine, and their disciples called for a dismissal of philosophy, in the classical and traditional sense of the concept, from whose perspective there is nonetheless room for systematic and foundational investigation, the response could, and should, have been: "Your conceptions concerning the theory of meaning blatantly ignore the role of rhetoric as a theory of argumentation and communication. The end of philosophy that you proclaim is premature and unacceptable. While it makes no sense to speak of "essences" in regard to anything (the mind, language, the world), irrespective of ─ as we rhetoricians like to say ─ the "way how we talk or argue about them", let us then seek this last path (the path of connection, from the point of view of rhetoric, between language and the world) and see what follows from there, see what implications can be drawn for the philosophical work generally". This, as we know, was not the response that was generally given, although it could and should have been so, since, as I said, it follows, in principle, from Perelman's and Toulmin's conceptions. However, as I see it, the main reason for the absence of an answer such as this was that, on the one hand, rhetoric and argumentation theorists, after Wittgenstein and particularly after Quine, were almost obsessively committed to safeguarding what was miserably left in universities for themselves, after the teaching of philosophy as it was traditionally conceived had been accomplished; there was no room, no time, and no motivation to pursue the *desideratum* I was telling you about, which is indeed a very provocative *desideratum*. This issue is particularly relevant, especially in Anglo-Saxon universities, where, as we know, the role and the relevance of analytic philosophy are quite prominent (see Ribeiro 2016, pp. 127-151). On the other hand, as regards the interdisciplinary nature of rhetoric and argumentation, we philosophers have grown used to it as an irremediable situation to which so-called "post-modernity" has condemned us. Again, there is apparently no room, no time, and no motivation for meta-philosophical and meta-systematic problematics such as those that I have defined, which have to do with the foundations of philosophy itself.

Within this new conception of philosophy that I have first mentioned in regard to Descartes' tree of knowledge, only rhetoric and argumentation can guarantee a true or authentic interdisciplinarity. Again: the main point here consists in the fact that, as I have emphasized, they do not have to do only with the form of your speech, generally, but they rather concern the substance of this same speech. This connection is what essentially characterizes the rhetorical turn and distinguishes it from other approaches to philosophy; in particular, this is the connection that allows for a clear demarcation between rhetoric and argumentation, on the one hand, and alternative approaches to the philosophy of language and, particularly, to the theory of meaning, as is the case of analytic philosophy. Faced with such approaches to language as Wittgenstein's and Quine's, who reduce their object to information and overtly ignore the dialectical role of argumentation and communication, therefore concluding that it is impossible to develop them systematically, the idea is that, if philosophy is focused on these dialectical matters, it will continue to be a perfectly feasible, and thus, possible enterprise. Arguments such as Quine's holistic argument concerning the indeterminacy of translation and the inscrutability of reference (Quine 1969; cf. Quine 1962) no longer make sense, since the dissociation between language and the world (form and substance), which is the starting point for this philosopher, is in itself rhetorically unacceptable. Again: when we communicate or argue we are not merely informing others about the world, as analytic philosophers somewhat naively presume: the subject-matter of these speeches cannot be reduced to my speech or to my interlocutor's ─ it is a third, intersubjective entity which imposes itself dialectically and can therefore be closely analyzed. Strictly speaking, this is not simply about a theory of meaning, but rather about a theory of

argumentation. What was said above concerning the role that rhetoric and argumentation could have played in the second half of the 20th century is that, had Wittgenstein and Quine realized the crucial importance of that role, they would certainly not have subscribed to any pessimistic conceptions as regards the future of philosophy in systematic terms.

2.1 A word on ethics

One of the consequences that stem from what I have just said regarding the new conception of philosophy with which we must deal at present is that traditional conceptions no longer make sense, particularly the well-known distinction, or dissociation, between knowing and acting, which originates in modernity and which, as we know, Kant introduced as a distinction or dissociation between a supposedly pure reason (knowledge) and another reason which was supposedly practical (action) (see Kant 1998, 2015). As Perelman, in particular, has shown, commenting on Quine's work, *speaking* may already be a way of *acting*, and, more generally, the realm of knowledge — even in the most refined areas, speculatively speaking, as is the case of axiomatic deductive systems involved in the application of logics to physics and to physical-natural sciences — has to do with essentially practical assumptions, which, in turn, concern the role of rhetoric and argumentation (Meyer (ed.) (1989, 109-122). When, as Quine explains in "On What There Is" (Quine 1961), philosophers who deal with the foundations of logic must choose between the different meta-philosophical orientations concerning those foundations (for example, between formalism and intuitionism), that choice, that decisional act, does not belong to logic itself. Perelman, in turn, believes that it is a matter of rhetoric *par excellence*; that choosing between certain axioms or principles in detriment of others is a matter of rhetoric, not of logic, or, if you wish, of applied logic. Therefore, and for the same reasons why the traditional dissociation between knowledge and action does no longer make sense, the idea that ethics encompasses exclusively the latter domain is unacceptable (see Toulmin 1976). This means that one should discard this type of dissociations when it comes to trying to understand what we mean when we talk about "ethics", or, as is my own case in this presentation, an ethics of action and in action. Certainly, as I said before, this is not about an ethics that might concern, either by comparison or by contrast, a different realm which we call "knowledge". More generally, for that new conception of philosophy which I mentioned at the beginning of this section, that is, for a conception that brings to bear the best elements in some postmodern philosophy, as is the case of Rorty's, traditional concepts such as subject, object, mind, language, world, truth have stopped making sense as more or less unquestionable or indisputable truths (Rorty 1989, pp. 3-22). In particular, the thesis that truth can be attained through a correspondence between language and the world has stopped making sense (Rorty 1991, pp. 1-17). Provocatively, I include among these concepts the old philosophical principles of identity and of noncontradiction, which are especially important for ethics, as we have conceived of it since the distant past. That something can at once be and not be, that a proposition can simultaneously be true and false, these are conceptions which rhetoric and argumentation should begin by pondering and analyzing closely, without any scruples or repugnance. More generally, the vocabularies of rhetoric and argumentation, and namely those of ethics, must yet be fully reconstructed or reformulated.

We have to reconstruct everything from the very beginning, and we should not be afraid to do it. In regard to relativism and the application of the principle of noncontradiction, in a conference on argumentation that was recently held in Portugal and which caused some scandal, I defended precisely what I have just suggested, following the thought of a contemporary argumentation theorist (Fisher 2012). Personally, as a theorist of rhetoric and (supposedly) as a specialist in the theory of argumentation, I do not hold any scientific, academic, or institutional privileges that might enable me to decide between a theory that

advocates abortion or euthanasia and a different theory that advocates the exact opposite. Unfortunately, that is not possible or doable; if it were, argumentation theorists would have played a key role in the cultural and political organization of western democratic societies; and, as we know, they have not generally played that role (for example, a role that might be comparable to that of astrologers or chiromancers). Unable to completely resolve this issue, I have to accept that a person may simultaneously be pro and against euthanasia, for example. Nothing in my expertise entitles me to fully qualify the people involved to formulate a final judgement on the matter; a judgement of the yes/no type. Even admitting that such a judgement is eventually made (which is what happens in most cases), I must accept, on the other hand, the following fundamental reservation: "Yes, I did vote in favor of it for one conjunctural or circumstantial reason or another, but, in accordance to my conscience, had I wished to be rational and consistent, I would have voted against." Now, if we were to accept that all that I have been telling you is appropriate or adequate (and I am convinced that some of it is), we would have to dismiss or, at least, repair many contemporary theories of rhetoric and argumentation, starting with those upheld by dialectical schools, as is the case of pragma-dialectics and formal dialectics, for which it is absolutely essential to safeguard the principle of noncontradiction. In my opinion, this dismissal is far from being serious: the idea is to respect and to understand real experience, or practice, in all its complexity, in the face of more or less speculative theories about it, and to sacrifice the latter entirely when that respect or understanding fails to happen or is not possible.

Faced with such serious and grave problems as the problem of relativism and others in ethics, what I am arguing is that, when confronted with their respective dilemmas and aspirations, we must, as philosophers, seek to understand and safeguard real experience, facts, in detriment of theory and speculation. If theory and speculation do not enable us to understand experience and facts without good faith and without inconsistences this is because they are ultimately of no use and should therefore be sacrificed and done away with. As the late Toulmin, the author of *Cosmopolis* and *Return to Reason*, shows, what is universal, necessary and timeless, that which we consider to be "rational" is, more often than not, not our best choice (see Toulmin 1992, 2001) . On the contrary, in regard to what ethics and human action are supposed to be, we must focus on what is essentially local, contingent, and temporal, i.e., what is "reasonable", which does not in principle and necessarily coincide with what is "rational" (see Perelman 1979, pp. 117-123). Matters as different as the defense of women rights or the rights of homosexuals, or the right to abortion and euthanasia can be included in the ambit of the "reasonable". The "reasonable" is, by definition, the incommensurable. There is, in that respect, no catechism and no categories that can teach us how to basically distinguish between what is "good" and what would, in principle, be "bad". That is determined by the reactions and the assessment made by the community or communities to which we belong; but even this assessment, as Toulmin argues in *Knowing and Acting*, is *par excellence* an anthropological matter (a "generalized anthropology, as he describes it), which is not necessarily transcendental (Toulmin 1976, pp. 141-206). Now, in the absence of universal, necessary, and timeless criteria to assess human knowledge and actions, as we have become accustomed to believe since the establishment of modernity, with Descartes and Kant, everything remains to be done or to be thoroughly reconstructed.

3. KNOWING AND ACTING

Let me sum up all that I have said up to now. (1) the first, fundamental idea is that our conception of philosophy as an endeavor to found knowledge and action at large, i.e., philosophy as it was conceived of by Descartes and Kant practically up to Wittgenstein's and

Quine's theories of meaning, has reached the end, is dead, and must be reformulated. This has been a key conception in analytic philosophy, through different agents and different paths, from the 1960s on, a conception which the theory of rhetoric and argumentation has only been able to follow in part. (2) The second idea is that such death does not mean that philosophy itself, as systematic investigation, has died. Rhetoric or the theory of argumentation can play this key philosophical role in the traditional sense of the concept, now as an approach to knowledge and action which deals not with the world, or with what in the world might correspond to our language, but rather with *the way we speak and argue about it* (see Ribeiro 2012). As I said before, what interests us — in following this path — is not precisely either one side of the problem (language/world) or the other, but rather the way how we are able to establish connections between both, namely why we establish a specific type of connection instead of other possible ones. (3) The third key idea which I have tried to introduce and clarify is that, if we accept these two first theses (and I am convinced that we should), then all of our philosophical vocabulary — and in particular that of ethics — still needs to be completely reworked, reformulated or rebuilt (cf. Rorty 1989, pp. 3-22). As paradoxical as it may seem, we must start anew.

Most of what I have been saying follows from Toulmin's well-known 1976 book, *Knowing and acting: An Invitation to Philosophy*, which I have mentioned above. By "knowing and acting", Toulmin is fundamentally speaking about rhetoric and argumentation, rather than two separate or divorced fields referring to two separate, or even opposed, essences. There is no place here for the old metaphysical problems posed by Kant and others since modernity: subject, object, determinism, freedom or free will, moral law. *Regardless of the field, this is about arguments and argumentation*: argumentation in the case of the areas traditionally associated with what we call "knowledge", which have to do fundamentally with logic (including metaphysics as "first philosophy"); argumentation in the case of those that are associated with action and have to do essentially with ethics (in Toulmin, with what he calls "generalized anthropology", after Wittgenstein in his *Philosophical Investigations*) (see Toulmin 1976, pp. 141-206; Wittgenstein 1953). Now, if, for heuristic purposes or for purposes of a philosophical dialectics with tradition, we should wish to keep the distinction between knowing and acting within the very framework of rhetoric and argumentation, as is proposed in *Knowing and Acting*, the result would be that those known assumptions which allow us to speak of "knowledge" and which have to do with the application of logic are quite unfit to explain action or argumentation in context; and this leads to skepticism (Toulmin 1976, pp. 123-139). And that the assumptions that allow us to explain that same action prove to be totally incompetent when it comes to explaining and justifying knowledge and logic, i.e., argumentation irrespective of its context; and this fact leads to relativism (Toulmin 1976, pp. 200-206). Consequently, as Toulmin suggests, the distinction or dissociation at issue must be definitively abandoned by rhetoric and argumentation (Toulmin 1976, pp. 207-261). From a perspective like his, what ultimately distinguishes knowledge from action is not the subject-matter of our argumentation, but rather its scope or its universality: the former will be universal, necessary and timeless *par excellence*; the second, by contrast, will be local, contingent, and temporal. In this matter, he follows Kuhn and, in particular, *The Structure of Scientific Revolutions*, and admits that the ultimate criterion to distinguish between science and non-science (or, if you prefer, between the rational and the reasonable) is essentially sociological rather than metaphysical (see Kuhn 1996, pp. 174-210). The alternative to both models of argumentation that I have mentioned earlier (that of knowledge and that of action or of common-sense) is what Toulmin calls a "critical model", which claims for itself (amid many doubts and uncertainties which the author himself emphasizes) the unification and possible conciliation between the fields at issue, which are theoretically opposed; a

compromise between the rational and the reasonable, or between the universal and timeless, on the one hand, and the local and contingent, on the other.

Nevertheless, for Toulmin, ethics is not a department of reason, essentially distinguishable from that of knowledge, as happened in the history of western philosophy after Descartes and Kant. This is not about a practical reason by opposition or by contrast with a would-be theoretical reason — the realm of the categories of the universal, the necessary, and the timeless, that is, the "rational" *par excellence*. Surely, ethics has to do with human action and its specific characteristics, although not because these would be distinguishable from and opposed to others — such as those pertaining to knowledge — which would be essentially different. The latter can also be considered a matter of ethics, provided they do not follow the above-mentioned fundamental categories. As I explained above when mentioning the relationship between Perelman and Quine as concerns the ultimate philosophical justification of the axiomatic-deductive systems of mathematics and the physical-natural sciences, a decision that is apparently only logic may have an extraordinarily deep ethical or practical significance/impact. This is what Perelman argues in different texts, including *La nouvelle rhétorique* (see Perelman & Olbrechts-Tyteca 1969, pp. 187-260). Therefore, there is no reason to ultimately divide reason into different departments and their respective categories. Its essential framework is, in general, fundamentally the same, irrespective of the realm at issue: argumentation and its applications. Thence it follows that, in principle, the metaphysical categories of traditional ethics (will, autonomy, determinism, freedom, etc.) must be completely revised and reformulated from the standpoint of the theory of rhetoric and argumentation — which should definitely not frighten us at all as philosophers.

4. CONCLUSION

I have tried to show how our current understanding of the role of rhetoric and argumentation within the interdisciplinary ambit of knowledge in general essentially involves how we understand the role of philosophy. Philosophy is, *par excellence*, rhetoric and argumentation, because more than twenty centuries after its beginning and development it cannot consistently be anything else, as analytic philosophy came to demonstrate, by default, during the entire second half of the 20th century. This fundamental thesis — I dare to say, "only this fundamental thesis" — honors the genius and the work of all our great predecessors, from Socrates, Plato, and Aristotle to Wittgenstein and Quine. At present, that is, in the post-modern era, any other conception condemns philosophy to a completely secondary and irrelevant role; and, in practice, to its progressive disappearance. Having said this, the essential — that which remains to be clarified in more detail — involves the idea that — like in Ancient Greece — in philosophy, and especially in the ambit of rhetoric and argumentation, everything remains to be done.

Calling someone a racist: Orthodox and heterodox affective orientations in the context of the debate about Confederate monuments

MICHAEL JANAS

Department of Communication Studies
Samford University
Birmingham, United Kingdom AL 35209
mjjanas@samford.edu

ABSTRACT: This paper examines two controversies over the removal of Confederate statues in New Orleans, LA and Charlottesville, VA. Using Moral Foundation Theory, it claims that arguments happen in predetermined affective frames. While many social scientists lament that these frames mean the end of reasoned argument, this paper argues that the frames provide opportunities for engaging with differing opinions.

KEYWORDS: affective argument, cognition, Confederate, moral dumbfoundary, moral foundations theory, motivated reasoning, turnaround

1. INTRODUCTION

The affective turn in communication studies has led to a pervasive cynicism regarding the possibility of argument. Recent studies in cognitive psychology illustrate this cynicism by noting that argument might be impossible and that all persuasion is affectively motivated. Moral Foundations Theory(Haidt & Joseph, 2004; Graham, Haidt & Joseph 2009), Cultural Cognition Thesis (Kahan et al., 2012) and Motivated Cognition (Nyhan & Reifler, 2010) pose traditional public argument as a nearly impossible task (to the extent that it can drive people to change their minds) that has greater social than epistemological significance. The apex of this movement is found in the Argumentative Theory of Reasoning (Mercier & Sperber, 2011) that places argument as little more than an evolutionary adaptation that is not so much a function of making better decision or having better beliefs as it is a social phenomenon where truth and accuracy are strategies of social capital that lead to an evolutionary advantage.

However, handwringing over the failure of rationality and argument to change minds poses opportunities for an affective based approach to argument. Beginning with insights from Moral Foundations Theory, I examine the ways that radically distinctive communities may engage each other. Using examples of affectively-charged debates over the disposition of Confederate monuments in New Orleans and Charlottesville, VA, I attempt to identify successful and unsuccessful approaches to winning over heterodox communities. I introduce the notion of the link-turn as an effective approach to arguing in a value-laden environment.

Here, I advance two main arguments. First, that affective arguments are not fundamentally irrational in that different communities must always stand completely apart from one another. Instead, they possess universally applicable internal argument logics that may be accessed by outsiders to engage heterodox communities. I will examine this through the lens of Moral Foundations Theory, a cognitive theory of argument.

My second claim will be that within these internal logics there are opportunities for argument and engagement. Because the foundations of a claim are established and can rarely be argued, argument theory helps to identify elements of a claim's structure that open them to appropriation. Here, I will introduce the notion of the link-turn from academic debate as a

way of adding subtlety to our understanding of political arguments and the best way to think about opportunities to appropriate orthodox claims.

Motivated reasoning starts with the notion that people evaluate arguments relative to their ability and motivation. Because people are motivated to think of themselves as smart and virtuous, they tend to evaluate argument that are consonant with the current views less critically than negating arguments. Consequently, people act more like advocates of a position than objective judges of argument (Lebo & Cassino, 2007; Slothuus & de Vreese, 2010). Thus, they are much better at creating counter-arguments to consonant claims than they are at defending things that they support. In motivated cognition literature, this inability to speak for arguments that one supports is called "moral dumbfounding" which manifests in an inability to offer elaborated arguments in support of consonant moral claims (Schein & Gray, 2018; Haidt, Koller, & Dias, 1993).

One of the consequences of moral dumbfounding is that the taken-for-grantedness makes it difficult to argue for consonant moral premises of arguments. Therefore, if someone disagrees with a moral premise, advocates are not in a good position to support them making heterodox argument significant difficult. Such a condition is generally the source of the frustration at the general lack of argumentative effect that undergirds much of the motivated reasoning literature. Because moral premises are considered foundationally important, providing the weight to an argument, it appears that rational engagement might be impossible.

This cynical theory of argument is laid out most clearly in Moral Foundations Theory (MFT). Graham et al. (Graham, Haidt, & Nosek, 2009) argue that there are five moral foundations for individuals' judgments of proper behavior. They are Harm/Care, Fairness/Cheating, Loyalty/Betrayal, Purity/Degradation and Authority/subversion. Each of the five dimensions receives a unique weight in evaluating moral situations encouraging different moral judgements. While the five foundations do not determine the final disposition of any argument, they provide a "first draft" or initial framework for engaging in moral judgement. These foundations results in "fast, automatic gut-like reactions of like or dislike" which aid determinations of wrong and right (Koleva, Graham, Iyer, Ditto, & Haidt, 2012)

Graham et al. (Graham et al., 2009) have advanced the argument that the foundations distribute along the lines of political ideologies. A series of studies demonstrate that Conservatives tend to use all five foundations while people that identify as liberal tend to use only the Harm/Care and Fairness/Cheating dimensions. In a step further, some research has demonstrated that liberals can come to support conservative polities when they are framed by liberal foundations and conservatives can come to liberal policies when framed by uniquely conservative values.

The source of these preferences are disputed. They may be biological (meaning that conservative or liberal ideologies might be hard wired). More likely, they are learned values that undergird orthodox communities. Consequently, there is the potential that such foundations may act more as peripheral cues linked to the desire to be part of a community. So, conservative argument might simply be the style of one party or the other. Use of the style is a marker that signals which arguments are sanctioned by the community. While there is good evidence that party cues are important to voter behavior.

However, there is evidence that under several conditions, people will listen to elaborated arguments, especially when they occupy familiar and comfortable moral frames. Bullock (Bullock, 2011) has argued that partisans that are well-informed on policy issues may be open to argument frames that are consonant with their moral foundations and may be resistant to party cues. Additionally, people are generally more willing to process information systematically and ignore source cues when they care more about the issue at hand (Nicholson, 2011; Chaiken, 1980; Petty, Cacioppo, & Goldman, 1981).

Moral Foundations Theory problematized heterodox argumentation because it predicts that it will be very difficult to argue with people outside of an orthodox/native community and that people are not equipped to explain the warrants for their foundational arguments. However, there is the potential that one could argue within the terms of the moral-givens of an argument community. While heterodox argumentation is doomed to fail, orthodox strategies might provide some hope. There are two reasons for this. First, people are more comfortable with consonant messages and that when messages match the moral foundation of arguers, that they are viewed as less of an assault and more likely to be accepted (Feinberg & Willer, 2015). Second, the use of a moral frame may indicate that an issue is important and may result in greater and more effortful analysis (Bullock, 2011).

Most of the studies of Moral Foundations Theory have taken arguments as a given whole or framework. In many instances, they are reduced to the use of a few terms laid out in the Moral Foundations Dictionary (Graham et al., 2009) which reduces frames to particular vocabulary terms. However, this semantic reduction may systematically simply the ways that moral foundations work their way into argument. Perhaps, it is possible to construct a more sophisticated notion of argument to better enable the use of moral frames for argument.

2. THE TURNAROUND

The narrow and unsophisticated understanding of argument where arguments are either for one side or another embraced by psychologists encourages cynicism. A more robust construction of argument puts a new spin on the potentialities of argument. This is especially true when arguments are viewed through a debate lens.

As early as the 1940s and by the end of the 1960's debaters grew tired of the traditional paradigm of policy debate that centered on the affirmative defense of a topic. This "Inherency-Harms" debate centered on the intrinsic inadequacies of the current system and the need to replace it with something substantially different. Bernard Brock (1972) located the roots of this traditional paradigm in the seminal work of John Dewey and his propagation of a "problem-solution" approach to decision-making. Brock argued Dewey's notion of a policymaker as an objective judge of facts no longer reflected the policymaking process. In its place, he advocated a "Systems Approach" to decision-making that emphasized the advantages and disadvantages to change rather than the solution to pre-determined objective problems.

Brock initially identified four burdens that debaters would have to meet to show a legitimate comparative advantage over the status quo (Brock, 1967). They would need to demonstrate that the affirmative was consonant with the goals of the status quo, that the plan was compatible with the current system, that the advantages were significant and that they must uniquely spring from the affirmative action (p. 120). In subsequent years, the obligations of an affirmative advantage have generally been reduced and applied to both affirmative and negative justifications. As every novice policy debater learns, dis/advantages must fulfill the burdens of a link, uniqueness and impact where a link is a statement of relevance related to an action, uniqueness is an establishment that the relation comes only or substantially from the action and an impact is a statement of significance or a claim of weight.

Within the systems paradigm, debates revolve around a series of causalities where an action uniquely results in a new (unique) condition (link) which is related to some valenced outcome (impact). This structure and approach to argumentation should be familiar to every novice policy debater and is one of the first things that they learn.

The Link, uniqueness, impact structure of debate creates the opportunity for debaters to selectively appropriate their opponents' arguments to their own end. In academic debates,

such arguments are called "turnarounds." Paczewski and Madsen (1993) write: "Strategically, the turnaround provides a way to coopt an opponent's position, either by accepting the impact arguments as true and reversing the impact or by accepting the impact arguments and reversing the link (p. 17). The two argue that there is a third variety of turnaround, where the terms of an opponent are appropriate and the vagueness of the enthymematic associations means that they can be coopted. They term this appropriation of language a "linguistic turnaround."

This common division of argument has implications for political debates. Whereas Moral Foundations Theory argues that you are either within or without a community of arguers (an orthodox or heterodox position) and that this position determines the potential for success. The ability to selectively appropriate pieces of argument through the turnaround increases the opportunities to engage in heterodox argument situations. It may be that moral foundations' framework approach cannot give a full accounting of what happens in political arguments and that the potential to engage others can be enhanced through a more sophisticated approach to argument structure.

In this next section I will quickly examine two case studies in heterodox and orthodox argumentation. While the first case study demonstrates the variety of argumentation that Moral Foundations Theory predicts will fail, the second offers a scenario where the strategic use of a link-turn diffuses a controversy and enables engagement through argument.

3. CASE STUDIES

From the outside, attempts to remove the General Lee statues in Charlottesville, VA and New Orleans, LA appear to be part of the same movement. In the aftermath of the 2015 shootings in Charleston, SC where an avowed white supremacist killed nine black churchgoers, popular attention turned to removing confederate flags and monuments to public spaces. Both Charlottesville, VA and New Orleans, LA appointed "blue ribbon" panels to review Confederate monuments for potential removal. In both instances, committees recommended the removal of Robert E. Lee monuments that had been installed at the start of the 20th Century.

In Charlottesville, the removal of the monument was spearheaded by Wes Bellamy, Charlottesville's vice mayor. Along with a city counsellor Kristin Szakos, Bellamy called for a "moment of rupture"(Johnson, 2017). In removing the monument, they would "just rip the entire band aid off" and "deal with the issue of race." Bellamy argued that the statues were a reflection of a deep seated white supremacy that systematically ignored the concerns of African American citizens. In an interview, Bellamy observed that white politicians "don't understand the psychological damage that our history has had on us"(Johnson, 2017).

Bellamy's call to remove the monuments was soon placed in a context his advocacy for Black Lives Matter (BLM) protests in Charlottesville, especially his leadership of protests against at restaurant owner that had equated BLM with the Ku Klux Klan. A local Charlottesville paper editorialized that: "Meanwhile, having dropped his matches, Mr. Bellamy is largely responsible for a conflagration that continues to escalate. And we see no sign that he is attempting to use his influence to mitigate the damage ("Counsellor should", 2016).

Bellamy's aggressive approach probably would not have been noticed if not for Jason Kessler. Within a month of Bellamy's and Szakos' press conference, the white supremacist and activist had labelled Bellamy as "anti-white" and had started a petition for his removal. During the petition campaign, Kessler unearthed some lewd messages that Bellamy had

tweeted that caused him to be removed from his job at a local school (Higgins & Dodson, 2016).

After failing at the recall petition, Kessler organized a small protest at the Lee statue that was marked by a torch-lit parade. In August, he helped to organize a larger protest of united white supremacist and right-wing groups labelled "unite the right". The August protest drew a few hundred participants and nearly a thousand counter-protesters. The march and speeches were marked by running skirmishes and tragically the death of one counter-protestor. Speaking of the rationale for the protest, Kessler said: "We have a serious double-standard in this community and across this country where people who are white are not allowed to advocate for their own interests.…There is no one who is protecting white people, and that's absolutely unacceptable… If people really care about diversity, if they really care about values like equality, you have to be allowed to have white people advocate for their own interests"(reports, n.d.).

There are two interesting takeaways from the Charlottesville example. Arguments for both side are orthodox. They exist to speak to the interests of each constituency. Whereas the Bellamy rhetoric relies on harm as a primary value. This harm value is unlikely to appeal much beyond that constituency according to MFT. On the other side, Kessler's appeals are to fairness, loyalty, and tradition, which are broader themes likely to appeal to conservatives. In either instance, the frames are competitive in that one either must ignore white objections or take them seriously. In the process, Kessler systematically ignores Szakos as an advocate (a white woman) and scapegoats Bellamy as the source of anti-white ideology. Faced with silencing arguments, there is little room for compromise.

The New Orleans examples is a little bit different. New Orleans does not have the overt history of massive resistance that characterizes Virginia. Additionally, Lee had only a peripheral role in New Orleans history. Also, because New Orleans is a majority African American city, there has been more ambivalent support for Civil War monuments and a greater willingness to alter and adapt them to contemporary circumstances.

In the wake of the Charleston shooting, jazz legend Wynton Marsalis and Mayor Mitch Landreiu called for removal of several monuments and renaming of several squares. Central to their campaign was removal of the Lee monument. Marsalis argued in the New Orleans Times-Picayune: "When one surveys the accomplishments of our local heroes across time from Iberville and Bienville, to Andrew Jackson, from Mahalia Jackson, to Anne Rice and Fats Domino, from Wendell Pierce, to John Besh and Jonathan Batiste, what did Robert E. Lee do to merit his distinguished position? He fought for the enslavement of a people against our national army fighting for their freedom; killed more Americans than any opposing general in history; made no attempt to defend or protect this city; and even more absurdly, he never even set foot in Louisiana. In the heart of the most progressive and creative cultural city in America, why should we continue to commemorate this legacy?"(Marsalis, 2015).

Landrieu used this same approach in his speech on the issue at Gallier Hall. He noted that the history depicted by statues was a sanitized and political history that ignored the bulk of New Orleans history. He then moves the argument toward issues of patriotism and loyalty. He notes, "we can more closely connect with integrity to the founding principles of our nation and forge a clearer and straighter path toward a better city and a more perfect union." He notes that removal of the monuments reflects loyalty to higher powers: "In our blessed land we all come to the table of democracy as equals. We have to reaffirm our commitment to a future where each citizen is guaranteed the uniquely American gifts of life, liberty and the pursuit of happiness." He finishes with an overt appeal to American patriotism:

> we are one nation, not two; indivisible with liberty and justice for all... not some. We all are part of one nation, all pledging allegiance to one flag, the flag

of the United States of America. And New Orleanians are in... all of the way. It is in this union and in this truth that real patriotism is rooted and flourishes. Instead of revering a 4-year brief historical aberration that was called the Confederacy we can celebrate all 300 years of our rich, diverse history as a place named New Orleans and set the tone for the next 300 years ("Transcript", 2017).

Rather than indicting the supporters of the monument as wrong-headed and rejecting their claims of loyalty and patriotism in their support for the monument, Marsalis and Landrieu appropriate the impact of the argument and embrace loyalty and patriotism as positive values. What they do is invert the link. The support for the historical monuments becomes a rejection of American patriotism. This value can only be achieved by removing the monuments and replacing them with something more representative.

4. IMPLICATIONS

It is unlikely that Mitch Landrieu's speech would have held the day in Virginia where the attachment to the Confederacy and General Lee are stronger and there is a history of massive resistance. However, it is clear that the attempts to win the day in Charlottesville were impossible in a world where one has to engage heterodox communities. Here, Moral Foundations Theory and systematic approaches to argumentation reveal a few dynamics of heterodox argument.

First, in heterodox situations, any attempt to turn the impact (to demonstrate that one impact super-cedes another) is a recipe for escalation rather than de-escalation. Motivated Reasoning theory predicts that dissonant messages receive much more attention than more consonant iterations and that people are better at making defensive arguments rather than offensive arguments designed to engage an opponent. The rejection statue supporters were more likely to receive strong responses in defense of the ideology. More overt and face denying rejections would receive more negative attention and arouse more negative affect.

This is borne out in the Charlottesville example where Bellamy and Szakos were more interested in creating a 'rupture" than engaging opponents. Their overt rejection of the legitimacy of any counter-argument was likely to gain more attention than would be more conciliatory attempts. Additionally, the fact that Bellamy and Szakos' argument relied on impacts related to MFT's harm foundation (rooted in the damage that the statues did to the African-American community) also predicts that they would be rejected by conservative thinkers for whom such considerations are inherently less important.

To the contrary, Marsalis and Landrieu did not so much reject the existence of opponents or their concerns or frameworks so much as attempt to co-opt them. Their acceptance of their opponents' impact enabled them to turn the link. In short, they concede that loyalty and patriotism were supremely important but also pair it with the link claim that the statues stand in the way of a true "patriotism" located in a combination of parochialism and diversity and historical diffusion. The appropriation of conservative values would help to reduce the attention that the argument would receive from opponents and increase the risk that people would attend to the policy claim. In short, they helped to turn moral dumbfoundary to their advantage by accepting the thing that was mostly likely to result in a purely affective response.

A second insight has to do with the utility of Moral Foundations Theory. Typically, as most motivated reasoning theories, MFT is used to indict the potential for argumentative engagement. The idea is that conservative and liberal thinkers occupy largely independent value spheres. As with many motivated reasoning theories, this indicates that argument is

impossible in heterodox situations. However, a more nuanced approach to argument indicates that the foundations also offer opportunities for engagement. There is evidence that morally reframed arguments can make a difference (Voelkel & Feinberg, 2017). Making the parameters of orthodoxy clear also means that the manners of appropriation become available. Here, the intransigence of impact arguments opens opportunities at the link level.

Finally, Moral Foundations Theory has implications for the study of argument. While such motivated reasoning theories typically throw up their hands at the potential for change, this theory indicates that teaching argument and debate are more radical acts than they appear. To the extent that argument and debate embrace the harm mindset and largely reject ideologically or authority-based arguments, argument and debate are in the business of creating politically liberal thinkers. Attention to arguments regarding degrees of harm and emphasizing care for others are exactly the kind of thinking favored by liberals.

Presentational choice in *ad populum* argumentation

HENRIKE JANSEN & MAARTEN VAN LEEUWEN

Leiden University Centre for Linguistics (LUCL)

h.jansen@hum.leidenuniv.nl & m.van.leeuwen@hum.leidenuniv.nl

ABSTRACT: *Ad populum* appeals are regarded as a weak type of argument. We therefore expect that arguers do not use them in a 'blatant' form, but make use of 'presentational devices' to present these arguments in a disguised way. In this paper, we present the results of an analysis of *ad populum* arguments by the Dutch populist politician Geert Wilders. Four stylistic means are discussed allowing Wilders to deny commitment to such an argument.

KEYWORDS: *ad populum* argument, presentational device, symptomatic argument, disguised presentation, commitment

1. INTRODUCTION

In this paper research will be reported that has been carried out on the actual use of the *argumentum ad populum*, i.e. on the ways it is linguistically presented in real discourse. See below some examples of how an *ad populum* argument is described in the literature:

- Because many, most, all people accept a certain belief or approve of a certain course of action, we have sufficient reason to accept that belief as true or that course of action as right. (Freeman, 1995, pp. 267-268)
- Everybody (in a particular reference group, G) accepts A. Therefore, A is true (or you should accept A). (Walton, 1999, p. 200)
- Everyone believes P; therefore P is true. (Johnson & Blair, 2006, p. 176)
- It is widely held among S that P, therefore, P is true. (Godden, 2008, p. 107)

All these descriptions of an *ad populum* argument mention a premise saying that a lot of people have the same view on some matter and a standpoint concluding that this view must therefore be regarded as correct. In other words, the line of reasoning of an *ad populum* is that the popularity of an opinion is taken to be an indication of the acceptability of that opinion. The class of *ad populum* arguments should therefore be considered as a subtype of the class of symptomatic arguments – arguments in which the premise-content presents a sign of the standpoint-content. The specific rationale behind this subtype is the idea that if so many people think the same, this should be taken as a sign that what they think cannot be wrong (Nolt, 1984, p. 250).

In argumentation theory, an *ad populum* argument is regarded as a bad argument. For instance, Johnson and Blair (2006, p. 177) call it an "outrageous" fallacy. And when this argument is not regarded as fallacious due to contextual circumstances, it is still regarded as a very weak argument, as is argued by Walton in his monography *Appeal to Popular Opinion* (1999). For this reason, it is to be expected that *ad populum* arguments are used in a disguised way. This expectation is also supported by Johnson & Blair's remark that it is not very likely that *ad populum* arguments are used in the way they have described the argument: "(…) the fallacy of popularity rarely occurs in such a blatant form. You often have to dig below the surface to find it" (*ibidem*). There has been hardly any research, however, addressing the

question of how *ad populum* arguments do occur in actual discourse. A small exception is Jansen (2018), presenting a short explorative inventory of referrals to 'the will of the people' used by the Dutch populist politician Geert Wilders, who has been characterized by political scientists as a 'textbook example' of populism (Pauwels, 2014, p. 118; Vossen, 2016). According to Jansen's (2018) inventory Wilders could not be held committed to an explicit line of reasoning displaying the type of *ad populum* argument of which we showed descriptions above.

Following Jansen (2018), we are interested in the actual use of *ad populum* arguments and will give a further report on the ways in which these arguments are formulated in argumentative discourse. We will present the results of a systematic analysis of all appeals to the people in 29 texts by Geert Wilders. In our analysis we distinguished four stylistic characteristics of the ways in which Wilders formulates his *ad populum* appeals. We regard these characteristics as 'presentational devices' that can entail a strategic presentation of an argument (cf. van Eemeren, 2010). It is argued that these presentational devices entail a disguised presentation allowing Wilders to evade explicit commitment to the line of reasoning conveyed in an *ad populum* argument.

2. CORPUS ANALYSIS

In order to investigate how *ad populum* arguments occur in actual argumentative discourse, we have systematically analyzed a corpus of texts from the Dutch populist politician Geert Wilders. The corpus contains 29 texts, covering the period of August 2015 until November 2016. The texts were taken from the website pvv.nl – the website of Wilders's political party, the Party for Freedom (PVV). They include speeches presented to followers and likeminded people, an interview, contributions to parliamentary debates and three tweets. The corpus also contains the written versions of the speeches held by Wilders when he made use of his right to speak in a legal case that was directed against him. This was the second case against Wilders, which was occasioned by statements expressing the wish to have fewer Moroccans in the Netherlands. In December 2016 Wilders was convicted on grounds of insulting a group of people and inciting discrimination.[1]

Our corpus analysis concerns any reference in these texts to a group of people.[2] A first result of the analysis is that not all of these references are an instantiation of an *ad populum* argument. Some references to 'the people' don't have a clear argumentative function or they are part of 'regular' symptomatic argumentation – as is the case in (1):[3]

> (1) Dutch democracy is going through a difficult patch. Citizens are having less and less confidence in politics and don't agree with the decisions taken by the Second Chamber.

---

[1] Wilders and his lawyers disagree with this verdict and have brought the case to a court of appeal. The appeal case started in May 2018 and was not finished at the time of submitting this paper.

[2] Following the criteria described in van Leeuwen (2015, pp. 109-110), these references included: references to people or groups of people in society, references to *the Netherlands* when used metonymically to stand in for Dutch citizens, and impersonal pronouns like *everyone* or *nobody* when the context indicates that these words refer to citizens.

[3] An example of a reference to the people lacking an argumentative function is the following fragment: "What a historic day it was, last Thursday 23 June 2016. The UK chose for Brexit, for independence (…). And everyone in Europe saw it. Millions of people feel strengthened by this." (Geert Wilders's contribution in the parliamentary debate after the Brexit referendum result, pvv.nl, June 27, 2016, https://www.pvv.nl/index.php/36-fj-related/geert-wilders/9203-inbreng-geert-wilders-debat-over-brexit.html.)

In fragment (1) the people's opinion is expressed in the second sentence and concerns the citizens' decreasing confidence in politics and their disagreement with the decisions taken by the Second Chamber. This referral functions as a premise supporting the standpoint, expressed in the first sentence, that Dutch democracy is going through a difficult patch.[4] This is not an *ad populum* argument, because the standpoint does not contain an opinion that corresponds with the opinion of the people referred to in the premise. In other words, the opinion expressed in the standpoint and the people's opinion expressed in the premise are not the same. If it were an *ad populum*, the standpoint would have to be something like 'The decisions taken by the Second Chamber are wrong'. The argument conveyed in (1) is a 'regular' symptomatic argument, in which the premise is a sign or indication of the state of affairs that is mentioned in the standpoint:

1   Dutch democracy is going through a difficult patch
1.1   Citizens don't agree with the decisions taken by the Second Chamber
(1.1'   If citizens don't agree with the decisions taken by the Second Chamber, this indicates that Dutch democracy is going through a difficult patch)

Our systematic argumentative analysis of references to 'the people' in the corpus yielded 20 *ad populum* arguments. A detailed analysis of these cases confirms our expectation: Wilders's argumentation does not reveal any explicit case of an *ad populum* argument being formulated in one of the ways in which such an argument is described in the literature. Wilders makes argumentative appeals to the opinion of the people in many different ways, but never with an explicit line of reasoning saying that a standpoint should be accepted because a lot of people hold that standpoint. Wilders, who is – paradoxically – known for his clear language and even won prizes for this (cf. van Leeuwen, 2014, p. 228), can be regarded as a master of vague, unclear and most of all implicit language when his argumentation is concerned. As a result, it is often difficult to hold him responsible for the line of reasoning ascribed to an *ad populum* argument. We will demonstrate this by presenting four types of stylistic choice being characteristic for Wilders's formulation of such an argument.

A first stylistic characteristic of Wilders's unclear presentation of *ad populum* arguments is that he hardly ever expresses an argumentative relation between his mentioning of a group of people and a standpoint. This is directly related to a more general problem with Wilders's argumentative language: his texts are compiled of all sorts of statements, but there is very little indication of how these statements are related – argumentative indicators are systematically lacking. And when discourse markers actually *do* occur, they often cause more problems for the interpretation than that they solve them. For this reason, Wilders's texts lack clear and transparent lines of argumentation. At the same time these texts often seem to be argumentative, because they do contain statements that can be interpreted as standpoints. It is only through context, co-text, background information and the strategy of maximal argumentative interpretation (van Eemeren, Grootendorst and Snoeck Henkemans, 2016) that arguments can be distinguished for these standpoints.

A relatively unproblematic case in which we identified an *ad populum* is example (2). In this text Wilders comments on the outcome of the British referendum on the Brexit, which is evident from the first lines:

(2) Thursday June 23, 2016 will go down in history as Independence Day. The europhile elite has been defeated. Great Britain is showing Europe the path to the future and

---

[4] Strictly speaking, the referral to the citizens can be regarded as two premises constituting coordinatively compound argumentation: (a) citizens are having less, and less confidence in politics and (b) don't agree with the decisions taken by the Second Chamber.

to liberation. It is time for a new start now, relying on our own strength and sovereignty.

A recent poll of [the Dutch news programme] EenVandaag [OneToday] shows that a majority of the Dutch people want a referendum on EU-membership, and that there are even more Dutch people who favour an exit instead of a remain.

The Dutch people deserve a referendum too. The Freedom Party therefore demands a plebiscite on a NExit, a Dutch EU exit.[5]

Unlike most other instances of Wilders using *ad populum* argumentation, this text does actually contain an argumentative indicator, which is 'therefore' in the last paragraph. This indicator makes it likely that the part of the sentence following this indicator is the standpoint, while the preceding part of the sentence functions as an argument for this standpoint. The *ad populum* argument covers the whole second paragraph and consists of coordinative compound argumentation because of the word 'even'. The *ad populum* seems to support the argument of the last paragraph – i.e. that the Dutch people deserve a referendum too – which turns this argument in a sub-standpoint:

1	There should be a plebiscite on a NExit, a Dutch EU exit
1.1	The Dutch people deserve a referendum
1.1.1a	A majority of the Dutch people want a referendum on EU-membership
1.1.1b	More Dutch people favour an exit instead of a remain
1.1.1a/b.1	This is shown by a recent opinion poll carried out by EenVandaag

Content-wise, the above reconstruction makes sense. However, it still contains some difficulties. Firstly, there is no argumentative indicator connecting the referral to the will of the people to a standpoint (cf. the standard descriptions of *ad populum* in the literature discussed in the Introduction). This is even more problematic because the *ad populum* appeal occurs in another paragraph than the one containing the standpoint. A last difficulty is that one may doubt whether the last sentence of the first paragraph – starting with "It is time now for a new start…" should not be considered as the standpoint as well, meaning that the Netherlands should make a new start by leaving the EU.

A second characteristic of Wilders's presentation of *ad populum* arguments is represented by cases in which the standpoint remains completely implicit. This can be illustrated by the following tweet, which comments on the fact that Wilders was prosecuted for his 'fewer Moroccans' statement:[6]

(3) Tweet @geertwilderspvv: prosecuted for what millions of people think. #political process #fuckoff

In our opinion, the standpoint that Wilders adopts in (3) can be interpreted in two ways. A first interpretation is the prescriptive standpoint 'I should not be prosecuted for my 'less Moroccans' statement'. This interpretation results in the following reconstruction:

(1	I should not be prosecuted for my 'fewer Moroccans' statement)
1.1	Millions of people think what I said
(1.1'	If millions of people think what I said, I should not be prosecuted)

[5] 'PVV congratulates the British with Independence Day!', pvv.nl, June 24, 2016, https://pvv.nl/36-fj-related/geert-wilders/9201-pvv-feliciteert-britten-met-independence-day.html.

[6] We chose this example because a tweet is conveniently short, but the corpus also contains examples of this characteristic in other text types.

The second interpretation – incited by the hashtag title – concerns the evaluative standpoint 'This is a politically motivated lawsuit'. This interpretation entails the following reconstruction:

(1   This is a politically motivated lawsuit)
1.1   I am prosecuted for what millions of people think
(1.1'   If millions of people think what I said, this indicates that this lawsuit is politically motivated)

It depends on the interpretation of the standpoint whether the reference to "what millions of people think" can be labelled as either an *ad populum* argument (in the first interpretation) or as a 'regular' symptomatic argument (the second interpretation). In the first interpretation, the standpoint that Wilders should not be prosecuted for his 'fewer Moroccans' statement is supported with reference to the opinion of a lot of people. The standpoint thus contains an evaluation of the opinion of a lot of people that is put forward in the premise: because a lot of people want fewer Moroccans in the Netherlands, this opinion cannot be liable to punishment. In the second interpretation, the standpoint does not conclude anything about the opinion of a lot of people presented in the premise. It just uses this opinion in order to support the standpoint that the lawsuit against Wilders is politically motivated.

A third way in which Wilders's presentation of an *ad populum* argument deviates from the standard conception of this argument concerns the choice of an atypical verb. In the standard definitions of *ad populum* arguments that we presented earlier, the premise always clearly indicates that people have an opinion:

- Because people *accept a certain belief* or *approve of* a certain course of action, we have sufficient reason to accept that belief as true or that course of action as right
- Everyone *believes* P, therefore P is true
- Everybody *accepts* P. Therefore, A is true (or you should accept A)
- It is widely *held among* S that P therefore, P is true

In our corpus, we did indeed find verbs that are suited for indicating an opinion, like *think, want, say yes/no, be in favour of*. But we also encountered verbs that do not necessarily refer to an opinion, such as *be sick to death, realize, trust*, *see* and *understand*. In the context of an appeal to the people, however, these verbs seem suitable for implying or presupposing an opinion, like in (4):

(4) My heart bleeds when I see what kind of wrong choices this cabinet is making, my heart bleeds when I see what is happening with our elderly people. Every day we receive e-mails from people who need our help, but who are left to fend for themselves. People who do not *understand* why the cabinet gives things for free to asylum seekers and not to them. And I support them. It is unconceivable, it is unacceptable, it is disgraceful. [5c]

We analyzed this example in the following way:

1   It's unconceivable, unacceptable and disgraceful that the cabinet gives things for free to asylum seekers and not to people who need help
1.1a   People do not understand it
1.1b   I support them

In (4), Wilders uses an *ad populum* argument to defend his claim that it is disgraceful that asylum seekers get something for free and Dutch people don't. He defends this standpoint by claiming that people "do not understand it". The semantics of the verb 'understand' do not necessarily contain an opinion: if one does not understand something, this does not automatically imply that one *disagrees* with it.[7] In fact, if one does not understand something, one cannot even know whether one agrees with it or not, because agreement presupposes understanding. However, this is the meaning of 'understand' in a literal sense, used in a context that one does not understand something because it is difficult or complicated. Instead, Wilders attributes this verb in (4) to a group of people in a context where the object of the verb consists of something negative. In (4) the object of understanding does not consist of something difficult, but of something that gets a negative evaluation, i.e. a practice that is called disgraceful. In this a context, not understanding something means having a negative opinion about it.

A fourth characteristic of Wilders's presentation of *ad populum* arguments is the use of a construction by means of which the verb that indicates the people's opinion is left out. This concerns formulations like: '*in the name of [the people]*', '*on behalf of [the people]*' or '*together with [the people]*'. These formulations present another deviation from the standard line of reasoning attributed to an *ad populum* argument, as is illustrated with example (5), taken from Wilders's parliamentary contribution to the General Debate of 2015:[8]

> (5) I say to you all: you are not the Netherlands. The heart of the Netherlands is no longer beating in this hall [the Second Chamber]. The real heart of the Netherlands is beating outside this building, where the Dutch people are, where our people live. That is the real Netherlands. In the name of all those millions of people that you no longer represent, I say this:
>
> (…)
> Stop that Islamic invasion.
> And please let the Netherlands remain the Netherlands.

In this excerpt, Wilders presents himself as the mouthpiece of his followers, who are represented as the 'true' people. The referral to the "millions of people that you do not represent anymore" seems to have an argumentative function, but this is neither indicated by an argumentative indicator, nor by a verb expressing (or implying) an opinion. Wilders does not say that the people have a certain opinion, but by using the construction 'in the name of', he *implies* that the "millions of (Dutch) people" he is referring to, share his standpoints that are listed below the brackets ("Stop the Islamic invasion. And please let the Netherlands remain the Netherlands"). In our opinion, therefore, fragment (5) can be reconstructed as follows:

1	Stop the Islamic invasion. And please let the Netherlands remain the Netherlands
1.1	I say this in the name of millions of people (that you no longer represent)
(1.1'	If I say X in the name of millions of people (that you no longer represent), then X should be accomplished)

Up till now we discussed four stylistic means of Wilders presenting an *ad populum* argument: lack of argumentative indicators, leaving the standpoint implicit, use of an atypical verb and

---

avoiding a verb expressing an opinion by using a construction. It should be stressed that we have discussed these characteristics in isolation, for sake of clarity. In many cases though, the vagueness and implicitness of Wilders's *ad populum* appeals is the result of a *combination* of two or more of these stylistic techniques. This can be demonstrated with example (6), taken from one of Wilders's speeches held in the legal case that was directed against him after his 'fewer Moroccans' statement:

(6) I am being prosecuted because of my words. Whereas I didn't say anything wrong. Fewer Moroccans, fewer Syrians, fewer Mexicans, fewer Russians, I don't see why that is liable to punishment. But if Turkish members of parliament call me a cancer that needs to be combatted, and compare me to Hitler, then there is no consternation, no massive reporting of a crime with pre-printed forms, no prime minister who cries out against it, and no prosecutor who comes into action. In what country do we live.

But I speak on behalf of millions of Dutch people. And I will continue doing that. It is my duty as a representative of the people. And it is my right. It is a travesty that I am standing here in front of you [i.e. the judge] today.

Fragment (6) poses many problems for the analysis. For a start, it contains the adversative indicator 'but' two times, but in both cases it is not immediately clear what the antithesis amount to. The first 'but' seems to contrast the condemnation of Wilders's words on the one hand and the lack of condemnation with regard to similar words spoken by other politicians on the other hand. Wilders suggests that double standards are applied with respect to prosecuting politicians. Pointing out this inconsistency may support the last sentence of this first paragraph, which indirectly states that we live in a terrible country. The second 'but', introducing the referral to the people, may then implicitly address the politicians (and other 'elite' persons) behaving in the inconsistent way as is sketched in the preceding text. It may be meant to suggest that the people with their inconsistent behaviour are not backed up by millions of people, in contrast to Wilders himself.

Could a line of argumentation be discerned in the above text? The final sentence gives the impression that a standpoint is expressed: 'It's a shame that I am standing here today'. As this standpoint is part of a paragraph also containing the referral to the people, there may be reason to conclude that the latter functions as a premise supporting the first. But how does the argumentation run? Argumentative indicators are absent and an explicit referral to the people's opinion is absent due to the construction 'on behalf of'. We do know, however, on the basis of background information, that Wilders has often stated to be in favour of sending Moroccans back to their home country by declaring that a lot of people are fed up with Moroccans causing trouble. This allows for an interpretation of (6) in which Wilders uses an argument saying that it is a shame that he has been brought to court for expressing an opinion that is shared by millions of people. Or in other words, that it should be allowed to express a wish for fewer Moroccans (and thus not be prosecuted for that), because a lot of people think that there should be fewer Moroccans.

The above analysis entails an *ad populum* argument. But the analysis should be extended, because Wilders also refers to his role as a political representative. He states that it is his right and duty to voice the opinion of the people he represents. This addition seems to anticipate criticisms directed to an *ad populum* argument, i.e. criticisms saying that the amount of people having a certain opinion does not guarantee the correctness of that opinion. Wilders's addition can be analyzed as a second element in coordinative compound argumentation addressing this kind of criticism, as is shown in the reconstruction below (the implicit elements have been put between brackets):

1	It is a travesty that I am standing here today
(1.1	I should be allowed [i.e. not be liable to punishment] to express a wish for fewer Moroccans)
1.1.1a	I speak in the name of millions of Dutch people
1.1.1b	It is my duty and right as a representative to voice the opinion of millions of Dutch people
(1.1.1c	Millions of Dutch people want fewer Moroccans)
(1.1.1a-c'	If a representative voices the opinion of millions of people wishing fewer Moroccans, then it should be allowed [i.e. not be liable to punishment] to express a wish for fewer Moroccans)

The unexpressed premise 1.1.1a-c' makes clear that Wilders's anticipation to criticisms does not render his argument into a reasonable one. In the Netherlands, politicians are certainly liable to punishment if they transgress the boundaries posed by the law, even if they represent the feelings and wishes of their supporters. These boundaries may indeed be loosened up on the basis of majority vote, but only after a democratic process leading to an adaptation of the relevant legal rules. Thus, the fact that Wilders acts as a political representative does not legitimize everything he says.

In the reconstruction of (6) so far, the first paragraph has no role. One could think, however, that this paragraph contains two arguments as well. Firstly, the beginning of the first paragraph – Wilders stating that he did not say anything wrong – could contain another argument for the standpoint that it is a travesty that he has been brought to court. Secondly, Wilders's suggestion that double standards are applied with respect to his prosecution (as is indicated by the remark that other politicians saying controversial things have not been prosecuted) could also be reconstructed as an argument for this standpoint. Such an analysis – which is purely based on considerations regarding the content – entails the reconstruction below, which is an elaboration of the one above:

1	It is a travesty that I am standing here today
1.1	I didn't say anything wrong
1.1.1	I don't see why saying fewer Moroccans, fewer Syrians, fewer Mexicans, fewer Russians is liable to punishment
(1.2	Double standards are applied when it comes to my prosecution)
(1.2).1	If Turkish members of parliament call me a cancer that needs to be combatted, and compare me to Hitler, then there is no consternation, no massive reporting of a crime with pre-printed forms, no prime minister who cries out against it, and no prosecutor who comes into action
(1.3	I should be allowed to express a wish for fewer Moroccans)
1.3.1a	I speak in the name of millions of Dutch people
1.3.1b	It is my duty and right as a representative to voice the opinion of millions of Dutch people
(1.3.1c	Millions of Dutch people want fewer Moroccans)

The above two reconstructions of (6) illustrate how a combination of stylistic factors makes it hard to pin down Wilders's *ad populum* appeals. Analysis problems are the result of a combination of stylistic factors. Not only is an argumentative indicator linking the *ad populum* argument to a standpoint missing, but this (sub-)standpoint ((1.1) in the first reconstruction and (1.3) in the second) is left implicit as well. Moreover, an explicit referral to the content of the people's opinion (1.1.1c/1.3.1c in both reconstructions respectively) is also absent as a result

of using the construction 'on behalf of'. Our reconstruction thus shows that even the *ad populum* appeal *itself* can be left implicit. Such an (implicit) presentation is quite the opposite from how *ad populum* arguments are described in the literature.

3. CONCLUSION

The aim of this paper was to explore how *ad populum* arguments are presented in actual argumentative discourse. To this end, we presented a case study of how the Dutch populist politician Geert Wilders formulates *ad populum* arguments. In line with our expectation, the analysis did not reveal any instance of an *ad populum* argument as it is defined in the literature. Instead, we often had to "dig below the surface" to find appeals to popularity – to use Johnson & Blair's terminology (2006, p. 177). Although Wilders is well known for using 'clear language', from an argumentative perspective his discourse is often vague and hard to interpret. Wilders never presents *ad populum* arguments in a clear and explicit way.

We highlighted four stylistic factors in Wilders's discourse contributing to a disguised presentation of *ad populum* arguments: 1) leaving out argumentative indicators; 2) leaving standpoints implicit; 3) using atypical verbs, i.e. verbs that do not intrinsically refer to an opinion but can be used to imply such an opinion; and (4) using constructions which enable an arguer to leave out the verb that indicates the people's opinion. Wilders presents his *ad populum* arguments often by using a combination of these techniques, which makes that Wilders's *ad populum* arguments are often presented in a disguised way. Strikingly, our corpus analysis also revealed instances of *ad populum* appeals in which the *ad populum* appeal is left completely implicit (see the discussion of fragment (6)).

Some strategic advantages are connected to the presentational means used by Wilders to formulate an *ad populum* argument. In cases where argumentative indicators are absent and/or the standpoint is left implicit, arguers can claim that they only wanted to stress what people's opinions are and nothing more, thus denying commitment to an *ad populum* argument. In cases where an atypical verb is used for referring to the opinion of a group of people, it is not only less obvious that an *ad populum* argument has been used, but such a verb can also have the strategic effect of presupposing this opinion as true. For instance, a statement like "people understand that the deal with Turkey is not a solution" implies that it is generally agreed upon that this deal is not a solution. Finally, by using a construction like 'In the name of [the people]', politicians can deny commitment because they can easily say that as an elected representative they should mention the opinion of the people that they represent. By using such a construction, a politician can maintain that the opinion put forward is not necessarily *his* opinion, but that it is his duty to act as a mouthpiece. Moreover, these constructions are also strategic in that they presuppose that the people referred to share the politician's opinion.

Our research has shown that Wilders presents his *ad populum* arguments very differently from how this type of argument is described in the literature. In order to get a better grasp of their actual use and strategic presentation, we aim to further explore the discourse of Wilders and of other (populist) politicians.

Causal patterns for justifying historical explanation. Causation in P.C. Hooft's *Dutch History* (1642)

JEROEN JANSEN

University of Amsterdam
The Netherlands
j.jansen@uva.nl

ABSTRACT: The practice of justifying historical explanations generates causal patterns in which several types of arguments play a role. This paper is aimed at identifying some of such causal patterns on the basis of an exploration of the institutional conventions regarding the nature and the shape of historical explanations as reflected in the *Dutch History* (1642) by Pieter Hooft. Causal patterns can unveil bias, prejudice and strategic aims, as well explain why a text may be (or has been) interpreted in a specific way.

KEYWORDS: abduction, causal patterns, causation, Early Modern historiography, P.C. Hooft

1. INTRODUCTION

Causal relationships are essential to establishing historical explanations (Tapp, 1952; Carr, 1964; Keil & Wilson, 2000). These explanations are a fundamental part of historiography, as historiographers not only use linguistic tools to respond to events emotionally (cf. Broomhall, 2013), but also causation as to select and assess different explanations of historical facts. This paper aims at providing an analytical tool to identify the way in which Dutch seventeenth-century historiography supports its claims with different causal patterns. My aim is to describe the prototypical causal patterns that arise when historiographers provide such a justification for their explanation of a memorized fact or a set of facts.

It has been assumed that historical genres, such as medieval chronicle-like narrative, use causation that simplify cause-and-effect, account genres that are not specifically capable of integrating a multiplicity of simultaneously occurring factors and outcomes: "Something happened and then something else happened *because*..." (Benson, 1972, p. 82). These narratives are focused on more immediate causes neglecting long-term, background reasoning. This article explores causal patterning in an intermediate phase between medieval and eighteenth-century account, a period as well between at the one hand chronicles and annals and at the other the contribution by 18th-century empirical theorists like David Hume. It focuses on Dutch humanist historiography, of which the most important representatives are the `world-famous' Neo-Latinist Hugo Grotius and the pre-eminent Dutch poet, playwright, and historian Pieter Hooft, who's *Nederlandsche Historien* (1642), the `Dutch History' (DH), will be in the centre (Haitsma Mulier, 2003, p. 43). This prose text is argumentative throughout. At the beginning of his book Hooft expresses as his cardinal aim to give advices to a current generation of local and state governors, as a school for politics and state administration. He considers it valuable for the `instruction of princes and nations' as well.[1] But most of all, he intends his historiography (which

---

[1] Hooft, 1972, p. 3. Like Grotius, Hooft regarded historiography a "direct instrument for ruling in the hands of the government itself. Crucial to the working of this instrument is the statesman-historian's sharp perception of the real

is not without reason in Dutch, not in Latin) to be read and used by his fellow-countrymen. Hooft tries to get his advices accepted by his readers. He underpins them by examples from recent history, i.e. the Dutch Revolt against Spain (argument by `example).

In section 2 of this paper, I explore the institutional conventions that shape this way of supporting historical claims and provide a causal pattern for justifying historical explanations. This analytical tool, build for historical texts from the Early Modern period, will be tested in section 3. Here, after a short introduction of Hooft's *Dutch History*, an analysis of text fragments will indicate how the causal patterns work in practice. In section 4 I will discuss and evaluate my findings and indicate which causal patterns can be identified within the historiographic domain. The importance of this finding is twofold: the design of an argumentative tool for the analysis of Early Modern historiography, as well as the application of this tool in a significant Dutch treatise, of which the analysis has been neglected for a long time.

2. JUSTIFYING HISTORICAL EXPLANATIONS

In her study *Historical Discourse. The Language of Time, Cause and Evaluation* (2006), Caroline Coffin discusses causation as a value of educational linguistics and as an important part of the learning and teaching of history in secondary schools. In her opinion, there are some important classifications to be identified: historiography distinguishes between linear cause-effect chains and non-linear (factorial or consequential) explanation. A linear cause-and-effect chain involves chronological narrative in which cause and effect have a one-to-one correspondence. The non-linear variant is a more complex, analytical model in which short- and long-term causes and consequences operate across social, political and economic domains (Coffin, 2004, p. 263). The goal of factorial explanation is to explain the (supposed) reasons leading to a particular historical outcome by the sequence identifying a historical outcome - elaborating causes of historical outcomes - emphasizing key factors. A consequential explanation explains the consequences or effects of a historical event.

Early Modern historiography may be assumed to be predominantly narrative. In a narrative model, linear cause-and-effect operates relatively simply and mechanistically, with a focus on human agency and specific historical events. The analytical form of causation, in which cause-and-effect chains are dominated by abstract, nonhuman forces (like external economic and social causal processes), is presumed to be extremely rare in historiography before the eighteenth century. As our focus is on Early Modern historiography, a more and different detailed classification of cause-and-effect is desirable. Moreover, the distinction by Coffin is not fully indicative for the way in which causal patterns can justify historical explanations. Stone has distinguished conditions that make an event possible (`preconditions') from conditions that make it probable (`precipitants') or necessary (Stone, 2002, pp. 58ff; cf. Lorenz, 2007; Froeyman, 2009). Translated into a pragma-dialectical approach to argumentation, which regards argumentation as a complex speech act that occurs as part of natural language activities and has specific communicative goals (Van Eemeren & Grootendorst, 2004) the argumentative pattern for justifying historical explanations runs like table 1. Statements of particular facts are the premises here (Wagemans, 2015; Walton, 1999, p. 243). The standpoint in factorial explanation is that we may assume that a particular historical outcome is the case, in consequential explanation that a specific effect has been established.

---

historical motives and causes" (Waszink, 2008, p. 97). See below.

Table 1. Causal argumentation for justifying historical explanations[2]

1 We may assume that a particular fact is the case (standpoint)
      1.1   It is observed that a (set of) particular fact(s) is the case
            1.1'   If it is observed that a (set of) particular fact(s) is the case, then we may
                      assume that a particular fact is the case
               1.1'1 Y causes Z
                      1.1'.1.1a   Y is a necessary cause of Z
                      1.1'.1.1b   Y is a sufficient cause of Z
                              1.1'.1.1b1   Y is the most likely cause of Z
                              1.1'.1.1b2   Y is a probable cause of Z
                                1.1'.1.1b3   Y is a possible cause of Z

It may be a true historian's task to put an argument or justification (1.1) to the historical account, as his purpose may be "to justify a particular representation of the past against other possible representations" (Megill, 1989, p. 647). In argumentative discourse, the writer not only shows his ability to record the past by explaining and narrating events, but also includes negotiation or debate, abstracting from and reasoning about historical events in order to persuade and influence his readers of his choice (cf. Coffin, 2006, p. 77). Like in scientific communication, in historiographic discourse it is not the explanandum but the explanans that is initially doubted and need further support. After all, if the explanans contains a (set of) fact(s), this does not mean that the occurrence of the explanandum (fact F) is the direct (necessary) result of the occurrence of the fact(s) mentioned in the explanans (Wagemans, 2015, p. 7). As a third fact may be relevant here, it has to be made explicit which fact is the cause of the explanandum. As Wagemans describes, in pragma-dialectical terms, this can be translated as the need to add an argument of the form `Y causes Z' (1.1'1). Within a *factorial explanation* such an argument may for instance express that without the occurrence of the reason, a particular historical outcome does not occur either (necessary cause), or that there are no other reasons needed for that historical fact to occur (sufficient cause). Within a *consequential explanation* such an argument may express that without the occurrence of the cause, the effect does not occur either (necessary cause), or that there are no other factors needed for the effect to occur (sufficient cause). In the latter case, with application of the distinction by Stone (2002), the relation between the reason and the outcome or the cause and the effect may be described in different gradations of sufficiency. In other words, in 1.1'.1.1b1-3 (table 1) Y is a sufficient cause of Z but in different degrees.

     In historiography, causal explanation is often represented as (the result of) a process of choosing from different explanations that are considered and assessed. The process of weighing different possibilities in order to select the best explanation may be supported by argumentation why a specific decision has been taken. As there may be special (implicit) reasons regarding the criteria used for the selection of a sufficient cause from a number of possible explanations as the best or most suitable one, I have added 1.1'.1.1b1-3 in table 1 as gradual differences in probability. Among them 1.1'.1.1b1 is known as `abductive reasoning' or `inference to the best explanation', one of the most common forms of inductive argument (cf. Fogelin & Sinnot-

---

[2] The scheme is partly based on the basic argumentative patterns for justifying scientific explanations by Wagemans, 2015, p. 6.

Armstrong, 2005, p. 254; Froeyman, 2009; Wagemans, 2013). In abductive reasoning there is an implicit or explicit appeal to explanatory considerations (Douven, 2011). It "involves the consecutive process of selecting the 'best candidate' from the hypotheses that have been generated" (Wagemans 2013, p. 3; Campos 2011; Wagemans, 2013), with a conclusion that is plausibly true. The sub-standpoint motivating the choice is of an evaluative nature and can be formulated as "Of candidate explanations E_1-E_n, E_i is the best explanation of F" (cf. Wagemans 2015). This sub-standpoint may be explicitly supported by arguments in favour of E_i, or in disfavour of alternative explanations. If we consider *probability* in terms of "closeness to the truth concerning the relation between a historical fact and a possible explanation of that fact", the following scheme may be obtained (cf. Douven, 2011):

Table 2. Extension concerning the choice of the best explanation

1. It is observed that F is the case
    1.1 It is observed that candidate explanations E_1,...E_n are the case
        1.1'.1 Of candidate explanations E_1...E_n E_i is the best explanation of F
            1.1'.1.1 E_1...E_n meet criteria C_1-C_n with value $V_{1,1}$-$V_{n,n}$
                1.1'.1.1' If E_1...E_n meet criteria C_1-C_2 with value $V_{1,1}$-$V_{n,n}$,
                    then of possible explanations E_1...E_n E_i is the best
                    explanation of F
                    1.1'.1.1'.1 Decision rule R applies

In other words, given historical fact F and the available candidate explanations E_1,...E_n of F, if on the basis of value V E_i explains F better than any of the other explanations, infer that, after application of a decision rule R, E_i is closer to the truth than any of the other explanations.

Decision-making always implies criteria on the basis of which it is decided which explanation is the most preferable. These criteria may differ from one discipline to the other, and from person to person. In the field of scientific communication simplicity, generality, accuracy, consistency, and fruitfulness are just some of the criteria for deciding what the best explanation is (cf. Kuhn, 1998; Douven, 2011, Wagemans, 2015). For Early Modern historiography it seems reasonable to add criteria like reliability and expertise. If the choice of the decision-maker has been effected without a clear indication on the basis of which criterion the `best' explanation has been chosen, it seems quite difficult to get grip on this criterion (cf. Kuhn, 1998, pp. 103-104; Wagemans, 2015), in particular when different criteria at the same time are involved.

3. HISTORIOGRAPHY ANALYSED: PIETER HOOFT'S *DUTCH HISTORY*

In this section the usefulness of the analytical patterns from section 2 with respect to seventeenth-century historiographic discourse is demonstrated. As an introduction to the analysis, in 3.1 I will give some general background information of the historiography involved: Pieter Hooft's *Dutch History*. My analysis in 3.2 is based on a small corpus of justifications of historical explanation in the *Dutch History*, both factorial and consequential explanation. This corpus will give a representative picture of humanist historiography in this period. The selection offers a fair indication of the diversity of causal patterning in this historiography, though no claim can be made to be exhaustive concerning the different concepts of causation in history.

3.1 Background of the Dutch History

As a *historian* Hooft describes the first period (1555-1587) of the Dutch Revolt against Spain (cf. Parker, 2002) in lengthy prose, consisting of more than twelve hundred folio pages. The content of the DH (*Dutch History*) is rather patriotic, albeit with a clear-sighted understanding of the enemy's motives and qualities. Hooft's sympathies were unequivocally on the Dutch side, as he regarded the Revolt as a legitimate fight against Spanish tyranny. The narrative of the DH is chronological and divided into books, which tell the history of events year by year.[3]

From the argumentative standpoint to give advice to his governing fellow-countrymen explanation and interpretation play an important role. Causal links are essential in all parts of his work. Though the DH appears to be a chronicle-like account of established facts at first sight, causation is not merely limited to explaining events as they unfolded over time. Hooft's history is an example of a humanistic approach, in accordance with classical conventions, and history is no longer regarded as a process of linear development (Haitsma Mulier, 2002, p. 67). Humanist historiography aims at a convincing and lively presentation of what happened, or could have happened, and of the considerations thereof, the motives and utterances of the most important figures, rather than an exact reproduction of what was found in the sources, passed down through the ages.

Factorial explanation seems to prevail. Apart from an individual style Hooft has specific ideas about what to mention of (supposed) reasons leading to a particular historical outcome and what to avoid in telling his story. Moreover, he must have had a clear picture of which aspect(s) of the examples were the most valuable for his readers. Likewise, he felt it to be of little interest for them to have any knowledge of the historical (long-term) consequences. These served `rather as filling than as food' in his opinion, because the reasons behind the actions, thus the causes, would have been more important and useful than what it brought about or could have been brought about. Hooft described, for example, the planning of an attack (1581) on the city of Flushing in full detail, although this attack was never launched. He explains the background of the reasons that would have led to this attack (Hooft, 1972, p. 777):

> However, as knowledge of the bare consequences of historical events functions rather as filling than as food to the reader's reason - after all in the matter of usefulness they cannot weigh up against reviewing the ways by which the causes are brought about - it won't grieve us to tell these actions [in the margin: `Attack on Flushings (that did not take place)'], planned with as much bravery as craftiness, one by one.

After all, from Hooft's point of view the historiographer had to explain people's motives that were often hidden (*arcana imperii*), fact *and* judgment, as Tacitus had done, laying open a truth that transcended mere factual truth and offered insight into the real and deeper causes of events (Jansen, 1995, pp. 184-185). As Waszink (2008, p. 97) has stated with regard to Grotius - and the same goes for Hooft -, the usefulness of the ways by which the causes are brought about, was `revealing the real causes and motives in history' and in actual politics. It enabled the historiographer to directly steer and correct the present. By way of consequential and factorial explanations Hooft uses causal argumentation as a means to order and make history into a

---

3. Hooft's DH shows all the characteristics of a chronicle, in the sense that it recalls events as arranged in a rather strict chronological order; the mutual connection between the events may be under discussion, but evidently Hooft did not venture a lot of digressions across the time boundary of each year, in accordance with his most important source of inspiration, Tacitus, who mentioned any deviation of time sequence. Hooft apologizes for interrupting chronology as well (Haitsma Mulier, 1985, p. 65; cf. Breen, 1894, pp. 236-237).

reliable and comprehensible account, creating an impression of a considered and `well-documented' argument.

3.2 Analysis

The *Dutch History* is a historical account, in which linear causation is most common. Causation, as such, may be characterized as a judgment made that A causes B, as a process between A and B in which a necessity, force or causal power is transmitted (Ahn & Kalish, 2000). A linear causal narrative has the following structure:

event A →[causes] event B → [causes] event C, etc.

The facts are described in a coherent way, with a certain direction and meaning (Froeyman, 2009, pp. 13ff). Causal connectives that indicate this structure are for example `as a result of', `led to', and `resulted in' (cf. Coffin, 2004, pp. 263-264). The following case will illustrate this.

In 1587 the eastern provinces of the Netherlands remained the theatre of war, a fight between the Spanish troops of Parma and those of the United Provinces, in collaboration with English troops. One day the leader of the Dutch (and English) soldiers, Maarten Schenk, sees an opportunity to open the gates of Nijmegen, in order to take the city. That is why he makes his way to Elten, with his troops, most of them English ones, and from there to the other side of the Rhine. His journey starts at night with the aim to arrive in Elten at the crack of dawn. But when he has almost arrived there, he is forced to rest his English troops, who are at the forefront. He is unable to quickly mobilize them again.

(1) That's why [consequence] he [Schenk] started to drive the Dutch troupes forward, fearing [cause] that the daybreak would betray him. But the English troops, not willing to allow them the way through [cause], opposed them [consequence and cause] in such a way, with spears put forward, that [consequence] the plan [to arrive in the village of Elten] was a total disaster. (Hooft, 1972, p. 1096)

This description is an example of (mostly) consequential explanation in which the focus is on the effects of a specific event (the plan being a disaster as a result of the opposing English troops, the English troops opposing as a result of the Dutch troops being driven forward, the Dutch being driven forward as a result of the fearing by Schenk that the daybreak would betray him). All the causes mentioned are sufficient causes, to be valued as *probable* causes.

Factorial explanation may have a multi-layered character, as seen in example (2) with arguments from different places, however, without a clear internal evaluation of them by the writer:

(2) After Charles the Fifth (either due to his health, to which he himself put it down, or because his normal luck gave out), tired with reigning and not standing up to his problems, has drummed knowledge of governance [...] into his son, and appointed him as head of the Golden Fleece, he turned up [...] in the assembly of the States General. (Hooft, 1972, p. 3)

The argumentation structure runs as follows:

1 Charles drummed knowledge of governance into his son, and appointed his son as head of the Golden Fleece.

        1.1 he could not stand up to his problems

> 1.1.2 he was tired with reigning
>> 1.1.2.1 his normal luck let him down [reason given by Hooft]
>> 1.1.2.2 his health let him down [reason given by Charles]

The text does not make completely clear how the different causes have to be arranged and which premise belongs to which voice. Only 1.1.2.2 is explicitly linked by the writer with the judgment of Charles himself. All causes seem to be probable causes except for the reason given by Hooft himself (1.1.2.1) that Charles' normal luck let him down, which is a possible cause of 1.1.2. The gradual difference between these causes is based on an `initial condition'. Charles declared himself that health was the reason for his fatigue, and the reason given by Hooft (1.1.2.1) is another, possible, reason from someone judging the relation between 1.1.2.1 and 1.1.2. The cause is a *possible* one, as more than just `real-world'-knowledge is involved. After all, according to Sweetser (1990), the relation of sentences with causal connectives can be based on three types of causation: 1. real-world causation, 2. epistemic causation, and 3. speech-act causation. In this example there is a `real-world' or factual relation between the two discourse segments. Both the standpoint 1 and argument 1.1 contain a factual proposition. It is characteristically for an emperor (Charles V) to appoint someone else (his son) to be his successor if he cannot stand up to his problems, due to tiredness with reigning, as it is real-world-knowledge that being tired with reigning may be caused by insufficient health (1.1.2.2). Argumentation based on this kind of factual relationship leads to coherent utterances, and furthers that the reader can understand the relation between both. But the coherence concerning the other reason given here (1.1.2.1) asks for more than `real-world'-knowledge. That `it is considered a sign of luck if someone keeps his health' may be obvious, but an analysis of the context is needed to test the acceptability of the opinion that `Charles was normally lucky'.

The analytical form of causation, in which cause-and-effect chains are dominated by abstract, non-linear and non-human forces, is rare in the DH. This may be partly explained by the fact that in general seventeenth-century historiography has a more narrative, chronicle-like character. It focuses on historical facts and individual human acts rather than on abstract, long-term or coordinating forces and trends. Moreover, the DH has a dramatized literary style, which goes hand in hand with episodical narrative. An example though of analytical causation may be the passage in which Hooft evaluates the view of `several chroniclers' about the causes of a shortage of grain in the Southern Netherlands in 1587. The `non-human force' is the stagnation of agriculture. Indeed, the harbors and rivers in the Southern Netherlands were blockaded by the provinces of Holland and Zeeland, and the farmers lived on the verge of disaster, due to the burden of soldiers passing through, as Hooft describes. According to him, one historiographer explained the high cost of grain by stating that greedy traders only delivered grain when the prices of it have soared. The passage takes the form of a refutation with a conclusion on the basis of probability:

(3)   One writer from this period claims that the high cost did not arise from the grain shortage, but from the greed of the traders [...]. When the market was sluggish, these traders swore, in his opinion, that they had nothing in stock, but when demand for these goods increased, they could provide enough from their lofts, which were packed with grain. But, except that this has only been mentioned by one person, it can be easily refuted. For surely, the magistrate or the population would in all likelihood have heard about this despicable misuse and would have settled it by way of an order or revolt. Moreover, several chroniclers unanimously testify about this year [1587] that the earlier mentioned blockade of the waterways and the stagnation of agriculture cause the shortage [of grain]. For the achievement of this effect [the shortage] these factors [the blockade and the stagnation] were certainly sufficient. That's why I think it is more plausible that by proclaiming it this man

[the aforementioned writer], perhaps incited by the Spanish governors, may have tried to dissuade the people from the idea that it was in the power of the United Provinces [i.e. Holland and Zeeland] to take the other provinces [in the South] by the throat. (Hooft, 1972, p. 1160)

Hooft's own conclusion, after mentioning the insights of the different chroniclers, is based on a kind of abductive reasoning that "involves the consecutive process of selecting the 'best candidate' from the hypotheses that have been generated" (Wagemans, 2013, p. 3; Campos, 2011), with a conclusion that is plausibly true.

1 It is observed that the shortage is the case
    1.1 It is observed that greed by traders, blockade of the waterways, and stagnation of agriculture are the case
        1.1'.1 Of all possible explanations the blockade and stagnation is the best explanation of the shortage

The standpoint is supported by causal argumentation

        1.1'.1.1 The shortage can be explained by the blockade/stagnation
            1.1'.1.1.1 Several chroniclers unanimously testify this
            1.1'.1.1.2 The blockade/stagnation are a sufficient explanation

The refutation of an alternative explanation (the greed of the traders) is also supported:

1 The high cost is not likely to be explained by the greed of the traders
    1.1 This explanation is mentioned by only one writer
    1.2 The population would in all likelihood have heard about the misuse and would have settled it by way of an order or revolt [which didn't happen]

Decision-making always implies criteria on the basis of which it is decided which explanation is the most preferable one. Which ones are involved here? Due to a scarcity of factual evidence, Hooft selected the most probable possibility by logical reasoning and common sense. The decision is valued by words that on the one hand indicate determination like `easily refuted', `surely', `certainly', and on the other probability: `in all likelihood', `more plausible', `perhaps'. Moreover, his choice is supported by explaining why one of the explanations is less probable. It was in his opinion "intended to dissuade the people from the idea that is was in the power of the United Provinces to take the other provinces by the throat". This claim has been substantiated by reference to the Spanish governors, who `perhaps' incited this.

    Although reasons or consequences are selected and sometimes evaluated, they are mostly presented as categorical, objective facts, rather than as a set of propositions that have to be argued for (Coffin, 2006, p. 71). Solidarity between writer and reader may therefore been assumed. The same goes for the evaluation of the decision-making process. For the smooth functioning of this kind of historical narrative, common feeling and shared values seem to be essential conditions. The argumentation takes place in the context of a process of joint dispute resolution, aimed at persuading the readers of the way in which the reasoning has been made, elucidating the collaborative way in which the protagonist and the antagonist respond to each other's (i.e. assumed) doubts and objections. As in example (3), Hooft often delivers argumentation for the choice he made between different explanations. By using lexical choices

like `surely', `easily', `certainly', `main' and `important', he seems to construe a degree of causal impact in the DH but mostly refrains from further explanation of why it is classified in this or that way, implicitly referring to shared values.

4. CONCLUSION

In this paper, I have given a description of the prototypical causal patterns that arise when historiographers provide a justification for their explanation of a memorized fact or a set of facts, and when underpinning their choice for the selection of arguments. Causal argumentation has been described, in which a specific (historical) fact is supported by a (set of) particular fact(s). This argumentative pattern has been extended in a version that is focused on the quality of the explanation. It sets a necessary cause apart from a sufficient cause, and divides the latter into three different gradations: `the most likely', `probable' and `possible' cause.

The first one of these three has been identified as `abduction' and described as an extension concerning the choice of the best explanation. The extended version of causal argumentation concerning the choice of the best explanation (table 2) has made clear that on the basis of a valuation from the available candidate explanations one explanation is to be selected as the best one to explain a specific historical fact F, after application of a decision rule. For DH abductive reasoning seems to be highly relevant, as in several cases Hooft tries to reconstruct the historical process on the basis of available (and in some way conflicting) sources.

The analysis of causation in Hooft's DH sought to provide further insight into the application of the argumentative tool. The author often delivers argumentation for the choice made between different explanations. By using lexical choices like `surely', `easily', `certainly', `main' and `important', he seems to construe a degree of causal impact, though mostly refraining from further explanation of the decision made. Decision-making always implies criteria on the basis of which it is decided which explanation is the most preferable. Example (3) shows some of the motives for selection: one of them is the opinion of only one writer against the explanation unanimously made by several chroniclers. The criterion involved will have been `reliability'. Another criterion for selection of the best explanation is here that the proposed explanation is a sufficient explanation, while an alternative would have caused an effect (order or revolt) that did not happen. The criterion is here supposed to be `simplicity' or `sufficiency'.

In Early Modern historiography not only historical facts as (sub)standpoints need (sub)argumentation, but also the decision which of the available explanations is the best to be supported by (sub)argumentation. On the basis of the latter it can be decided not only which are the criteria for good explanations but also on the basis of which criterion a decision has been made.
